May 15 - May 18, 2017

## vol. VII. - VIRTUAL ECONFERENCE

SHARING KNOWLEDGE IS ONE OF THE MOST EFFECTIVE  
AND SUCCESSFUL WAYS TO GET AHEAD AND HELP  
ANOTHER THE SAME TIME

Interdisciplinary Scientific Conference for PhD students and assistants

[www.quaere.econference.cz](http://www.quaere.econference.cz)

### CONFERENCE INVITATION

ALL PHD STUDENTS AND ASSISTANTS ARE INVITED TO THE INTERNATIONAL SCIENTIFIC CONFERENCE QUAERE. ANNUAL CONFERENCE IS ORGANIZED BY MAGNANIMITAS ACADEMIC ASSOCIATION. THE CONFERENCE IS INTENDED ESPECIALLY FOR PHD STUDENTS AND THEIR SUPERVISORS AND ASSISTANTS FROM ALL EUROPEAN UNIVERSITIES. THE AIM IS TO SUPPORT THE SCIENCE, YOUNG RESEARCHERS AND CREATE A PLACE WHERE ALL SCIENTIFIC RESULTS CAN BE PRESENTED.

INTERDISCIPLINARY SCIENTIFIC CONFERENCE QUAERE IS GOING TO BE A TRADITIONAL MEETING OF PHD STUDENTS AND ASSISTANTS. THE CONFERENCE IS ORGANIZED WITH 7 TOPICS:

- MANAGEMENT, MARKETING
- ECONOMY, BANKING, INSURANCE MANAGEMENT
- PUBLIC ADMINISTRATION, MACROPROCESSES
- NATURAL SCIENCE
- PSYCHOLOGY, SOCIOLOGY, PEDAGOGY
- INFORMATICS
- TECHNOLOGIES, ENGINEERING, BUILDING INDUSTRY

THE CONFERENCE AND THE OUTCOMES OF PHD WORK SHOULD FOLLOW THE MEMORANDUM OF SCIENTIFIC INTEGRITY, ALLEA | EUROPEAN FEDERATION OF NATIONAL ACADEMIE OF SCIENCE AND HUMANITIES. MAGNANIMITAS ASSN. IS A SIGNATARY OF THE BERLIN DECLARATION ON OPEN ACCESS TO KNOWLEDGE IN THE SCIENCE AND HUMANITIES (OA.MPG.DE). THE DECLARATION WAS INITIATED BY THE MAX PLANCK SOCIETY

THE APPLICATION FORM IS AVAILABLE AT: [HTTP://WWW.QUAERE.ECONFERENCE.CZ/REGISTRATION](http://www.quaere.econference.cz/registration)

INTERDISCIPLINARY SCIENTIFIC CONFERENCE FOR PHD STUDENTS AND ASSISTANTS QUAERE FOLLOWS ALL REQUIREMENTS AND IS A HOLDER OF CERTIFICATE LEVEL B OF CERTIFICATION SYSTEM I/11, OF CERTIFICATE AUTHORITY NO. 5966

**Abstract:** Government affairs requires comprehensive policies and laws so that they can effectively implement it in the light of the macroeconomic management of the country. In the early nineties and then determine the governance paradigm with the introduction of indicators of good governance, both cooperative and private sector to run the country's next government. For better handling of all three parts according to its own policies and rules, are required to rule in accordance with the conditions of implementation of the law, which is known to governance contingency. The aim of the present study is designed to Effectiveness Implementation governance model contingency rules on governance and the role of Max and upgrade three parts to this type of governance in the country.

**Key words:** Governance Contingency, Public Sector, Cooperative Sector, Private Sector and Effectiveness Implementation

### 1. Introduction

Implementation by studying literature review and Experts in different countries can be realized this was a significant problem in law enforcement the problem is that the concept of governance and its implementation has not been properly explained. Discussion on the run governance known as governance contingency; By combining literature at home and abroad, including three dimensions is essential Which can accept any policy change components of its capacity and its own policy to be coordinated. Effective implementation of a policy variable represents the research criteria In fact, the effects of the three dimensions of governance in the implementation of effective contingency policies examined the principle of law. In the new paradigm governance of the idea of "governance contingency" to the time, place and specific areas of implementation of each policy is used. Another aspect of this type of governance for effective implementation of the policy requires that the legitimacy and capacity of its associated policy making and apply the rule of three is required. So a general Conclusions can be effective implementation public policy and rules governance according to law depends on its specific definition.

Governance contingency requirements public policy making such as capacity, the capacity of rationality and legitimacy capacity as predictor variables in this study is. When Implemented effectively, and ensure that the public accepted the framers of that kind are the people's representatives Attract and proper implementation of the law enforcers also hopes to make a positive impact. Perhaps the most important element in the implementation of any policy rule three parts considered (Gunther, & .Diamond, 2013). But effective implementation of integrated governance based on capacity addition of these variables require comprehensive underway The study of the components provided in the implementation of the policy is used by Calista in 1995. So the main subject of this study, lack of

effective implementation of laws and why it using the dimensions contingency model governance.

### 2. Research Context

Kettel in his book called concepts of governance, governance structure and activities of state institutions and procedures to get the job done and knows (Kettle, 2009). Governance, at least in the case of transactions in the market and sub-markets for public services should be run. Governance means the integrity of the government new public management and governance and management prelude private parts and it is normal for parts of the state and commercial cooperation creates incentives (Ansell and Maxwell, 2009). Governance means good governance. Union leaders new government is liberal democracy. The command system of governance as interdependence among political actors enforcement community. Product governance interactive combination between the policies of the government and society. Governance as self-organizing networks, network development and political ownership defined (Lapalombara, 2007) Farazmand in 2000, knows the importance of international standards governance as well as the fact that in reality the principles and guidelines for good governance and increasingly are value-laden shows (DeGeer, 2010). Good condition and properly implemented and problems with the monitoring mechanism to assess the policy context provided (Winter, 2009, 288). Capacity rationalization is the optimal forms of navigation and how the various actors on the basis of individual or collective wisdom and reasoning which can Make a difference in the world around them (Backstrand, 2015). Multiple goals governance to change the behavior of individuals within communities contingency cause substantial environmental sustainability of this particular type of governance rules. In the contingency of governor's powers and responsibilities are different (Haas, 2011). Governance approach contingency arrangement of governance suggests that many actors involved. The cast includes actors, private sector actors and actresses public institutions are legitimate and effective decisions in a role that environmental policy (Elmore, 2014). In other words, decisions and has the capacity to fulfill a legitimate need for capacity is not actually determined the legitimacy of the government and divided the nation and will be unenforceable and never not be mutually acceptable and this is the spirit of the current law. Capacity legitimacy of the people's ability to accept policy says and refers to the entirety of policy formulation and implementation (Kronsell, 2014). In this capacity, the ability of policy in its acceptance by the public and other institutions expressed. In other words, the legitimacy of a policy vacuum that fills the executive and the legislature, the executive and the beneficiaries will reach its goal of implementing specific policies (Sabatier, 2009) Effective implementation of the many factors involved, which is mainly affected by two types of inter-organizational and intra-organizational. In models (top-down) is usually Implemented by internal factors but the models (bottom-up) run more external factors affecting the organization. Sabatier and Mazmanyán the implementation of a combination of two types of model are Calista effective implementation both within the organization are influenced by three factors: networks, influential officials and field implementation and external factors such as: public opinion, powerful people and institutions interpreter knows (Gunther & Diamond 2013).

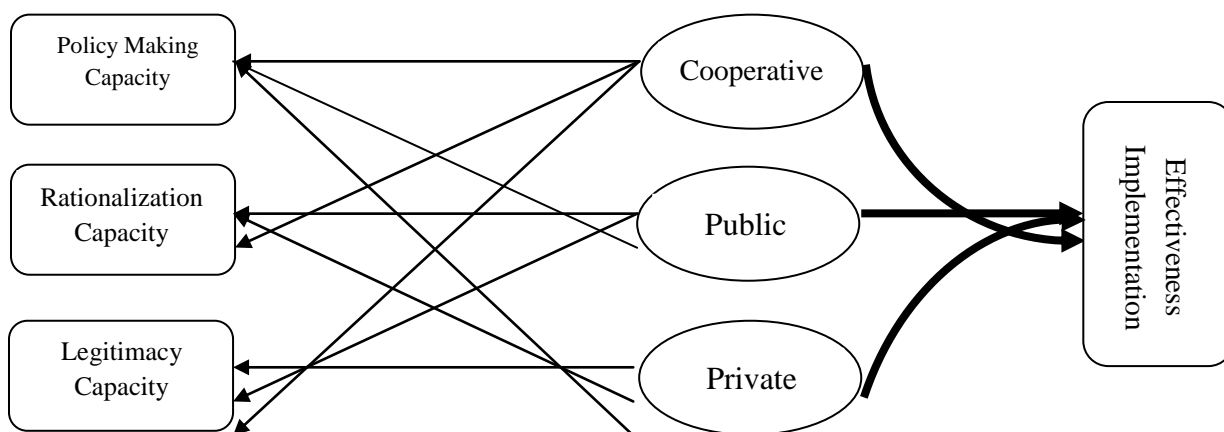

Figure 1. The contingency governance model

**3. Method**

In this sense, the present study applied research. Other classification, according to the study research method is descriptive - survey and correlation analysis was performed. Descriptive research is to describe what he does. The characteristics of this type of research can be Focusing on the present, past information is needed to identify the current situation and to suggest ways to improve it in the future. One of the survey research methods, Delphi method (Borg and Gall, 2003, 217). The procedure for the identification and confirmation of the final parameters of dependent variables

(criteria) and independent variables (predictor) is used for the preparation and verification of the questionnaire. Then the questions about the future status indicators derived from the subject under investigation is formulated addressing In this study, concepts, dimensions, elements and indicators are reflected in management books and items of the questionnaire was developed based on these indicators. The validity of the questionnaire is proven. In order to determine the reliability of the questionnaire Cronbach's alpha coefficient was used. According to Table 1, the amount equal to 82.4% respectively, which indicates the high reliability.

Table 1. Cronbach's alpha (reliability of the questionnaire)

Cronbach's alpha coefficients	Number of Questions	Concept and research dimensions
0.843	16	Public sector
0.714	16	Cooperative sector
0.768	16	Private sector
0.815	12	Effective implementation
0.824	60	Total (governance contingency)

**4. Research Aims**

It can be said with regard to the arrangements proposed in this study and practical goals were trying to reach it.

- Modelling to Effectiveness Implementation contingency governance rules.
- The effect of the public sector on the effective implementation of laws.
- The cooperative sector on effective implementation of laws.

- The private sectors on effective implementation of laws.

**5. Results**

To analyze the data collected from the questionnaires should be the first step toward determining the distribution of data in population And secondly to determine the type of tests With regard to the distribution of data in order to answer the research questions and the research necessary to achieve the goals. To check the current status of predictor variables and the criterion of one-sample t-test was used.

Table 2. One-sample T-test results for the predictor variables and the criterion

Average standard error of	standard deviation	mean	N	number of variables
0.2284	2.8976	3.246	40	Public sector
0.8509	3.3642	2.264	40	cooperative sector
0.1146	3.6433	2.869	40	Private sector
0.2376	3.1242	2.886	40	Effective implementation

Table 3. One-sample T-test results for the predictor variables and the criterion

Test Value = 3					
95% Confidence interval	Mean difference	significance	Degrees of freedom	T	Research variables

Upper limit	Lower limit					
0.6952	0.3476	0.4256	0.057	39	4.678	Public sector
-0.3512	-0.6427	-0.4522	0.042	39	3.425	cooperative sector
-0.1244	-0.2846	-0.1452	0.035	39	3.852	Private sector
-0.1785	-0.5417	-0.3012	0.032	39	5.448	Effective implementation

In the public sector policy-making capacity within acceptable limits and capacities of rationality and legitimacy are lower than the average for legislation. Capacity in the cooperative sector at an acceptable level of legitimacy and capacity of policy-making and rationality is lower than the average for legislation. In the private sector capacity within acceptable limits and capacities of policy rationality and legitimacy are lower than the average for legislation. The effective implementation of laws impact of

factors affecting officials and arena Implemented at an acceptable level and the impact of component Networks, public opinion, there are powerful individuals and institutions interpreter lower than the average. To approve the proposed model, the effect of not changing the effective implementation of the contingency governance by law and the stepwise multiple linear regression was measured.

Table 4 .shows the results of regression model between the predictor variables and criteria dimensions

Input predictor variables	correlation coefficient	coefficient of determination	Adjusted coefficient	standard deviation error	Durbin-Watson
PMC <sub>S</sub> - 1	0.457	0.324	0.321	0.5281

RC <sub>S</sub> - 4	0.711	0.546	0.449	0.4502	
RC <sub>N</sub> - 5	0.765	0.502	0.496	0.4266	1.785
RC <sub>P</sub> - 6	0.859	0.641	0.638	0.3974	
LC <sub>S</sub> - 7	0.874	0.689	0.682	0.3812	
LC <sub>N</sub> - 8	0.903	0.795	0.788	0.3549	
LC <sub>P</sub> - 9	0.924	0.847	0.816	0.3467	

Table 5. Impact Equation T test result dimensions predictor variables on criterion variables

Model	Non-standard coefficient		Standard coefficient	T	significance
	B	Std.Error	Beta		
Constant	0.745	0.168		2.656	0.019
PMC <sub>S</sub> - 9	0.362	0.065	0.192	4.387	0.000
PMC <sub>N</sub> - 9	0.324	0.061	0.187	3.358	0.000
PMC <sub>P</sub> - 9	0.308	0.058	0.184	3.473	0.000
RC <sub>S</sub> - 9	0.295	0.057	0.174	2.751	0.005
RC <sub>N</sub> - 9	0.284	0.052	0.169	2.846	0.003
RC <sub>P</sub> - 9	0.276	0.046	0.169	3.342	0.000
LC <sub>S</sub> - 9	0.259	0.044	0.152	2.769	0.004
LC <sub>N</sub> - 9	0.248	0.039	0.144	2.917	0.002
LC <sub>P</sub> - 9	0.236	0.032	0.138	3.576	0.000

The above table reflects the significance of the regression. Thus, according to statistics the remaining F distribution is normal. Level of less than 0.05 is significant for all variables that represent a direct linear relationship between the independent variables and effective implementation of the rules. The Durbin-Watson from 1.5 to 2.5, which is the sign of remaining independent. Given the significant level of value and (F) the normal distribution of residuals. In other words, one can say with 95% confidence. The model provided by the predictor variables are well able to express variables and criteria proposed model is approved. 0.847 is the coefficient of determination indicates that the 84.7% of the variation in the effective implementation of laws, under the impact of contingency governance is nine. With each unit increase in capacity for policy making, rationality and legitimacy in the triple governance, 0.236 of the effectiveness of the implementation of the contingency governance is added.

## 6. Discussion

Cooperative sector networks (institutions) people-centered and then the private sector has the lowest impact on the effective

implementation of legislation. The main challenge the legitimacy of the cooperative sector with the capacity of the sector. People oriented sectors based on interactions with external organizations and people work try not to rely on the public and private sectors through the interaction between individual and group-based utilities move. The adoption of this action by groups and other institutions often faced with challenges. Lack of capacity and investment policy as well as economic rationality and Administrative capacity also leads to a lack of efficiency and effectiveness in the implementation of the rules provided in this section. In the private sector the main problem in the future, lack of appropriate policies and laws are integrated. The lack of legislative capacity can cause the legal gaps in this sector. This legal gap caused by the economic corruption. Because the economic rationality of this section is discussed much more than other capacities As a result of negative interactions between the private sector and other sectors, especially the public sector. Financial and administrative corruption in his country in recent years indicates a huge gap in the private sector.

## 7. Conclusion

In this research governance model designed for different rules and the sharing of market and public institutions and people, time sensitive benefit from their help. The implementation of policies and macroeconomic policies if there is public support and private sector, Implemented in the bottom According to the detailed policies and accounts above will not lead to the desired result. It is concluded with a capacity of three contingency governance model for public policy making, rationality and legitimacy in the country is to view the effectiveness of enforcement and people with regulator in the formulation of policies and effective implementation of laws across the country to be used.

**Abstract:** This paper aims to find new methods in managing events using the characteristics of high reliability organizations such as airline companies, nuclear power plants and controlling aero traffic in service organizations. Existing characteristics in high reliability organizations are first proposed in this research then required activities for implanting the characteristics of a high reliability organization are inferred in electricity companies as a service organization. The tools of collecting data were questionnaires and they were conducted through surveying in statistical population of senior managers of Iran's electricity distribution companies and interviewing the elites of these companies. The methodology is descriptive exploratory and in terms of goal, it is applied research.

**Keywords:** events, service organization, electricity Distribution Company, high reliability organization

### 1. Introduction

Simultaneously with technological and social developments and following that equipping organizations with complicated technologies, complicated organizations have been created as a complicated system. Based on the theories of complicated systems, any system which is complicated and its components are tightly coupled to each other, will face events in normal flow of its operation. It is resulted by lack of control and perceiving processes which happen. In another word it is derived from uncontrollability and unpredictability of these events in complicated systems (Perrow, 1984). To prevent events and cope with them in case of emerging, different theories have been proposed. One of them is the theory of high reliability organization (HRO). This paper aims to use mentioned characteristics and methods in service organizations such as the companies of distributing electricity, water, gas and telephone. The case study of this paper includes electricity distribution companies as a public and large extent service company that is responsible for distributing electrical energy all around the country among electricity consumers and in order to achieve high reliability in the performance of these companies. To simplify high reliability organization in this research, it is mentioned as HRO.

#### 1.1 The concepts and theories

There are two theories for coping with events in the field of organizations that work with high risk technologies: 1- normal events theory, 2- high reliability theory (Wieck, 1999). Normal events theory is based in the attempt of Charles Perrow in 1984 to interpret his perception from Three Mile Island disaster in a more complete formula. Perrow argued that each system whose components are coupled to each other tightly and complicated interaction ally, will have exactly events in normal flow of operations. Perrow's argument is based on three principles; first is that people make mistake, even in nuclear power plants, second is that big events almost always start from very small events, third is that many errors are arisen from organizations more than technology. These three principles are still appropriate up to now (Perrow, 1984). The second theory is high reliability. This theory belongs to organizations which have complicated technology and work in stressful environments so that there will be disaster for them in case of events (Roberts, 1990). If the performance of organization can be shown with reliability, it will

be high reliability organization (Ericksen and Dyer, 2004). The samples of these organizations include nuclear power plants, the centers of controlling aero traffic and aircraft carriers. According to the theory of HRO, the characteristics and methods which are used in these organizations can be utilized to cope with unexpected events in other organizations (Wieck, 1999).

#### 1.2 Events management

Anything which leads to interrupt giving services to the customers of service organizations is called events. These events can be resulted by equipment improper function, human error or natural disasters such as earthquake and flood. Events management includes the activities which are used to prevent control and reduce the events in such organizations.

#### 1.3 Reliability

Reliability of a system is the possibility of safe and faultless operation for specific time according to the current and predetermined conditions. Reliability is usually used for ensuring the proper functioning of a piece or generally a set of factors (system) during specific time and period (Faqih et al., 2007).

#### 1.4 The events and reliability in electricity distribution companies

Electricity distribution companies are responsible for distributing electrical energy to almost 30 million of consumers including domestic, business, public, industrial and agricultural consumers all around Iran. This operation duty includes maintaining and repairing electricity networks, selling energy, getting consumed cost and accepting new recruits of electricity. Any kind of event which interfere in this operation or duty and it is also unexpected is called events. In this paper, the events are only considered that are created for the networks of electricity distribution and lead to electricity interruption. The indexes of reliability in these companies will be measured according to standard number 1366-1998 of IEEE that is the reference for developing electricity standards. These indexes include:

1-System average interruption frequency index (SAIFI): this index shows that how many electricity interruptions have been averagely experienced by an electricity consumer within reporting period. Whatever the value of this index is higher, it indicates that the network is weak reliable and the interruption number of this system consumers is more.

2-System average interruption duration index (SAIDI): this index shows average duration that each study consumer doesn't have access to electrical energy. Whatever this index is lower, it shows higher reliability of network in terms of blackout duration for each electricity consumer.

3-Customer average interruption duration index (CAIDI): this index shows average required time for subscribers' service recovery and the difference between this index and first one is that instead of all consumers, only consumers who have had one experience of blackout will be considered in this index.

4-Average service availability index (ASAI): this index shows reliability from the perspective of blackout, as this index is closer to one, the reliability will be higher in study network.

5-Customers experiencing multiple interruptions (CEMIN): this index shows the number of consumers that have had more than n times of blackout out of whole consumers. Whatever this index is lower, it shows higher reliability in study network.

#### 1.5 High reliability organization (HRO)

HROs are some types of organizations that are designed in order to cope with complicated environments. The processes which can be found in HROs either provide the possibility of reliability performance or the possibility of adaptive learning (Holman,

2005). These organizations work in a social, political environment without overlooking, a rich environment of potential for error and mistake, the place where a scale of consequences prevents learning through experience and use complicated technology to avoid failure in their complicated processes (Rochlin, 1993). Primary characteristics of HROs are concentrated on complete elimination of error and mistake and lack of trial and error in learning (Wieck, 1987). The characteristics below are mentioned for HROs by Social theorists: (Sutcliffe, 2011)

- 1-Preoccupation with failure
- 2-Reluctance to simplify interpretations
- 3-Sensitivity to operations
- 4-Commitment to resilience
- 5-Deference to expertise

These five characteristics cause that organization has a permanent awareness for coping with events. This awareness is called mindfulness. Mindfulness is the process of active attention to new things, conducting this put people in present time and

make them sensitive to the context and perspective (Langer, 1989). Work mindfulness is related to interpreting weak signs in organization (Vaughan, 1986). This means that mindful organization feels even weak signs of error in performance of some sections in organization and react to them because it is believed that in organizations which use complicated technology, organization units are severely attached to each other or in another word are coupled to each other and error in one section of organizations will be rapidly transmitted to other units and a small error will turn to bigger ones cascading and leads to events, this is the feature of high technology organizations (Perrow, 1984). Ultimately the five mentioned characteristics in HROs cause organizations' mindfulness and through this mindfulness, the organization will be capable of discovering and predicting unexpected events and finally coping with them. These hierarchy of activities increases operation reliability and creates a high reliability organization. Generally, it can be said that high reliability organizations aren't capable of being without errors, but such organizations will have this capability that created errors cannot disable them. The figure below shows this process which is intellectual infrastructure of high reliability.

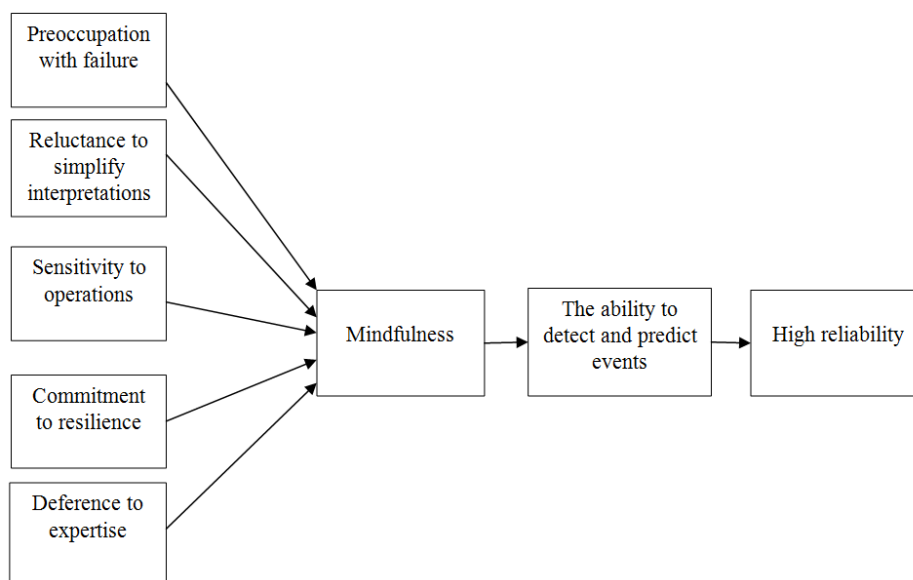

Figure 1- intellectual infrastructures for high reliability (Wieck, 1999)

### 1.6 General characteristics of HROs

#### 1-Preoccupation with failure:

In most of organizations when organization succeeds in its performance, its managers usually attribute this success to themselves or at least their organization instead of chance. The confident of organization members to their abilities, managers' skills and existing programs and methods of organization will be more. They trust this method. Assuming that success shows their ability, people get floated in their self-satisfaction, ignorance and habits that this pattern often leads to neglecting the mistakes and weaknesses or organization and consequently increases the possibility of human error. In very effective HROs, self-satisfaction is severely avoided, it is assumed that each current success decreases the possibility of future success (Wieck, 1999). The success isn't noticed in such these organizations but the thing which is paid attention is failure in the operation of organization. What factors lead to failure? Investigating failure in previous operations and failure in similar organizations are the factors that are most noticed in HROs. In another word the preoccupation of these organizations is failure in operation not success. The failures are rare events in such organizations because failure in them will be defined as disaster. Dealing with each one of errors will be conducted as some holes in the health

of system and the beginning of future failures so effective HROs either encourage reporting errors or they have the best use of each error which is reported.

#### 2-Reluctance to simplify interpretations:

Most of organizations simplify complicated duties that is when a sign of error is observed in system, one specific person or section of organization will be responsible to solve it and the rest of organization have nothing to do with it while simplifications are potentially dangerous for HROs because they limit either cautious actions of people or the number of unexpected consequences that they predict. Simplification increases the possibility of probable surprise. Whatever the organization is more accurate and neglect fewer data, it will be surprised less. Traditional organizations tend to overlook this question that what they have overlooked (Pearson and Mitroff, 1992). While effective HROs notice this question and investigate more about what they don't know. To avoid simplification deception, HROs promote complicity and assume that a complicated system should exist for feeling a complicated context and they believe that all human make mistakes and sceptics improve the reliability (Wieck, 1999).

### 3-Sensitivity to operations:

Operational personnel who are at the forefront of operations are specifically noticed in HROs, their comments are continuously taken. The managers of this organization focus on forefront (the place where working is really conducted) (Wieck, 2003). It is believed in these HROs that people are operational that in order to run the programs do all improvising works, handling and heaving (Wieck, 2003). Therefore, these people have to be aware of all organization operations and its levels. In another word big picture of organization operation should exist in the mind of operational personnel. This awareness is because in case of observing error whatever small in one section of organization, its effect should be perceived in whole organization and error transmission to other sections and their accumulation that is the feature of complicated organizations should be avoided and ultimately those errors should be modified. Another problem is lack of complete trust to technology that is done to prevent what is called automation surprise (Miller and Woods, 1997). Whatever developed, technology cannot be replace human and in the path of operations, the works shouldn't be done all by systems without continues monitoring.

### 4-Commitment to resilience:

The word resilience is often used for returning to the past (Dadashpur and Adeli, 2015). This word is more used in HROs because they don't have any other choices except real time response to the events. Effective HROs tend to have either anticipation or flexibility (Wildavsky, 1991). Anticipation refers to prediction and prevention potential dangers before having a damage while flexibility refers to the capacity of coping with unexpected dangers after they were revealed and learning for returning to the initial status. Unlike effective HROs, traditional organizations hardly tend to go toward one or both. Traditional organizations usually go toward predicting expected events, risk aversion, planned defend against predictable dangers while HROs show more attention to unpredictable dangers. Not only returning to initial statuses before errors but also flexibility is coping with events in the moment. The best HROs don't wait for error to deal with before response, instead they get prepared for possible surprise by expanding public knowledge and technical facilities, general order on resources (Wildavsky, 1991). It is obvious that HROs accept unavailability of errors. The knowledge of HROs consists of the reality of human error, doubtful technology and limited expertise (Vaughan, 1996). To cope with this reality, they either notice error prevention or error inhibition (Wieck, 2003). Ultimately flexibility comes as doubt on the applicability of past action, that is an action which used to be answered in the past might not always answer. Unlike many other organizations, HROs are able to either believe or doubt in past action simultaneously (Wieck, 1969).

### 5-Deference to expertise:

Effective HROs don't usually have any failure not because of existing discipline in their organization but because of their indiscipline that is official hierarchy isn't always effective in decision making but sometimes lack of particular hierarchy when moment decision making is required is useful in making a correct decision. In another word, each disciplined hierarchy can strengthen the errors especially when they occur near peak (Turner, 1978).

In case of delaying in decision making, smaller errors will be more likely to expand, accumulate and interact and start serious consequences. To cope such conditions, HROs obtain flexibility by organized anarchy (Rasmussen and Batstone, 1989). This indiscipline and ditching hierarchy introduces a kind of decision making that is known in management science as garbage can. Severe environmental changes cause that organizations move toward the structure of garbage can (Cohen and March, 1972). The problems, solutions, decision makers and opportunity selection in a garbage can depend on current flows inside system. It means that making decision isn't predicted but it is immediate.

Making decision here will be given to trained and experienced people instead of managers, the solutions are linked to the problems and decision makers are linked to selections that is by their common presence on that very moment (March and Olsen 1986). Of course this indiscipline isn't predicted only for critical situations but it is also valid for other times of organizational structure and this anarchy of organizational structure will be facilitated by the loosening of hierarchy restrictions using organizational mindful system in HROs (Wieck, 1999). Finally, in the event of unexpected circumstances in HROs, decision making of a person who is experienced and knowledgeable in the emerged subject is superior to making decision of a person who lacks this expertise although he has lower position organizationally.

## 2. Research history

Wieck, Sutcliff and Ostafold (1999) discussed the concept of high reliability organization (HRO) in order to have attitude to the organization's efficiency under erosive conditions as well as anarchy conditions, uncertainty and high risk and accompanied it with the theory of high reliability (Wieck, 1999). HROs theory has been used up to now in many service organizations to increase reliability in the performance such as firefighting organization (Anderson, 2013) and health services organization of America government (Vogus and Sutcliff, 2007) and Education Department of America (Reynolds and Stringfield, 2006) and Energy Department of America (B &W Pantex 200) and Urban Railway Organization in the UK (Bigley and Roberts, 2001).

In his research named "the theory of high reliability organization as an entry for operation risk management in project management", Werner (2012) uses the concept of team and education while using the HROs theory for managing operational risk projects (Werner, 2012).

Frankel et al (2006) in investigation of high reliability in medical and health care organizations, have identified the main tools of achieving high reliability as fairness and justice-oriented culture, team behavior and leadership employment (leadership informal communication with components of the organization) (Frankel et al, 2006). To achieve high reliability, the organizations have to make relationship among these three concepts. Common required activities to achieve high reliability in these organizations included team work, job rotation, permanent training, knowledge management, creating trust and talent management. These researches have shown that using the characteristics of HROs in mentioned service organizations in related performances, high reliability can be achieved. Considering research history, 16 activities which are used in HROs are identified that include the ability of high interaction, high transmission speed, high learning ability, calmness, job rotation, knowledge management, learning, security, trust, teamwork, talent management, organized anarchy, experience survival, loyalty, work hardness and the dignity of human resources. These activities can meet the characteristics of HRO.

- 1- Learning ability means educability and having string mind for learning in organization personnel.
- 2- High transmission speed is required characteristic for rapid decision making while events occur.
- 3- Calmness after decision making which is necessary for decision making and its stability.
- 4- The ability of high interaction with others and the skill of working with each other are required for the employees in HRO.
- 5- Job rotation or displacement in different jobs of organization is required for acquiring multi skills.
- 6- Knowledge management includes production, distribution and sharing knowledge in organization.
- 7- Organizational learning includes initial and while working training continuously.
- 8- Security for sending the reports of errors and mistakes for employees and no punishment even in case of their failure.

- 9- Team work is as coordination and the work of specific people with each other for particular subjects.  
 10- Talent management means discovering, growing and encouraging people who are talented in management fields.  
 11- Organized anarchy means in case of emerging crisis, decision making is on elites not organizational hierarchy.  
 12- Trust means that each person in organization is able to ensure the other one doesn't work to his detriment.  
 13- Experience survival means people who leave organization, transmit their experience to others.  
 14- Loyalty means after retirement, organization refer to employees and help them.

- 15- Work hardness means early completion of work in organization or early retirement from the organization in case of personnel's request  
 16- The dignity of employees who have left the organization means glorifying honoring them and providing them relative rights and benefits

Considering obtained activities above from research literature, model below is proposed by research to provide the characteristics of high reliability organization:

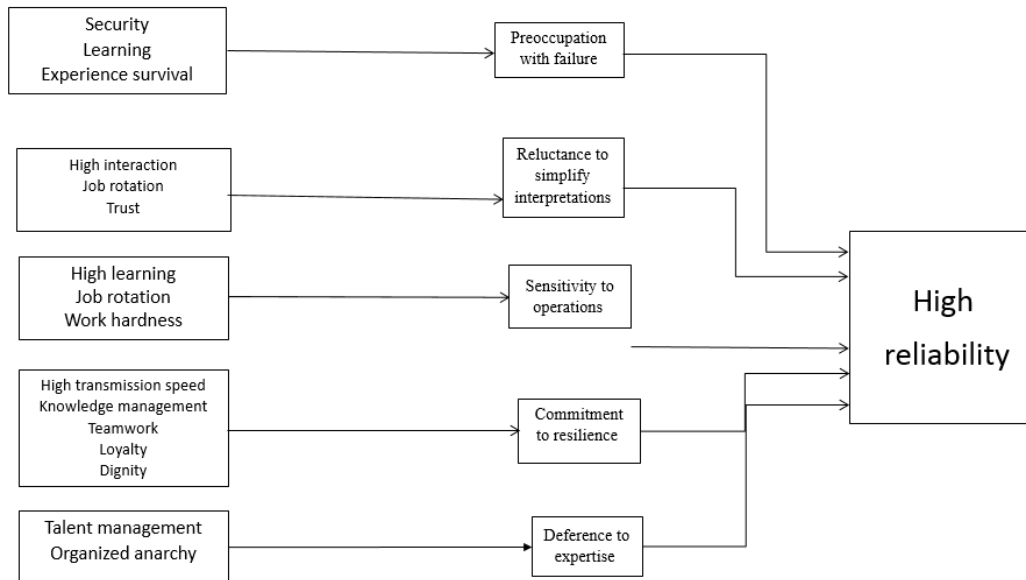

Figure 2- research conceptual model (reference: authors' findings)

## 2.1 Research questions

- 1-What are related activities to preoccupation with failure in service companies?
- 2-What are related activities to reluctance to simplify interpretations in service companies?
- 3-What are related activities to sensitivity to operation in service companies?
- 4-What are related activities to commitment to resilience in service companies?
- 5-What are related activities to deference to expertise in service companies?

## 3. Methodology

The methodology which is used in current research is discovery explanatory and in terms of goal the research is applied and in terms of collecting data it is survey.

### 3.1 Statistical population and sampling method

Statistical population of this research includes the managers and assistants of Iran electricity distribution companies that are under the Ministry of Energy. These companies are responsible to distribute electrical energy all around the country and form statistical population of the research. 40 companies of electricity distribution work in the country. Whole statistical population includes 300 people. To select the sample out of these people, Cochran's formula was used and 178 people were obtained as sample number, selection method was also simple random.

### 3.2 The tools of collecting data

Collecting data tools in this research consist of questionnaire and interviewing the elites. The questionnaire was provided and

distributed among them by the researcher to take the ideas of statistical samples which included the managers and assistants of Iran electricity distribution companies. Spectrum used in the questionnaire was Likert 5-item and consists of very high, high, average, low and very low. To investigate obtained result from questionnaire, the elites of electricity industry elites who had expert jobs and work experience upper than 10 years and management organizational position were interviewed through snowball method.

### 3.3 Validity and reliability of the research

To provide the validity of questionnaire, the ideas of elites and guiding professors as well as consulting ones were continuously used and necessary modifications were applied in the questions of questionnaire. In order to determine the reliability of questionnaire, Cronbach's alpha coefficient has been used. Calculated Cronbach's alpha coefficient is 0.72 which shows appropriate reliability of questionnaires' questions.

### 3.4 Analyzing data

To analyze data in this research, inferential statistics have been used. Due to this, SPSS software which is strong software in analyzing statistical data was utilized. In first level after collecting statistical samples, normal distribution of statistical population was first tested using Kolmogorov and Smirnov test and after ensuring the normalization of population, T-test was selected to experiment generalizing the results of sample volume to statistical population.

#### 4. Research findings

To ensure normalization of statistical population data, Kolmogorov and Smirnov test was used that obtained results are proposed in table below:

##### 4.1 Data normal distribution test and statistical test

Table 1- obtained results of Kolmogorov and Smirnov test for research variables

Result	Significance level	Z statistics	Standard deviation	Mean	Number
Normalization approval	0.057	1.334	0.65	2.898	176

After ensuring normal distribution of statistical population, t-test was used for generalizing obtained results of sample volume to used statistical population. Single sample t-test is one of the most functional statistical tests in investigating the attitude of one group about a subject or investigating a variable adjective in a particular group. In this research, the attitudes of 176 managers and assistants of Iran electricity distribution have been measured as sample about the existence of related activities to high reliability organizations in these companies through questionnaires. It means that according to the model, there are 16 activities in HRO to provide its characteristics. The research seeks to know to what extent of these activities in study organization which is Iran electricity distribution, use these activities so in order to this, questionnaire was sent and completing it was asked from manager and assistants of each Iran electricity company that are the most aware people in the field of administrating the company. In this questionnaire each respondent has answered to Likert 5-item scale including very

high, high, average, low and very low. It is now investigated if obtained answers from sample work in statistical population. The mean of statistical sample was calculated and it was 2.89. Therefore, it is claimed that population mean is 2.89 so the hypothesis is stated as below:

$$H_0: \mu \neq 2.89$$

$$H_1: \mu / = 2.89$$

Now considering the hypothesis, if the absolute value from obtained t is bigger than  $t_{0.05}$  that is 1.65 then  $H_0$  is rejected and claim is accepted. In another word the components are remained and the components whose obtained t value is smaller than critical value  $t_{0.05}$  that is 1.65 will be eliminated. The calculations have been done by software, the results have been shown in table below.

Table 2- the results of single sample t-test

Activities	Test value: 2.89			
	t	Sig. (2-tailed)	$t_{0.05}=1.65$	Result
High interaction ability	2.986	.003	$t > t_{0.05}$	Accepting claim
High transmission speed	3.520	.001	$t > t_{0.05}$	Accepting claim
High calmness	6.234	.000	$t > t_{0.05}$	Accepting claim
High learning ability	10.935	.000	$t > t_{0.05}$	Accepting claim
Job rotation	1.296	.197	$t < t_{0.05}$	Claim is rejected
Knowledge management	.132	.895	$t < t_{0.05}$	Claim is rejected
Learning	-3.962	.000	$t > t_{0.05}$	Accepting claim
Security	2.456	.015	$t > t_{0.05}$	Accepting claim
Trust	1.566	.119	$t < t_{0.05}$	Claim is rejected
Teamwork	-4.385	.000	$t > t_{0.05}$	Accepting claim
Talent management	2.593	.010	$t > t_{0.05}$	Accepting claim
Organized anarchy	-2.990	.003	$t > t_{0.05}$	Accepting claim
Experience survival	-9.001	.000	$t > t_{0.05}$	Accepting claim
Loyalty	-6.871	.000	$t > t_{0.05}$	Accepting claim
Work hardness	-1.532	.127	$t < t_{0.05}$	Claim is rejected
Dignity	-5.626	.000	$t > t_{0.05}$	Accepting claim

##### 4.2 The results of statistical test

T statistical test gives the results below:

- 1- High learning ability which is one of prominent feature of attracted human resources in HRO is noticed in Iran electricity companies during recruitment.
- 2- High transmission speed that is required characteristic of rapid decision making when crises occur is notices in Iran electricity companies during recruitment.
- 3- Calmness after decision making that is derived from trusting God is necessary in decision making and its stability is noticed during recruitment.
- 4- The ability of high interaction with others that is required for employees of HRO especially managers is the factor of selection in such organizations during recruitment.
- 5- Job rotation which is required due to acquire multiple skills in maintaining and promoting human resources doesn't exist adequately in electricity companies.

6- Knowledge management that is production, distribution and sharing knowledge in organization isn't noticed in maintaining and promoting human resources in electricity companies.

7- There is organizational learning in electricity companies as maintaining and promoting human resources activity.

8- There is security for sending error reports for the employees of HROs and they are encouraged in the activities of human resources.

9- Teamwork is conducted and encouraged as an activity of human resources.

10- Talent management which means discovering, training and encouraging people who are specifically talented in management field, is followed in electricity companies.

11- Organized anarchy that is decision making is on elites while crisis occur not on organizational chart can be found in electricity companies.

12- There isn't trust adequately among the members of electricity companies for exchanging information and intra-organizational interaction.

13- Experience survival means people who leave organization should keep their experience inside organizations through different methods and transmit it to other colleagues.

14- Loyalty means after retirement of people are referred by organization in case of need and are helped by organization.

15- Work hardiness which means early completion of work in electricity companies or early retirement cannot be found in the organization.

16- The dignity of retired employees while leaving the organization is respected through appreciating them and providing their relative rights and advantages.

From 16 activities of research model, the component of job rotation, knowledge management, trust and work hardiness don't exist in statistical population that is in Iran electricity companies, these activities aren't conducted while in a high reliability organization, these components have to be present. In this stage, now it has to be investigated if this shortage derived from negligence or lack or needing these activities in companies so the subject was followed during interviewing 10 elites of electricity industry. The question is that if the existence of knowledge management, trust, job rotation and work hardiness is necessary in electricity companies. Should companies implement these activities or considering their mission, there is no need for these activities. The ideas of ten elites and involved people in human resources in electricity companies are as follows:

1- To have high reliability performance, electricity companies should consider trust, job rotation, knowledge management and work hardiness in their employees' retirement.

2- The necessity of existence of trust, job rotation, knowledge management and work hardiness of employees while leaving organization is clear and can be found in some companies but it isn't followed in all companies.

3- Pioneer electricity companies consider trust, job rotation, knowledge management and work hardiness of employees but these activities aren't done in all companies.

4- Considering increasing expectations of people from electricity companies and to provide these expectations, there should be trust, job rotation, knowledge management and work hardiness in electricity companies.

5- The existence of trust among employees, job rotation, knowledge management and work hardiness of employees while retirement is required due to high reliability performance.

6- Job rotation and trust are necessary among the employees but knowledge management and work hardiness aren't necessary while retirement for high reliability performance.

7- In order to achieve high reliability, acquiring multiple skills with job rotation and trust among employees and work hardiness of employees is necessary but knowledge management isn't that much necessary.

8- Job rotation, knowledge management, trust among employees and work hardiness while retirement is necessary to achieve high reliability.

9- Job rotation, knowledge management, trust have been notified in electricity companies but because of some problems, they have not been executed and work hardiness is also followed by Power Ministry.

10- Trust among employees, job rotation, knowledge management and work hardiness of employees are necessary for achieving high reliability and lack of them hurt the performance.

Through the results of interviewing the elites, it can be concluded that according to them, the existence of job rotation, knowledge management, trust among employees and work hardiness of employees while retirement is necessary to have high reliability performance and lack of them in some of electricity companies is because of managers' ignorance especially those who are the managers of human resources in these companies. Due to several reasons such as cultural differences among people that manifest in the level of people expectation from electricity companies and financial abilities of companies that limit doing human resources management activities as well as insurance limitation which is derived from legal problems in the country have caused these activities not be implemented in some

companies. Considering the information above and obtained results of field investigating and conducted interviews, mentioned activities are necessary for a high reliability organization.

#### **4.3 The relationships of activities with characteristics of high reliability organizations**

a) The activities of security, learning and experience survival are necessary for providing the characteristic of preoccupation with failure for HROs. The personnel of electricity distribution companies should be able to report the errors and problems of organization even if they made those mistakes. Without being worried about the consequences of reporting errors and mistakes, people should report them to related centers. In HROs, the employees aren't blamed for their reports but they are also encouraged (Vaughan, 1996). These reports are used as much as possible to prevent turning them to bigger problems. Unexpected events are because of a chain of errors that had been hidden and suddenly caused events as cascade in electricity networks. If people report these errors on that point of production, mentioned chain won't be formed or at least it can be controlled. The thing which is important in electricity companies and increases reliability is preventing occurrence of events in network and blackout, if this important issue is preoccupation of personnel in these companies (preoccupation with failure), they will be always worried about events and seriously investigate the smallest sign of events and try to prevent it. This is organizational mindfulness that is one of characteristics on HROs, another necessary activity is learning. Here learning is using others' experiences to modify current behaviors in order to prevent repeating mistakes. Continuous trainings and effectiveness evaluation of these trainings, visiting and face to face negotiations with similar companies that had the experience of failure and analyzing the reasons of these failures and the occurrence of crises increase learning. Simulating events and creating controlled crises and comparing with crisis through implementing operational maneuvers as well as maintaining people organizational experiences while leaving the organization for example while retirement through different methods such as holding class and seminar or writing the leaflets and books so that these experiences are kept in organization in another word experience survival are of conditions of providing preoccupation with failure of organization as the first characteristic of HROs.

b) The activities of high interaction ability, job rotation and trust are required for providing reluctance to simplify interpretations in HRO. In electricity distribution companies, the belief which indicates that working in complicated organization and complicated environment is important. This belief especially should turn to faith for managers. In each electricity distribution company there are some errors and problems while exploitation that lead to blackout, if each one of these blackouts is considered as a failure in current operation, this failure will have reason or some reasons. If this failure is dealt vaguely or another person or unit is blamed for that (simplifying in interpretation) the possibility of events repetition will be more. While when for investigating and analyzing each events regardless the importance of that, all units of company try to solve the problem and prevent repeated blackout that of course the interaction among these people is necessary for it or in another word if all data even apparently less important aren't ignored, then there won't be simplification. The personnel of the company need to be trained for negotiation technique. This means negotiation and interaction of people with each other and using the abilities of each other to be able to create synergy. To achieve this ability, the existence of trust among employees as well as between employees and managers is necessary, here the person should be sure that other one doesn't do anything to his detriment (Holman, 2005). Without trust, people won't share their knowledge with each other. Job rotation can be effective in trust and mutual perception among the units of organization because being in different jobs and familiarizing with problems and hardiness of each job will increase its employees' perception. Ultimately if this belief is created that failures and problems

aren't because of one person or unit but a chain of people or involved units and to solve it whole organization should be involved and use whole its power, then the company has provided reluctance to simplify interpretations that is second characteristic of an HRO.

c) The activities of high learning ability, job rotation and work hardiness are required for sensitivity to operations in HR, each one of the employees in electricity companies should be relatively aware of whole purchase, distribution and sale electricity operations that is they should be able to create a mental image of complete operation of electricity company because if they saw a problem or error in a part of company's current operation, they would be able to perceive the effect of this error or mistake in whole operation of the company. To achieve this recognition electricity company needs to have job rotation. Displacement and using organization personnel in different jobs create this cognitive ability for them to be aware of whole organization operation. For example, the personnel of engineering and designing section should be also used in exploitation sections and vice versa. Even the personnel of official units and customer service should work in exploitation section for a while and be trained. This perception of all organization operations is effective on increasing the attempt motivation for modifying or handling created problem. On the other hand, the managers of companies should believe that main activity of company is conducted by operational workforce and they are directly faced to the problems and work hardiness and they are the most important resources of company and their ideas should be considered in administrating a company. When these workforces felt tired or found problem in facing work pressure, their request for their displacement should be agreed and in retirement they should be also retired sooner than usual. Particular attention of managers to operational workforces and providing their needs are necessary for sensitivity to operations which is third characteristic of HRO.

d) High transmission speed, knowledge management, teamwork, loyalty and dignity are required for providing commitment to resilience. People expect electricity companies when there is a blackout, it is immediately solved and the conditions get normal again. This is a right expectation because main owners of the company are people. To provide this expectation, electricity companies should conduct two activities; first predict the events and before occurring be prepared to cope with it. The necessity of this preparedness is continues visits from network and identifying its weaknesses. Second is that when an events occurred, whole company would be able to return the conditions to the normal status. This ability can be achieved through using people who are fast in making decisions, teamwork and cooperation of people to solve problem is another necessary point for returning to initial status. In wide events such as earthquake and flood that damage is high and long blackouts are expected, using the experiences of experienced people even those who had left the company is required. The conditions should be so that people outside the company like experienced retired ones can refer to organization in case of need, that is they should be loyal to the organization and retirement shouldn't be permanent separation of these people from organization that of course it will be through appreciating and respecting these people. If people who have left the company aren't satisfied with their situation, they won't cooperate their organization again. Collecting the experiences of employed people in organization and those who are retired in critical conditions and events is a kind of organizational knowledge that can be effective in returning to previous situations. Fourth characteristic of HRO which is commitment to resilience will be provided in this way.

e) Talent management and organized anarchy as well as calmness while making decision are required for providing the characteristic of deference to expertise in HRO. When events occur in electricity distribution companies, people who are able to handling the events and coping with its destructive consequences and above all returning the conditions to initial status are elites and experienced experts of these companies. Solving occurred problem usually needs to making decision and

more important than that stability in decision making, for example, people displacement, buying some goods, transferring the equipment from a point to another one or even relationship with companies and other organizations. Elites and experts should be able to make such decisions while events occurs and all people of organizations should obey these decisions. While in normal situation, the decisions are made according to organizational structure that is managers and senior people of organization decide, other people of organization have to obey it. To be able to put responsibility on their elites and experts in events especially in critical conditions, electricity companies should be prepared before. One of this preparedness is talent management in electricity companies. Talent management is identifying, noticing, attention and strengthening the people who are able to manage the events (Armstrong, 2012). Management is a set of art and science that is it requires either natural talent or learning and training so people who are talented in management and are usually known passing the time and facing hard situation should be identified and trained scientifically and practically to be able to manage critical situation. Simulating crisis and doing operational maneuvers are also necessary for keeping and increasing the power of crisis management and training required elites, on the other hand senior managers of organization should dare to give the responsibility of making decision to experienced elites and experts and although the responsibility of making decisions is one them but final accountability is on senior managers of electricity distribution companies. All of these conditions will realize fifth characteristic of HRO.

## 5. Conclusion

If an organization wants to have high reliability performance that is not having failure in its mission or at least having rare failures and passes events successfully or in better word best management, it can use the characteristics of HROs. To achieve the characteristics of HROs that were mentioned in this paper, the security of personnel for reporting errors, creating trust among the personnel of organization, the survival of stored experience, high interaction of personnel with each other, trusting each other for exchanging the knowledge, high transmission speed for decision making in events, knowledge management for distributing organizational knowledge, job orientation in order to acquiring several skills, teamwork, organizational learning, identifying and promoting management talents in people of organization and ultimately creating loyalty and dignity for people who left the organizations for using their experiences in events are necessary.

**Abstract:** The purpose of the present research is studying the effect of communication channel, perceived quality of web and perceived services on after sales services in Saman insurance in Tehran. This is a practical in terms of purpose and a descriptive research based on data collecting method and type of correlation in terms of analyzing data. Statistical population of the present research is customers of Saman insurance, the random sampling method was used to select sample that 384 people were selected. The questionnaire was used to collect data. Then the tools of data analyzing were evaluated including descriptive statistic and inferential statistic by using structural equation modeling. The results showed that the communicational channel, perceived quality of web and value of perceived services have effect on after sales services.

**Keywords:** communicational channel, perceived quality and value from web, after sales services.

### 1 Introduction

By fast global development in electronic business and turning most of businesses toward internet and using websites to presentation, introduce and sale their services and products, the need for designing a website in the name of company is felt. There are many agents in the websites that in form of presentation designed services to attract attention and trust of customers who enter the website. So that customers achieve satisfaction feeling from all service agents which are in this website, and spend a longer time in the environment of that website and utilize from the website services by complete evaluation of introduced services and products in that and amount of perception which they achieve from the quality of presented electronic services by the internet website such as website designing, reliability, responsiveness, trust and overall quality. If in the process of service presentation, interactions between human and machine are formed in a virtual environment; conceptions will be described in the form of electronic services. These services are presented through nets and systems such as internet, ATM systems, telephone banking, telephone services, presenter systems of automatic services and etc. (Chang, K et al., 2010) in services part, the quality of that is evaluated during the process of services presentation. Aladwani and Palvia (2002) measure the perception of users in the scale from services quality based on development study. They suggested that the qualities of perceived services from web as the evaluation of users are from the features that they need when they face with web which is a reflection of top website. Based on exploratory factor analysis, they have presented four dimensions of perceived quality: technical efficiency, content quality, special content (service) and perceived quality. Researchers previously argued that quality of perceived services from web with services contents (such as service to customers and maintaining privacy) self-service technology such as ecommerce website can positively have effect on the perceptions of consumers from enjoying the system and buy behavior. (Hallowell, 1996) From one hand, competition is very close and intensive in distribution channels; electronic distribution channels soon will have the most shares in the field of retail. Experts believe that electronic distribution channels will surmount channels stationed on objective stores.

Based on description of Waytesk in 2005 "after sales serviced is often said to services that are presented to customer after delivery of goods" supporting after sales and technical support and product support are also phrases that have been used about this (Lin, J.S.C. & Liang, 2001) in the belief of Gronruz after sales services are often the responses to the customer's problem. These problems include lack of product proficiency; diagnose the problem, expert help in solving the problem, lack of

knowledge of how to use the product by the customer, etc. (Yen et al., 2007).

Similar researches in this field have been conducted which have been mentioned them in short, Jafari et al., (2014) in e research with the topic of "evaluating effect of judicial electronic services quality on satisfaction of citizens " showed that two variables of offices services quality and judicial electronic services system quality with its dimensions have a positive and significant effect on satisfaction of citizens. Ranjbaran et al., (2012) in a research with the topic of "analyzing the relationship between perceived value, perceived quality, satisfaction of customer and intend to re-buy in chain stores of Tehran" showed that in chain stores, perceived value has effect on perceived value and also on satisfaction of customer and intend to re-buy. Results from Chit Chartun et al., (2013) with the topic of (study of evaluating model of channel effect, perceived quality of web, awareness from brand and perceived quality on after sales services of all products in a company) showed that only channel, perceived quality of web and perceived quality had a positive effect with after sales services of the company (Yarahmadi, 2015). Hutchinson et al., (2009) also in a research with the topic of "perception of relationships quality, value, justice, satisfaction and behavioral relationships among Golf travelers" showed that services quality didn't have a significant effect on value and satisfaction. While the perceived value has a positive relationship with satisfaction variable, (Qalavandi et al., 2012). (Jafari et al., 2014) Hise and Sizmani (2002) have introduced determinant factors of electronic satisfaction, buy convenience, factors related to product, designing site and financial security by presenting a model. Li and Torin (2001) also have known support agents for receive and send orders, services to customer, cost, website (speed, articles quality, and use easiness), financial security (financial, maintaining private secrets) effective on electronic satisfaction (Chan et al., 2010). Miles (2002) evaluated electronic satisfaction in Midwestern University and among 174 students, the recognized factors which were effective on electronic satisfaction include: interaction with website, perceived quality of web site services and perceived value of website for customer (Ranjbaran et al., 2012). Baner and Garther (2002) also with research on available characters in internet have introduced determinant factors of electronic satisfaction, accessibility amount to information, communicational structure, personal-making, consolidation of information and exchanges (Edward & Sahadev, 2011). In fact, available information in organizational websites are not only considered as the input port of users to each one of organizations but also quantity and quality of presentation of informing services and accessibility to up-to-date services by them create an image in the users' minds which arbitrage based on that about organization generality, so organizations should be assiduous more than pervious in designing and maintaining life cycle of their website.

According to the importance of communicational channel which customers have in services industry especially insurance, pay attention to customers' attitude about perception of them from web quality and the service value which is provided for them through electronic, has high importance and companies can easily manage after sales services through this. So according to mentioned cases, conducting such research which evaluate many factors in service industry but the same time, it seems necessary and because the insurance industry is one of service industries in the country that has many diverse and complex needs, need to evaluate the way of services presentation quality, after sales services and processes related to that and communicational channels with customers to present solutions if necessary to improve services quality and process related to that in the electronic field. So according to growing of electronic communications and necessity of studying that and considering the following purposes, the present research is conducted:

- Study of communicational channel effect on after sales services in insurance industry.

- Study of perceived quality of web effect on after sales services in insurance industry.

- Study of perceived services value effect on after sales services in insurance industry.

### 3 The research methodology

#### 3.1 Hypotheses of the research

- The communicational channel has effect on after sales services in insurance industry.

- Perceived quality of web has effect on after sales services in insurance industry.

- Perceived services value effect has effect on after sales services in insurance industry.

The present research is practical in terms of purpose. Based on way of collecting data it is considered as the descriptive researches. Also according to way of data analyzing it is the type of correlation. The statistical population of this research is all

employees of Saman insurance company, according to this that the statistical population of the research includes the customers of Saman insurance that are unlimited, the random sampling method was used in order to select sample which 384 people were selected by using Cochran formula.

The most important methods of information collecting in this research include library methods which are used in all scientific researches in order to collect information in the field of theoretical principles and subject literature of the research and in order to collect data and information for analysis, questionnaire has been used. After preparation of preliminary plan of the questionnaire it was tried to determine the validity and reliability of the questionnaire. So the Cronbach's alpha method and "SPSS" software have been used in order to determine reliability of the test. The purpose of evaluating measurement model is evaluation of weights and loadings of latent variables and the purpose of evaluating the structural model is evaluation of path coefficients between the latent variables.

#### 3.2 The reliability of the structure (internal compatibility)

This index is calculated based on Cronbach's alpha coefficient. The value of this index should be equal or more than 0.7 (Nunnally, 1988) table 1 show the reliability value of the structure for each one of the latent variables.

Table 1: the reliability of the latent variables structure

Latent variable Reliability of structure	communicational channel	Perceived quality of the Web	Perceived services value	after sales services
compound reliability	0.665	0.624	0.655	0.643
Cronbach's alpha	0.712	0.772	0.761	0.801

As it is observed all compounded reliability values have been calculated more than 0.7. The value of Cronbach's alpha coefficient also has been shown in above table and it is observed that all these coefficients are more than 0.7. So the measuring model has suitable structure reliability. Also convergent validity in PLS model has been analyzed by average variance extracted (AVE). This index shows the value of variance that a structure

(latent variable) obtains from its indexes. For this criterion; Farner and Laker (1981) suggest values more than 0.5 because this value certifies that at least 50% of variance of a structure is described by its indexes. In continue results from evaluation of convergent reliability have been presented in the present research.

Table 2: convergent reliability of structures of the research (latent variables)

Latent variable Convergent validity	communication al channel	Perceived quality of the Web	Perceived services value	after sales services
Mean variance extracted (AVE)	0.665	0.678	0.625	0.654

As it is observed in table 2 all values of average variance extracted are more than 0.5 and so the measuring model has suitable convergent reliability.

As it is observable the value of coefficients of all variables are more than criteria value of 0.7, so the present research has the required reliability in order to distribute in statistical population. Also the structural equation modeling that partial least squares (PLS) have been used. First the measurement model and then the structural model have been analyzed. Finally obtained information has been analyzed by using descriptive statistical and inferential statistical methods. So frequency distribution table, the related central indexes have been used in descriptive analysis. The point that should be considered before any statistical analysis is that the synergy of interactions between the components should be considered. So techniques such as neural network should be used to achieve the desired result. But because data is not definitive and accurate (deterministic) and it

is the result of the people's poll and different from person to person; means it is random (stochastic), the statistical techniques should be used. In this part, model of the research has been tested and its validity has been evaluated. For this purpose the structural equation analysis method (PLS) has been used.

## 4 Findings of the research

### 4.1 Descriptive findings

In this part from statistical analysis, the way of statistical samples distribution is evaluated in terms of variables such as sex, work experiment, education level and age.

Based on obtained information from descriptive statistics, in terms of sex 57% of respondents have been male and 43% of respondents have been female in this research. In terms of education level, about 7% of respondents have education

diploma and lower, about 14% of respondent have associate degree, about 57% have bachelor education and also about 22% have MA education and higher. Also the work experiment, about 63% of respondents have lower than 10 years of work experiment, 28% of respondent have work experiment between 10 to 15 years, 7% of respondents have experiment between 15 to 25 years, about 2% of respondents have work experiment more than 20 years. Also in terms of age, about 27% of respondents have age less than 25 years old, about 57% have age between 25 to 35 years old, about 14% have age under 35 to 45

years old and about 2% of respondents have age 45 years old to up.

**4.2 Analysis of Structural Model**

In the model of research, Communicational channel variables, perceived quality of web, perceived services value has been used as an independent variable, after sales services has been used as dependent variable. The research model was implemented with the defined relations and following results obtained.

Figure 1: The structural model

Path coefficient of each of paths has been shown in Figure 1. Each of the coefficients is acceptable if it's P-value to be less

than 0.05. P- values related on each of variables has been presented in the following table.

Table 3: path coefficients significantly

path	Path coefficient	P- values	Result
Communicational channel → after sales services	0215	001.0	Confirmation
perceived quality of web → after sales services	251.0	002.0	Confirmation
perceived services value → after sales services	231.0	001.0	Confirmation

like the data show, in relations defined, all variables have achieved significant the coefficients of their path, so the communicational channel, perceived quality of web and perceived services value has effect on after sales services. The prediction power of designed model is analyzed with the use of coefficient of determination value (R<sup>2</sup>) for the dependent variable. Falk and Miller (1992) have indicated values of greater than or equal to 0.1 for coefficient of determination. In this research, according to the values in Table 4, it can be concluded that structural model of present study has sufficient prediction power. In other words, 24.2% of the variability in after sales services is explained by entering variables in the model.

Table 4: coefficients of determination for dependent variables

Index of Dependent variables	R <sup>2</sup>
after sales services	242.0

Finally, it is appropriate that analysis of estimated structural model to be completed by PLS technique, by using Stone-Geisser test (Q<sup>2</sup>). Q<sup>2</sup> coefficient is a non-parametric criterion. This criterion is used for assessing the predictive validity of

latent variables in the model. Q<sup>2</sup> values are usually close to the values of R<sup>2</sup>, although unlike the coefficients of R<sup>2</sup>, Q<sup>2</sup> coefficients can also adopt negative values. In this research Stone-Geisser test values has been calculated higher than zero that shows the intended model, has necessary capacity and power.

Table 5: Stone-Geisser test for latent variables

Index of Dependent variables	Q <sup>2</sup>
after sales services	235.0

According to the subjects mentioned on analysis of the structural model of the second stage, it is seen that all under study values had the necessary conditions and so this model has sufficient predictive power. Analysis of the findings showed that the communicational channel, perceived quality of the web, perceived services value has effect on after sales services in the Saman insurance. Positive relationship of each of variables has been shown below. Path coefficients of the each mentioned variables have been presented in Table 6.

Table 6: path coefficients and research hypotheses

path	Path coefficient	P- values	Result
communicational channel → after sales services	0215	001.0	Confirmation
perceived quality of Web → after sales services	251.0	002.0	Confirmation
perceived services value → after sales services	231.0	001.0	Confirmation

According to the results presented in Table 6, in first hypothesis (communicational channel effect on after sales services) is more than 0.2 (0.215) and the number of significant level is less than 0.05 (0.001). So the first hypothesis is confirmed. Means communicational channel has an effect on after sales services in the Saman insurance company.

- According to this that path coefficient of the second hypothesis (effect of perceived quality of web on after sales services) is more than 0.2 (0.251) and number of significant level is less than 0.05 (0.02); so the second hypothesis is confirmed. Means perceived quality of web has effect on after sales services in Saman insurance company.

- According to this that path coefficient of the third hypothesis (effect of perceived services value on after sales services) is more than 0.2 (0.231) and number of significant level is less than 0.05 (0.001); so the third hypothesis is confirmed. Means perceived services value has effect on after sales services in Saman insurance company.

- According to this that path coefficient of the second hypothesis (effect of perceived quality of web on after sales services) is more than 0.2 (0.251) and number of significant level is less than 0.05 (0.02); so the second hypothesis is confirmed. Means perceived quality of web has effect on after sales services in Saman insurance company.

- According to this that path coefficient of the third hypothesis (effect of perceived services value on after sales services) is more than 0.2 (0.231) and number of significant level is less than 0.05 (0.001); so the third hypothesis is confirmed. Means perceived services value has effect on after sales services in Saman insurance company.

## 5 Discussion and conclusion

The present research was conducted with the purpose of evaluating the effect of communication channel, perceived quality of web and perceived services on after sales services in Saman insurance in Tehran city. In this regard, one model and three hypotheses were designed and tested, results from this research showed that the perceived quality of web with path coefficient of 0.251 has the most effect on after sales services of the company among the variables. It is suggested to managers and authorities of Saman insurance company to conduct required needs assessment to recognize needs, demands, preferences and interests of customers for increasing the perceived quality. Also it should be more pay attention about the quality of existing services in the company. In addition to this, quality and speed of presenting services should be increased. By this customers' satisfaction will be increased and they realize the quality of the presented services of Saman insurance company better and they will return again.

Results of the research showed that the perceived services value with path coefficient of 0.231 is the second variable that has the most effect on after sales services. Authorities of Saman insurance should be aware that the perceived value has effect on customer's satisfaction; in the other word, the high perceived value can lead to more satisfaction of each of customers of Saman insurance. In addition to this, results of the research show that the perceived value, customer's satisfaction and perceived quality have effect on after sales services. So it is suggested that to balance between received services and paid cost by customer to increase perceived value, to make culture and informing about benefits of services of Saman insurance company. Also services be determined logically and laws and policies of Saman insurance be clear and understandable. Results of the research showed that the communicational channel with path coefficient of 0.215 is the third variable that has the most effect on after sales services. Authorities of Saman insurance company should establish diverse channels with their customers. These channels can be contrived in website of the company; including online

answer to demands and questions of customers, receiving their comments, timely informing about new services. Whatever communicational channel be more and more powerful, customers will have more trust. Also this matter can have a great effect on after sales services and income amount of the company.

**Abstract.** Economic problems, particularly unemployment in the Ghaemshahr County, have led authorities focus on tourism section. However, Ghaemshahr County is poor in developing of tourism despite its environmental attractions, horticultural products and strategic location. Due to the necessity of tourism development in this area, making practical strategies is inevitable. In this research, at first the questionnaire has been designed based on extraction of indexes from resource study, after filling out these questionnaires by tourists, these data are used in factor analysis, then the main factors will become determined. All of these steps are for supplying the SWOT matrix to elicit the practical strategy for developing tourism in this destination

**Keywords:** tourism destination, destination factors, tourism services, factor analysis, regression analysis

### 1 Introduction

Experiences show that tourism industry has influences on everyone and everything which are related to it (Theobald, 2005). Tourism enhances the economy growth (Tugcu, 2014) and decreases the unemployment rate (Inchausti-Sintes, 2015) and can concentrate the economic activity in region while degrades the gap between regions (Andraz, Norte, & Gonçalves, 2015). Tourism provokes the region development by making employment, makes variety the areas' economic bases and makes opportunity to renovate regions and increasing the social benefits (Butler, Hall, & Jenkis, 1998, p. 3). But tourism development needs huge sources and expenditures, considering the limitation of resources, efficient strategy should be selected for region development, so that it can make the region develop. While tourism can respond to its costs, it should grow according to the capacities, potentials and capabilities of the certain region, without spending enormous costs. For example (Benur & Bramwell, 2015), emphasize on destinations good rather than accommodation, hospitality and transportation. In recent years, a lot of researches have been done on Development Tourism Destination (Benur & Bramwell, 2015; Artigas et al., 2015; Kiráľová &

Pavličeka, 2015) and new methods for measuring the function of tourism destination are introduced (González-Martínez, 2014) but lack of a method for introducing reinforce indexes of tourism in destination, analyze and prioritizing them is felt.

Since Ghaemshahr county not only is struggling with a lot of problems such as unemployment and economic crisis, but also is the poorest county in tourism section in its province. So, the officials decided to improve tourism industry in order to improve employment and increase in employment concentration and positive growth and finally exiting from crisis (Fars news, 2015). Ghaemshahr is located on main transit roads of north corridor of Iran and Firuzkooh orient that connect Mazandaran province to Tehran province. Moreover, the Trans-Iranian railway crosses from this county. That makes Ghaemshahr country as a strategic place. This county is about 425.4 Km<sup>2</sup> in area and has gorgeous nature scenery and historical places like Gerdkooh hill (Municipality Ghaemshahr, 2009). Talar forest park and is one the recreational area even one of the sixty tourism areas of Mazandaran province, also by locating in Jaddenezami lake on the sideline of the Talar park, is made suitable place for servicing to tourists (Ghatreh, 2012). Furthermore this county stands on the first place in ranking of lemon productions in province and has good position in productions of citrus despite its low area (Statistical Center of Iran, 2010). But, in contrast of imagination, this county doesn't have good position in tourism section in Mazandran province and its capacities and potentials are denied. Also there is no good plan and policy for using these capacities. This research introduces the primarily factors for developing destination tourism from tourists' point of view, the result can be used for planning and developing tourism in destinations.

### 2 Methodology

In this research, the library-documentary method as well as heuristic analysis has been used. At first the questionnaire has been designed based on extraction of indexes from study of resources. After filling out these questionnaires by tourists, gathered data will be used in factor analysis, then, main factors will become determined. These factor arrived in regression analysis for attaining Beta coefficient (fig.1). By this Beta coefficient, the rate of satisfaction will be determined. All of these steps are for supplying the SWOT matrix to elicit the practical strategy for developing tourism in that destination

Fig. 1: Diagram of research's method

### 3 Literature

They are energetic and invigorating sources of tourism industry. Attraction can instigate visitors to travel here and then can satisfy tourists by making good experiences (Kazemi, 2007, p. 56). Attractions can be divided in two kinds, at first natural-base attraction such as plants, fauna and lands, secondly human made, or in the other categories, it can be classified by cultural differences like language, music and folklore (Doswell, 1997, p. 45), (Lea, 1988). Also initial products have basic role in tourism attraction (Benur & Bramwell, 2015). The attraction of destination for tourists usually depends on physical, environmental, socio-cultural characters. Moreover, variety of this goods is important to competitive and sustainable tourism (Benur & Bramwell, 2015). Quality of tourism services is one of the efficient component in destination success, as some of countries considered this as their policy for competition in this market. (Albaladejo, González-Martínez, & Martínez-García, 2014). Furthermore, gaining the costumers' satisfaction and comprehension of their needs by the managers for developing tourism services are vital (O'Cass & Sok, 2015). Tourism services include breadth of supporting services like banks, restaurants, medicine centers, and shop stores (Lea, 1988) that have multiple effects on economy (Gunn & Var, 2002). Moreover, monitoring on the cost of provided services can be important (Gholami, 2004).

Tourism activities strongly depend on other current and executive activities in country and are relied on many different infrastructures and other supporting factors. Countries have invested hugely for attracting tourists. For example France had 32 billion dollars income, but he spent 12.8 billion dollars on tourism industry in the same time or United States spent 40 billion dollars on tourism industry in the same time. Infrastructures and facilities are really extensive in meaning that used for cover all of supporting things in preparing services (road, railway, airport, electrical power, challis and drainage, security infrastructures) (Mohseni, 2009). Because of its high capital costs, usually governments are responsible of provision

of these services and often give services to local people (Lea, 1988, p. 45). Moreover, this section play important role is relating between market source and destination (Gunn & Var, 2002, p. 52). Doswell (1997) and Lea (1988) also indicate transportation as one the most important infrastructures for comfortable arriving in a country or region. Also number and location of airport, ports, and road development and other transportation network are very important (Kazemi, 2007, p. 56). Furthermore, water and electricity network have great importance. Without those, it isn't possible to make extensive tourism system and also without drainage system, tourism development will causes destruction of natural ecosystem and pollution from industries (Choovanichchannon, 2015) (Rahmati, 2008).

**Tourist Costs:** in tourism, usually emerge as transportation costs and accommodation costs (Samadian, Hoseini, & Raouf Ara, 2009)(Croes, 2000). So, tourism destination have to present proper price in order to improve standard of tourism quality (Choovanichchannon, 2015) (Samadian, Hoseini, & Raouf Ara, 2009).

**Information technology:** considering that tourists accommodate in destination just a short time, it's essential they know what they are supposed to see and do as well as purchase. They have to be aware of destination and its services (Doswell, 1997) so, equip of institutes and organs that are involved with tourism industry and information system are inevitable.

Nowadays, tourists became more aware and more demanding of more suitable facilities, so, tourism section has to improve their employments to pamper their tourists (Zargham, 2004). Threat commitments and security can effect on tourism section negatively more than other factors and this influences of travel tendency (Malviya, 2005)(Kazemi, 2007).

Totally, tourism component in destination can be divided to: Attractions, services, Infrastructures and superstructures (table 1).

Table 1. Tourism development factors

<ul style="list-style-type: none"> <li>▪ <b>Attraction</b></li> </ul>	<ul style="list-style-type: none"> <li>▪ Attractions and natural attractions Capacity</li> <li>▪ Attractions and historical and cultural capacities</li> <li>▪ Products (gardening and crafts)</li> <li>▪ Customs and local traditions and encourage the use of local coverage</li> <li>▪ Behavior and people</li> <li>▪ Festival (artistic, cultural and sports, etc.)</li> <li>▪ Exhibitions (art, food, etc.)</li> <li>▪ Developing Local Markets</li> </ul>
<ul style="list-style-type: none"> <li>▪ <b>Services</b></li> </ul>	<ul style="list-style-type: none"> <li>▪ Access to settlement services and accommodation services (hotels, inns, etc.)</li> <li>▪ Access to Services Sport Entertainment</li> <li>▪ Access to health care</li> <li>▪ Access to services Dining</li> <li>▪ Access to quality stores</li> <li>▪ Access to banking services</li> </ul>
<ul style="list-style-type: none"> <li>▪ <b>Infrastructure</b></li> </ul>	<ul style="list-style-type: none"> <li>▪ Access to water and energy infrastructure (electricity, gas)</li> <li>▪ Access to telecommunications</li> <li>▪ Access to transport facilities (roads, terminals, etc.)</li> <li>▪ The position of health, cleanliness and sanitation</li> <li>▪ Security</li> </ul>
<ul style="list-style-type: none"> <li>▪ <b>Superstructure</b></li> </ul>	<ul style="list-style-type: none"> <li>▪ Superstructure local investment</li> <li>▪ The level of staff training tourism</li> <li>▪ Advertising and marketing</li> <li>▪ Development of travel agencies</li> <li>▪ Shipping cost (the cost of fuel, car rentals, etc.)</li> <li>▪ The cost of accommodation and stay</li> <li>▪ Monitoring and control pricing</li> </ul>

Regarding to elicited components, the questionnaire was arranged. This questionnaire, at first, has been factor analysis to extract main factors, then these factors consider as independent variables and the quality of tourism section consider as dependent variable used in regression analysis.

### 4 Analysis

The confidence level in this analysis was ordained 95% means 5% fault is acceptable. As total manner, number of specimen has to be 4 or 5 times more than the variables (Sarmad, Bazargan, &

Hejazi, 2015). Cronbach's alpha was used to measure the validity of the test. Cronbach's coefficient alpha for one-dimensional measure of attitudes, judgments, opinions and other categories that measure it is not easy to apply (MansourFar, 2009, p. 48). The test was 0.931 value greater than 0.75 is a value that is acceptable. The validity is that if the measure with the same characteristics by and under the same conditions again be measured at different times results will be the same (MansourFar, 2009, p. 48).

#### 4.1 Analytical Model

Determination of effective factors in tourism development using factor analysis

Sig value in Barlett's test is less than 5% which indicates that factor analysis is appropriate for recognition of factor model

structure and the known hypothesis of correlation matrix is rejected. Since  $K.M.O=0.848$  is close to 1, it can be indicated that factor analysis is in a good level and its results are generalizable to the population and sample number is appropriate for factor analysis.

According to table 2 if the obtained factors be rotated with Varimax method, five factors can define the variances. These five factors in total can explain 63.404% of variance and the first factor is the biggest part (21.5%) and the fifth factor is the smallest part (5.34%). The second, third and fourth factors can explain in the order 16.5%, 11% and 8.25% of all variances. According to Varimax rotation, mentioned variables have greater share in the first to fifth factors which are shown in table 2.

Table 2. Effective factors in tourism development

F1	F2	F3	F4	F5
Access to water & energy( electricity & gas), access to facilities of long distance relationship, access to health services, access to accommodation (hotels, inns), security & military infrastructure, pricing control	How to use natural attractions, how to use cultural & historical attractions, strengthening local traditions & encouraging the use of costumes	Exhibitions(food, artistic,...), local market development, festivals (artistic, athletic, cultural), advertising & marketing, travel agencies development, access to high quality shops, access to banking services	Accommodation cost, transportation cost	Inhabitants behavior & hospitality

According to this analysis & indexes which form factors, factors are named:

F1: tourism infrastructure F2: attractions F3: advertisements  
F4: costs F5: inhabitants behavior

#### 4.2 Factor prioritizing by using regression

In this research, "enter method" in regression has been used. Enter method is a kind of method in which all independent variables simultaneously enter into analyze & effects of all independent variables on dependent variable are investigated. Dependent variables in this analysis are the factors which are extracted from factor analysis & dependent variable is same as the last question of questionnaire (tourist's satisfaction of tourism conditions in the city Ghaemshahr). This analysis shows the importance and factors' effect on dependent variables so that the more obtained beta coefficient, the more effective independent variables (factors) on dependent variable. Coefficient of determination ( $R=726$ ) in table 5-5 shows that 72.6% of total tourists satisfaction changes can be explained by these variables and the rest can be explained by the factors which aren't considered.

Obtained number for F(49.834) in table(model summary), which shows regression being meaningful and linear relation among variables, indicated that at least one of the dependent variables is

effective in predicting independent variables. In table of dependent coefficients, sig of all independent variables are less than 0.05 which shows they are meaningful. According to beta coefficients, linear equation of regression is

$$Y=0.531 x_1+0.514 x_2+ 0.330 x_3 + 0.110 x_4 + 0.243 x_5$$

As we know beta coefficient is used for determination of independent variables effectiveness on dependent variables.

After all stages done, in order to compute the satisfaction average - (1-1) formula - at first factors averages are computed according to indexes and their efficiency. Then according to (2-1) relation dissatisfaction average is computed. Coefficient of importance shows their rank in beta coefficient as well. The factor which gains the most beta, is the most important in planning and its changes in dependent variable is the most effective among all other factors. After computing amount of dissatisfaction, we should prioritize tourism planning, therefore beta coefficient is multiplied in amount of dissatisfaction in order to get each factor's score. So each factor's importance in changes and amount of dissatisfaction, factors' scores which are same as planning prioritize, are determined.

Amount of satisfaction=factor average\* specific amount

Amount of dissatisfaction=amount of satisfaction -200

Table 3. Final prioritizing

Factors	Factor average	Specific amount	Amount satisfaction of	Amount dissatisfaction of	Beta	Score	Priority
Tourism infrastructure	4	26.3	0.531	49.49756	150.5024	22.198	6.78
Attractions	1	72	0.514	140.5254	59.47456	11.096	5.36
Costs	3	40	0.330	112.2788	87.7212	16.520	5.31
Advertisement	5	17.3	0.110	157.8425	42.1575	8.250	5.11
Inhabitants behavior	2	42.3	0.243	174.368	25.632	5.340	4.8

#### 4.3 SWOT Matrix

According to the regression analysis and other calculations, these results have been extracted that the most important priority of tourism planning in Ghaemshar County is Advertisement including marketing for local festivals and markets. Although costs are one of the important issues in tourism services, it gained the lowest position in this analysis. Resident's behavior and Attractions as well as infrastructures are in the next priority after Advertisement.

According to the SWOT matrix, these strategies are extracted:

- Holding seasonal festivals attract tourists focus on citrus fruits
- Focus on local festivals, pick-prone villages in the rural villages and make ready to receive tourists
- Holding a few days local festivals in the countryside
- Community education, and service providers
- Sustainable development and the preservation of natural and cultural resources and approximation people to receive tourists and to tourism as a source of income
- Training managers and officials
- Using practical plans and strategies

#### 5 Conclusion

Tourism industry can help economic growth in areas and regions and also causes concentration on economic activities in regions as well as reduce the gap among regions by helping undeveloped regions. But tourism development needs a lot of investments and

financial sources that by considering limitation of those, this is important to find an efficient strategy for infill development of this industry. This way tourism industry not only affords costs but also can grow according to capacities and capabilities of the certain destination therefore it causes regional development. This research introduces a suitable method to achieve that goal therefore the lack of previous researches related to destination and planning will be leaded to a correct way. According to the factor analysis that has done on questionnaire, is shown, 5 factors can introduce 64.4 percent of total variance. Those factors contain Attracting, Advertisement (marketing and festival), Residents behavior, as well as infrastructures.

According to the regression analysis and other calculations, these results have been extracted that the most important priority of tourism planning in Ghaemshar County is Advertisement including marketing for local festivals and markets. Which means that success of tourism in this region depends on spending money and processes in advertisement (marketing and festivals and traditional markets) more than anything. Although costs are one of the important issues in tourism services, it gained the lowest position in this analysis. Resident's behavior and Attractions and infrastructures are in the next priority after Advertisement.

As a result and regarding to the strategies that extract from SWOT matrix, this model introduces major strategy for development tourism section in Ghaemshahr county that are:

Holding a few days local festivals in the countryside Focus on local festivals, pick-prone villages in the rural villages and make ready to receive tourists.

**Abstract:** The present research was aimed to examine the effect of structural capitals in organizations on entrepreneurial orientation. Research method was practical in terms of objective; in terms of data collection method, it was descriptive-correlational; and in terms of the type of collected data, it was a quantitative research. The statistical population of the present study consisted of employees of Qazvin's municipality's. From them, 130 individuals were selected as sample size using a Stratified Random Sampling method and Cochran Formula. Data analysis was done using a Partial Least Squares method and Smart PLS 2 software in two sections: measurement model and structural model. Results show that structural capitals in the organization have a positive and significant effect on entrepreneurial orientation in organizational members.

**Keywords:** Entrepreneurial orientation, Structural Capital, organizational culture, organizational processes, information systems, and intellectual property

### 1 Introduction

In recent decades, evolutions in competitions and uncertainties in environments have caused big organizations with little structural and methodological changes to be unable to compete with small organizations which have greater flexibility, speed, and innovation (Jenkins, 2009; Kontinen & Ojala, 2011). Societies pay particular attention to organizations that encourage entrepreneurship and glorify peoples' talents. Today, organizations are increasingly exposed to situations which make it necessary for them to resort to entrepreneurial activities (Shepherd et al., 2009). Organizations must provide an atmosphere where the whole organization experiences entrepreneurial spirit, leading to entrepreneurial activities in individuals and groups. Hence, different organizations are willingly developing entrepreneurial activities among employees.

There have been studies in which intellectual capital is considered as one of the factors affecting entrepreneurship (Talebi et al., 2015). Organizational members' intellectual capital has been introduced as a set of intangible intellectual assets such as knowledge, skills, technology, experience, and communicational power. Intellectual capital has certain dimensions such as human capital, structural capital, and relational capital (Moon & Kym, 2006). In conducted studies, the effect of structural capital has not been referred to as a dimension separate from intellectual capital; and it seems that there is a gap in studies connected to this subject. Therefore, the present study is trying to fill the gap. Hence, it has been tried to answer the question; "Do structural capitals affect individuals' entrepreneurial orientation?"

### 2 Literature Review

#### 2.1 Entrepreneurial orientation

Organizations increasingly do entrepreneurial activities in today's dynamic world of competitions, in spite of fast global changes, in order to survive and achieve competitive advantage (Covin & Kuratko, 2008). Today, entrepreneurship is considered as one of the tools of development, because the presence of

entrepreneurs helps to provide the ground for success. According to Naman and Slevin (1993), companies in challenging environments are more willing to be innovative, take risks, and be leading than those in static environments. An entrepreneurial organization is constantly ready and able to adapt itself to the many external changes in order to make its plans flexible and adaptive to changes in environmental needs. Most entrepreneurship scholars believe that organizations can perform better if they have entrepreneurial orientations (Dess & Lumpkin, 2005; Naldi et al., 2007). In other words, entrepreneurial orientation includes intentions and activities of key factors in a dynamic production process, which contributes to opportunities. In their studies, Covin & Slevin (1989) introduce entrepreneurial orientation as a multidimensional construct, which can be evaluated from different perspectives (Chang et al., 2007). For instance, Miller (1983) proposed certain dimensions for describing entrepreneurial orientation; he considered entrepreneurial firms as entities that are engaged in markets which possess innovative products, including a little risk as well as being willing to be pioneers in innovations, and challenging rivals (Morris et al., 2007).

Innovation is a reflection of companies' tendency towards new ideas and creative processes, results of which might be products, services, and/or new technological processes (Li et al., 2008). Risk taking refers to companies' willingness to allocate basic resources to projects with likelihood of success or failure (Lumpkin & Dess, 2001; Baker & Sinkula, 2009). Leading organizations monitor market trends; they identify future needs of current customers; and they predict changes in demands or problems, which can lead to the possibility of forming a new company. Lumpkin & Dess (1996) added two other factors to the above-mentioned factors, which can play an important role in entrepreneurship: competitive aggressiveness and autonomy. Competitive aggressiveness refers to companies' tendency towards difficult and direct challenges with rivals in order to improve market conditions. Companies which construct their competitive status in an aggressive way in order to make profits might be able to sustain their competitive advantage in the long run, on the condition that their aim is to surpass rivals not to put them under pressure (Dess & Lumpkin, 2005). Autonomy refers to individuals and teams' direct activities to form and implement ideas (Chang et al., 2007). Factors of entrepreneurial orientation work together in order to improve entrepreneurial performance in organizations (Shan et al., 2016).

#### 2.2 Structural Capital

Structural capital of a construct refers to explicit knowledge, which flows in internal processes through employees' (human capital) implicit knowledge, skills, competencies, and experiences (Martinez-Torres, 2006); it comes in different forms such as information systems, organizational culture, and intellectual property (Moon & Kym, 2006). According to Edvinsson & Malone (1997), structural capital comes from hardware-software capabilities, database, organizational structure, organizational rights, trademarks, and other explicit capabilities in organizations, which support employees' productivity. Structural capital is referred to as a type of asset which remains in the organization even when employees leave work and go home. In other words, structural capital includes all non-human accumulations of knowledge in an organization. Bontis (1998) introduces structural capital as non-human assets and capabilities, which are used in order to meet market needs.

Moon & Kym (2006) believe that structural capital is reflected in internal factors such as organizational culture, organizational processes, information systems, and intellectual property. Because this classification comprises important internal factors

and because it refers to the importance of intangible assets, it is used by many scholars; hence, it is valuable.

The first factor is organizational culture. Organizational culture includes basic values, beliefs, and ethical principles existing in organizations, which play a crucial role in organizational management. Organizations with strong structural capital possess a culture which pushes employees to innovations through trial and error and learning from mistakes (Bontis, 1998). If values, norms, and beliefs of organizations support employees' efforts to increase creativity and innovation, it is likely that they will identify and exploit entrepreneurial opportunities. Zahra et al (2005) classify factors affecting entrepreneurship into two sets: internal factors and environmental factors. An internal factor is organizational culture. According to them, in an organization with a culture that supports creativity and innovation, organizational entrepreneurship will develop, and employees will be encouraged to identify and exploit environmental opportunities. Dimitratos et al., (2012), with the introduction of "international entrepreneurial culture", refer to organizational culture as a key to identification and exploitation of entrepreneurial opportunities in international situations. Additionally, they stated that if organizational values and norms conform to the global market's activities, it will be easy for the organization to identify and exploit opportunities. Other researchers such as Dimitratos & Plakoyiannaki (2003) and Jones et al., (2012) refer to the fact that organizations' success in identifying environmental opportunities is subject to support from organizational culture for factors such as innovation, risk taking, active learning, and networking. Hence, considering the aforementioned, the first hypothesis of the research is as follows:

First hypothesis: organizational culture has a positive and significant effect on individuals' entrepreneurial orientation.

The second factor is organizational processes. Organizational processes refer to the styles of doing organizational activities, in which individuals use existing data resources in order to perform their duties in the best possible way (Hobley & Kerrin, 2004). Bhagavatula et al (2010), referring to the effect of human and social capital on organizational entrepreneurship, stated that the fewer constraints and limitations in the way of entrepreneurship, the more creative the employees will be, and the more entrepreneurial behaviors will be seen. Li et al (2012) stated that if operation processes in organizations follow learning, inter-organizational relationships in senior management level can increase the ability to discover entrepreneurial opportunities. In another research, Gregoire et al (2010) stated that when internal processes are designed in a way that risk taking for innovations fades, and when individuals are intensely punished for their mistakes, no efforts are made to be creative and innovative,

leading to loss of entrepreneurship. Hence, considering the aforementioned, the second hypothesis of the research is as follows:

Second hypothesis: Organizational processes have a positive and significant effect on individuals' entrepreneurial orientation.

Information systems, as the third factor, refer to IT (Information Technology) in organizations; IT is used for correctly and completely managing information systems (Soh & Markus, 1995). Numerous studies have focused on the effect of information systems in the development of entrepreneurship. For instance, Shane & Venkataraman (2000) believe that it is necessary for individuals and organizations to have access to useful and valuable information obtained from business environments in order to succeed in developing entrepreneurship. In addition, Busenitz (1996) stated that the reason why some individuals are able to recognize entrepreneurial opportunities is that they are capable of gathering and utilizing useful information. Referring to the significant effect of organizational members' presence in social networks outside the organization on the increase in the ability to recognize innovative ideas, Ozgen & Baron (2007) consider shared information in networks to be a key factor which helps expand individuals' knowledge. Hence, considering the aforementioned, the third hypothesis of the research is as follows:

Third hypothesis: Information systems have a positive and significant effect on individuals' entrepreneurial orientation.

The fourth factor, intellectual property, is the most tangible and obvious dimension of structural capital, because it is legally maintained in the organization (Moon & Kym, 2006). Intellectual property is a type of asset which is accomplished through incorporation of inventions and trademarks in every organization. Siegel et al (2007) report that with an increase in the rate of commercialization of intellectual property rights in American/European universities and companies over the last decade, the importance of knowledge and technology transfer strategies for quickly discovering and exploiting ideas has increased. In addition, Friedman & Silberman (2003) refer to the fact that with individuals' conformations to the maintenance of intellectual properties such as new inventions, organizations' competitiveness increases through identification and exploitation of entrepreneurial opportunities. Hence, considering the aforementioned, the fourth hypothesis of the research is as follows:

Fourth hypothesis: Intellectual property has a positive and significant effect on individuals' entrepreneurial orientation.

Fig 1. Conceptual Model

### 3 Research Methodology

The present research was practical in terms of objective; in terms of data collection method, it was descriptive-correlational; and in terms of the type of collected data, it was a quantitative research. In order to analyze data obtained from questionnaires, a Structural Equation Modeling method was used along with a Partial Least Squares method (PLS-SEM) and Smart PLS software. The latent variable of structural capital was examined through Moon and Kym's (2006) standard questionnaire (19 items); in addition, the latent variable of entrepreneurial orientation was examined through D-Clerk's et al (2013) standard questionnaire (7 items). The statistical population of the present study consisted of employees in Qazvin's municipality' first and second regions (200 individuals), 130 of whom were

selected as sample size, using a Stratified Random Sampling method and Cochran Formula.

In order to examine the reliability of the questionnaire, criteria of a Partial Least Squares method were used. In this method, reliability is measured using two criteria: 1) Cronbach's Alpha, 2) Composite Reliability (CR). Cronbach's alpha coefficient expresses the ability of the questions to properly express corresponding dimensions. Composite reliability coefficient determines the correlation between the questions of one dimension in order to sufficiently fit measurement models (Fornell & Larcker, 1981). The results related to the reliability of the questionnaire have been shown by the two mentioned criteria in table 1; and we can see a favorable level of reliability.

Table 1: Reliability of measurement tool

Variables	Cronbach's Alpha	Composite Reliability
Organizational Culture (OC)	0.78	0.78
Organizational Process (OP)	0.86	0.82
Information System (IS)	0.79	0.73
Intellectual Property (IP)	0.76	0.85
Entrepreneurial Orientation (EO)	0.91	0.78

Validity was calculated using convergent and divergent validity as well as criteria that are exclusive to the Partial Least Squares method. Convergent validity was examined using AVE criterion (Average Variance Extracted); and if this criterion is greater than

0.4, convergent validity of the measurement tool will be approved (Magner et al., 1996). According to table 2, all values show that the convergent validity of the questionnaire is favorable.

Table 2: Results of AVE value for research constructs

Variables	OC	OP	IS	IP	EO
AVE	0.56	0.64	0.47	0.53	0.69

For measuring divergent validity, Fornell and Larcker (1981) have recommended comparison of AVE root of each construct with correlation coefficients of other constructs. As it can be

seen in the following matrix (table 3), the values on the main diameter are greater than low values, which shows that the divergent validity of the constructs is favorable.

Table 3: Matrix of comparing AVE root with correlation confidents of constructs (divergent validity)

Variables	OC	OP	IS	IP	EO
OC	0.74				
OP	0.41	0.80			
IS	0.52	0.27	0.68		
IP	0.37	0.39	0.34	0.72	
EO	0.42	0.26	0.209	0.63	0.83

### 4 Research Findings

After examination of reliability and validity, here, the cause-and-effect relationship between structural capitals and entrepreneurial orientation is examined using Smart PLS 2 software. Hence, in order to test research hypotheses, the variable of structural capitals was designed as an exogenous construct, and the variable of entrepreneurial orientation was designed as an endogenous construct in a certain model. The output of the model included standardized coefficients and significance coefficients of "t" (the values in the brackets), which have been presented in figure 2. When values of "t"

are greater than +1.96, it is shown that the corresponding parameter is significant, and that research hypotheses are approved (Vinzi et al., 2010). According to figure 2, the "t" coefficient between research constructs is greater than 1.96, which shows that research hypotheses are significant. Additionally, the standardized coefficient shows what percentage of changes in entrepreneurial orientation is expressed by structural capitals. Hence, organizational culture expresses 67 percent of changes in entrepreneurial orientation; organizational processes express 58 percent of changes; information systems express 74 percent of changes; and intellectual property expresses 31 percent of changes.

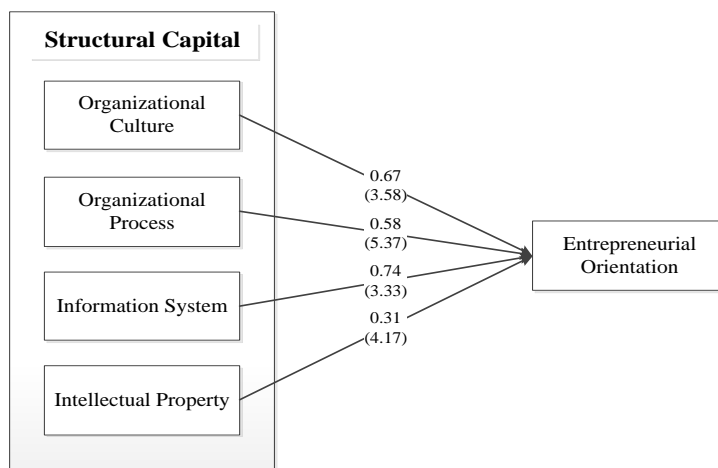

Fig. 2: Output of Smart PLS software for examination of research hypotheses

## 5 Conclusion

Obtained results showed that structural capital affects entrepreneurial orientation, and that in an organization with strong structural capitals, entrepreneurial activities are done more easily. Ramos-Rodriguez et al (2010) approve of the effect of intellectual property on entrepreneurship, and believe that employees' access to external knowledge is the key to reinforcement of the ability to recognize entrepreneurial opportunities; they also believe that structural capital is an effective factor too. According to them, the knowledge flowing in organizational structures and processes helps facilitate the process of acquiring knowledge and consequently improving entrepreneurial behaviors among employees. Edvinsson & Malone (1997) have introduced structural capital as a type of explicit capability, which supports employees' productivity through enhancing entrepreneurial capabilities. Furthermore, Barringer & Ireland (2007) and Cooper & Park (2008) refer to the important effect of prior experiences in entrepreneurship. The results of their studies indicate that employees with prior experience in identifying and exploiting opportunities are considered as capitals for organizations. If this human capital is managed correctly and sufficiently, it can become a precious structural capital for organizations.

Hence, it is recommended that companies design a particular mechanism for maintaining knowledge formed through organizational members (human capital) and use it in organizational processes, considering the importance of structural capital and its effect on entrepreneurship. It is also recommended that organizational values and norms be used in order to enhance individuals' creativity and innovation, as well as preserving organizational members' intellectual property rights in the elements of organizational culture. Finally, it is recommended that companies' information systems be designed in a way that employees can have free access to information in order to share knowledge in internal elements, and develop entrepreneurship.

**Abstract.** Financial decisions are important to all natural and legal persons, therefore bank is known as a place that always takes the proper decision. Companies that are experiencing turmoil and the crisis is on the verge of collapse and financial resources they need to prevent it, so to reduce the risk of creditors and credit relationships that have died can reduce this risk. Present study investigates the effect of financial turmoil on banking relationships listed companies in Tehran Stock Exchange. For this purpose 132-stock company in the period 1384 to 1393 were examined. According to the statistical methods applied at 95% using regression analysis, findings showed that short-term banking relationships bank will reduce the amount of financial turmoil this year and next.

**Keywords:** Banking Relations, Banking Relations Long-Term, Short-Term Banking Relationships and Financial Distress

### 1 Introduction

One way to avoid bankruptcy, predict or showing signs of financial distress. Referring to the situation in financial distress that the company is unable to meet the obligations and pay debts or faces problems; of course this problem now is not the form of reduced liquidity surplus assets and liabilities of the financial turmoil may be temporary; but if the financial situation does not improve, it may be bankruptcy.

Various factors such risky investments and the company's financial turmoil and some of the capital structure as well as the correct decisions may reduce the financial turmoil. Capital structure, including securities issued by public, private investments, bank debt, commercial debt, leases and so well.

According to signaling theory and theoretical foundations of bank financing compared to public debt, in reducing the agency problems and issues related to information asymmetry is most effective. In addition to providing a good image of the company established banking relationships, ability to obtain external financing increases. Firms with more bank debt, more easily have access to foreign funds and financial turmoil and a lack of funds, they will be reduced.

Given the importance of financial leverage and bank debt that the company eventually has an important role, can identify the implications, strategies for control and guidance of this important element in improving the company's financial situation can be identified. In order to extend and integrate existing literature, this study attempts to expand the understanding of bank debt Companies listed on Tehran Stock Exchange, trying to reduce the impact of financial turmoil on banking relationships to be studied.

### 2 Theoretical Foundations

Banking relationships, when the lender repeatedly that extends credit to a company. Frequent lending to a company, by raising awareness information to the lender than the borrower's ability to repay the loan, can reduce the information asymmetry between the borrower and the lender. Information with respect to the debtor companies, including information about management's ability to deal with adverse situations and how to act in inappropriate and repay the debt, internal controls and financial

statements of the company is spending. (With Company informed of this information asymmetry is reduced.)

Information asymmetry between the lender and the borrower when the company is facing financial distress and uncertainty about its ability to repay can be increased. Companies that have the financial distress to remain financially strong, have need of money and capital, hence, the company will rely on bank until the bank is interested in preserving the procedural income through this way. (Rosen Feld, 2014)

The financial turbulence is the general term used to refer to the Terms of Use that the company is unable to meet the obligations and pay debts or to have problems and in this case the company's liquidity is lower than its current liabilities and obligations, companies financial turmoil may be temporary, but if it does not improve the company's financial situation may lead to bankruptcy. (Miraki, 2012)

Given that the financial turmoil imposes costs on all company stakeholders (creditors, owners, investors and even government, etc.) Identify factors affecting the decrease in financial distress can be prevented incur such costs. Generally, identifying factors that reduce the company's financial distress and prevent their bankruptcy is very important and can be a turning point for the company.

Two views regarding the impact of banking relationships (loan) on financial distress company. The first view is that corporate banking relationships, when the bank decides to companies that are experiencing financial distress loan, the banks of the great advantages of information. The continued granting loans information asymmetry between borrower and lender can reduce, banks by appropriate information regarding the in fact that the company acquires the ability to repay the debt at any facilities, reduce information asymmetry.

It should be noted that short-term banking relationships, is longer, more and more accurate access to this information by banks, because the company when the facility received the short run, are required to provide financial information to the bank to close the deal also new. If you have a full disclosure of this information and their reliability, this can include information management capabilities to overcome perilous situations, internal controls and the accuracy of the financial statements of the company.

In fact, this information will allow the banks to companies that are experiencing financial distress trust and this ability to repay obligations on the part of these companies is stabilizing. The second view is that, unlike the first comment by Weinstein and Yafeh (1998) is provided, show that although lenders to make credit company, but they agree that, given that companies are experiencing financial distress will receive loans more difficult circumstances and conservative investment policies adopted by banks shall be unable to achieve profitability in the future.

This issue weakened the company's future status and value to banking relationships, for example, including bank policy is that if the financial crisis is now in the range, creditors with collateral heavier shorten the payback period on its bank insurance contracts and this for creditors biggest advantage is that there is information asymmetry is eliminated and the outstanding bank debt to avoid.

It is derived from the theory of insurance, (Mehrani, 2009) and is now quoted on the banking system's main problem the Bank of bank debt outstanding is that banks are not able to reclaim them. In general, financial analysts and financial turmoil of the financial crisis as the main risk to firms and investors refer arrives, because in the event that all groups will be affected in

some way associated with the company. Creditors, providers of finance, banks may be an important part of your quest to lose.

Investors will be worthless assets and employees will lose their jobs. An overview of the phenomenon of crisis and financial distress, losses to society will exhibit overt and covert bankruptcy. Will be a waste of resources and lack of trust is a barrier to the development of economic and social future. Based on the importance crisis and financial distress is obvious. If this unpleasant phenomenon is predictable, perhaps it can be prevented from occurring or to minimize its impact.

Developing companies banking relationships makes further investments do and can also inhibit financial crisis and financial distress. According to Central Bank statistics on Iranian companies, also major source of financing through debt from banks and financial institutions active in this field is, which examines how corporate behavior in loans from the bank and the bank's response to this request and finally the effects of facilities granted by banks to companies that are experiencing financial distress in the short and long term, results can be an important and useful to the users.

Given the importance of financing and the significant role that the company eventually, can identify variables affecting it and guidance and control solutions, is also important to identify the positive and negative consequences. Much research taking loans from financial companies as a risk indicator variable or financial condition of the company have been identified. In addition, many arguments to get financing associated with the company's growth opportunities there.

According to the theory (theory) signaling of bank financing compared to public debt, in reducing the agency problems and issues related to information asymmetry is more effective and banks in monitoring companies to collect and process certain information appear that compared with other lenders, enabling them to be more effectively monitor the borrower and this may reduce the amount of financial distress. (Ozkan and Ozkan 2004)

In order to extend and integrate existing literature, this study attempts to develop an understanding of the financial and banking relationships facilities Companies listed on Tehran Stock Exchange, linear trying to influence banking relationships examined the financial indignation. According to the stated purpose of this study is to answer the question, whether banking relationships and significant adverse impact on the Company's financial distress or not?

### 3 History Research

Internal investigations: Abbasi (2014) study entitled "The relationship between content components accounting profit with financial distress and information asymmetry" to do. In this research effect of financial distress, bankruptcy intangible assets and level of information content and operating cash flows have been examined in determining prices and stock returns. For this purpose, the data distressed 64 companies and 64 healthy companies listed on the Tehran Stock Exchange during the period 87 to 92 are used.

To test the hypothesis in relation to the stock prices of panel data with random effects in relation to not see the stock return of the used panel data. Research results show that financial distress significantly reduces the information content of prices of all components of earnings and stock returns have been in. This reduction in content is not related to the tangible assets and also for companies with high information asymmetry and for companies with low information asymmetry these rates are the same.

Also level of bankruptcy and informational content discretionary accruals there is a significant relationship, while the level of earnings in bankruptcy and information content not see all the components of stock returns no relationship. Pour Ali, et al

(2013) study, "Relationship between the degree of financial leverage, financial distress of listed companies in Tehran Stock Exchange" did. In this study, the company's financial leverage as the main lever detected that explains the company's financial distress.

The study society consisted of listed companies in the stock during the period 2007-2011. After sampling 32 companies were selected by systematic elimination method. Findings show a significant negative relationship between leverage and the degree of helplessness. Yazdani (2012) study entitled "Relationship bankruptcy, financial distress, manage growth and free cash flow of listed companies in Tehran Stock Exchange" to accomplish. This study is correlational research method and survey method of data collection from websites of Tehran Stock Exchange.

The results of tests showed a significant negative correlation between excessive growth and excessive growth and financial distress and bankruptcy. Also characterized by rising financial distress, bankruptcy increases. While at the same time due to excessive growth and free cash flow on the strength of this relationship adds. Other companies that result in excessive growth and free cash flow less strong relationship exists between bankruptcy and financial distress.

Khajavi, et al., (2011), a study entitled "A comparative study of the quality of financial reporting and non-distressed distressed companies listed in Tehran Stock Exchange" did. This study compared the quality of financial reporting distressed and non-distressed companies in Tehran Stock Exchange 1381 to 1388 as well. To compare the quality of financial reporting and independent t-test for equality of variances in the second test of Levene's test was used at a given society.

The results show that the quality of financial reporting in non-distressed firms listed in the Tehran Stock Exchange, in compared with failed firms are less and less stable. It can be concluded that the findings obtained or non-distressed companies active in the Tehran Stock Exchange, they attempt to manipulate earnings or economic conditions in the country have problems with the country's projected cash flows and reduce the quality of financial reporting in non-distressed companies has been active in the stock.

Hosseini (2011) study entitled "investigate the effect financial leverage and capital intensity related to the financial distress of listed companies in Tehran Stock Exchange". This study, after controlling for variables such as size, profitability and cash assets, the impact of capital intensity (capital of the Company) on the relationship between financial leverage and financial distress all companies listed on the Tehran Stock Exchange during the period 2002-2009.

In this study measured the financial distress Altman model. Findings indicate a significant and negative relationship between leverage and resonator and financial distress. On the other hand significant correlation between the intensity of capital and financial distress is not and finally the results showed that capital intensity is a decisive moderating effect on the relationship between financial leverage and the financial distress of listed companies in Tehran Stock Exchange.

Farzinavash and Wealthy (2010) in a study titled "Global Financial Crisis experiences and lessons for the Iranian economy." Showed that different countries according to economic conditions and the vulnerability of the financial crisis, various economic policies such as reducing interest rates, supporting small businesses, extension of credit, plans to guarantee deposits and debt financing by reducing the interest payments will have to work in order to deal with the crisis.

External research: Höwer (2016) in a study entitled "The role of banking relationships when companies are in financial distress," German firms began to study. A total 319,423 company during the years 2013 to 2000 studied treaty. Tobit regression was used

to test the hypothesis. The results showed that the banking relationship reduces the financial distress. They believe the dissolution of banks to finance more efficient decision making and the ability to depend on the characteristics and motivations of banks.

They also believe that banking relationships and enhance the company's ability to reduce the financial distress. Teruel Garcia et al (2014) study entitled "The Impact of quality in achieving commitments on bank loans" to study Spanish companies involved. To this end, in 1281 the number of companies examined in the years 2005-1988. Two-stage least squares regression model to test their assumptions used.

The results showed a positive association between the quality of the bank's obligations and liabilities. This communication even controlling for other factors that affect access to bank loans and to check whether the correlation between two variables inherent in bank loans and established the company's commitment to quality. The results show that the benefits of high precision, information asymmetry between banks and corporations reduce the loan applicant.

Rosen Feld (2014) in a study entitled "The impact on the future of banking relations firms with financial distress" Showed that support borrowing in the six months before the financial distress significantly increases the probability of transition from distress; thereby reducing the effect of this (lack of education loans) now increases the turbulence intensity for the Altman Z model were calculated on the basis of their financial distress.

Young et al (2012) study entitled "Effect of predictability of earnings on bank debt contracts" did. They used a sample of 8022 bank loan agreement of US companies, concluded that companies with more predictable earnings, more favorable loan terms such as lower interest rates, longer maturities, collateral clauses restrictive and less.

The results also indicated that the link between the predictability of earnings and the cost of bank loans, to access private information about borrowers, competition between banks and bonds and depends on company size. Lee et al (2011) study entitled "Effect of concentration of capital in the industry on the relationship between leverage and financial distress restaurants in America" aims at testing the subject of financial distress in America's restaurant industry. Data collection firms over the period 2008-1990 in America.

Check the degree of financial distress with z scores measure the results indicate a positive effect modifier of the relationship between financial leverage and financial turbulence is the focus of capital. They believe that the company's leverage (leverage) as a main factor that explains the company's financial distress is known, and the fact that leverage increases the degree of financial distress.

Cho et al (2010) study entitled "Effects of Financial Distress and capital structure on work outside directors" to review the conflict of interest between shareholders and debt holders by check work outside directors when a company is experiencing financial distress or facing discuss a high financial leverage and came to the conclusion that external managers with higher financial distress less effort to control their financial levers.

Charalambakis et al (2008) study entitled "financial distress costs and capital structure" of 143,562 years-the company during the period 2002-1950 were examined. They use modified Altman z-score as a benchmark to estimate the probability of financial distress concluded, there is a positive relationship between leverage and the possibility of failure, so that no matter how helpless higher financial leverage is higher.

In fact, they are using the estimated probability of financial distress as a proxy for the costs of the financial crisis, found that the dynamic leverage the relationship between financial crisis and the leverage is very important. They were removed when the dynamic leverage the direct and positive relationship between financial distress and leverage achieved. Also included in the model when the dynamic leverage, and leverage the relationship between the probabilities of financial distress were negative. Our results show that the dynamics of leverage (capital structure) companies in financial distress very important asset.

#### 4 Research Methodology

Due to the expected results of this research in the decision-making considerable financial managers, investors and other stakeholders should be, the purpose of this study from the perspective of applied research component, as well as the investigation discuss the relationship between several variables, considering the nature and procedure of the kind of research is descriptive. All companies listed in the Tehran Stock Exchange, constitute the study society.

A sample of the systematic elimination method is used, in this study, companies with the following characteristics were chosen as examples:

1. From 2004 to 2014 are present the stock.
2. Firms to the banks and financial intermediation, leasing and other companies not to invest.
3. In order to be comparable information, the fiscal year ending 29 March.
4. Trading interval not more than 4 months.
5. Data and information is complete.

#### 5 Hypotheses and regression models

1. The amount of short-term banking has opposite relationships and significant effect on financial turmoil this year.

$$F \quad (1)$$

2. The short-term banking has relationships and significant adverse impact on the upcoming year's financial distress.

$$(2)$$

Here:

$FD_{it}$  = financial distress i and t;

$FD_{it+1}$  = financial distress i d t + 1;

$STBR_{it}$  = short-term bank relations firm i in period t;

$OPM_{it}$  = operating profit margin i in period t.

$ATA_{it}$  Tangible assets of company i at time t.

$ATU_{it}$  = The total asset turnover ratio of company i at time t.

$ICR_{it}$  = Company interest coverage ratio at period t.

$CMV_{it}$  = Changes in the market value of company i at time t.

Size<sub>it</sub> = Size of the company i at time t.

α = Fixed value model.

β = Constant variable.

ε<sub>it</sub> = The model error.

**5.1 Studied variables**

The variables used in this study are of three types: the dependent variable, independent variable and control variable. The dependent variable is the variable that to happen explain or predict their variability. The independent variable is a characteristic that its effect on the dependent variable is examined by the researcher. Variable control variable is the independent variable on the dependent variable to distinguish the effects of other variables, are examined. Accordingly variables used to explain the impact of the financial indignation banking relationships, as Table 1 have been used.

Table 1 List of studied variables

Symbol	Measurement criteria	Name of variable	Kind of variable
	$Z_{i,t} = 3.3(EBIT_{i,t}/TA_{i,t}) + 1(S_{i,t}/TA_{i,t}) + 1.4(RE_{i,t}/TA_{i,t}) + 1.2(WC_{i,t}/TA_{i,t}) + 0.6(ME_{i,t}/TL_{i,t})$	Financial distress	Dependent
	The ratio of short-term debt (credit) bank completely debt	Short-term banking relationships	Independent
	Operating profit sharing virtually Sale	Operating profit margin	Controlling
	Fixed assets virtually divided assets	Visibility of assets	
	Please virtually divided assets	Asset turnover ratio	
	Earnings before interest and taxes to interest expense (financial)	Interest coverage ratio	
	Market Value Market Value difference this year compared to the previous period	Changes in market value	
	The natural logarithm of market value	size of the company	

**5.2 Analysis tools**

To analyze the data from this study will be used descriptive and inferential statistics. To describe and summarize the collected data, descriptive statistics (mean, variance, correlation, covariance,) and inferential statistics were used to analyze and test hypotheses will be. In this study, F-Leamer tests and Hausman, to determine the type of panel data and test t, to determine the significance of the relationship between each independent variable and the dependent variables to test F with a little difference, to test the significance of the overall relationship regression equations, also from coefficient of determination R<sup>2</sup> adjusted for the relationship between dependent and independent variables will be used. Also for analyzing data mining results, Excell software and Eviews and Stata will be used.

**6 Research findings**

**6.1 Descriptive Statistics**

Table 2. Descriptive statistics of variables in this model for 132 sample companies, 10 years shows that the descriptive parameters for each variable separately is indicated. These parameters generally include data on central indexes such as mean, median, maximum, minimum, and distribution of information on indicators such as standard deviation, skewness and kurtosis is. Most important central index that represents the average balance and center of gravity point distribution and index the data center is perfect for showing off.

For example, the average variable interest coverage ratio is 152.6649 shows that more data on these variables are concentrated around this point. Another indicator of central median that shows the status of the community. As shown in Table 2 can be seen mid-term relationships between the bank and size of the company, respectively 0.0000 and 5.6300 is shows that half of the data is less than this amount and half are greater than this amount.

In general, scattering parameters, the criteria for determining the distribution of each other or the distribution of data compared to the mean. Among the most important scattering parameters, the standard deviation. Rate of asymmetry of the frequency curve is called skewness. If the coefficient of skewness is zero, and if the coefficient is positive, society is completely symmetric, skewed to the right and left if there will be negative skewness.

Skewness is positive for all variables in this model. Most variable interest coverage ratio and variable short-bank relations are skewed and variable operating profit margins skewed to the left and right skewness variable interest coverage ratio and the size of their deviation from the center of symmetry. Elongation rate of frequency curve to curve the normal variable is called the land or strain.

If the strain is nearly zero, frequency curve in terms of strain-balanced situation will be normal. If this value is positive, highlighting curves if it is negative, the curve is flattened. Strain is positive for all variables. Most prominent short relationship banking assets and variable interest coverage ratio less prominence than normal curve.

Table 2. Descriptive statistics research variables

Kurtosis	Skewness	SD	Minimum	Maximum	Mean	Name of variable
17.9511	2.4330	2.218591	-6.4300	23.7500	2.669659	Financial distress

Source: research findings

**6.2 The first hypothesis test result**

To test the first hypothesis, the dependent variable, the financial distress this year with the independent variable (short-term banking relationships) and control variable (operating profit

margin, asset visibility, asset turnover ratio, the company's market value changes and interest coverage ratio, size of the company) were examined. Select the type of model to test results in Table (3) is provided. According to the table to test the first model of panel data and fixed effects model was used.

Table 3. Summary pattern of model estimation first hypothesis

Significance	T Statistic	Standard error	Coefficients	Variables
0.0000	-16.29163	0.426197	-6.943441	Intercept
0.0406	-2.050291	0.129258	-0.265017	Short relations bank
0.0000	11.15456	0.152575	1.701909	Operating profit margin
0.0000	-4.859688	0.18163	-0.882666	Tangible assets
0.0000	28.37748	0.71797	2.037414	Asset turnover ratio
0.0000	8.371867	0.012805	0.107205	Changes in market value
0.2313	-1.197802	0.0000352	-0.0000422	Interest coverage ratio
0.0000	19.17465	0.071863	1.377941	size of the company
0.0000	17.51984	0.028059	0.491597	The elimination of autocorrelation
0.8965 :Adjusted coefficient of determination		0.9086 :Coefficient of determination		
1.9624 :Durbin Watson		0.0000 :Significance F		74.9762 :F Statistic

Source: research findings

According to the p-value obtained for the regression equal to zero and less than 5%, therefore the null hypothesis that all the regression coefficients are zero is rejected at the same time and this shows that all the regression coefficients are not zero simultaneously. Also, the Durbin-Watson (AR after entering the first level) in the range of 1.50 to 2.50, which indicates the absence of autocorrelation in the data.

Coefficient of determination model 0.9086 shows that 90.86% Changes dependent variable (the financial distress this year) is followed by the independent variable and control. Given that a significant bank of the Short variable coefficient is less than 0.05, so it can be concluded at the level of 5% short of indignation banking financial year there is a significant impact. The first model is the result of research.

It should be noted that the control variables, the operating profit margin (OPM), the visibility of assets (Ata), asset turnover ratio (ATu), changes in market value (CMV), firm size (SIZE) has a significant impact indignation year because the t-statistic p-value variables operating profit margin, asset visibility, asset turnover ratio, changes in market value, size is less than the level of 0.05. (P-value <0.05)

Given that achieved a significant level of short-banking relationship is significant for the independent variable, i.e. short-term banking relationships has a significant impact on the financial distress. According to the obtained coefficient is negative for the independent variable (short-bank relations) The impact of financial distress on the company's short-term banking relationships is negative; in other words, by increasing the intake of short-term facilities, the company reduced financial distress and an inverse relationship between short-term banking relationships and financial distress.

**6.3 The second hypothesis test result**

To test the second hypothesis, the dependent variable, the financial distress next year with the independent variable (short-term banking relationships) and control variable (operating profit margin, asset visibility, asset turnover ratio, the company's market value changes, interest coverage ratio, firm size) about investigated. According to the table to test the second hypothesis of panel data and fixed effects model was used. The second hypothesis test results in Table (4) is provided.

Table 4: Summary template model second Hypothesis

Significance	T Statistic	Standard error	Coefficients	Variables
0.0012	3.260765	0.737005	2.403201	Intercept
0.0000	-5.06244	0.199109	-1.00798	Short relations bank
0.0198	2.334047	0.276141	0.644526	Operating profit margin
0.0005	-3.5209	0.289553	-1.01949	Tangible assets
0.0000	7.293806	0.123855	0.903372	Asset turnover ratio
0.0511	1.953386	0.027066	0.05287	Changes in market value
0.6216	0.493758	0.000212	0.000105	Interest coverage ratio
0.9696	-0.03814	0.125642	-0.00479	size of the company
0.0000	0.493576	0.039741	0.258064	The elimination of autocorrelation
0.753273 :Adjusted coefficient of determination		0.78578 :coefficient of determination		
2.092239:Durbin-Watson		0.0000 :F Significance		24.17252 :F Statistic

Source: research findings

Regarding the amount of p-value obtained for the regression equal to zero and less than 5%, therefore the null hypothesis that all the regression coefficients are zero is rejected at the same time and this shows that all the regression coefficients are not zero simultaneously. Also, amount of Durbin-Watson (AR After entering the first level) in the range of 1.50 to 2.50, which indicates the absence of autocorrelation in the data.

Coefficient of determination to show that model 0.78578 78.578% Changes dependent variable (the next year's financial distress) is followed by the independent variable and control. Given that a significant bank of the Short variable coefficient is less than 0.05, so it can be concluded at the level of 5% of the Short-bank financial indignation next year there is a significant impact.

As a result, the second hypothesis is confirmed. It should be noted that the control variables, the operating profit margin (OPM), the visibility of assets (Ata), asset turnover ratio (ATu), changes in market value (CMV) next year has a significant impact indignation; because the t-statistic p-value variables operating profit margin, asset visibility, asset turnover ratio, changes in market value is less than the level of 0.05. (P-value <0.05)

In general, given the significant level of short-banking relationships obtained for the independent variable is significant, i.e. short-term banking relationships has a significant impact on the financial turmoil next year, according to the coefficient obtained for the independent variable is negative (short-bank relations) The impact of short-term banking relationships over the next year is also negative financial distress; in other words, the findings show that the company's short-term debt problems reduces their financial distress.

Perhaps because of an increase lenders monitoring the performance of managers, or concerns about the exposure of their inability managers which there is a loss position. On the other hand findings showed that coefficient obtained for the independent variable (short relationship banking) in the second version of the first model, which suggests which short-bank relations next year than this year will be more effective and reduces the financial distress.

The overall results obtained from these two hypotheses compared to the results of research Pour Ali and colleagues (1392), Hussein (1390), Höwer (2016) and Rosen Feld (2014) is aligned and compared to the results of research Lee et al. (2011), Charalambakis et al (2008) is inconsistent.

## 7 Recommendations based on research findings

1) The results showed that increasing the intake facility (short-term) financial distress this year and reduce future; therefore, corporate executives (especially to managers who have their company's financial distress) and recommended to other users, which to decide to move out of the financial distress credit and financial facilities, consider, as this increases which were associated performance monitoring Director of the Bank, company's ability to increase investment and prevent the bankruptcy of the company.

2) Due to banks and financial institutions have a risk management committee shall adopt decisions on granting loans, leading to calls for strict conditions on granting their facilities, faced with such a situation with more regulatory and corporate managers face, therefore, it is recommended that owners, managers are required to provide the required financial resources to use their facilities, because this method can be regarded as a regulatory mechanism.

3. Applicants choose facilities based on their proposed rate of return on the project is the subject of contracts. In this case, the applicant's assessment of the profitability of the facility should be submitted to the bank and declare their desired activity. In this

situation, banks are faced with financial constraints in providing, with interest rates suggested by the applicants facilities, able to choose plans with higher profitability and lower risk are that this may reduce problems of financial distress companies applying for loans, so the managers of companies experiencing financial distress, it is recommended that special attention be facilities based on contracts.

## THE RELATIONSHIP BETWEEN ORGANIZATIONAL COMMITMENT AND JOB STRESS AND JOB SATISFACTION OF TEACHERS EMPLOYED IN DEHDASHT DEPARTMENT OF EDUCATION, IRAN

<sup>a</sup>TAHA TARAN, <sup>b</sup>SEPIDEH FATHI

<sup>a</sup> Corresponding Author, M.A. of Industrial and Organizational Psychology, Marvdasht Branch, Islamic Azad University, Marvdasht, Iran (Corresponding Author)

<sup>b</sup> M.A. of Educational Psychology, Tehran University, Tehran, Iran

Email: <sup>a</sup>tetaran54@gmail.com, <sup>b</sup>sepidehfathi32@yahoo.com

**Abstract.** The present study sought to investigate the relationship between organizational commitment and job stress and job satisfaction of teachers. The study population consisted of 2200 teachers employed in Dehdasht Department of Education in 2015. Sampling was done using cluster random sampling technique and the number of samples was obtained as 327 cases through lottery using Morgan Table among which 167 cases and 163 ones were males and females, respectively. Data were analyzed using Pearson correlation coefficient, ANOVA, t-test and stepwise multiple regression analysis. The findings indicated that there was a negative and significant relationship between organizational commitment and job stress. Job satisfaction in women was significantly more than that in men.

**Keywords:** organizational commitment, job stress and job satisfaction

### 1 Introduction

Today the crucial importance of jobs in various aspects of life is obvious to everyone. Since job it is directly related to physical-mental health and provides the ground for the satisfaction of his non-material needs in addition to a means to meet the cost of living, because, firstly, job characteristics fit the employed person, and second the person feels self-esteem, capability and effectiveness in his job. In other words, one experiences a sense of desirable job success. To meet the needs of the people under the coverage of the department of education, or any other organization and to create incentives to enhance the quality of their work indicate the importance that managements consider for their human resources as one of the valuable assets (Saadatmand, 2009).

In our time, almost all works and issues of the society are carried out by organizations and that the workflow of organizations depends on individual activities and collaboration. People do things more effectively through organizations and that the ways they do things affect the quality of the organization's activities and consequently affect the way the society's works and issues are done. As one of these organizations, Department of Education is the prominent feature of our time in the way it grows and expands. The consequence of this growing is the transformation of educational system to a massive and inclusive organization. Undoubtedly, the workflow of such an organization depends on proper goal-setting and planning and intelligent organization (Saadatmand, 2009).

Job satisfaction is an issue that many people are involved in whether for those who are in search of work and want to experience the workplace for the first time or those who have been working for many years and suffer from its problems. Workplace is actually the second home of individuals. Many people spend many hours of their lives in the workplace. It is clear that the environment must generate a minimum of mental and psychological needs of people so that they can upgrade their professional knowledge and sincerely provide their job services along with earning money (Yaghoobi, 2009).

#### 1.1 Theories related to job satisfaction

**Expectancy theory of job satisfaction:** This theory states that people consider different jobs in their possession and choose the one that would most likely lead to their favorable rewards. The theory was first proposed by Victor Vroom. He presented two models: one is to predict specific choices such as the career the person will take in his job, or how hard he will try. And the other

is to predict a person's attitudes towards his job. The combination of expectancy and value determines what the person will choose (Alvani et al., 2007).

#### 1.2 Maslow's hierarchy of needs theory

This theory was proposed by Abraham Maslow in the years 1940-1950. At the beginning of the 1960s, this theory emerged as a good model of organizational behavior. Maslow classified human needs into seven categories: 1. physiological needs, 2. safety needs, 3. belonging needs, 4. respect needs, 5. aesthetic needs, 6. epistemology needs, and 7. self-actualization.

Although at first, Maslow aimed to provide a model to explain the general relationship between motivation and personality, he later turned his attention specifically to the issues of employee motivation in work organization (Robbins 2008, cited in Parsaeian et al., 2008).

#### 1.3 X theory and Y theory

This view was expressed by Douglas McGregor. X theory assumes that most people prefer to be directed, avoid responsibility, and seek security more than anything else. This philosophy is the belief that money, fringe benefits, and threatening to punishment motivate people. They suspect that for the management of unreliable, irresponsible and immature people, direct control is quite useful and necessary. Under the heavy influence of Maslow's Hierarchy of Needs, McGregor concluded that the assumptions of theory x about human nature is generally incorrect. As a result, McGregor developed theory y. This theory assumes that people are not lazy and unreliable in nature. According to this theory, people can be creative and self-rule in his work in principle, provided that he is appropriate motivated. Thus, the primary responsibility for management is to change this potentiality to actual human capability (Robbins 1, 2008, cited in Parsaeian et al., 2008).

#### 1.4 The theory of difference:

The theory was first presented by Smith et al (1997). They demonstrated that job satisfaction can be explained by the difference between job motivation and incentives provided by organization. According to the theory, if needs incenting a person to work are precisely satisfied by incentives of organizations, job satisfaction will be in higher level while if someone's needs are more than rewards received by a person for job, a difference leading to dissatisfaction will arise. If rewards are more than needs, the difference will result in positive job satisfaction (Rezaei, 2007).

Today one of the problems of organizations is organizational dissatisfaction with job among the managers and workers and their organizations as well as to cope with the stressors inside and outside the organization. In this regard, organizations should be able to increase the endurance of the personnel and to reduce the factors that cause stress so that individual and organizational productivity, and job satisfaction increases (Saadatmand, 2009).

Sources of potential stressors in a person's life can be divided into three groups according to Rolinson i.e. environmental stressors, organizational stressors and individual stressors. Environmental stressors are highly varied including economic changes, political changes, social changes, and finally technological changes.

**Organizational stressors:** Today, anyone in any place and situation has almost felt some degree of stress in the workplace and the organization and this issue is an undeniable and objective reality in the modern organization. The stress may be due to the internal or external organizational factors; however, it

is associated with effects such as loss of productivity, withdrawal from work, physical and mental exhaustion, low yield, and decreasing satisfaction etc. (Yaghoobi, 2011).

Organizational commitment looks like job satisfaction because both are involved with feeling relating to working conditions. Since organizational commitment deals specifically with the attitudes of workers, it may be directly related to variables of presence in the workplace, such as absenteeism, and labor turnover rather than job satisfaction. Organizational commitment is the employee's tendency to the organization in terms of loyalty to the organization, gaining identity with it and the rate of challenge in the organization (Yaghoobi, 2009). Although the concepts of job satisfaction and organizational commitment distinct from each other, they are completely interdependent. Research shows that there is a high positive correlation between these two factors (Baird, 2010). The direct and indirect relationship between professional commitment, job satisfaction and job stress among Taiwan's public health nurses was investigated. The results of this research indicated that job satisfaction significantly predicted turnover among nurses. Noorbakhsh (2004) investigated the relationship between organizational commitment and job satisfaction of female employees participating in Health Plan class at Shahid Chamran University. He concluded that there was a significant positive relationship between employees' job satisfaction and organizational commitment.

### 1.5 Different viewpoints about organizational commitment

Two perspectives have been proposed in organizational commitment. The first attitude which is the most common method in contact with organizational commitment is considered as a kind of dependence on the organization. According to this view, one who is strongly committed to get his identity from the organization participates in the organization and is pleased by it and enjoys membership in the organization. This practice was formulated and operationalized by Berter et al (1974). Another perspective is Baker's view (1960) which considers commitment as a behavioral matter rather than emotion or attitude. According to this attitude, people are more dependent on organization for more affiliates as benefits or seniority rather desired emotions than an organization (Izadi, 2008). According to what was said, it can be said that the capability and efficiency of Department of Education depend on the optimal use of facilities, resources and human resources. In this regard, the more the workforce is competent and efficient, the more the progress and success of organization will be. According to Philip Koebner (1996), if a development should happen in the society, this should be started from Department of Education (Mirkamali, 1999). Out of the factors causing satisfaction and achieving goals in schools is job satisfaction. Job satisfaction has a major impact on organizational behavior and teachers can have an important and positive impact on the organizational development, job performance and motivation and ultimately the commitment and performance of people in the organization (Heidary, 2010). Therefore, considering job stress and its causes and consequences is essential for any organization. Attention and study on job stress and its relationship with organizational commitment is crucial because organizational commitment is considered as the basic elements of any organization. Organizational commitment is an important job and organizational attitude which has attracted the attention of many researchers in the fields of organizational behavior and psychology, especially social psychology in recent years (Pourbabkan, 2010).

In a study entitled "investigating inter-group and intra-group conflict at workplace", in a sample of 255 employees of a factory in Japan on psychological stress and job involvement, Melhem (2004) found that inter-group and intra-group conflict increases

psychological stress in men while intra-group conflict increases psychological stress and job involvement in women.

Given the importance of the role of teachers and employees in achieving the objectives of Ministry of Education and adverse conditions prevailing in their work environment, there is a need for such study and in this study; the researcher follows a suitable answer for the following questions in addition to the study hypotheses.

1. Which dimension of organizational commitment is a stronger predictor for teachers' job stress?
2. Which dimension of organizational commitment is a stronger predictor for teachers' job satisfaction?

## 2 Materials and Methods

According to the issue and objectives of the study, this study is descriptive and correlational. The study population consisted of teachers formally employed in Dehdasht Department of Education in primary, middle and high levels in the academic year of 2014 that were totally 2200 individuals. Sampling was done using cluster random sampling technique and the number of samples was obtained as 327 cases through lottery using Morgan Table among which 167 cases and 163 ones were males and females, respectively. Data were generally analyzed using descriptive statistics (frequency, percentage, mean, standard deviation) and correlational statistics (multivariate regression analysis, Pearson correlation coefficient and analysis of variance).

### 2.1 Materials

Job Stress Scale (GJSS): this scale and its resources has been presented by Philip L. Zeiss (1992) which is consisted of 57 questions and presents information on job stress to people. In relation to the validity and reliability of job stress questionnaire, the reliability has been reported as 0.99 and 0.72, respectively using alpha and retest methods. Also, in the present study, Cronbach's alpha of the above scale was obtained as 0.85.

Job Dissatisfaction Index (JDI) was designed by Smith (Dewettinck, 2011) which contains 72 questions and five dimensions of salary, relation with colleagues, promotion, job and supervision. Due to the length of the questionnaire, a study was done to reduce the questions by Halepota (2011) through which the number of questions was reduced to 30. In this study, 30-item questionnaire of Gregson was used. In his study in 1994, Abbas Azadgale obtained the reliability of the questionnaire as 0.86, and in 1997, Mohamadian measured it as 0.72 (cited in Saadatmand, 2009). The total reliability of the questionnaire was calculated 0.75 via Cronbach's alpha coefficient in this study.

Organizational Commitment Questionnaire (OCQ): it was formulated to assess organizational commitment by Gallardo (2010) and was first prepared to be used in Persian by Hossein Shokrkon in 1993 and has 24 self-report questions. The questionnaire have been used in numerous studies. Some researchers such as Wang (2007) calculated its reliability using Cronbach's alpha coefficient for the subscales. For emotional, continuous, and normative commitment, the reliability was obtained as 0.86, 0.79, and 0.75, respectively. Also, the total reliability of organizational commitment was obtained as 0.90. The reliability of the questionnaire in this study equals .078 using Cronbach's alpha coefficient.

## 3 Findings

First hypothesis: there is a significant relationship between organizational commitment and its dimensions and job stress.

Table 1: Correlations between the dimensions of organizational commitment and job stress

Organizational commitment and its dimensions	Correlation coefficient with job stress	Level of significance
Total organizational commitment	-0.21	0.001
Emotional commitment	-0.15	0.006
Continuous commitment	-0.19	0.001
Normative commitment	-0.043	0.44

As shown in the above table, the relationship between organizational commitment and job stress equals to  $r = -0.208$  which is significant at the significant level of  $p < 0.001$ . This means that there is a significant negative relationship between organizational commitment and job stress. Also, there is a negative (inverse) and significant relationship between the

dimensions of emotional commitment and continuous commitment and job stress; however, no significant relationship is observed between normative commitment and job stress.

### 3.1 The second hypothesis: there is a significant relationship between organizational commitment and job satisfaction

Table 2: Correlation coefficient between organizational commitment and its dimension and job satisfaction

Organizational commitment and its dimensions	Correlation coefficient with job satisfaction	Level of significance
Total organizational commitment	0.51	0.0001
Emotional commitment	0.49	0.0001
Continuous commitment	0.084	0.128
Normative commitment	0.36	0.0001

According to the contents of this table, the correlation between job satisfaction and organizational commitment equals to  $r = +0.51$  which is significant at the significant level of  $p < 0.0001$ . Therefore, it is concluded that there is a positive (direct) and significant relationship between organizational commitment and job satisfaction. Also, there is a significant positive relationship between the dimensions of emotional commitment and normative commitment and job satisfaction. But there is no

significant relationship between normative commitment and job satisfaction.

### 3.2 The third hypothesis: there is a significant difference between the teachers' job stress and the level of education.

To investigate this hypothesis, one-way ANOVA was used.

Table 3: mean and SD of job stress in terms of the level of education

Level of education	Number	Mean	SD
Diploma	13	133	22.8
Associate degree	138	140	25.3
Bachelor	176	151	22

As shown in the above table, the higher degree of education increases job stress. To assess the significance of these

differences one-way ANOVA was used whose results are given in the table below.

Table 4: ANOVA table

resources of change	Total square	Degrees of freedom	Square mean	f	Level of significance
Between group	10998.3	2	5499.19	9.92	0.0001
Within group	179585.9	324	554.27		
Total	190584.2	326	-----		

This means that there is a significant difference between at least two educational groups in terms of job stress. To answer this question among which one of educational groups there is a significant difference, sheffe post-hoc test was used and its result showed that there is no a significant difference just between diploma and associate degree in terms of job stress and there is a significant difference among the rest of levels of education i.e. The level of job stress in holders diploma is significantly lower

than those with bachelor degree and job stress in holders associate degree is significantly lower than those with bachelor degree. The overall result is that holders of a bachelor's degree have the most job stress.

### 3.3 The fourth hypothesis: here is a significant difference between job satisfaction and the level of education.

Table 5: Mean and standard deviation of job satisfaction and level of education

Level of education	Number	Mean	SD
Diploma	13	113.6	11.78
Associate degree	138	102.29	17.8
Bachelor	176	96.49	16.73

As shown in the above table, job satisfaction decreases with increasing the level of education. To assess the significance of

differences between the above means, one-way analysis of variance was used.

Table 6: ANOVA table

Sources of change	Total square	Degree of freedom	Square mean	f	Level of significance
Intergroup	5318.6	2	2659.34	9.15	0.0001
Within group	94140.92	324	290.55		
Total	99459.52	326	-----		

As it is observed, the value of F is equal to 9.15 which is significant at  $p < 0.0001$ . In other words, there is a significant difference between at least one pair of the above means. There is no significant difference between the mean job satisfaction of individuals with diploma and associate degree. Also, there is a significant difference between the mean job satisfaction of

graduates and those with diploma and associate degree. This means that the job satisfaction of those with bachelor's degree is significantly less than those with diploma and associate degree.

#### 3.4 Fifth hypothesis: here is a significant difference between teachers' job stress based on gender

Table 7: Results of independent t test to compare job stress between male and female teachers

Groups	Number	Mean	SD	t	Degree of freedom	Level of significance
Female	163	142.4	23.9	2.83	325	0.005
Male	164	149.9	23.8			

LevensF = 0.903 and  $P < 0.9$

As it can be seen, LevensF is 0.903 which is not significant in  $P < 0.9$  i.e. the variance of the two groups are homogeneous (default of Independent t). The mean job stress is 142.4 and 149.9 in women and men, respectively. Given that t is equal to

2.83 and is significant at  $P < 0.005$ , it is concluded that job stress in men is significantly more than that in women.

#### 3.5 The sixth hypothesis: is a significant difference between job satisfaction and gender

Table 8: independent t test to compare the mean job satisfaction of women and men

Groups	Number	Mean	SD	t	Degree of freedom	Level of significance
Female	163	103.1	16.15	3.67	325	0.0001
Male	164	96.13	18.06			

LevensF = 0.67 and  $P < 0.411$

As it can be observed, LevensF is not significant, so the variances of the two groups are homogeneous. The mean job satisfaction has been obtained as 103.1 and 96.13 in women and men, respectively. Considering that t is equal to 3.67 and is significant at  $P < 0.0001$ , it can be concluded that job satisfaction among women is significantly more than that among men.

#### 3.6 Research questions

**The first research question: Which of the dimensions of organizational commitment is a stronger predictor of job stress among teachers?**

Table 9: Results of stepwise multiple regression analysis

Steps	Variable	R	R2	F	P	B	t	P
First step	Continued commitment	0.186	0.35	11.68	0.001	0.186	-3.41	0.001
Second step	Continued commitment	0.257	0.066	11.49	0.0001	-0.209	10.6	0.0001
	emotional commitment					-0.179	-3.86	0.0001
							3.3	0.0001

As it is observed, continuous commitment enters the equation as the strongest predictor at the first step in which multiple correlation coefficients (R) equal to 0.186 and the coefficient of determination equals to 0.35 that is continuous commitment can predict 3.5% changes in job stress and Beta value equals to 0.186. In the second step, emotional commitment enters the equation as the second variable. The two variables together have correlation coefficient equal to 0.257 with job stress which

predict 6% of changes in job stress. Because the value of F is equal to 11.49 and it is significant at the level of 0.0001, these two variables together are able to predict job stress. Normative commitment has not been entered into the equation.

**The second research question: Which of the dimensions of organizational commitment is the strongest predictor of job satisfaction among teachers?**

Table 10: stepwise multiple regression analysis

Steps	Variable	R	R2	F	P	B	t	P
First step	Emotional commitment	0.49	0.24	102.5	0.0001	0.49	10.13	0.0001
Second step	Emotional commitment	0.51	0.26	57.45	0.0001	0.51	10.6	0.0001
	Continuous commitment					0.15	3.1	0.002
Third step	Emotional commitment	0.53	0.28	41.67	0.0001	0.43	7.7	0.001
	Continuous commitment					0.16	3.3	0.001
	Normative commitment					0.15	2.8	0.006

As it can be observed, the strongest predictor of job satisfaction is emotional commitment which has been entered into the equation at the first step and its multiple-correlation coefficient is 0.49 and predicts the percentage of variance of job satisfaction. Since F is significant at  $P < 0.0001$ , this variable is able to predict job satisfaction and Beta is equal to 0.49. In the second step, continuous commitment which is the strongest predictor for job satisfaction is added to emotional commitment. These two have a correlation equal to 0.51 with job satisfaction and can predict the percentage of variances in job satisfaction i.e. they predict 2% of changes in job satisfaction. Since F is significant at the level of 0.0001, these two variables are able to predict job satisfaction. Beta r has been achieved 0.51 and 0.53 for emotional and continuous commitments, respectively. In the third and last step, normative commitment also was entered into and in the equation so that all three dimensions together have a correlation coefficient equal to 0.53 with job satisfaction and predict 28% of variances in job satisfaction i.e. normative commitment also predicts job satisfaction about 2%. Since F is

significant, these three variables are able to predict job satisfaction and the strongest predictors are emotional commitment, then continuous and normative commitment, respectively.

#### 4 Discussion and conclusion

This study aimed to investigate the relationship between organizational commitment and job satisfaction and job stress among teachers in Dehdasht in 2015. In this research, organizational commitment and its dimensions were introduced as the independent variables (predictors) and job satisfaction and job stress as dependent variables (criteria). The study consisted of six hypotheses and two research questions. First, the findings are discussed, and then the results will be evaluated.

**The first hypothesis: there is a significant relationship between organizational commitment and its dimensions and teacher's job stress.**

According to Table 1, b there is a significant negative correlation between organizational commitment and its dimensions and job stress ( $p < 0.001$  and  $r = -0.208$ ). However, there is a significant and negative relationship between the dimensions of emotional commitment and continuous commitment and job stress. But no significant difference has been observed between normative commitment and job stress. The result of this finding is consistent with the results obtained by Michae (1999) because its relationship with turnover, absenteeism, and employees' delay is reverse and negative. Therefore, the nature of a person's relationship with an organization is different in any one of these three dimensions of emotional, continuous and normative commitments. Employees with strong emotional commitment stay in the organization because they want to stay there. People having a strong continuous commitment stay because they need to be and those who have a strong normative commitment also stay because they feel they should stay. Thus, the first hypothesis was confirmed. In other words, the more the job stressors in a workplace, the more the employees' organizational commitment is reduced and along with increasing the mental stress, employees' commitment including emotional and continuous commitments, decision making, communication, responsibility, dedication, attachment to the organization, the quantity and quality of work and work mentality are decreased and cause the weakness and shortcomings.

**The second hypothesis: there is a significant relationship between job satisfaction and its dimensions and organizational commitment.**

According to Table 2, it can be seen that here is a significant positive relationship between organizational commitment and job satisfaction and also between dimensions of emotional commitment and normative commitment and job satisfaction ( $p < 0.001$  and  $r = +0.505$ ). The result of this finding is consistent with research results by Noorbakhsh (2004). Personnel job satisfaction and organizational commitment leads to high performance and their persistence in their job and profession. Since the salary would result in self-esteem, it increases a person's commitment and job satisfaction. Also, when employees are involved in decision-making, appropriate reward and punishment system will be established and improper interaction between people and discrimination in the workplace will be removed leading to job satisfaction and organizational commitment.

**The third hypothesis: there is a significant difference between teachers' job stress and the level of education.**

According to Tables 3 and 4, there is a significant difference between teachers' job stress and their level of education ( $p < 0.0001$  and  $F = 9.92$ ). In other words, the higher the level of education, the higher the job stress i and a bachelor's degree holders have the most stress. The results of this finding are consistent with results obtained in the study by Kazemi (2010). One of the reasons is that scientific knowledge and giving more importance to works among educated people result in this issue. Therefore, the third hypothesis was confirmed.

**The fourth hypothesis: there is a significant difference between teachers' job satisfaction and the level of education.**

According to Tables 5 and 6, there is a significant difference between teachers' job satisfaction and their level of education ( $p < 0.0001$  and  $F = 9.15$ ). The difference between the mean job satisfaction of bachelors and diploma and associate degree is significant i.e. the amount of job satisfaction of those with a Bachelor's degree is less than that of those with Diploma and Advanced Diploma qualification. Therefore, it can be said that the higher the degree the lower the job satisfaction. The results of these findings are not consistent with research results by

Prington (1994). There may be several reasons, but the followings are a few. The first reason may pertain to the fact that educated people have higher expectations. Employees who have more education and are paid less, they may have less production or reduce the quality of productions (work) (i.e. efforts are reduced). If high degree results in security, status and other interests, it creates job satisfaction in the person and vice versa. Thus the fourth hypothesis was confirmed. This means that there is a significant difference between the mean job satisfaction of graduates and diploma and associate degree i.e. the amount of job satisfaction of those with Bachelor's degree is less than that of Diploma and Advanced Diploma qualification. Therefore, it can be said the higher the level of education, the less the job satisfaction.

**The fifth hypothesis: there is a significant difference between teachers' job stress in terms of gender.**

According to Table 7, there is a significant difference between the teacher's job stresses in terms of gender. ( $F = 0.903$  and  $p < 0.9$ ) ( $t = 2.83$  and  $p < 0.005$ ); therefore, the fifth hypothesis was confirmed. In other words, the amount of stress in men is more than women. The results of these findings are not consistent with the results obtained by Kazemi (2010). It can be said that in studies, it is often assumed that there is a difference between men and women in terms of the experience of job stress. Financial needs in men are higher than that in woman and they should do more work for subsistence and survival or should work consecutive hours, as well as, suffer from more stress in the workplace than women because they participate in organizational politics and the struggle for power. Since stress may lead to alcoholism and narcotics, the men are at more risk than women. It seems most newly hired employees are men with high educational degrees and because of falling in a new and unfamiliar environment where there is a lot of information for learning, they feel more stress. Since men are more involved in work than women, they have less time for exercise and rest and due to lack of a regular diet; they may suffer from more stress. Therefore, the fifth hypothesis was confirmed.

**The sixth hypothesis: there is a significant difference between teachers' job satisfaction based on gender.**

According to Table 8, there is a significant difference between teachers' job satisfaction based on gender ( $P < 0.0001$  and  $T = 3.67$ ) i.e. job satisfaction in women was significantly greater than that in men. The obtained results are consistent with the results from studies by Andrvazh (2007) and Hagari (2009). There are several factors together which can create job satisfaction among people. Perhaps, the lack only one factor of all these factors can reduce a person's satisfaction or dissatisfaction with their jobs. Income; social status; possibility to job promotion; how to manage in workplace; non-discrimination and one's knowledge are the most important factors creating job satisfaction in individuals. The rate of income is one of the most serious and employment causes selecting a job for people so that in many cases, the other factors can even be ignored. Sometimes, there are people with important jobs and social status and prestige do not feel job satisfaction because of low income so that in many instances, they change their job even to lower-status job. It seems that: 1- since women is not responsible for living expenses, they usually have job satisfaction despite small salary while men are seeking more than what they receive to have complete satisfaction from their work.

2- The little share in benefiting from job opportunities in today's society makes women more satisfy with their jobs than women.

3- Since women are always trying to adapt to the situation, they do not come to compete and this spirit in women causes increasing their job satisfaction. Therefore, the fifth hypothesis was confirmed i.e. the level of job satisfaction in women was significantly greater than that in men.

## 5 Explaining the findings of the research questions:

### The first question: which dimensions of organizational commitment is the strongest predictor of job stress among teachers?

According to Table (9), continuous commitment has been detected as the most powerful predictor in the first step and has predicted 3.5% of variances of job stress. In the second step, emotional commitment has been appeared rather than normative commitment in predicting job stress and both continuous and emotional commitments have predicted 6% of variances in job stress. The results from these findings are not consistent with the results of the study by Bellou (2007). Since both continuance and emotional commitments predict 9.5% of variances in the job stress, it seems that people with continuance commitment will be sensitive to increase the costs of the organization, the volume and size of individual's investments in the organization, spent time and energy for learning and objectives which the organization have been contracted to preserve for them and protecting them have been caused stress variances and one of factors for the weakness of normative commitment is probably a feel that one has no desire to remain in the organization.

### The second question: which dimensions of organizational commitment is the strongest predictor for job satisfaction in teachers?

According to Table (10), emotional commitment has been detected as the most powerful predictor in the first step and has predicted 24% of variances of job stress. In the second step, continuance commitment is added to emotional commitment and predicts 2% of variances in the job satisfaction and in the third step, the normative commitment predicts 3% one so that all three are capable to predict 28% of variances in job satisfaction. Therefore, the strongest predictors are emotional commitment, then continuous and normative commitments, respectively. The results from these findings are not in line with the results of the study by Noorbakhsh (2004). It seems that people with high emotional commitment desire to exert more effort for organization and highly remain and this high emotional commitment to performing duties causes a feeling of responsibility, deep understanding and selflessness.

## 6 Applied suggestions

- To increase organizational commitment and job satisfaction and decrease physical and mental stressors, more and deeper awareness to the strengths and weaknesses of variables be done on teachers via diverse and short-term training courses.

- It is recommended that the authorities create a friendly and cooperative atmosphere through which they can make the ground to increase job satisfaction and organizational commitment and reduce psychological pressures on individuals so that their efficiency and effectiveness can be increased.

**Abstract.** The purpose of this study was to determine the effectiveness of communication skills training on female high school students' happiness. At this experimental study, first Sixty female students, were selected using multi-stage cluster sampling and then by simple random method, divided into three test and a control groups. The data were analyzed using descriptive statistics, and inferential statistics. The results showed that, in comparison to control group, communication skills training significantly induces student's happiness in test group, and among communication skills, empathy was more effective than assertiveness and listening skill ( $P < 0.05$ ). Finally, the results showed that the communication skill training had a positive effect on students' happiness.

**Keywords:** communication skills training, happiness, students

### 1 Introduction

The human always had been seeking for joy and happiness. In other words, human does all his/her activities to reach happiness and bliss. According to Aristotle, there are at least three types of happiness. At the lowest level, the ordinary people consider that, equivalent to Success, but at the upper level the desired happiness is accordant to Aristotle opinion, or the happiness caused by spirituality. There are Six fundamental human emotions: anger, fear, hate, Surprise, sadness and happiness (Dickey, 1999). Mental happiness is a person's cognitive and emotional evaluation of his/her own life. This evaluation causes emotional reactions to the accidents and also cognitive judgments about satisfaction and to accomplish tasks. So, mental happiness is a wide concept, including: experience of desired emotions, low levels of negative emotions and high life satisfaction. People's mental happiness is reflected in evaluation and perception of their life in terms of emotions, psychological and social functions. Emotional component of mental happiness contains two components: happiness and life satisfaction (Carr, 2004). Studies show that in about one hundred-year life of scientific psychology, the negative aspects of emotion were mostly considered. For every fourteen articles about negative emotions, there is only one article about positive emotions. Other researcher, with a review of the literature over the past decade, considers this proportion, seventeen to one. But in the last two decades a number of psychologists innovated a kind of positive psychology which includes subjects like: positivism in coping with the pressures of life and overcome depression and exanimate.

Overall, this researches are in line with the positivist psychology movement which started by Martin Seligman. Happiness at least has two major components: emotional and cognitive. Although happiness is not the opposite of depression but the absence of depression is a prerequisite to achieve happiness (Alipour & noubala, 2009). Happiness is a character trait that is based on biological theory. The most comprehensive and also most operational definition of happiness was offered by winhoven. In his opinion, happiness is referred to the judgment of a person about the extent of desirability quality of life. In other words, happiness means that how much a person loves his/her life. In fact, happiness is the common goal of people and everybody tries to achieve that. And that is consist of evaluation of people of themselves and their lives (Buss, 2000). Researches conducted in relation to happiness show that treats of happy people are adaptive and helpful. These people look at things with clear vision, usually pray, attempt to solve their problems directly by themselves and ask help from others in time. On the other hand, unhappy people think and act pessimistic, are

immersed in fantasy, they blame themselves and others and avoid working for solving problems. Therefore, the mental health contains important principles that can be recognized using the effect of emotion on different aspect of human treats and its development including: Physical and mental health, training and skills development, social competencies and positive social relationships (Bridge, et al., 2002). Fortunately, by referring to the principles of positive psychology, the most valuable solution for increasing happiness can be found. Different ideas, reasons and ways of increasing happiness have suggested that these ideas should be properly investigated. Among these methods, life skills training and so that communication skills are the most important. In fact, the emphasis on human training, has a preventive role for healthy people and rescues the patients from disease. Communication skills play an important role in enhancing the health and vitality of human beings and can prevent the onset of many physical and mental diseases and eventually there will be much more happiness in our lives (Shahjafari et al., 2003). Argyle and Lu (1990) showed that part of the happiness expressing, in extroverts is for the sake of better social skills, especially assertiveness and cooperativeness. Communication skills training can help people a lot. This training includes verbal and nonverbal communication such as listening, empathy and assertiveness. Unfortunately, the people of the community are not always in the course of normal psychosocial development and for various reasons, a large number of adolescents and young people can't achieve external stimuli and find balance between stimuli's and their own internal motivations. Thus, the harmonious and comprehensive development of human as the main excellence objective, would not be realized. Meanwhile the society becomes more complex and broader social and interpersonal communication occurs, internal and environmental conflicts become more, and causes weak persons to get perplexity and confusion. Behavioral problems and mental disorders, make direct and immediate intervention necessary, so that, in this situation, the intervention is to increase the adaptability of people, raising their social and personal capacity in breeding programs that aims at promoting psychological capacity of adolescents and young people. This important and essential action takes place by life skill training (Farmahini, 2013).

Today, it has been proven that one of the characteristics of successful people in various fields, is the ability to communicate with others. On the other hand, a lot of stress that people suffer from in social and family relationships, is caused by establishing an inappropriate relationship by these people, that will affect their physical and mental health. In fact, learning effective communication methods, are important from different aspects. First, effective communication, is an essential component of prevention of mental disorders. Secondly, the main key to prevent social pathologies, is effective communication skills, especially assertiveness. Third point is that; it is of the necessary materials for the general concept of success. On the other hand, from a holistic view, today, on behalf of international community like the World Health Organization health is not defined only the absence of disease. But also health, includes a euphoric feeling in all physical, psychological, social and even spiritual dimensions. Undoubtedly, to achieve a desirable, happy situation of life, it is not enough to rely solely on holistic therapies and people must stabilize their health status using acquired tools and skills and prevent from imbalance in the body and mind, or disease. But the problem is that the modern man, in search of happiness, does not know where to take refuge in (Farmahini, 2013).

One way to create happiness, is social skills training. Social skills training, includes cognitive and behavioral set of techniques to increase happiness which was presented by Levinson and Goth Leap. The program includes training in assertiveness skills, fostering a sense of collaboration, spending leisure time, responsibility and communication skills which have been effective in increasing happiness according to many of

these researches. The results showed that the value of *t*, obtained for irrational beliefs and happiness variables was meaningful. So that the mean score of irrational beliefs is less for gifted students and their rate of happiness is higher. The results showed that there is a difference in irrational beliefs and happiness for regular and gifted students. The Taremian et al., (2006) presented that factors such as confidence, effective communication, purposefulness, decision-making and problem solving in is involved in mental health of adolescents and weaknesses in these skills will be reduced happiness and health. Researches of Hafezi et al., (2010) showed that life skills training is effective in reducing distorted behavior of delinquent teenagers. Tabesh (2008) also concluded that female high school students' life skills training has a positive effect on their compatibility. Researches of Myers (2000) showed that happiness can improve physical and mental health. Several studies also showed that happiness acts as a buffer against stress (Barati et al., 2011). Lyubomirsky, Sheldon and Schkade (2005) believe that each individual has a model for happiness or unhappiness, that makes him interpret events in such a manner that preserves his happiness. In general, they believe that happy people respond in a more adaptive and positive manner to happenings and conditions and have lower stress levels, stronger immune system and more creative than unhappy people. In life skills training programs, the skill refers to: The ability to create appropriate and effective interpersonal relationships, doing social responsibilities, make correct decisions, conflicts and struggles resolution without resorting to actions that harm self and others. Communication skills help to express ideas, beliefs, desires, needs and emotions and to ask help and guide from others when its necessary.

Listening skill or effective listening, includes the active participation in a dialogue, the activity which helps the speaker to transmit his own purpose. Clear and effective expression of desires, feelings, thoughts, is half of the communication process that is necessary for influencing and interpersonal communication. The other half is to listen and perceive others. effective communication is obtained when the recipient of a message, understands the purpose of the sender in the same way that the sender means to (Ghorbani, 2006). Empathy skill is the ability to understand others even if one not has the same situation of life. Empathy helps to individual to accept other people despite their differences and respect them. Empathy improves social relations and leads to create a supportive and accepting behavior toward other human beings. Assertiveness skill is the ability to express feelings and thoughts and ideas to be worthy so that nobody is disrespected and no one's right is spoiled (Fathy, 2015). Also the word Happiness has a psychological concept that has different definitions and dimensions. In dictionaries, happiness is synonymous with words like rejoice, joy and vitality (Moen, 2003). According to the above, the necessity of considering issue of the happiness has several reasons, one is that, happiness is contagious; which means that, happiness of a person can make others happy. Moreover, happiness makes life more pleasant (Abedi, 2006). Given the advantages of a happy life for the people, especially youth and students as future builders of society, some psychologists and researchers have tried to provide ways to increase the happiness of the people. Some of these methods could be social skills training program [Levinson and Gottlieb], cognitive therapy Beck, teaching interpersonal communication (Bus, 2000) and mood induction methods (Argyle, 2002). Due to the fact that happiness is partly learnable, to create happiness in people behavioral skills that can cause or increase the happiness can be trained to people. According to some research, it seems

that the issue of happiness has little role in the process of education and training. If this is true, it could be considered to be a serious injury in the process of education. Happiness and joy bring positive energy for the person, whether a student or teacher, both can take advantage of this energy. Therefore, in this research we intend to study the effectiveness of communication skills training on increasing the happiness of high school female students.

## 2 Method

This current research method is experimental. Research design is semi experimental "post-test - pre-test and control group" which includes four groups that all groups are measured twice. For experimental groups, before and after the intervention and simultaneously for the control group but with no training. There are three experimental groups, including those who trained listening skill, empathy skill and a group that receives assertiveness skills training and also one group, as a control group. Random sampling method was used to form groups. In this case, three groups of 15 subjects in the test group and a control group of 15 persons were defined. Each test group was exposed to its own variable test and control group continued to its previous program without any intervention. Measurement of the dependent variable for groups (control and test) was performed at the same time and under the same conditions. Research population consists of all secondary school students (first, second, third, fourth grade) of public schools in city of Sari in the academic year 90-89 which includes 5030 students. The sample size in this research is 60 students that were randomly divided into four control and experimental groups of 15 persons. Research participants were selected through multi-stage cluster sampling.

## 3 Research Tools

A. Research tools is Oxford Happiness Questionnaire. This questionnaire was prepared in 1989 by Argyle and Lu. This questionnaire has 29 parts (Alipour and Nourbala, 2000). Hills and Argyle (1998) have gained seven factors on their analysis including Life satisfaction, self-efficacy, sociability, positive recognition and self-esteem. These factors include 3/56% of the total variance. Farnham and Brewing (1990), in another research have emphasized the effect of three factors, personal development, fun and entertainment on life and health quality. The validity of the Oxford Happiness Questionnaire in Nourbala research on 25 students, Cronbach's alpha was obtained 93/0. The value of alpha was respectively obtained by Farnham and Brewing (1990), 0.90, 0.87 and 0.89 and 0.90. The reliability of the Oxford Happiness Questionnaire in Nourbala research with a very small sample size (25 students) was achieved 0.79 after three weeks. Argyle and Lu (1990) have reported the reliability 78/0 after 5 months. Noorbala (2000) research investigated the correlation between test questions and the total score of each part of the test showed a high correlation (40 to 73/0) with the total score.

B. Implementation of the independent variable of communication skills. After the implementation of happiness questionnaire at the first stage and selection of experimental and control groups, skills training was presented in the test groups during four sessions of 90 minutes (every week, one session). Then happiness questionnaire was given to both groups again.

## 4 Results

Table 2: Frequency distribution and percentage of subjects

Index/ Groups	control	Test1	Test2	Test3	Total
Frequency	15	15	15	15	60
Frequency percentage	%25	%25	%25	%25	%100

As table 2 indicates in the descriptive statistics, three student groups were considered as test groups and one for the control group. Their numbers are equal and group 1 possessed active

listening skill between two tests, group 2 possessed empathy skills and test group3 possessed assertiveness skills. The control group did not receive any training between the two tests.

Table 3: Distribution of happiness pretest and post test scores studied for four groups

Average happiness	Test1	Groups Test2	Test3	control
Pre-test	41.60	37.40	42.40	40.53
Post-test	47.60	43.60	49.40	42.66
Tests difference	6	6.20	7	2.13

Table 3 results show the average pre-test group that possessed active listening training was 60/41, and after the training was 60/47. For the group that possessed empathy skills, pre-test and after the intervention, average happiness score, were 60/43 and 60/43 respectively. And for the third group that possessed

assertiveness skills, pretest scores were respectively 40/42 and 40/49 before and after the training. The control group had gained an average score of 53/40 in pre-test and in the second phase, the average score was 66/42.

Table 4: independent t test (The effect of Listening skill training on happiness of female students)

Skill	Average		standard deviation		t	sig
	Test	control	test	control		
Listening	6	2.13	2.72	2.77	3.85	0
Empathy	6.20	2.13	2.56	2.77	4.16	0
Assertiveness	7	2.13	1.92	2.77	6.44	0
communication	7	2.13	2.15	2.77	-7Apr	0

The control and test group both include 15 students, t Critical 2.04 ,P<0.05 ; df=58

The results in table 4 show that the training of listening, empathy, assertiveness and communication skills has an impact on happiness students. And with comparison of averages it can

be concluded that the happiness of students that were trained listening, empathy, assertiveness and communication skill is more than the control group.

Table 5: Data analysis using stepwise regression models (step by step)

Resources	SS	df	MS	F	sig	α
regression	6110.62	3	2036.87	25.64	0.000	May-00
residual	3255.95	41	79.41			
total	9366.57	44	-			

Given that meaningful level is equal to sig =000/0, the alpha value was smaller than the considered one which is equal to α =05/0. So considering the degree of freedom, the regression

confirmed the effect of all three variables on Happiness. And then the share of each effective variable is presented in Table 5.

Table 6: The contribution using the stepwise regression model (step by step)

Skill	r	R	(r2)	(r2)
	step by step	each skill	coefficient	each skill
Empathy	0.45	0.45	%21	%21
Empathy + listening	0.78	0.33	%32	%10
Empathy +listening + assertiveness	0.99	0.21	%37	%5

Results table 6 shows that all three skills of listening, empathy and assertiveness is effective in students' happiness but they share is different. Regression showed that 21, 10 and 5 percent of changes of happiness are respectively related to empathy, listening and assertiveness skill training. The residual 64 percent is related to the contribution of other factors that were not studied in this. research.

**5 Conclusion**

This research aims to study the communication skills training influence on students' happiness. The results indicate the effectiveness of communication skills training on increasing of students' happiness levels. T test and regression analysis results indicate that the skills training has been positively influenced happiness components. Training listening, empathy,

assertiveness and communication skills affect students' happiness. And the comparison of the results showed that the happiness of the students who were trained Listening skill, empathy, assertiveness and communication skills was more than the control group. The results of current research consistent with Taremi et al., (2006), Hafezi et al., (2010), Tabesh (2008). So far, the direct study of the relationship between communication skills and happiness has not been made yet. Some studies, have generally evaluated life skills training effect, positive on happiness. Such as, Amiri Baramkoochi (2010) that studied the effectiveness of life skills training, on reducing depression symptoms of students. The results of data analysis, showed that the training was effective in reducing symptoms, actually, life skills training, has a positive effect on happiness (as opposed to depression). Since, communication skills is an important component of life skills, somehow this research is consistent to

the researches of this type. Poyrazli et al., (2002) Those with assertiveness are not only faced with the problem they encounter stressors, but also to conduct successful in dealing with these factors had a more positive cognitive evaluation And consequently they also experience more positive emotions and feelings (Prazly et al., 2002). anxiety, depression and personality disorders. Aryndl studies and et al (1991) and Rabstvn Temple (1991) and Nissi and Shahni yeylagh (2002) showed that the behavior of assertiveness, has a direct positive relationship with self-esteem, social self-sufficiency and independent behavior and mental health. Amalie (1992) and Ramezani (1996) also assessed the effect of assertiveness training positive in the treatment of shyness and decisiveness. As in this study was obtained and as well as the results of tables 5 and 6 presenting that 21% of the positive changes in happiness in the experimental group, were related to empathy skills training. Also 10% of the variance was related to listening skills and 5% of the positive changes related to happiness is related to assertiveness skills training. Also effects of all these three variables was confirmed on happiness. The share of empathy, listening and assertiveness skills were respectively determined in first, second and in the third grade. It seems, according to the dependent variable of happiness, what makes people in a relationship be happy, is the empathy above all factors, and after that it is active and effective listening. Although assertiveness has more effective share in a successful relationship, perhaps for cultural reasons, here it failed to brought more happiness for people than empathy. Unfortunately, there is no study found that directly or indirectly is related to these findings. However, since the share of empathy skills was more than other skills in happiness increasing. It can be assumed that in Iranian culture, at least in adolescents and among girls, empathy produce more happiness, joy and pleasure of people in interpersonal relationship, than active listening or assertiveness. In most studies, emphasis is on assertiveness and often overlooked role of empathy skills; Therefore, it seems necessary that the contribution of this factor in happiness in various related fields to be investigated. In general, it can be said that communication is one of the oldest and highest human achievements, that in addition to survival functions, it can pave the way for social activities. All of us on a daily basis, experience various communication, but most normal people, are not able to make a good and effective communication. Happiness is in fact is the magnitude of positive value that a person considers for himself (Vynhuven, 1997). This concept has two aspects, one is emotional factors that indicate emotional experience of happiness and other positive emotions. and the other one is cognitive appraisal satisfaction of various areas of life, which indicates happiness and mental health (Andrews & McConnell, 1980). In fact, happy people are mostly associated with positive emotional events, by raising their skills, instead of negative events (Carr, 2004). Generally, humans evolve in such a way that some situations make them happy and others, to bring the experience of failure. Individual differences, Happiness, have been associated with personality differences difference that can be caused by genetic factors (Bass, 2000). For this reason, Eysenck considers the biological basis for Among the limitations of this study (Alipour & noubala, 2009), environmental problems and deficiencies related of education system can be mentioned that provided no specific time and place for educational-consulting activities. It is also recommended that similar studies be conducted on larger groups, and a comparison between boys and different ages also be performed to generalize results to the whole community. Considering the great share of empathy in happiness according to results of this study, it is necessary to investigate this issue in different sex, age, and other personal and social differences. In addition, it has a greater effect in trainings. And even its role in other components of positive psychology such as mental health, self-esteem, etc. should be considered Given the importance of happiness on health of individuals and society and its effects on different individual and social functions, in research projects, rejuvenating process of academic texts should be investigated for different educational levels.

## THE INVESTIGATION OF HUMAN RESOURCES MEASURES WITH HIGH PERFORMANCE ON CREATIVE BEHAVIOR IN SERVING WITH MEDIATING ROLE OF ORGANIZATIONAL COMMITMENT (CASE STUDY: DANA INSURANCE OF TEHRAN CITY)

<sup>a</sup>ALI ALIKHANI, <sup>b</sup>FATEMEH KARAMI SARJOOYEE

<sup>a</sup> Assistant Professor, Faculty of Management and Social Sciences, Islamic Azad University North Tehran Branch, Tehran, Iran

<sup>b</sup> MA of Business Management, Faculty of Management and Social Sciences, Islamic Azad University North Tehran Branch, Tehran, Iran

Email: <sup>a</sup> dralikhani52@gmail.com

<sup>b</sup> hastiikaramii@gmail.com

**Abstract.** The main goal of this study was to investigate the relationship between human resource measures with high performance on creative behavior in serving based on marketing management. The study population includes all Dana insurance managers in Tehran. After collecting data and information, a questionnaire was prepared and then using descriptive statistics, the status of obtained data was described and Cronbach's alpha was used to the reliability and to answer five research hypotheses, parametric inference statistical methods. In the meantime, with the help of confirmatory factor analysis, structural equation modeling, using partial least square, and Lisrel software the data analyzed. The results show that human resource measures with high-performance and organizational commitment, innovative behavior has an impact on service delivery.

**Keywords** human resource practices (measures) with high-performance, organizational commitment, innovative (creative) behavior in service

### 1. Introduction

In today's world, communication, exchange of goods, information and technology has increasingly expanded and progressed. Today the innovative services behavior in current technological space is required for the organization and plays an important role and most organizations are looking to create new ideas in order to use knowledge to offer new products and innovative and services for customers and in this way create the infrastructure necessary for business practice, innovation and learning. Increased importance of innovation caused by globalization of markets and competitive pressure to companies to be always looking for innovation. These facts will stimulate companies as a requirement, increase their focus on innovation. The importance of the enterprise and organizations development hasn't been away from governments' attention. State officials more and more provide areas for innovation activities in these businesses because they form a large percentage of the economy and have an important role to play in promoting innovation. For this purpose, in this chapter an overview of the research has been described. To achieve this goal, after the statement of the problem and the importance of research, objectives, questions, and hypotheses are expressed. Then the theoretical framework, conceptual and analytical models, conceptual and operational definition of variables will be examined respectively.

### 2. Literature

Creative behavior in service, as behavior that brings change, is associated with a change in career. This kind of behavior are expression and creation of new things or different and is defined by virtue of orientation for the change, because these behaviors are associated by creating new products, services, idea, procedures and processes.

The creative (innovative) behavior in service (serving) includes exploring opportunities and generate new ideas, but can also include behaviors to apply change, applying new knowledge or improvements of processes to enhance personal performance or job. Innovation in processes or new products is a useful behavior which is developed and applied in human resources so that solve organization's problems and improve its situation. The share of human resources in the development of organizational innovations refers to innovative business practices which include all activities related to the development of innovation.

Conceptually, this structure is based on psychology research of organizational services of innovative behavior. Studies show innovative business practices is influenced by individual and situational factors such as perception from influence or superior support (Leonard, 2010).

Now, at the beginning of the third millennium, the world is entering (experiencing) a new era. Today's world is the world of rapid and extensive developments in all aspects. The emergence of developments in the global trade also is no exception. Each of the actors of international situation is seeking improvement and establishment of their capacity and status in the international trade. So, the necessity of survival in today's competitive economy and changing environment is smarter, harder and faster performance than in the past. In the field of human resources we find that innovative organizations encourage actively the training and development of its members as they can be updated. They provide job security for their employees in an excellent level to reduce the fear of deportation because of a mistake and make people assertive to be changeable. When a new thinking evolves, vanguards of change actively and with enthusiasm give ascendancy to thought and support it and will overcome the problems and ensure that the innovation will be implemented.

In spite of the trained younger generation and expansion of higher education, due to lack of coordination between macroeconomic policies with policies on research and innovation and the vacuum of demand-driven innovation, this important hasn't been realized. Therefore, it is necessary to adopt appropriate macroeconomic policies in order to create development of innovative activities demand and creation of change and profitability (Rezai, 2014).

Today, the major industrial and advanced countries of world, in the light of creative behavior in different fields to serve not only to properly and optimally benefit from its resources and capital, but also using it move technical and production wheels for the development of the country and in this movement achieve innovations and creativeness that contributes accelerating the growth and development of the country.

In this regard, the conducted studies include a wide array of variables.

Taleghani et al., (2012), studied the relationship between knowledge management and organizational innovation in an insurance company. A total of 180 experts in insurance studied companies, 86 people were selected using simple randomly as sample. Information on knowledge management variable based on a "Whig" model which has also been by "Newman" and "Sedra and Gable" and information related the variable of organizational innovation was obtained based on "Moghimi" and "" and "Shah Hosseini and Kavooosi" model. Spearman's rank correlation coefficient results showed that the indicators of knowledge creation, knowledge preservation, knowledge transfer and application of knowledge have significant relationship with organizational innovation. The highest correlation coefficient for the prediction of organizational innovation was related to application of knowledge variable by a 0.878 coefficient and the lowest correlation coefficient was related to variable of knowledge preservation by 0.656 coefficient. To achieve organizational innovation, administrators need to integrate knowledge capital in different sectors and having knowledge of internal and external forces. On the other hand, knowledge should be distributed throughout the organization, because a better distribution of knowledge will increase the probability of organizational innovation.

Moaffagh (2014) stated that the employees' innovation or creativity is considered as major outcomes in adapting of

organizations to the environmental conditions and the use of opportunities. Despite the importance of this variable in identifying this structure in the organizational context and its assessment, few researches have been done to date. The results of this study can be effective for researchers and employers to optimized understanding of the nature of organizational innovation and evaluation of these structures.

Luthans (2008) in a research argues that knowledge acquisition and integration of existing knowledge with new knowledge lead to innovation in products. One of the ways to promote continuous innovation, is the ability of companies in reshaping organizational knowledge and of other roles of knowledge management in the innovation process, facilitating cooperation between the duty borders of organization, helping to build capacity, capability and reduced complexity in the innovation process can be referred.

### 3 Conceptual model of research

Figure 1: Derived from the research model (Dhar, 2015)

After break down factors influencing dependent and independent variables using questionnaires and adapt it to the conditions of present society, we examined the relationship between creative behavior in serving (service), organizational commitment and human resource practices (measures) with high performance. Independent variable is human resource practices (measures) with high-performance and the mediator variable is organizational commitment, which its effect on the dependent variable –creative behavior in serving (service) is measured.

### 4. Methods

The following hypothesis are considered for this research:

- Human resources practices (measures) with high-performance have a significant impact on organizational commitment.
- Organizational commitment has a significant impact on innovative behavior in service delivery.
- Human resources practices (measures) with high-performance have a significant impact on creative behavior in service delivery.

Regarding this research is to develop practical knowledge, in terms of purpose is an applied and in terms of data collection is a descriptive one. Also, because this study aimed to investigate

Shelley (2009) in a study entitled transformational (evolutionary) leadership, organizational creativity and innovation states transformational (evolutionary) leadership has significant impacts on creativity at the individual organizational level. At the individual level, hierarchical linear modeling results show a positive relationship between transformational (evolutionary) leadership and employees' creativity. In addition, transformational (evolutionary) leadership through psychological empowerment affects on employees' creativity. At the organizational level, regression analysis results show that transformational (evolutionary) leadership has a positive relationship with organizational innovation which is measured by market-oriented criteria (which specifically has been designed for developing countries and growing industries).

and identify factors influencing innovative behavior in service delivery, is a correlational one, and considering this study concerns the distribution of statistical characteristics of the population is a survey. Additionally, because the data are collected from a population at defined point of time also this is a cross-sectional study.

### 5. Results

In this study, to calculate the reliability Cronbach's alpha coefficient method was used. In this method, firstly the scores variance of each item of questionnaire and the total variance are calculated and then alpha coefficient is calculated using the following formula:

$$\alpha = \frac{n}{n-1} \left(1 - \frac{\sum si^2}{s^2}\right) \quad (1)$$

n= the number of questions Cronbach's,  $\alpha$  =Alpha coefficient, si = item standard deviation, s = standard deviation of total questionnaire

In this study, to calculate Cronbach's alpha coefficient SPSS 20 software was used. For this, Cronbach's alpha was obtained that its rate is more than 0.7 and is at an acceptable level indicating the research questionnaire has an enough reliability and the results can be trusted so that if a questionnaire is used to maintain the results achieved again.

Table 1: Results of descriptive statistics

Percentage	Frequency		
60.0	54	Female	Sex
40.0	36	Male	
6.3	6	Less than 30 years	Age
35.8	32	Between 30 and 40	
56.3	51	Between 40 and 50	
1.8	2	More than 50	
100.0	90	<b>Total</b>	
15.0	14	Diploma	Education
9.5	9	Associate	
53.5	48	Bachelor	

17.8	16	Master	<b>Marriage status</b>
4.3	4	PhD	
100.0	90	Total	
47.0	42	Married	
53.0	48	Single (unmarried)	
100.0	90	Total	

## 6. Testing of hypotheses

### 6.1 Descriptive study of research variables

The description of variables is important because the results of hypotheses are extracted based on data and indicators of these variables. The data are spatial scales. To describe the variables central and dispersion indicators were used that continues to be discussed.

The description of variables: In this study, 90 subjects were selected as sample and data has been gathered by questionnaire. Given the choice of 5-point Likert scale for questions constituent of questionnaire, the values of responders should be examined to be cleared the mean of their responses are less than 3 showing that the studied population in that index has been evaluated in an unfavorable situation. Because the mean value of responses have been more than 3. The statistical indices (indicators) of variables are shown in table 4-2.

Table 2: Measures of central tendency and dispersion variables

kurtosis	Skewness	SD	Median	Mean	sample size	Variable
-0.651	-0.217	1.0622	3	3.089	90	<b>Human resource practices with high-performance</b>
-0.665	-0.121	1.0252	3.2	3.3	90	<b>Organizational Commitment</b>
-0.412	-0.506	0.8267	3.8	3.7	90	<b>creative behavior in service delivery</b>

### 6.2 Inferential analysis of findings

To examine the normalization of factors of the model KS test was used and in all tests, statistical hypothesis is as follows.

H0: data are normal (data come from a normal population)

H1: data aren't normal (the data are not from a normal population)

Table 3: Kolmogorov-Smirnov test results

Normality result	Sig	statistic z	Variables
Normal	0.16	0.12	Human resource practices with high-performance
Normal	0.13	0.14	Organizational Commitment
Normal	0.17	0.10	creative behavior in service delivery

### 6.3 The convergent validity, mix reliability and goodness of fit index

A kind of relations of hidden variables in the structural equation model is based on correlation (harmony). The correlation is the relationship between two variables in a model, but non-directional and nature of this relationship is assessed by correlation analysis. Table 4.5 shows the Pearson correlation coefficients for the relationship between hidden variables for two by two. On the main diagonal of this matrix is 1 number showing each variable has a complete correlation of with itself. All coefficients are significant at the 95% confidence level (the value of significance level is less than 5%). Whatever the value

of the correlation coefficient is more, the relationship between two variables is greater and more powerful. Table 4-5 in addition to correlation coefficients concerns divergent validity. The square root of the mean of explained variance from all correlation coefficients of other variables is the necessity of divergent validity approval. For example, the square root of the mean of explained variance for human resources with high-performance variable is 92.3% which is more than the correlation of this variable with other variables. As the table shows the square root of the mean explained variance, for all the variables, is more than correlation of that variable with other variables.

Table 4: Indicators of reliability, validity and model goodness of fit

AVE	$\sqrt{AVE}$	(3)	(2)	(1)	Hidden variables
0.923	0.852			1	Human resource practices with high-performance
0.926	0.858		1	0.521	Organizational Commitment
0.932	0.868	1	0.269	0.439	creative behavior in service delivery

A kind of relations of hidden variables in the structural equation model is based on correlation (harmony). The correlation is the relationship between two variables in a model, but non-directional and nature of this relationship is assessed by correlation analysis. Table 5-4 shows the Pearson correlation coefficients for the relationship between hidden variables two by two. On the main diagonal of this matrix is 1 number showing each variable has a complete correlation of with itself. All coefficients are significant at the 95% confidence level (the

value of significance level is less than 5%). Whatever the value of the correlation coefficient is more, the relationship between two variables is greater and more powerful. Table 4-5 in addition to correlation coefficients concerns divergent validity. The square root of the mean of explained variance from all correlation coefficients of other variables is the necessity of divergent validity approval. For example, the square root of the mean of explained variance for human resources with high-performance variable is 92.3% which is more than the

correlation of this variable with other variables. As the table shows the square root of the mean explained variance, for all the

variables, is more than correlation of that variable with other variables.

Table 5: Goodness of fit indicators of model

Allowed Limit	Estimated	Index name
Less than 3	1.018	Chi-square on the degrees of freedom
More than 0.8	0.88	Goodness of fit index (GFI)
More than 0.8	0.84	Adjusted Goodness of Fit index (AGFI)
Less than 0.1	0.014	The Root Mean Square Error of Approximation (RMSEA)
More than 0.9	1	Comparative fit index (CFI)
More than 0.9	0.96	Normalized fitness index (NFI)
More than 0.9	0.99	Non-normalized fitness index (NNFI)
More than 0.9	1	Increased fitness index (IFI)

## 7. Conclusion

Table 6: Path coefficient, t-statistics and hypotheses result

Impact path	Hypothesis status	R <sup>2</sup>	T	Beta	hypotheses
+	confirmed	0.31	5.06	0.56	Human resource practices with high-performance ← <b>Organizational commitment</b>
+	confirmed	0.58	3.94	0.51	Human resource practices with high-performance ← <b>creative behavior</b>
+	confirmed		5.26	0.63	<b>Organizational commitment</b> ← <b>creative behavior in service delivery</b>

$|t| > 1.96$  Significant at  $P < 0.05$ ,  $|t| > 2.58$  Significant at  $P < 0.01$

The obtained results of the structural equation with respect to the amount of t-statistic is outside the critical interval (t value is greater than 1.96) and beta coefficient is a positive value, so with 0.95 probability the researcher claims that a human resource practices with high-performance has significant and positive effect on organizational commitment is confirmed. About hypothesis 2, the obtained results of structural equation show that given this amount of t-statistic is outside the critical interval (t value is greater than 1.96) and beta coefficient is a positive value, so with the probability of 0.95 researcher's claim that " human resource practices with high-performance has significant and positive effect on innovative (creative) behavior is confirmed and about hypothesis 3, the obtained results of the structural equation with respect to the amount of t-statistic is outside the critical interval (t value is greater than 1.96) and beta coefficient is a positive value, so with 0.95 probability the researcher claims that a human resource practices with high-performance has significant and positive effect on creative (innovative) behavior in service delivery is confirmed.

### 7.1 The researcher's proposals to studied organization

Considering the results of this study, to improve the effectiveness of human resources practices (measures) with high performance on creative (innovative) behavior in service delivery with mediating role of organizational commitment, seven suggestions can be noted as follows:

- 1) The use of reward and punishment system for employees who are provided feedback for their positive and negative works leading to their commitment to the organization.
- 2) The use of experts, in order to attract manpower suitable with position
- 3) Use of different marketing proper wit structure of each country, such as electronic, viral, integrative marketing in order to make creativity in service delivery to customers.
- 4) Providing gift to customers after sales thus customer always remembers who has given this gift to her/his and her/his friends and acquaintances will see the name and number and communication address and it is a kind of innovation and creativity.
- 5) Commitment and full obligation about assumed responsibilities of organization for customers to attract trust in the customers. The customer brings customer.
- 6) Using human resources management the organization hierarchy to be respected properly in order to the individuals do their responsibilities according to their

abilities and eventually everyone will be able to offer innovative behavior in his/her own place.

<sup>b</sup>roohola\_kheirandish@yahoo.com

Abstract. Criminal justice always trying responds to crime via one-sided approach. Today the approach due to legal reasons, criminological, and management are faced with fundamental changes. Agreement of prosecution is the main changes that the will of the parties to criminal case recognized. Delayed prosecution of a criminal case that, for the first time in the code of criminal procedure act of 2013 was anticipated, among the methods of this strategy in the pre-proceedings that the judicial authority after an agreement whereby the accused and the victim, special conditions can be qualified as criminal prosecution for a certain time delayed. In this paper, after defining the concept of criminal prosecution agreed to approach the legislator in the Code of Criminal Procedure concerning the postponement pursue.

Key words: deferred prosecution, agreement, offenders, judicial officials

### 1. Introduction

Gradually, under the influence of multiple developments in the field of criminal policy and especially because of the ineffectiveness of traditional criminal justice model in reducing the rate of delinquency new forms of criminal justice model have emerged. Restorative agreement and justice are the most obvious examples of this which in the light of the criminal justice system, out of the matter/command and soon had regressed and to accept flexibility in the field of criminal justice has gone. This attitude by accepting "criminal tolerance" to point out that crime is a social human phenomenon and thus should be considered when answering this feature. Paving the way for intervention offender and victim as the key actor in the process of criminal justice decision-making process is the most significant of these aspects in light of this determination and opinion of offender and the victim in different decision-making of the criminal justice recognized.

One of the most obvious innovation in the Code of Criminal Procedure Act of 2013 is privatization deal or prosecution of criminal case and the withdrawal repressive aspects of criminal networks is made to delinquent dynamic role in the criminal process. In other words, the aim of this strategy is the decision-making process of devolution of power to the offender, which can be approached most prominent symbol of civil rights and criminal law. Thus, criminal law, civil rights by copying the teachings of toys criminal and judicial authorities in the process of equalization will pursue criminal case has provided. Sometimes referred to withdrawal strategy to pursue criminal case and reduce the type and amount of charges and answer leads; so that the judicial authorities based on legal options to determine the fate of the offender's criminal case shall persist. Therefore, the strategy of how to implement justice in the particular circumstances of the offense and offenders transferred to the judicial authorities. The strategy is a way of pursuing criminal case postponed and the judicial authorities may be expedient in the light of the survey, once eligible and agreed with the offender and victim satisfaction adopt. This method makes the process stalled criminal court stage and offenders will be relieved of punishment. Iran had no history of such practices in the context of criminal policy and for the first time in the Code of Criminal Procedure Act of 2013 is anticipated.

In this section, before the institutional review deferred prosecution agreement as a manifestation of the strategy of pursuing criminal case investigate the nature and principles of agreement adaptive approach. Hence the legal nature of the

strategy is clear and we will then examine the foundations of this strategy.

Agreement deferred prosecution in the criminal case is very similar to the contract, because it no judicial determination, the victim and offenders gives the approach agreement aspect. Hence, the question: what is the legal nature of the agreement between the parties? Agreement criminal case pursued is a strategy which in the light of judicial and pre-trial offenders, the access to proper ways to compromise/reconciliation talks with the criminal. Accordingly, the strategy legally and among the contracts is as "signing of peace".

So agreement or private prosecutions in criminal proceedings with regard to the rules governing the contracts discussed (Niazpour, 2011).

In fact, the terms of the agreement the prosecution of a criminal case is approach that in light of judicial authority and offenders about how to determine the fate of the criminal case decision if offenders and indifference to its commitments, the strategy of the (judicial) cannot be peace as contract required him to perform his obligation; but just could again pursue the criminal case and the execution of penal sanction resume twice. Thus, the above-mentioned strategy has contractual nature, in the legal sense, not only because of reconciliation between parties to criminal (judicial, victims and offenders) is somewhat similar to marriage peace. Therefore, the agreement pursuit of strategic compromise circuit that causes withdrawal traditional methods provide a response to criminal behavior and a new approach, namely through the recognition of the will of offenders criminal justice and victim in deciding how to respond to the penal offense attention (Ibid., P. 25). For example, in a manner delayed criminal case to ignore the commitment by the criminal prosecution of the withdrawal method and planned implementation of the first call. According to Article 82 of the Criminal Procedure Code "... In this case, the judicial authorities charged with observing the provisions of Article (81) of this Act subject is required to run some commands. In case of non-implementation of commitments agreed by the accused without reasonable excuse at the request of the plaintiff or the defendant, the suspension canceled and continues the chase (Khaleghi, 2014, p. 82).

### 2 Foundations of prosecution agreement

Prosecution agreement or privatization strategy is not based on a different concept for thinking. The overall concept arose from philosophical thoughts, legal and social. Each of the intellectual foundations of the strategy, in forming an opinion of the legal systems of punishment and criminal prosecution are essential. The identification and explanation of these principles, the adoption of this approach will facilitate and followed by the main function of privatization pursued and fulfilled.

#### 2.1 Rehabilitation and Reform offenders

The consensus strategy of pursuing criminal case, see "Clinical and Therapeutic prosecutions" in which prosecutors accused thoughtful character dossiers and the ability to socialization and considering the interests of society. It trying corrects the condition and treatment of accused and also provides his return to society (Jafari & Norpour, 2015). Reforming offenders from the criminal justice system is the most fundamental goals and the criminal always returns policy makers to raise new criminal justice strategies and methods of reform - health.

In this way, the criminal policy decision-makers with a change in the nature and mission of the criminal process and seek to strengthen the sanctions regime corrective function - therapy criminal justice system have emerged (Bolek, 2005). Filing a

character in the criminal process, accepting the principle of individual responses, including mechanisms are functional changes and the clinical nature of the criminal justice system are taken into consideration (NajafiTavana, 2009).

Agreement of the prosecution, with the recognition of the will of the offender and his place in the criminal process seeks to promote the efficient functioning of the criminal justice system in the context rehabilitation of criminals. The strategy focuses on the participation of offenders in the criminal justice decision-making process. On the one hand a number of perpetrators of the criminal process to be taken quickly and on the other hand, the presence in the realm of criminal justice at least be subject to the answer that they pretty much keep harmful consequences once sanctions depriving freedom. The view out the negative effects of criminal prosecution for such labeling proposed the criminal military response against criminal behavior must be based on a policy shift. Should make every effort possible to spend specific segments of the offender in the criminal proceedings be conducted in different ways official channels.

The road they have contact with most of the formal elements of the system to round picks and in this way, reduce the likelihood of their infamous (Javan & Norpour, 2012)

## 2.2 Abbreviations of the criminal proceedings

Criminal justice institutions through proper investigation into criminal cases without unnecessary delay play an important role in preventing the escalation of crime and victimization and repeat. In addition, one of the important conditions for the enjoyment of the right to a fair trial, investigate the claims, sentencing and execution "as soon as possible". Hence, investigation of criminal cases not only clarify without delay the situation of the offender and the victim in reasonable time provides, but according to the usual criminal justice system, the field of health reform measures for offenders and also applying appropriate measures to protect the victims will be provided. If such actions are carried out properly and at the right time, it will play an important role in reducing the likelihood of repeated offenders and crime victims (Ahmadi, 2010). Such as the deferral of the prosecution that led to the temporary closure of the case are obvious examples are the abbreviation of criminal justice. It is obvious that such a solution in addition to accelerating the maturity, the goals of others such as corrections and crime charged is missing labels; during the deferral of prosecution as the accused controls the behavior and their actions as much as possible and try not to commit crimes. By achieving these objectives, efficiency and effectiveness of criminal justice are guaranteed. It is also one of the features brief orientations. Social reaction criminology thoughts and abbreviations regard to the application of the criminal justice system has not been immune to being productive. (Shamloo & Abdullahi, 2015) So privatization strategy of pursuing a criminal case, the most obvious solution is the quick response to crime by targeting accelerates criminal proceedings seeks to increase the efficiency of the criminal justice system in this area, which is immediately visible in the light of future criminal proceedings.

## 2.3 Identity of the offender

The identity of the offender is one of the fundamental principles of criminal pursuit consensus-oriented strategy. Code of Criminal Procedure and the general criminal law principle is an approach has been trying to respond to offenders. This approach was considered in the light of social norms delinquency phenomenon and hence criminals because ignoring these norms and harm to victims and the community deserve tolerance are allowed. According to this approach, the government through the criminal justice system and presumably to protect the values protected by the criminal answers. This approach has the unilateral aspect of the criminal justice system and criminal justice practitioners enables after taking offense to punish the guilty; for offenders in the criminal process and particularly dynamic role in the sentencing phase of reprisals (Najafi, 2009). The privatization approach pursued criminal case, as a new

strategy for withdrawal vertical approach to criminal justice, enter ranges in terms of criminal justice legislation has thereby become the imperative of having a break and fields of intervention and offenders in the criminal justice decision-making process will be provided. The strategy, to provide appropriate opportunities for alleged involvement in the process of determining sanctions unlike vertical approach as to his identity and has granted more active role than in the past. Thus, the defendants in at least some of the possible mechanisms of approach regarding the determination of criminal prosecution are actions. They agree that such a strategy in a number of instances of such conditions is essential selection and implementation of the strategy (Niazpour, 2011).

## 2.4 Reducing criminal enforcement costs and prolongation of proceedings

Save time and costs imposed on the judiciary, one of the fundamentals justifies privatization and compromise the criminal case is pursued. Official privatization strategy by diverting criminal proceedings, reduce the congestion of cases at different levels of the criminal justice system resulting in significant savings in time and costs of the judiciary. To conduct a full investigation, time, location and a large force is necessary. The complexities of the justice system sometimes causes serious problems are encountered (Mousavi, 2008). On the other hand, prolongation of procedure may lapse crime and it unpunished, leave, or whether to delay the execution of punishment enough that benefit destroy it, if treatise on crime and punishment, notes, "The rapid punishment and immediately run chase crime would be fairer and more useful. Would be more fair to blame because of the terrible punishments in vain doubt and imagination and a sense of his own weakness and uncertainty that intensified it, will be removed. Would be fairer because their criminal deprivation of liberty if necessary not appropriate, not right before sentence is imposed (Beccaria, translation: Mohammad Ali Ardabili, 2015). But the punishment after a long time, Asexual is a juvenile. The society also obliterated the memory of such punishment, benefit from no criminal purposes "As soon as the eruption occurs, spicy forget" (Norbaha, 2007). Thus, given that the privatization strategy criminal proceedings outside of the mainstream and responding to crime with the participation of the victim, criminal and judicial authorities will do, while reducing costs to the criminal justice system are dealt with quickly and without prolongation of the proceedings.

## B) Iran's criminal policy approach in field of criminal case deferred prosecution

Deferred prosecution agreement is the criminal case prosecution and one of the most important effects and then prosecutor whereby and after obtaining special conditions may prosecute criminal case to be suspended for a certain time. The method for this prosecution is the latest example of an agreement and selection and its implementation depends on obtaining a series of conditions, including agreement between official and the victim's and victim's consent. There was not implemented as agreed between the three actors to lead the way.

### 1. Deferred prosecution

Deferred prosecution including methods by which the prosecuting criminal case is delayed for a while. The legislator has not provided a definition of the institution. According to relevant laws in defining the institution can be said: Deferred prosecution agreement with the judicial institution whereby the accused and the victim or private claims, to compensate for damages to the injured party, criminal prosecution's case for a certain time delay. As mentioned in the definition of the institution of the institution to defer prosecution of the victim, criminal and judicial officials privately and outside the formal process of acting on hold to chase them (Khaleghi, 2014).

## 2. History of the deferred prosecution

The deferral of prosecution in the criminal justice system of our country was not identified as explicit. But actually puts our country in the penal system of some petty crimes that aspect of their private and their general aspect is more important than came into force and a number of judges by giving notice to the accused to satisfy the complainant or the victim in the criminal case prosecution to delay action. Tehran Penal Court Branch 230, for example, in the case Classifieds 81/1635/230 charged with breach of trust with the request to postpone the pursuit of criminal case the complainant has agreed to take over. Following this decision have committed to draw the complainant's consent. According to the court verdict passed on the fate of No. 984 due to the effect of such crimes decided (Niazpour, 2011) so although unofficially criminal courts of this institution used but this method has postponed the adoption of the Code of Criminal Procedure adopted in 2013 had not been incorporated into our penal system. There is an opportunity as a chance to prove goodwill that was somewhat similar to the deferral of prosecution. According to Article 6 of the law "In all the cases mentioned in the above case exporter check suspend the prosecution prove its goodwill.

## 3. Terms of issuance of the deferred prosecution

According to Article 82 of the Code of Criminal Procedure for the issue of postponement of prosecution there are some essential conditions and some of these conditions are related to crime and other related parties which are described below to check it.

### 3.1 Sentenced for crime

According to Article 82 of postponement of the issuance of mandatory criminal prosecution only in grade six, seven and eight are possible. So postponed prosecution in offenses with punishment, too, retribution (life and limb) and Diego as well as crime is not possible prison sentence of one to five. The territory is limited deferral of prosecution as below. First, it shows the beginning of Article 82 issue of postponement is not possible and judicial authorities are obliged to prosecute offenders. (Haji Tabar Firouzjaee, 2016)

Second only crime was sentenced grade six, seven and eight of postponement of prosecution. Sentenced for crimes committed crimes which require punishment and the sentence handed accordance with article 18 of the Penal Code which is punishable by as much subject to retaliation, law in cases of unlawful acts or violation of government regulations determine and apply. Penal Code and sentenced to eight degrees is divided among the eight grade, deferred prosecution only on the sentence handed grade six, seven and eight are possible.

### 3.2 Suspended of crime

In addition to crimes that must be punished crime, the legislator has written in this regard is another condition and it is that crime is suspended. In other words, crime is one of the crimes sentenced the possible imposition of a penalty of suspension of execution for it. The legislator of bringing indicating "suspended the crime" that some crimes sentence in Article 47 of the Penal Code has been entered withdraw from the territory of postponement of prosecution not that there are all conditions for the issue of postponement of prosecution suspension is necessary (Aghae Janet Makan, 2014). So the issue of postponement in prison for crimes even if they grade six to eight is possible:

A) Crime against internal and external security of the country, sabotage of water, electricity, gas, oil and telecommunications;

B) Organized crime, armed robbery or robbery to assault, kidnapping and acid;

C) Power and interfere with a knife or any other weapon, crimes against public morals, or the formation of centers of corruption and prostitution;

D) Trafficking of narcotics or psychotropic substances, alcohol and weapons and human trafficking;

E) Punishment instead of death, intentional murder and waging war against God and corruption on earth;

C) Economic crimes, the crime issue more than one hundred million (1000000000) riyals.

However, Article 82 issue of postponement of prosecution for all crimes was sentenced absolute degree is six to eight are possible but in addition to crimes that have been exceptions in Article 47 of the Penal Code Clause 2, Article 115 of the Act for the issuance of postponement should also bear in mind. According to the judicial authority cannot comment on authoritative legal sanctions of suspension issue. So the issue of postponement of prosecution of crimes with a degree of discretionary non-authoritative six to eight degree is possible.

### 3.3 Agreement judicial authority and the parties

One important feature of the deferred prosecution agreement is this institution. According to Article 82 of the Code of Criminal Procedure on deferred prosecution deal is subject to the will. It was therefore agreed to issue a "judicial authority". "The defendant" and "victim" condition and if one of these three actors is opposed by issuing criminal case will not be such an issue. This tripartite agreement shows that the issuance of a task is not for the prosecution and the prosecution may result even if consensual, the issuance of the refusal and the parties also has the right to challenge his decision. On the other hand if the judicial authority and the victim or his deputy are willing to issue such villages but the victim does not want to do is to file a criminal complaint they cannot do any of the victims were forced to accept the offer (Niazpour, 2011). In general issue of postponement of prosecution of the accused is subject to question and as long as he did not make such a judicial authority does not have the right to issue such an appointment. Criminal case has been postpones restorative nature and the grounds for compensation and the needs of the victim. It seems that when the case will issue in addition to being sentenced for crimes that crimes should be suspended from grade six, seven and eight are eligible for crimes and it is there that the victim or private claims otherwise there will be no possibility of issuing. In other words, if the crime of victimless crimes of postponement is not subject chase because in this type of crime (such as the veil, driving without a license, etc.), the victim has suffered direct damage. The purpose of the crimes is victimless crimes, which caused no damage caused to individuals cannot be fixed (Rahami, 2010)

### 3.4 Obtaining appropriate supply

If all conditions are met the injured official to serve the interests of the mass is required before the issue of postponement of providing appropriate prosecution of the accused under Article 217 of the Criminal Procedure Code obtain. Providing tailored to suit the type and importance of the offense, the severity of the punishment, the accused is likely to flee or hide, accused history, mental and physical condition and determined (Javanmard, 2014) however, cast financing should be such that it does not accused of supplying ability and thus be arrested because providing such supply will be borrowed by the judiciary violations.

### 4 Term of deferred prosecution and its consequences

If all conditions had delayed issuing a judicial authority must consider the circumstances of the parties to the case appropriate time to determine compensation or satisfaction of the complainant. Deadline should be fit on the one hand have the accused at the time the compensation and on the other hand

accused of abuse and further losses are not the victim. According to Article 82 of the Criminal Procedure Code following the issue of postponement of prosecution by judicial authorities on the accused the maximum two month deadline is the complainant went to school or compensation of crime act (Khaleghi, 2016) If the deadline fails to compensate damages or satisfaction to draw victim where appropriate, judicial authorities only once, can apply for the extension. Judicial authorities according to the circumstances of the case could be extended to two months of postponement of the chase. To renew two of postponement should be noted. First, as the primary issue, the judicial authorities have no obligation to extend and second, although the deadline for victim satisfaction or dissatisfaction of the legislation is silent but judicial authorities shall also draw the victim's consent to an extension. In other words, as may have been issued without the consent of the victim is absent; there is also the possibility of extension. The question that arises here is: that if the defendant during the victim not delay any action for compensation are the deadline postponed orders can be canceled?

In response to this question can be said on the basis of the compensation of crime and when nothing is done by the defendant in this case can be terminated orders. On the other hand it can be argued that the delay with the agreement of the parties and judicial officials and legislators to not allow any of them terminate issued without the consent of the other. Upon completion of the above-mentioned deadlines if the plaintiff's consent or damages to compensate the victim draw and the criminalization of offenses passed (in accordance with Clause 1 of Article 100 of the Penal Code offenses are crimes that started after the arguments of prosecution and trial and the penalty is subject to the plaintiffs and the lack passed him (Asrafilian, 2002) is a judicial authority in accordance with paragraph B of Article 13 of the Criminal Procedure Act to issue the cessation of prosecution and ordered the release of the accused as well as providing derived from exports. If unforgiving crime of crimes (in accordance with Clause 2, Article 100 of the Penal Code unforgiving crimes are crimes and the plaintiffs and passed him at the start of prosecution and trial and continue to implement punishment has no effect) in this case, if the plaintiff shall be passed or be compensated for his loss or agreed to be paid on and criminal convictions is accused of lacking judicial authority may, after obtaining the consent of the accused, according to article 82 of the Code of Criminal Procedure suspend his pursuit of six months to two years. But if they fail to implement deferred prosecution case will run its normal course.

### 5 Criminological assessment of the deferred prosecution

Deferred prosecution is the prosecution theory of restorative justice and the principle of proportionality and the imitation of Legislative France's penal system of our country. Prior to the adoption of this institution, the length of the criminal process allowed offenders before completing the process, the consent of the victim draw and thus benefit from legal discounts, but with the arrival of the penal system took it official that its effective implementation is undoubtedly a benefit for litigants and society. On the one hand losses into private claims paid him less time will be needed to achieve their rights during all stages of the criminal process (Sabouhi, 2015). On the other hand gives the defendant the opportunity to satisfy the victim and taking over the case, he shall cease or suspend prosecution or punishment use. The criminal justice system also can be closed off such cases the initial stage of creating additional costs and the accumulation of criminal cases avoid the time and have more power to handle high-profile cases. However, adoption of this institution is very blessed and admirable but how to accept criticism has noticed legislator. The first criticism that can be raised about the delay in prosecution related to the scope and range of the institution. Territorial Legislature limited the issuance of the crime were sentenced to six degrees, it has seven and eight, such an issue should be mandatory on most crimes, including offenses passed and unforgiving predicted. The vast

territory in accordance with the principles of restorative justice has been delayed prosecution and the rights of the injured party of the crime and the rights of society does not contradict any because one of the conditions for issuing the consent of the victim and judicial authorities as the representative of society and prosecution whenever he felt the issuance of this will be to the benefit of society refused to issue it. Legislator on the one hand prosecutes certain crimes (such as a crime under the penal code 699) regarding this crime is considered possible. This kind of blatant contradiction with the principles and objectives of the institution's limitations and cannot have any justification (Niazpour, 2011).

The issuance of crimes punishable by the legislature in retaliation and Diego did not anticipate; while the forgivable given the right human and many of these crimes about which there is the possibility of postponement of issuance. Including some that can be issued in respect of such and is based on article 255 of the Penal Code was enacted in 2013 and when will the expanded complained, enforceable and run it on demand. Thus, according to the law is pure and the issuance of no objection in this regard but in other cases such as adultery, sodomy, drinking alcohol and was basically right of Allah and do not have private complainant and often private prosecution is not in the issuing of such an problem. The crimes punishable by death and a member and past crimes punishable by Diego as well as the plaintiff's complaint in this regard have great importance. The legislator should not be limited to crimes sentence was delayed issuance of the territory; it would be possible to postpone the issue to be sued in all crimes that affected the effective mass and respects the rights of people it is a huge aspect of god predict according to which the entity is useful for victim and society better and optimal use of it.

### 6. Conclusion

Today, for various reasons the prosecution of offenders in the criminal procedure legal, criminological, management are pure asymmetric approach taken by the various changes to the Criminal flexible approach has been adopted. These developments have caused judicial and criminal policy of criminal prosecution for providing the core objectives of the Code of Criminal Procedure benefit of new strategies. Restorative Strategies compromise a deferred prosecution that is the most striking aspect of the Code of Criminal Procedure in prosecution horizontal is further. The privatization strategy or compromise the identity of the criminal prosecution of criminal case and offenders and victims together in order to determine the step response. Therefore, the agreement between official and offenders is the essence of this strategy and the same old nature / Traditional Criminal Procedure Code changed and it is grounds for pursuing or stops it in the pre-hearing and change the type and manner of response in criminal prosecution as well.

Privatization strategy and the agreement of the prosecution, as one of the strategies criminal regressive, traditional criminal justice where the basis for unilateral expression of the will of the judicial authority and respect for the expressions of it was provided by the offender, accredited with the will of the accused / offender has suffered a break. Namely, criminal justice strategy in the light of the just seek to impose unilateral punitive policy is not predetermined, but expedient approach to the critical and comprehensive assessment of all aspects related to the crime, the various stages of criminal proceedings, state actors criminal case and how to respond to the reality of crime and most appropriate way of your choice. In this way, the privatization of criminal prosecution strategy that the criminal process and against the will of the tripartite actors (ie the judicial authority, victim and offender) type and the nature of the criminal justice response to crime as a matter of criminal law has been introduced. The strategy for changing how we respond to crime, lead to changes in the nature / essence of criminal law provided as a result, the criminal justice system into a platform for dialogue and community representative, this time the (judicial) and criminal conversion is made. As criminal's

satisfaction to impose some answers as one of the most important criteria was introduced. Criminal case prosecution delayed the outcome of this new and significant shift in the territory of the Code of Criminal Procedure prosecution in criminal proceedings whereby the prosecution accused the terms of the agreement, especially between him and the victim of the judicial authority for a certain period stops. This method as an example of the strategy of suspending the prosecution of criminal case or it is subject to the Code of Criminal Procedure.

This means that those involved in the criminal justice this time instead focus on prosecuting the accused as soon as due to the fact that the public interest requires the prosecution of the accused is only in accordance with the teachings of the above-mentioned strategy to measure public interest and the consequences of its withdrawal shall deny prosecute the accused or the prosecution continued to be disproportionate to suspend. However, the deferred prosecution agreement, the criminal case prosecution strategy is one of the methods in the field of criminal policy of Iran, lacks the legislative history and the first Iranian legislator affected by the results of clinical criminology especially in the Code of Criminal Procedure Act of 2013 MFI has predicted, in the meantime, education, criminal justice practitioners optimal use of this method and culture among the public about the benefits mentioned methods play a significant role in the granting of the status of teaching and the effects of criminal prosecution, including deferred prosecution agreement, whether play role in the realm of legislation and what happens in the realm.

**Abstract:** The patent system is responsible for solving the technical and industrial problems through innovation. To determine the effect of the patent system on food security, the mechanisms and functioning of the patent system should be known in promoting innovation. By examining the elements of food security, we can examine the mechanism impact of patents on the basic elements of food security, particularly the availability, access and stability. Implementation of new processes and products, in particular, new varieties and improved farming are the key factor in increasing performance and improving agriculture and the food production. The patents by strengthening the knowledge-based economy and industrial growth caused by it could lead to the increasing per capita income and stability in accessing to adequate food.

**Key words:** patent, food security, agriculture, industry

### 1 Introduction

Lack of food security is considered the basic problems of each community. Fixing any of the problems of society by the government requires the approach and policies that define the legislative and operational framework. Determining these policies in the field of food security depends on the food security factors and indicators. It means the factors that will help to persons to distance from the vulnerability and the risk lack of food insecurity or factors that lead the ordinary people toward the vulnerability and the risk lack of food insecurity (Stamoulis & Zezza, 2003).

A patent is a tool that with the support of certain forms of innovation, in various industrial fields, in the form of granting exclusive monopoly business, seeks to achieve the economic goals and the progress of science and technology. The question is, achieving these economic and technology goals helps food security factors in what areas. Assuming the acceptance of the strengthening possibility of some food security factors, through the patent system, how does it realize and how the legislators of this country can use the patent system, to strengthen food security.

To answer these questions, we first need to identify the common elements of food security and the patent system and then evaluate the influence way among them. Study the concept and nature of food security shows that numerous factors affect directly or indirectly on food security that among them, agriculture and the economy have deeply relation with the patent system. Agricultural production, according to the nutritional needs of society plays a major role in food security and the patent system support the production of new varieties could provide the beginning of transformation necessary in this area. It can also strengthen the relation between industry and university and attract foreign investment, in the field of knowledge-based industries, and strengthen the knowledge-based economy.

#### 1.1 The concept and logic of patent system

A patent is a legal entity that was formed with the advent of Industry and Technology, and legal systems regulate it in order to support the development of new technologies. Patents, according to what has been detected in the contemporary period in legal systems is the statutory monopoly with respect to certain business practices, such as production, storage, distribution and sale of commodities, including patents in the case of patent

conditions for a limited period (World Intellectual Property Organization, 1997). If the invention was not about a certain product, and it has presented a new process to solve a technical problem, supporting it, include supporting for any product or product resulting from the process.

Accordingly, the results of each patent system should be a synergy encourage of science, wealth, and economic growth through two main strategies: 1. to reward investment in innovation by granting a monopoly; 2. early disclosure of initiatives information to accelerate the dissemination of science.

The patent will be taken into consideration with any basic, from the perspective of economists; it is an economic entity that interacts with other entities of economic system such as market with the right holder, the society and consumer. Each legal entity must be adjusted in such a way that could balance the interests of these factors in harmony with other institutions so that the least waste will be achieved. In particular, the resources are not available freely and in unlimited amounts. In economic analysis, the creator is evaluated as the producer and the community and consumer are classified of intellectual effect in the consumer class. Therefore, the benefit of an intellectual phenomenon depends on the amount of production and consumption. Due to this, people who think and have capital try to keep their attention focused to satisfy consumer demand and try to provide more consumer satisfaction and welfare. To clarify that with regulating any legal rule, whether resources are allocated to its most efficient use, the criteria of cost - benefit is used (Coleman, 1980). In this field, two fundamental questions about legal rules will be answered: What is the impact of legal rules on the behavior of economic factors? In addition, whether such impacts of legal rules are socially desirable (Kaplow & Shavell, 1999), and in fact, the legal economy analysis means applying the economic efficiency standards about the legal norms (Schafer & Ott, 2004).

The result of applying the above criteria to the patent system is that, since the creation of monopolies needs high cost, we should calculate the net social benefit surplus maximization of knowledge and information to the cost of producing them. Because of this insight, the following questions will emerge 1. Whether due to the monopoly, right amount of information and knowledge will be created at the appropriate time? 2. Whether the created knowledge and information can be used in the industry to provide the maximum social benefits for producers and consumers of goods and services? 3. Whether the ambient condition for creating new knowledge, is in such a way that it reduces its production of social costs to its minimum amount (David, 1993).

The patent institution from this perspective is a policy making institution that uses the efficient sole means for maximizing benefits and minimizing transaction costs. In any area such as food security, we must separately match the approach and above methodology to evaluate the effect and the effectiveness of the patent system. In the debate, namely food security, we must examine the rules to patent, on increasing agricultural production and accessing to them on the one hand and strengthening the knowledge-based economy and factors such as employment and income levels.

#### 1.2 The concept of food security

After an explanation and review the way of the patent system performance, it is the turn to the concept of food security and extracting its conceptual elements, so that to recognize the performance of the patent on each of these elements. The concept of food security, over the past five decades, has been changed according to the needs and complexities of the problem of hunger in the world and its differentiation with food shortages, poverty and hunger, is taken into consideration. As a result, these conceptual evolutions, the elements of food security,

and as a result, contributing factors to the lack of food security are studied in detail. Here, we investigate each of these two things, in legal literature, on food security.

**2 Elements of food security**

The concept of food security, in the 1950s, simply meant food availability in the economy and most of its discussions were about the National Food production. Green Revolution in the 1960s has improved the food security and in the 1970s, the concept of food security has entered the communities and international documents, and it was formalized (Babu & Gulati, 2005). Given the ambiguity of the concept of food security and its impact on policy, its debates about the definition has abundant prosperity, to the extent that some say, up to 200 definitions have been provided for it (Mukharjee, 2012; Willaarts, 2014).

Until the 1970s, the element of food shortages was more paid attention. World Food Conference, in 1974, with an emphasis on effective elements in food availability, defined the food security to "the availability of adequate supplies of food, at all times, in order to maintain and stable of food intake and eliminate fluctuations in production and prices (Clay, 2003).

In the second period of the evolution of the concept of food security, with emphasis on the balance between supply and demand, food availability was emphasized along with the availability of food. "In 1983, the World FAO also emphasized on the access to food and provided the definition, which aims to consider the balance between supply and demand in food security definition as: "to ensure that all people, at all times, have physical and economic access to staple needed foods.

In the third period, from these developments, the stability or sustainability of food security was considered. In addition to present the World Bank report on poverty and hunger 1986, it was emphasized on transient causes of food insecurity. In this report, the distinction between food insecurity, due to the structural problems of poverty and temporary food insecurity,

resulting from natural or economic crises, were emphasized. Before that, in 1981, some writers with famine theory on the impact of production, labor, trade and transfer of resources were focused on access to food. World Commission on Environment and Development (WCED), in 1987, stated that, to sustain food security, three areas related to food security, meaning the economy, justice and the environment should be considered by knowledge and experience, simultaneously.

According to a recent definition, food security exists when all people, at all times, have physical and economic access to sufficient safe and nutritious food to meet essential needs and food preferences for an active and healthy life. In fact, in the fourth period, with the emphasis on education and nutritional value, it was paid attention to the point that the lack of food security is not necessarily associated with hunger, but quality of food and the way to consume it had been considered and any abuse feeding, even if not accompanied by hunger, destroys food security.

Therefore, the forming elements of food security are including availability, access, stability and benefit. Now, to identify the patent mechanism influence way on these elements, the factors contributing to the strengthening or weakening of any of these elements will be taken into consideration.

**3 Factors affecting the food security**

The purpose of factors affecting the elements of food security is something that, though, may not have direct contact with the food, but for any reason, they affect on the production, distribution and consumption of food (figure 1). Naturally, each of the food security elements (availability, access, stability and utilization) is under the effect of external factors such as market conditions, globalization, macroeconomic approach, training and policies in the health field. It is clear that these factors are outside a simple process of the food supply and policy and decision-making about them cannot cope with an institution or ministry (agriculture) (Stamoulis & Zezza, 2003).

Figure 1: external factors affecting food security

According to the two-level approach, vulnerability and its management must be discussed (Chambers & Conway, 1992). Policymakers of the countries and relevant international institutions have tried to present more programs that are comprehensive, about the problem of food insecurity with respect both levels. FAO World in 2002 presented a plan to help the Food Security National Strategy for countries. The plan seeks to explain the member states focus on the issue of hunger, food security and agricultural and rural development to the multidimensional nature of food security. According to the multidimensional nature as well as both levels of food insecurity, any planning and policy in the field of food, security should be done with the participation of the custodians of the agricultural sector, trade, economy and social welfare. So that it had adequate integrity and required political commitment will be formed to fix the problems in this area and mobilizing resources will be formed in sufficient quantities (Stamoulis & Zezza,

2003). Strengthening sustainable agricultural and rural development, paying attention to the root causes of food insecurity such as productivity, public sector reform and decentralization, peace and security and reforming macroeconomic policies are the main axes of the FAO global plan (Stamoulis & Zezza, 2003).

Table (1) is based on the plan drawn by FAO. The first row in the table dedicates for rehabilitation of food system, especially for reforming food economy system, including in terms of the agricultural production, technology, diversity in the food processing, markets and consumption. The second line makes the options available to provide access to food for vulnerable individuals and groups (Clay, 2003).

Table 1: Policy levels to strengthen food security

Dual levels	Existence	Access and use	Stability
1. Rural development / Improving production	Improving the provision of food to vulnerable persons Improving food production, especially by small farmers in rural areas Investment in rural infrastructure Investing in rural markets The revival of the livestock sector Rehabilitation and conservation of resources Improving income, and other factors availability of food	Reconstruction of rural institutions Improve access with assets Guarantee access to land The revival of rural and financial systems Strengthening labor market Mechanisms to ensure food safety Social rehabilitation programs	Diversification of agriculture and workforce Food vulnerability monitoring Eliminating the structural causes of food insecurity Re-integration of refugees and the homeless The introduction of analysis and risk management Restoring access to savings mechanisms and credit system
2. direct and immediate access to food	Food aid Input assistance / seed Re-storage, livestock capital Restoring the ability of the market	Monetary exchange / Food Redistribution of assets Social rehabilitation programs Involvement in nutrition programs	Reconstruction of the social safety net Monitoring the effects of vulnerability and direct involvement making peace

The approaches presented by the World Food Conference in 1996 have considered the same things:

Encourage to sustainable production of food, reinforce the use and optimal allocation of public and private investment and rural development system, enabling vulnerable individuals, to ensure physical and economic access to food, ensure that agricultural trade and food policy are in order to strengthen food security and ensure the government's readiness to meet food needs in natural disasters. In the World Food Conference in 2002, it was also emphasizing the decisions of the summit in 1996, and the impact of factors such as political will, access to technology, erosion of natural resources, especially water and the effects of the rural economy and poverty reduction in rural areas. The Assembly also emphasizes on the strengthen role of trade and the use of biotechnology in removing poverty, hunger and a fair and sustainable maintaining of genetic resources.

Paying attention at the same time to both approaches is essential to solve the problem of food security. Policy, to ensure sustained economic growth, alongside structural problems and macroeconomic, structural reform and enough attention to non-food factors, can lead to solving problems about food security in the short and long term, in general and consistently.

#### 4 Patents and food security

Attention to the economic basis of the invention support in these supporting systems of the patent system can act as an essential tool to help both the above objective. Then, after examining the possibility of supporting the plant innovation, in the patent system, we study the effect of the patent system, in both agriculture and industry and their implications for food security.

#### 5 The impact of patents on agricultural strengthening

In a sustainable agriculture, the production should be noted that reduces the use of pesticides and chemical fertilizers and practices that were harmful to health and the environment, to meet the needs of food, health and protect the rights of future generations. This is emphasized on The International Treaty on Plant Genetic Resources for Food and Agriculture (ITPGRFA). Sustainable agriculture that is derived from the concept of sustainable development means attention to economic aspects, as well as other humanitarian and security needs in in the long term (Dutfield, 2006). Agricultural sustainability on the need to develop new technologies, which lead to improvements in food production and it has emphasized on less costs and negative side effects. In sustainable agriculture, no technology, or practice will be excluded such as transgenic technology or practices of organic farming based on non-scientific reasons. In addition, it is attempting to balance between the interests of traditional agricultural practices and formal systems of the seed supply (Chiarolla, 2011). Other pillars of sustainable agriculture are increasing agricultural productivity. According to some studies, the use of biotechnology and genetically modified plants create an average of \$ 250 per hectare benefit. Gains from biotech crops, for Argentina, until 2005, was \$ 20 billion, mainly due to the supporting approach of this country and acceptance of biotech crops, from day one, while with the countries technology owner, such as America and Canada. On the other hand, increase the income of farmers causes the increasing demand and strengthening commodity markets and services in the respective areas, and these conditions lead to an increase in employment and incomes and strengthen food security.

Another problem, related to sustainable agriculture is population growth and the consequent increase in food and agricultural needs and the shortage of agricultural land (Babu & Gulati, 2005). Among 51 billion hectares of land, 8.3 billion hectares were usable for agriculture, and 1.35 billion hectares of it is desirable for agricultural use, that almost all of the value is in use. Annually, 10 million hectares of these lands are released for various reasons. According to FAO statistics, there are less than 0.25 hectares of agricultural land per capita with right productivity.

This means that it is necessary, states plan in such a way that gains more products from less level of agricultural. To solve this problem, three approaches come to mind: an increase of fruitfulness, increasing the volume of crop and further land use. According to a study in 2000, 63 percent of shortages must be solved through enhanced product fruitfulness, 15 percent through enhanced crop culture and 22 percent by finding new agricultural lands. Regarding the fact that so the next Green Revolution of genetically modified varieties will be produced through technology. Given that, most fertile lands that can be used in this regard are in some countries in Africa and Latin America, for most countries, the use of the first option, ie an increase of fruitfulness, in particular through genetically improved varieties will be the main policy. Therefore, it is said that the next Green Revolution will be through genetically modified varieties production technology.

Table 2: the performance of Bt cotton varieties than non-GM cotton (percent)

	Argentina	China	India	Mexico	South Africa
<b>Fruitfulness</b>	33	19	34	11	65
<b>Profitability</b>	31	340	69	12	299
<b>The cost of pesticides</b>	-47	-67	-41	-77	-58
<b>The cost of seed</b>	530	95	17	165	89

Therefore, farmers in third world countries can benefit from this technology, but access to appropriate technology in competitive terms, institutional arrangements, such as intellectual property rights, national research capacity, non-deterrent regulations in the field of safety and health, trade regulations and the efficient system of supplying sources has a fundamental importance in the distribution of benefits of this technology. To make use of new technologies, such as genetic modification technology, and help food security, food security policies should facilitate the access to new technologies related to food production and strengthen the research in the field, particularly with the aim of developing local required figures, that protection of innovation through intellectual property plays the most important role in this regard. Some researchers believe that if the system of intellectual property will be in order to strengthen food security, the current legislation should be reviewed and policies appropriate to national circumstances should be considered.

The patent system, it is possible that, in particular, innovation, in areas that need more urgent to innovate and focus on investment in that field will be felt, will be encouraged. For example, in the UK, because of the urgent need to innovate to solve environmental problems, in 2009, the plan "Green path" was run, which allow patent declaration, in this field will be resorted in a different process. The main objective of this project is to strengthen and encourage the development of low-carbon technologies, which is better for the environment, which, apart from the environmental benefits, it could guarantee the competitiveness of the British economy in the future world. In practice, the plan "Green path" provides creative active businesses in the field of green technologies, and the accelerating chance of acquiring the rights to inventions and based on those patent statements, quickly and in less than nine months from the date of demand, the result will be reached.

In addition, because many third world countries do not have the capacity to supply all their needs of agriculture through domestic production, they heavily influenced by developments in agriculture in developed countries. Because, developing countries are benefiting well from technology, especially the genetic modification technology and it heavily effects on the quality, productivity and cost of products. Some countries, such as Brazil, Argentina and India have been able to transform themselves and to be in charge with a large share of the global market with transferring technology and strengthening innovation in the field of agriculture.

Studies show that the use of transgenic technology leads to reduce costs, increase profitability and increase agricultural production. In addition, the economic impact study of this technology shows that the popular notion that the transgenic values will influx interests to large and multinational biotechnology corporations is not true; on the contrary, it can be in the interests of farmers and consumers. As it is specified in the table 2, farmers and countries that have used improved varieties of transgenic for cotton farming in developing countries, have experienced more fruitfulness, less cost for pesticides and higher net income.

On the subject of debate, after careful study about the food security needs of each country, through the consideration of special privileges for producers of seed and plant varieties, we should attract the investments to meet those needs. For example, the Islamic Republic of Iran, strongly, faces with the shortages of water, that, in this context, the development of improved rice varieties, free from flooding and wheat, with low water requirements and cotton, with more than double fruitfulness are considered.

## 6 The impact of patents on strengthening the economy and industry

Enabling the transfer of technology from public universities and research institutions to industry is also national goals to help economic progress. Transfer of Technology here means the knowledge from the study and scientific research turning into products and valuable processes. The practical application of research that was done with macro governmental funds in universities and research centers depends on its results transfer to industry. This process normally will be elaborated through patent system, especially appropriate disclosure of invention information and operating licenses. Technology transfer and encouraging operation licensing is desirable because, it enables small and startups companies to have the advantages of a monopoly in trade negotiations, regardless of market competition.

Major science and technology in developing countries will be produced at universities or public research centers and with a state budget that their results remain unused in many cases.

What leads to unused academic research in developing countries is the lack of relation between these researches and their commercial applications in the marketplace, because universities are unwilling to commercialize their research results on the one

hand and the private sector and companies are unwilling to use the research centers on the other. To make the relish, between academia and industry, policy makers should provide a framework that, while entering the private sector, in the field of research, place universities and public research centers in a direct relation to the trade market and encourage the technology transfer and exploitation of it. The role of the patent system policies, in filling this gap is essential in promoting selling and exploiting licenses of research results and other forms of technology transfer and joint research activities. Registering university and research centers results in the form of patent papers will lead them to useful, practical, and new research and send them to business companies for the issuance of exploitation licenses and subsequently, the technology transfer from university to industry will be more. In addition, it provides motivation and the perfect base for private companies to strengthen the investment in this area. Usually, companies cost 50 to 100 times more than the initial cost of operating license paid to the University for Technology Development. The government can determine the universities' budget with a measure of the success of public universities and research centers in the registration and commercialization of innovations by industry.

Now it must be recognized, the patent system, in general, has the above function. However, this function, in different fields, has the strength and weakness. The function of the support system in the field of agricultural biotechnology is palpable more than other areas, because biotechnology research and development is much more expensive than other areas, and drawing intellectual and financial investment in it, needs more support. This matter will be effective in two ways of internal investment in the required research on the country and attracting knowledge-based foreign investment in the economy, agriculture and industry in the country. As well as lawmakers and enforcers of the patent system careless about the element of informational disclosure of the invention has decreased the efficiency of the patent system in third world countries.

## 7 Result

In this paper, by extracting elements of food security and factors affecting it became clear that each of these elements in some way influenced by new technologies, especially the biotechnology and allocation of public and private funds. On the other hand, with studying the nature and logic of the patent system, it became clear, the patent system, to strengthen innovation, will act by creating incentive system and creating a link between investment and production of science and technology.

Given the above matters, this matter was reviewed that how the patent can have an impact on each of the elements and indicators of food security. Elements of food security include availability, access, stability and utilization, so, if it is detected, encourage of innovation and production of technology lead to an increase in production, facilitate access and stable the production and access, it can be said that the impact of patents is specified on food security.

Food existence, at the national and local level the most important food security element, though it is not sufficient element and necessarily it does not mean access for all people to food. It is clear that innovation and implementation of new processes and products, particularly new varieties and improved farming are the key factors in increasing yield and improving the quality and quantity of agricultural products. The patent system leads to an increase varieties adapted to local conditions, and may also lead to higher prices or reduced free availability of farmers to seed and influenced food intake. Due to the economic basis of the invention of the support system, the patent system can act as an essential tool to help these.

Increasing agricultural production helps food security by increasing the income of the rural and poor as well as through

self-sufficiency in food production and price stability. Reduction of food prices in the local production of agricultural products reduces household food expenditures and creates employment for low-income classes' villages and small towns. Attention to technological innovation and commercialization strengthen have a key role in boosting agricultural production. For example, it may be imagined, the priority of food security requires the production of agricultural products, which have a role in providing essential food, take priority, but given the importance of commercialization, it must be said, essentially, we should not content to these matters and products that lead to more agricultural income and employment, also could be considered. If part of the population that lack food security could provide high yielding and modified varieties and the use of modern technologies, grow products that have faster and more commercial profitability, the hope to solve food insecurity, in their case, will be higher.

Sustainability in agriculture is other pillars of food security. Food production through the use of traditional varieties with low productivity, high water consumption, use of pesticides and chemical toxins ... that cause damage to other areas of human life such as health, biodiversity, and ..., do not lead to solve sustainable food insecurity. Here, food security requires that, by supporting the development of new varieties that are resistant to pests and tolerant to drought, along with other forms of agriculture, such as agricultural mechanization, solving food needs will be coordinated by meeting other needs. Policy, based on this approach requires adequate information about the relation between food security and other areas in terms of physical infrastructure and social arrangements.

In another aspect, the patent, by strengthening the knowledge-based economy and industrial growth, because of it can lead to increase per capita income and stability in accessing adequate food. By strengthening the relation between industry and academia and attracting foreign investment in the field of knowledge-based products, Patent system can strengthen knowledge-based economy and employment and income, and increasing employment and per capita income has also helped to strengthen the element of access and stability.

Abstract. Specific deterrence is a kind of function that civil liability can have to deter the imposer of harm from harming the victim again. On one hand, emergence of this type of insurance caused weakness of civil liability and increase in carelessness, since compensation of loss by the insurer can not result in deterrence of fault agent, but also it may encourage the doer and others for harmful and damaging actions. In this study, it has been tried to define firstly the concept of civil liability and especially tortious liability and to investigate the basis, nature and pillars of liability. Then, we have given some cases in field of committing harmful act and fault in tortious liability. Finally, this study has investigated deterrence cases in civil liability and the relationship between insurance and civil liability.

Key words: tortious liability, loss compensation, deterrence, civil liability, specific and general deterrence, insurance

### 1 Introduction

In all law systems, the main responsibility of law at the society is preventing commitment of harmful acts and making required decisions to compensate losses caused by such actions. Hence, it is competent to say that the principle of compensation for inadmissible losses, along with two other principles of ownership respect and contract binding power can be the summary of all civil rules. Civil liability that forms an important part of civil law is same legal liability and commitment of person to compensate losses inflicted on other party as a result of documented actions and as a result of taking harmful act, which may be caused by violation of contract and artifact of essay will of individuals or violation of legal obligations.

Civil liability includes two branches of contractual and non-contractual liabilities. If a contract is signed between two or more people and one of them has violated the contract (refuse to take action or delay in completing commitment) and a loss is inflicted on the other party, the violator of contract has contractual liability and should compensate the loss. When a person causes loss for the other party, whether there is a contract between them or not, the loss is not associated with the contract and this case is non-contractual liability.

The obligations out of the contract or civil liability refer to the liability created as a result of legitimate or illegitimate actions with no adequate contract. Civil Code has emphasized the obligations in articles 301-337 under the title of "obligations incurred without a contract"<sup>1</sup>. The foundation of obligations without a contract is the benefit created for a person or loss caused for the person; it means that these obligations are always caused by a benefiting or harming legal act. For example, if a person has caused loss on another party intentionally or as a result of carelessness, the person should compensate the loss. However, in this case, obligation without contract and mutual consent of parties is created<sup>2</sup>.

Till 18<sup>th</sup> century, civil liability was not separated from criminal liability and is used to be described as fault-based liability, tort or civil fault. Accordingly, two goals of deterrence and loss compensation were defined for civil liability. Although civil liability was separated from criminal liability since 18<sup>th</sup> century, its deterrence is still being regarded as one of the main goals of

civil liability even in presence of all criticisms (Can, 419, Williams, 1951, 137). Emergence and promotion of liability insurance could weaken civil liability deterrence on one hand and could strengthen its loss compensation on the other hand because of fast compensation of loss for the injured party and guaranteeing it and supplying expenses easily.

### 2 Concept of tortious liability

The origin of this kind of liability is the rule of law, which is out of framework of contractual relations. It could be mentioned that tortious liability refers to responsibility of person to compensate inflicted loss and harm for the other party based on rule of law because of taking harmful act or violation of property or service of the other party such as liability caused by confiscation, loss and inadmissible fault (Katuzian, 2006).

In Iran Law, Civil Code has given civil liability under the title of "obligations without contract" as an independent section and has investigated this issue under the title of tortious liability. By 1960, an act was approved under the title of Civil Liability, which was mainly associated with obligations without a contract. Hence civil liability in its specific sense refers to same obligations without a contract or tortious liability; although in its general sense, it includes both forms of liability (contractual and tortious).

In field of concept of tortious liability, if it is assumed that two people have signed no contract and one of them causes loss for the other party intentionally or by fault, the non-contractual liability or without contract is realized. Tortious liability is the liability to compensate loss caused by an act or leave an act that is fault and crime from perspective of law (An-Naqib, 1984). Moreover, it could be mentioned that tortious liability is the liability caused by violation of an obligation that was previously codified by law. Such obligation is general and violating it could be compensated through presenting lawsuit to ask for loss compensation (Badini, 2005).

#### 2.1 Nature of tortious liability

The lawyers believe that necessity to compensate losses in tortious liability is in line with legal events, which is considered in group of means to create commitment and includes events that their effects are determined by law. In Civil Code, these effects are called as obligations without a contract and tortious liability. Hence, some lawyers believe that no term can encompass various means of tortious liability such as legal events and they can infer on this basis (Katuzian, 1995).

Although in an overview both liabilities end in compensation of loss for the harmed party, in contractual liability, parties are limited and in tortious liability, commitment is general. In terms of amount of the loss in contractual liability, just direct and predictable losses can be demanded while conclusion of the contract. However, in tortious liability, the loss caused by any kind of direct loss can be demanded, whether it is predictable while conclusion of contract or not (Al-Sanhuri, 1998).

#### 2.2 Foundation of tortious liability

Searching for foundation of tortious liability should be in collection of regulations and not in expressions of parties as a title referring to non-contractual liability. It means that tort refers to this issue that in relations of parties after the realization of loss is impossible in position of need for interpretation or other obligations of following the contract. This is because; there is no will at all for realization of the liability. According to one expert in this field, contractual liability is violation of commitment caused by contract and the sign of obligation without a contract is violation of commitment by law. This difference is enough to separate the two types of liability and to consider independent identifies for them (Yazdaniyan, 2000).

<sup>1</sup> In addition to the mentioned articles, Civil Liability Act, Law on compulsory insurance of liability of owners of vehicles against third party (edition of 2008) and articles 316-366 of Criminal Law approved in 1991 have also played key role to define tortious liability in Iran Legal System.

<sup>2</sup> Droit civil, carbonnier, 20ed, t.2, no198

Contractual liability is caused by violation of commitment between limited entities and these entities have created the commitment by themselves; although in tortious liability, the law creates the commitment and the commitment is against everyone.

### 2.2.1 Fault

Fault is one basis of civil liability and in Iran Law; it is at least one important basis and foundation of liability. In article 1 of civil liability act, liability is mainly defined on basis of fault. Whereby this article, if a person inflicts loss on another party as a result of carelessness (fault), the person is responsible to compensate the loss and no responsibility is existed for the person without commitment of fault. In fault, differentiation and lack of differentiation of the doer (individual element) is not obligatory, but also typical element and common personal behavior should be considered. Hence, to determine the fault, reasonable and careful human behavior should be considered and following common human behavior is required for carefulness.

In an assumption that there is no reliable contractual relationship to regulate mutual relations or the victim has no tendency to follow the lawsuit based on tortious liability, solving the dispute and determining the probable liability of the doer would be based on regulations of tortious civil liability according to opinion of majority. Hence, 3 elements are required to achieve this liability:

### 2.2.2 Harmful act

Accordingly, doer of harmful act is responsible to compensate the inflicted loss, when the harmful act is attributed to him/her. Also, the doer is responsible for compensation of loss, when the act is taken without legal permission (Sepahvand, 1974). In article 1 of Civil Liability Act, the term "without legal permission" is referred; meaning that the person is not responsible to compensate loss if the action is taken with legal permission. Every person who causes loss or harm for property, life or freedom of another person as a result of carelessness and without legal permission or causes harm or dignity or commercial fame of a person that results in material or spiritual loss, the person would be responsible to compensate the loss caused by that action.

Some lawyers believe that referring to "against law" in harmful act is for this reason that although person can cause loss because of lack of prediction or intentionally, the person can't be considered as an entity with liability, since his/her action is not prohibited by law (Aminfar, 2005).

### 2.2.3 Loss infliction

In Iran Civil Code, no article has referred to loss and harm as the main element in civil liability; although in articles such as 221, 226 and 227, the term "loss" is used and from this perspective, lack of definition of these terms seems to be because of evidence of the issue (Katuzian, 1995). In some articles, this meaning can be derived. According to article 1216, "In case the minor child, lunatic or immature person, causes loss to another person, he shall be considered a guarantor for the same". According to article 520 of Civil Procedure Law, "in field of demanding for inflicted loss, the plaintiff shall prove this that the inflicted loss is created immediately by lack of acting to commitment or delay in it or lack of submission of demand; otherwise, the court will reject the claim of demanding for compensation of loss". Moreover, articles 1 and 2 of Civil Liability Act have referred to principle of harm.

Harm should be certain and absolute. Hence, in order to make the harmed party to demand for the loss compensation, the harm shall be proved, since according to principle of absence or based on probability, no one can be liable and hence, one condition for compensable loss is certainty of the loss and harm (Shahidi, 2003). Now, an issue considered here is the harm that is not created till now and may be happen in future as a result an accident that is already happened (Emami, 1998). In this field,

some lawyers believe that necessity of compensating future losses are imagined in both tortious and contractual liabilities (Al-Sanhuri, 1964). Also, some others have separated the future and probable loss and believe that the first type loss is compensable and the probable loss in present time and future is not compensable (Aminfar, 2005).

### 2.2.4 Causal relationship between harmful act and loss infliction

To realize the liability, it shall be authenticated that there is causal relation between loss and harmful act, meaning that the loss is caused by the harmful act. However, to create an accident, the accident should be in dominance of binding conditions of realization of loss; it means that it should be authenticated that the loss is not created.

Such relationship can be extracted as it is mentioned in article 328 of Civil Code: " If anyone destroys the property of another person, he will be held responsible and must either produce its equivalent or its value, whether or not the property was destroyed intentionally and whether it was the actual property or profits there on that were destroyed; if he causes defect or damage to such property, he is responsible for the depreciation in price". Noting to this article shows that in law, to realize loss, direct causal relations should be created between loss and the act of doer. In article 331 of the said law, existence of this relation indirectly is emphasized. The later section of article 1 of Civil Liability Act has also mentioned that person is responsible for compensation of loss caused by harmful action, if the action has caused material or spiritual loss and this can refer to necessity of causal relation between harmful act and loss inflicted.

### 2.3 Factors affecting civil liability

In regard with factors affecting civil liability, 4 factors are mentioned as follows: a) ethical aspect of behavior of the defendant b) ease of enforcement c) loss tolerability and d) deterrence and punishment. Hence, this study has mentioned just two factors based on necessity.

#### 2.3.1 Ethical aspect of behavior of the defendant

One factor affecting civil liability is ethical aspect of behavior of the defendant. In other words, ethical fault or criticism attributed to the defendant and mental status of the defendant by the society can be one of the mentioned factors.

Personal behavior and ethics are issues that there are various beliefs and opinions on them; although it should be accepted that in every society, there are actions and motivations recognized as proper ethical actions and there are also some other acts and motivations that are wrong ethically and morally and are regarded as fault and certainly, beliefs can affect decisions made by courts. About the Tyrant, guilty, liar, rascal, traducer and rumors maker and a person who inflicts loss on a neighbor for his/her own benefit, a selfish person violated rights of a neighbor as a result of carelessness and intentional inattentiveness, it is expected that courts sentence such person based on public opinions. On one general hand, the law related to civil liability can be a reflection of moral thoughts and beliefs and has preserved its adjustment with change in the mentioned beliefs; although the theory has not been always right and there are basically disputes on this issue that how the mentioned laws are begun.

#### 2.3 deterrence and punishment

The deterrent factor of loss infliction in future in cases related to civil liability is also very important and hence, the courts pay not only attention to compensation of loss for the harmed party, but also they consider punishment of the guilty. When the result of decisions made by the court are cleared and the defendant is informed that he/she may be responsible for the action, this sense

of responsibility can be a strong stimulant to prevent causing loss in future.

Liability of successor is considered more than other cases and the liability of good manufacturer against the consumer is considered more than other types of liability, since the liability of manufacturer can cause achievement of good in best manner by the consumer. Although such idea is less considered, it can be valuable cause to consider liability for the defendant. The theory of prevention of loss infliction is similar to crime punishment. Because of the crime committed, the punishment can be one of the most accepted goals and destinations by the civilized governments to deter recidivism (William Prosser, the obligations, 1965).

#### 2.4 Fourth discussion: liability for compensation

To determine compensation, the criterion is the amount of inflicted loss to the harmed party and not the amount of fault of the doer and this is one item for separation of civil and criminal liabilities. In tortious liability, the assumption of giving compensation or paying in cash may be done using brand and causing loss for the owner of the brand, which can be compensated with some money. In contractual liability, most of the times the compensation are done in same manner and this approach the most common approach. One of the most important elements of liability if loss infliction. If there is a contract and if the loss is not caused by it, the liability is obligation without a contract.

For example, a ship causes damage for the seafront and the loss is caused by contract; although is not related to lack of acting based on contractual commitments, since the commitment of custodian has been shipping the good that is fulfilled and the loss has been result of violation of a contract that has no contractual source (Jordan, 2007).

Another example is transportation of passengers for free. The lawsuit is presented in cases that it is hard to recognize that is there any contract or not. Some lawyers believe that the act is similar to contract; although the liability of the custodian is not contractual liability (Hosseini Nejad, 2009).

In French Law, some lawyers believe that according to article 1105, charity contracts are existed; although others believe that the relations are just on basis of politeness and customs and out of contract.

It seems that one can consider this type of liability as contractual liability, since even in this case, transporter take the passengers for free and safely. Although safety commitment is in kind of commitment by vehicle, the liability of the driver is based on strict liability according to Compulsory Insurance Law and is a loss is caused, there is no need to prove fault of the driver and it is in benefit of the harmed party to refer to tortious liability of the driver.

The law dominated on tortious liability is the low dominated on the place of accident, since it is created as a result of liability of a religious relationship. In such relationship, adequate law is the law by religious origin. In the American Law, the dominant law in tortious liability is law of place of committing a crime and the adequate law is the dominant law of contractual liability, which can be place of conclusion of contract or the law agreed by both parties (Loubser, 1977). In U.K Law, the conditions are absolutely different.

### 3 The amount of compensable loss in tortious liability

#### 3.1 Predictable and non-predictable

Popular opinion is that as predictability of loss is a condition in contractual liability, the liability can be limited to predictable losses; although in tortious liability, the person is liable for any kind of loss. The problem with tortious liability is that the loss is

not on basis of will of parties and the liability is imposed based on law.

In legal terms, it could be mentioned that something happened by natural affairs as a result of a fault is attributed to doer and unexpected affairs are not attributed to action taken by the doer. In French Law, article 1150 of Civil Code mentions that "A debtor is liable only for damages which were foreseen or which could have been foreseen at the time of the contract, where it is not through his own intentional breach that the obligation is not fulfilled" (Mazeaud et al., 1965). The discussion is considered under the title of farness of loss and predictability in Common Law. In obligations without a contract, the criterion for predictability is time of taking a fault and in contract, the date of agreement is considered and not the date of fault (violation of contract).

#### 3.2 Punitive damage

This kind of damage in Common Law is not considered for loss compensation, but also it is considered to amend or prohibit the defendant from taking actions causing loss for the plaintiff. This kind of damage can be demanded just in tortious liability; although the procedure is different in different countries of Common Law. For example, in Australia, only the guilty and in U.K, only some agents of fault may be sentenced (Loubser, 1997). Moreover, in case that violation of contract is regarded as tortious liability, the doer is competent to get punitive compensation. Punitive compensation can be more than loss compensation. This kind of compensation is existed in England, Commonwealth states, the United States, Japan and New Zealand.

#### 3.3 Spiritual damage

In many legal systems, spiritual compensation could be received just in lawsuits of tortious liability. According to Common Law, if violation of contract causes physical or mental harm or anxiety, spiritual damage may be considered in addition to material damage caused by the contract. In French system, spiritual damage is considered with no difference in contractual and tortious requirements. Moreover, limiting attitude of spiritual damage on attribution to tortious lawsuits was rejected in lawsuit "jarris. vs. swanstours ltd" on 1973. Same result is also obtained in negligence of attorney to present the lawsuit<sup>3</sup>. This kind of separation is not applicable in Iran Law.

#### 4 Role of deterrence in tortious liability

In Iran Law, this issue is investigated implicitly. For example, article 386 of Commerce Law shows that an important issue is attempting to make required decisions and accident prevention precautions. In Iran Law, some lawyers have not considered same role for unpredictability.

Regarding note of article 337 of Islamic Penal Code shows that the legislator in this law believes that Inevitability is the binding condition of Force majeure, since it has declared explicitly that force and tort factors are factors out of limit of power and authority.

If the aim of civil liability is deterring the harmed party to have harmful act in future, it is required for the party to pay compensation to an extent that is enough for this purpose, although it is not true in practice and the cost that the doer is charged to pay as compensation may be more than this amount or too low that may have no effective deterrent effect. The act of the harmed party is a case of external cause that can remove the liability of the defendant with realization of force majeure or reduce it and there is no necessity to consider fault in conditions of force majeure for disclaimer of the defendant.

<sup>3</sup> Damages for vexation and distress were also awarded in a case where a solicitor failed to institute proceeding to restrain molestation of the plaintiff by a particular individual, with the result that the molestation continued

To make civil liability as adequate mechanism for deterrence, it is required to create direct relationship between degree of fault of the doer of fault and intentional or unintentional nature of the action and the amount of compensation of loss. However, the relationship is not existed in practice and no attention is paid to degree of fault or intentional or unintentional nature of the act in field of issuing sentence for loss compensation.

On the other hand, a person with intentional or heavy fault may be charged to pay insignificant cost as compensation; although the other one with insignificant fault may have to pay a lot as compensation (Gibson, 1993; Waldron, 1995).

If liability of a person is considered on basis of objective fault, it may have no deterrent effect in some cases, since the criterion for being guilty is same in this case and individual properties are not considered.

In relation with the losses caused by accidents and human mistakes that are common today, deterrent effect may not be considerable, since in most cases of the current world, accident and human mistakes are inevitable effects of human faults and use of machinery and can't be prevented<sup>4</sup>.

Hence, it should be mentioned that issuance of sentence to compensate losses can not only deter the doer of fault from harmful and antisocial acts in future, but also is can be a lesson for other members of society, especially those who are more talented to make loss for others because of their special position and there are many lawsuits against them.

In other words, civil liability can be pressure leverage on them who have political, economic and thinking power at the society and can change their behavior in such manner that they feel responsible against the society members. In fact, private law plays supervisory role through this with guaranteeing rights and freedom of citizens (Rogers, 2002).

If deterrent regulations of civil liability are not existed, people consider only their own benefit and prefer their personal desire to safety of others. Sanctions of civil liability force individuals pay attention to interests of others too and show behavior that is accepted socially. This issue can reduce accidents and losses caused by the accidents to considerable level in long-term (Sugerman, 1992).

More importantly, civil liability today plays controlling role through the theory of abuse of rights in social relations and can make individuals violate social foundations to apply some regulations (Delbecque, 2001).

Certainly, civil liability can play key role in general deterrence and even social reforms and legislation and in some cases and lawsuits, the harmed parties may take such action for money (even in tortious liability) and not for the principles and ideals that lead to effective deterrence and reforms and also ignoring lawsuit by them may not be because of deterrent rules and ethics, but also it may be because of high costs of trial. Moreover, similar to specific deterrence, this type of deterrence can also affect only the behaviors that are needed by subjective state and not every kind of behavior (Cane, 1996).

Therefore, it seems that criminal, labor, administrative and disciplinary sanctions can play this role in better manner.

On the other hand, in some laws, there is another type of deterrence that is applied under the title of specific deterrence. The aim by specific deterrence is the role that civil liability can have to deter the doer of fault to inflict more losses. This type of deterrence is against general deterrence, which means prevention and deterrence in social level and preventing other people of the

society from taking harmful act in future. The general deterrence is also divided to two types of general deterrence in economic sense and general deterrence in noneconomic sense (Cooke, 1999).

Deterrence in noneconomic sense is creation of safety regulations and standards and determining sanctions for violation of the standards. On the other hand, if the injured party has not observed the standards, the amount of compensation to him/her would be reduced. Through this, the law has created some encouragements for safe behavior. Based on economic sense and concept of deterrence, the cost of losses caused by an economic activity should be paid by the individuals involved in that act. If the cost of preventive actions is less than the compensation paid by the doer of fault on the injured party, the doer of fault will take deterrent measures to prevent the damages (Cane, 2006).

Hence, in some legal systems, typical insurance plays deterrent role in civil liabilities (and some examples of tortious liabilities). However, it seems that despite to existence of liability insurance, deterrent role of civil liability is still remained strongly. The person can only be insured against the damages caused by unintentional faults and the civil liability insurance of intentional fault is illegal and may be regarded against public order and even there are some doubts in field of civil liability insurance of heavy faults (Mazeaud, et al., 1965).

With the emergence of liability insurance, civil liability deterrence was weakened and using strategies innovated by insurers and legislators to reduce behavioral risk can't recover deterrence of civil liability at all. On the other hand, supporting the injured parties and fast compensation of losses and reduction of social damages caused by accidents and development of insurance institute is a social requirement. Hence, in Compulsory Insurance Law (2016), efficient regulations are codified to create relative deterrence and prevention of increased carelessness and emergence of behavioral risk of insurance. In new legal economic analysis that supports the principle of fault and applying it, one can't observe denial of advantages of liability insurance with behavioral control tools.

For example, if one tends to use same regulations of traditional legal system for the accidents arising from traffic and if the intention is to make the injured party to prove the fault, this would be impossible in some difficult and complicated cases. To prevent such conditions and to adjudicate rights of the injured party, despite to traditional system foundations, civil liability of Compulsory Insurance Law has assumed liability of the holder or the driver and if the fault is not proved because of force majeure or proving fault of third party or fault of the injured party by the driver, the driver or holder would be innocent; otherwise, the driver should compensate the loss of the injured party (Dehghan, 2013).

This is because of typical liability that holders of vehicles are recognized as liable party and should compensate the losses without proving their fault by the injured party. The legislator has made it binding for holders of vehicles to have Third Party Insurance and insurance company can decrease many difficulties and problems through facilitating loss compensation. Hence, it could be found simply that insurance has facilitated compensation of losses through regarding liability of holders as typical liability and through making third party insurance compulsory and through ignoring personal loss compensation and considering a common system of loss compensation (paying by insurance companies).

Many doers of fault are not covered by liability insurance even in some fields such as traffic accidents that insurance is obligatory and hence, they have to compensate losses in person<sup>5</sup>. Because

<sup>4</sup> This issue is mostly true for traffic accidents. It is proved that people make a mistake in average per mile and as a conclusion; every common driver in Washington makes 9 driving faults per 5 minutes (Markesinis, & Deakin, 1999).

<sup>5</sup> In compulsory insurance, having no insurance while accident may lead to deprivation from driving and this issue is indirect effect of civil liability and can be regarded as an important deterrent factor. Through codifying some driving and traffic rules such as fastening seatbelt while driving that is a kind of tortious liability can also play key deterrent role in this field.

of being beneficiary in field of reduction of accidents, insurance companies consider some approaches to encourage and punish the insured parties (such as attributing insurance fee of everyone to history of accidents), which can be a deterrent factor. In cases that compensation of loss is taken by social security or projects of loss compensation or funds and special regulations, deputy of insurance institutes and the government on behalf of the injured party to refer to the guilty can preserve deterrent role of civil liability and tortious liability<sup>6</sup>.

## 5 Conclusion

Civil liability has two branches including contractual liability and non-contractual liability. If there is a contract between two or more parties and one of them violates the contractual provisions and loss is inflicted on the other party, the violator of the contract has contractual liability and should compensate the losses. In cases that a person inflicts loss on another party without existence of contract or in presence of contract, the loss is not attributed to the contract and the discussion here is related to non-contractual liability.

In Iran Law, Civil Code has presented civil liability under the title of obligations without a contract and has investigated its specific issues under the title of tortious liability. By 1960, a law was approved under the title of "Civil Liability Act", which was mainly related to obligations without a contract. Hence, civil liability in its specific sense refers to same obligations without a contract or tortious liability; although in its general sense, it includes both types of liability (contractual and tortious).

Fault is one of the foundations of civil liability and in Iran Law; it is at least one of the most important bases of liability. In article 1 of Civil Liability Act, the liability is mainly considered based on fault. To realize such liability, 3 elements are required as follows: a) harmful act: on this basis, doer of harmful act is responsible to compensate the loss inflicted on other party to whom the harmful act is attributed b) loss infliction: loss shall be certain and absolute and hence, to ask for compensation of loss, the injured party shall prove the fault of the doer, since according to the principle of no harm and based on probabilities, no one can't be liable c) causal relation between harmful act and loss infliction: to realize liability, it should be authenticated that there is casual relation between loss and harmful act; meaning that the loss is caused by the harmful act.

Preserving liability based on fault is required because of its deterrent effect. However, extension of systems based on strict liability such as strict liability caused by objects and dangerous activities can result in social welfare and efficient allocation of resources with the aim of providing coverage of private insurance and internalization of social costs of accidents.

With the emergence of liability insurance, civil liability deterrence was weakened and using strategies innovated by insurers and legislators to reduce behavioral risk can't recover deterrence of civil liability at all. On the other hand, supporting the injured parties and fast compensation of losses and reduction of social damages caused by accidents and development of insurance institute is a social requirement. Hence, in Compulsory Insurance Law (2016), efficient regulations are codified to create relative deterrence and prevention of increased carelessness and emergence of behavioral risk of insurance. In new legal economic analysis that supports the principle of fault and applying it, one can't observe denial of advantages of liability insurance with behavioral control tools.

**Abstract.** The purpose of this study was to investigate the relationship between time management and emotional intelligence with the effectiveness of physical education teachers of Karaj city. The statistical population is the physical education teachers of Karaj city (N=750). Based on the Morgan Table the number of samples are 250. Validity of the questionnaire is obtained using Chronbach alpha method which is 0.94 for time management and 0.93 for emotional intelligence and 0.88 for effectiveness. The results of the present study showed that there is a positive and significant relationship between the dimensions of the time management (monitoring, interaction, protection and description of the job) with the effectiveness of the teachers and there is a significant relationship between emotional intelligence and the effectiveness.

**Keywords:** Effectiveness, emotional intelligent, physical education teachers. Time management

### 1 Introduction

We live in an organizational society. Organization as a fundamental basis of modern society plays a major role to meet the expectations of societies and human resources has a vital role for such organizations. Thus considering the needs of employees and providing the mental and physical health of them as well as their satisfaction has a great importance in order to increase the productivity and efficiency of the organization. Nowadays, one of the main sources of stress "as the main reason of the burnout" is the excessive work pressure and not having enough time but as the work pressure is varies significantly between individuals and consequently the mental stress is not the same for everyone . Jung (2011) expresses that due to the active work environments of today's organizations the managers needs to provide fundamental changes in their management method for the survive of the organization and the ability to be powerful in the global competition cycle. Time management cycle is considered as one of the best method to utilize the time which starts with setting goal that underlies the time management. Time management is that of putting much more time to think about responsibilities, not doing duties in a shorter period of time (Lucas 2008) furthermore, time management includes several skills, such as Self-discipline, goal setting, interrupt handling, techniques for organizing Affairs, etc. this skill will lead to elimination of many sources of organizational stress and reduce the related side effects, (Melk Ara, 2009). In addition to rational intelligence, this intelligent is has also a considerable effect in personal job and life guidance (Bar-On 2006), has investigated this subject in a research named "the emotional intelligence of managers". This research shows that the rational intelligence is not adequate for the twentieth century. Based on the Goulman (2003) the emotional intelligence includes personal and social components and the personal components includes self-awareness, self-adaptation and motivation while the social components includes sympathy and social skills wherein each has the related subsets. Generally, emotional intelligence refers to competency in identification, understanding and expressing emotion in oneself and others which has four region, 1) understanding of emotions 2) accessibility and production of emotions 3) Knowing emotions 4) management emotions (Mayor et al., 2004). Here, teachers as the most effective components in schools are responsible for educational promotion of students and targeted actions of the organizations, (Baldauf and Cravens, 2002). Researchers believe the effectiveness is

used in all the components of the organizations and it is not acceptable for an organization being not effective (Kazemi 2016). Effectiveness is considered as one of the most important issues in the field of organizational behavior (Chelladurai & Haggerty 1991). Papadimitriuos & Taylor (2000) believe that effectiveness is the main issue in the scientific field and attention to effectiveness, develops the organizational theories. According to Medley et al., (1982), having knowledge and various skills, is called competence of the teacher and application of these knowledge and skills is considered as teacher performance. Therefore, researchers who are trying to understand the effectiveness of teacher, should be able to connect the teacher competence and performance with educational goals. Shilbury and Moore (2006) stated in his research that due to vast changes in the today's world and more intense competitions, many researchers have focused on the design of effective strategies for rapid and effective performance of the organization, and in this regard, education organizations are no exception. Jihadi et al (2016), Melinde et al., (2014), Lindebaum (2012), Elena et al., (2011), James & Lobus (2010) have pointed, directly or indirectly, to the relationship between time management, emotional intelligence and effectiveness, in separate studies. So it is important that human resources in the educational environments, have good performance and effectiveness. Application of emotional intelligence in teachers can be effective in their effectiveness.

As discussed earlier the emotional intelligence is not a new research area but the effects of emotional intelligence on the performance of teachers has not yet been studied in details. While there are many research on the effect of emotional intelligence in academic success of the student the related research on the effect of emotional intelligence of the effectiveness of the teachers is not adequate. Thus this research aims to investigate the role of emotional intelligence on the effectiveness of the physical education teachers in order to answer that how is the relationship between the time management and emotional intelligence with the effectiveness of the performance of the teachers?

### 2 Methodology

This research is a descriptive-correlational in which the researcher investigates the relationship between the variable of research using questionnaires. The statistical populations are all the physical education teachers of the Karaj city, primary, secondary and high school teachers which includes 750 teachers. Based on the statistical population and according to the Morgan table 250 teachers are selected as statistical samples in a classified random method. For measuring the variable of the research the time management questionnaire of the Burt et al (2010), the emotional intelligence questionnaire of the Bradberry and Greaves (2005) and the effectiveness of the teacher's questionnaire of Choo and Bowley (2007) is used.

#### 2.1 The Measurement tools

Three questionnaire is used to measure the variables.

**Time management questionnaire:** This questionnaire which has been made by Burt et al., (2010) includes 28 question with five options according to the Likert five-point scale with the options, completely agree, agree, neutral, disagree and completely disagree which are identified by 1, 2, 3, 4 and 5 respectively. This questionnaire includes five components, which are monitoring, employees interaction, description of work process, protection of the time management process and time values wherein the related Chronbackh alpha coefficient are 0.94, 0.88, 0.82, 0.83, 0.83 and 0.7 respectively.

The emotional questionnaire of Bradberry and Greaves (2005): This questionnaire has been always the most common and well known scale for evaluation of work burnout. The questionnaire includes three independent scale which investigate the behavior from 28 different aspect which is evaluated with the marks 0-5, never-always. In this research the Chronbach alpha coefficient is obtained 0.93 for emotional intelligence and for the self-awareness, self-management, social awareness and the relationship management its value is obtained 0.8, 0.77, 0.74 and 0.84 respectively.

**The effectiveness of teacher’s questionnaire:** this questionnaire is made by Choo and Bowley (2007) which includes 28 five-option question based on the Likert five-point scale having the options completely agree, agree, neutral, disagree and completely disagree having the points 1-5. The

Chronbach alpha coefficient for the effectiveness variable is obtained 0.88.

After gathering questionnaire, the obtained data is analyzed using SPSS software, version 23. To analyze the data in descriptive statistics, tables, relative frequency percentage and standard deviation is used while in inferential statistics the Pearson correlational statistics method among with the step to step multivariable regression and statistical examinations is used. The value of probability of the error tolerance is set to  $\alpha=0.05$  in this research.

**3 Results**

Table 1- shows the descriptive statistics of the variables of the present for the teachers.

Table 1: descriptive statistics for the variable of the research based on the gender

variable	Statistical indices							
	average		Standard deviation		Minimum score		Maximum score	
	man	woman	Man	woman	man	Woman	man	woman
Time management	3.73	3.54	0.54	0.76	2	1.04	5	4.82
Monitoring	3.7	3.54	0.63	0.85	1.88	1	5	5
Interaction	3.83	3.58	0.64	0.84	1	1	5	4.8
Job description	3.72	3.58	0.66	0.94	1.83	1	5	5
Protection	3.62	3.48	0.63	0.89	1.83	1	5	4.83
Values	3.97	3.55	0.75	0.99	2.33	1	5	5
Emotional intelligence	3.89	3.8	0.4	0.73	2.64	1.07	5	5
Self-awareness	4.17	4.03	0.49	0.74	2.67	1	5	5
Self-management	3.63	3.68	0.51	0.73	2	1	5	5
Social awareness	3.76	3.61	0.46	0.91	1.8	1	5	5
Relationship management	4.05	3.88	0.5	0.84	1.75	1.25	5	5
effectiveness	4.06	4.04	0.42	0.54	3.05	1.62	5	5

**3.1 Inferential statistics**

Hypothesis 1. There is a simple relationship between the emotional intelligence and its dimensions with the effectiveness of the female physical education teachers of Karaj city. The Peareson correlation coefficient is used to find the relationship between the variable of the research and the results is shown in table 2. Based on this results the relation of the time management and effectiveness is 0.27 and significance. The relationship between the monitoring, employee interaction, job description process and protection process for the time management and effectiveness is obtained 0.24, 0.35, 0.23 and 0.23 respectively. The correlation of the time values and

effectiveness was not significance and the relation of the self-management and effectiveness obtained 0.19 and significance. The relation of time management and emotional intelligence is 0.27 and significance. The relation of self-awareness with the self-management and time management obtained 0.22 and 0.3 and significance. There was no significant relationship between time management and the other dimensions of the emotional intelligence. The relation of emotional intelligence with the dimensions of monitoring, job description process and protection of the time management obtained as 0.29, 0.3 and 0.24 respectively in which the relations are significant. The relation of emotional intelligence with the other dimensions of the time management was not significance.

Table 2: the results of Pearson correlation coefficient in the female physical education teachers

	1	2	3	4	5	6	7	8	9	10	11	12
Time management	1											
Monitoring	0.88**	1										
Interaction	0.75**	0.54**	1									
Description of work	0.89**	0.71**	0.62**	1								
Protection	0.85**	0.67**	0.57**	0.67**	1							
Values	0.72**	0.59**	0.36**	0.62**	0.57**	1						
Emotional intelligence	0.27**	0.29**	0.1	0.3**	0.24**	0.57**	1					
Self-awareness	0.22**	0.23**	0.15	0.21**	0.16	0.24	0.78**	1				
Self-Management	0.3	0.29	0.1	0.32**	0.33**	0.16	0.85**	0.57**	1			
Awareness	0.16	0.25**	0.01	0.19**	0.1	0.33	0.75**	0.46**	0.55**	1		
Management of relations	0.16	0.17**	0.04	0.19**	0.11	0.1	0.81**	0.52**	0.49**	0.54**	1	
Effectiveness	0.27**	0.24**	0.35**	0.23**	0.23**	0.01	0.1	0.11	0.19	0.04	0.06	1

\*\* Correlation is significant in the level of 0.01

Hypothesis 2. There is a simple relationship between the emotional intelligence and its dimensions with the effectiveness of the male physical education teachers of Karaj city. The Pearson correlation coefficient is used to find the relationship between the variable of the research and the results is shown in table 3. Based on this results the relation of the time management and effectiveness is 0.44 and significance. The relationship between the monitoring, employee interaction, job description process and protection process for the time management and effectiveness is obtained 0.47, 0.38, 0.47 and

0.34 respectively. The correlation of the employee’s interaction and effectiveness was not significance. The relation of time management and emotional intelligence was not significance. The relation of emotional intelligence and effectiveness was not significance. The relation of emotional intelligence with the dimensions of the monitoring and interaction of the employees was obtained 0.2 and 0.31 and significance. The relation of emotional intelligence with the other dimensions of the time management was not significance.

Table 3: the results of Pearson correlation coefficient in the male physical education teachers

	1	2	3	4	5	6	7	8	9	10	11	12
Time management	1											
Monitoring	0.87**	1										
Interaction	0.71**	0.55**	1									
Description of work	0.9**	0.69**	0.5**	1								
Protection	0.9**	0.68**	0.51**	0.84**	1							
Values	0.82**	0.59**	0.52**	0.72**	0.78**	1						
Emotional intelligence	0.16	0.2*	0.31**	0.02	0.03	0.13	1					
Self-awareness	0.15	0.1	0.21*	0.13	0.1	0.18	0.86**	1				
Self-Management	0.17	0.19	0.24*	0.1	0.1	0.19	0.94**	0.8**	1			
Awareness	0.13	0.24*	0.35**	0.1	0.02	0.1	0.91**	0.66**	0.8**	1		
Management of relations	0.12	0.21*	0.34**	0.05	0.01	0.03	0.95**	0.72**	0.82**	0.89**	1	
Effectiveness	0.44**	0.47**	0.1	0.38**	0.47**	0.34**	0.04	0.1	0.01	0.1	0.01	1

\*\* Correlation is significant in the level of 0.01

**Hypothesis 3.** Time management, emotional intelligence, gender predicts the effectiveness of the physical education teachers of Karaj city. In order to predicts the effectiveness of the physical education teachers of Karaj city with time management and emotional intelligence the multivariable regression is used. As it can be seen from table 4, the correlation coefficient of the time management variable with the effectiveness of the physical education teachers is 0.36 and the coefficient of determination, which is the percentage of the reference variance obtained by prediction variables is 13%. The regression equation with the significance level of 0.00 which is lower than 0.05 is significant, thus there is a linear relationship between the prediction variable the relation reference.

In order to investigate the regression variable the step by step method is used. In this model the management variable has the most significant level of correlation with the effectiveness variable and was used in regression model. The regression coefficient is B=0.26 and the standard regression coefficient is B= 0.36, the level of significance is 0.00 which is lower than 0.05. In this model the fixed variable obtained 3.1. Thus considering the regression coefficient of time management and the fixed variable the regression equation will be as follow:

$$Y' = 3.1 + 0.3 * (\text{time management}) \tag{1}$$

Table 4: The results of multivariable regression among the physical education teachers using step by step method

Reference variable	Predictive variable	Correlation coefficient	Deterministic coefficient	Level of significance of statistics	Regression coefficient
					Time management
effectiveness	Time management	0.36	0.13	36.9 0.00	B=0.26 B=0.36 0.00

**4 Discussion and conclusion**

Based on the researches in this subject it can be found that beneficial usage of time and time management has a considerable effect toward the success. Time is the issue that no considerable attention is paid to it. Many individuals working in organizations do not use their time in a proper way which leads to many problems and prevents the promotion of the organization. Having no identified goal which leads to disorganization is among the main factor for such a problem. Thus identifying goals has to be investigated. In today’s world the identification of the reasons for effectiveness of the employees is among the main management programmers. The importance of this subject is much more in education and education organization and it is because in such an organization

the human resources are involved to transfer knowledge to individuals in their learning ages. Thus the human resources should have a suitable and effective performance. Having emotional intelligence have a significant effect on the efficiency of the teachers which has a great importance. As discussed earlier the emotional intelligence is not a new research area but the effects of emotional intelligence on the performance of teachers has not yet been studied in details. While there are many research on the effect of emotional intelligence in academic success of the student. Eslaminan et al., (2014) have investigated this subject in a research named “the relationship between the emotional intelligence and application of teaching components of the professors of the Mazandaran medical university”. Their research showed that there is a significant relationship between the emotional intelligence of the professors and application of the teaching components. David and Jousef, (2005) investigated

this subject in a research named “the emotional intelligence and its relationship with leadership performance in work place”. The analysis of correlation and regression showed that there is a significant and a direct relationship between the emotional intelligence and the effectiveness of leadership performance. The more the emotional intelligence the more the effectiveness of the leadership. Comparing the results of the David research and the present study we found that there is a direct and significant relationship between emotional intelligence and the effectiveness of performance. Hajiloo and Eyvazi (2015) investigated this subject in a research named “the effectiveness of emotional intelligence on the time management and efficacy of the students. Their results showed that there is a direct and significant relationship between emotional intelligence and time management which is in line with present study. Mollayi et al., also investigated this subject in their research with the title “Investigation of the relationship of emotional intelligence and the success of the educational managers of the Golestan University of Medical Science. According to the result of present study and the direct relationship between emotional intelligence and the success of the managers, holding educational workshop for increasing the emotional intelligence of the educational managers leads to a greater performance of the managers. Comparison of the present study and that of Mollyi et al., showed that both research are in line with each other. Dirik investigated this subject in a research named “whether the emotional intelligence is effective in the balance of the relationship between mental health and work performance? The founding in the public section of the England shows that emotional intelligence balance the relationship of the mental health and the work performance just to some extent. In this research the out coming of the management theories and performances in studied. Comparison of the Dirik research with the present study shows that these research are not in line with each other. Regarding that the increasing the emotional intelligence will balance the performance which is not in line with the present study. According to the result of the study and because the dimensions of the time management is effective on the effectiveness of the teachers it can be proposed either of the dimensions can be used to increase the overall structure of the time management. Meaning that considering all the offers of the dimensions the level of relationship between the time management and effectiveness of the physical education teachers increases. As the emotional intelligence is one of the providers of the mental health of the students it is proposed to hold educational classes to increase the emotional intelligence skills by providing budget to counseling centers of the education ministry to increase the efficiency of the teachers.

**Abstract.** The purpose of the study is to study the relationship between human resource productivity and transformational leadership with considering the mediating role of spirituality in the workplace. So the employees of National Iranian Oil Products Distribution Company elected as statistical population and after selecting 195 people as statistical sample through simple random sampling. Results demonstrated that there is significant relationship between transformational leadership and human resource productivity and between transformational leadership and spirituality at work and between spirituality at work and human resource productivity. Also it was found that the full mediating role of spirituality at work in the relationship of transformational leadership and human resource productivity.

**Keywords:** transformational leadership, spirituality at work, human resource productivity, mediating effect

### 1 Introduction

Efficiency is not a new concept as old as human history. Generally, after the 1929 recession in the world so much interest in knowing the status of national income and there was economic productivity as an indicator of performance evaluation. Today all developed and developing countries of the importance of efficiency as one of the requirements of economic development and competitive advantage in the realm of the individual, institutional, national and international focus, because the countries surveyed survival in competitive world productivity. During recent decades, many countries in the world to achieve the desired level of life, improving labor productivity targets and some countries such as Korea, Malaysia, Singapore and Hong Kong through this economic considerations valuable results achieved and to help it sit higher in the structure of economic power on the base. Research studies indicate that economic development, social and political ruler of the country, especially in developing countries depends on the culture of productivity and having the right attitude and reasonable efficiency category.

On the other hand, different changes started in the late twentieth century led to a loose more traditional paradigm based on Newtonian physics in various fields including managed and in this regard, a growing emphasis on concepts such as self-control and transformative and working life and moral integrity has been done (Farhangi et al., 2009). It is clear in this context how to check the efficiency of human resources was also somewhat affected by such changes and on the basis of identification factors on increasing the productivity of human resources should be made to pay special attention to factors related to the new paradigm. Among the factors related to the concepts introduced in the new approach can be considered transformational leadership and spirituality in the workplace. In general, since the hard and soft factors, affecting the productivity of human resource discusses and the need to do more research on the effectiveness of the concepts of spirituality paradigm based on the productivity of human resources is felt. Therefore, the aforementioned base material and increase global trends arising from the paradigm focusing on the concepts of spirituality necessary to assess the impact and the concepts of productivity of human resources as the most important factor for achieving organizational goals to be felt. This study aimed to investigate

the relationship between transformational leadership and labor productivity given the role of spirituality in the workplace by the National Iranian Oil Products Distribution. In this study, the element of spirituality in the workplace as one of mediating variables in the relationship between transformational leadership and human resource efficiency are discussed.

### 2 Theoretical foundation and research topics

In general, World War II caused a change in the development of theories of leadership and several theories regarding the motivation of the followers of the theory- purpose, charismatic leadership, transformational leadership and interaction is presented. Transformational leadership by Burns in 1978 as a process through which leaders of the radical changes in outlook and behavior caused their followers, was introduced (Ralph and Masi, 2000). This theory by Bass in 1985 conceptualized and was developed further, in his view transformational leadership beyond traditional leadership development and promised a reward for the effort is rewarded based transactions (Chin, 2007). Burns defines transformational leadership as a process in which leaders and followers together to promote the ethical level. Transformational leaders are those who are able to motivate followers, the ability to inspire and commitment to gain followers. In fact, transformational leadership of interactive leadership style that only through reward and punishment-based motivation beyond and the trust and loyalty of others, outlining the dramatic landscape of potential opportunities and also to inspire followers would make a commitment to change and they are high in self-control. Transformational leadership thus contributes to individual staff, each disguised as something transformative, and the organization toward future moved (Farhangi et al., 2009).

According to Lehmann - Willenbrock et al., (2015) also transformational leadership process of influencing major changes in attitudes and assumptions of organization and commitment to the mission, goals and strategies defined. In the study, Lehmann - Willenbrock et al., (2015) based on the views Podsakoff College (1990), a measure based on six factors identified and expressed landscape, providing a suitable model, encourage acceptance of group goals, expectations are high performance, providing individual support and mental stimulation has been used for transformational leadership. Meanwhile Afejeh and Hamzehpour (2015) for transformational leadership characteristics such as the patterns of followers into leaders and admiration, respected and trusted by their followers and attention to others' needs above personal needs sharing risks with followers, grittiness and lack of personal use of power, motivate and inspire followers by giving meaning and challenge of giving leadership through their work. Follower's efforts to stimulate the creativity and innovation using questionable assumptions, framework remake the problems and dealing with the conditions of new ways and behave differently from followers based on an individual's personal needs and capabilities discussed.

Productivity at the micro level to the macro can be analyzed. However, in examining the issue of productivity should be considered equivalent to what can be achieved by adopting the views of six economists, accountants, physicists, industrial engineering, organizational psychology, industrial psychology finally, managers should be taken to investigate the matter. In accordance with the views of management efficiency in the use of resources for achieving objectives include the success and somehow also involves the concept of efficiency and effectiveness of the concept. In fact, the essential element in creating and improving efficiency, human resources and most common cause of failure in achieving the goals of the

organization can be considered related to the lack of productivity of human resources.

In this regard, Hersey and Goldsmith efficiency of human resources in the form of seven variables within the meaning of ability and skills followers is in accomplishing a task successfully. Clarity or understanding of the concept of understanding, acceptance of work, where and how they work, organizational support, within the meaning of the support needed to complete the work effectiveness follower. The concept of motivation or incentive followers incentives for successful completion of a specific task, such as daily feedback and performance assessment or feedback on the concept of casual, credit within the meaning of the appropriateness and legality of decisions regarding human resources managers and the environment in the context of factors affecting performance of individual power. Despite, having the ability and role clarity and motivation have been classified.

In recent decades, the concept of spirituality and its applications in the world and especially in the West have been of great interest. So that the arrival of such concepts as God, religion and spirituality that were considered private issues into academic research in the humanities and managed. In general, theoretical foundations in various scientific disciplines that have addressed the resurgence of spirituality based on dissatisfaction with the status quo (Joanna, 2010).

Actually, introduction of these concepts as ethics, truth, belief in God and a superior force, meaning savings in labor, altruism, and ... in the field of research and management actions and indicates the emergence of a new paradigm have business and according to many researchers. This new paradigm based on quantum physics, science, cybernetics, chaos theory, cognitive

science, western and eastern religions and rituals, and the reaction to modern mechanistic paradigm is dry, is the spiritual paradigm.

In this regard, Kennedy (2002) believes that satisfies the high demands of employees in an enterprise environment can also be searched pattern spirituality. In fact, on one hand the undeniable importance of human resources in the organization. On the other hand, given the importance of spirituality in human life, attention to spirituality in the workplace is also highlighted. According to studies to date, spirituality in the workplace is one of the emerging concepts in management literature and from the perspective of managers as source organizations that can help them in times of turbulent and chaotic, support decreased gradually.

Mitref and Denton (1999) spirituality at work trying to search and find fans in person for working life, in order to establish a strong relationship between the individual and colleagues that somehow involved in his work, also Gybnz (2001) as well as a sense of spirituality in the sense of integrity, continuity and deep appreciation of the work is known. Also in terms Marquez (2005) spirituality in the workplace means there is a sense of trust, belonging, respect and meaning in all fields for a more perfect life. Salman et al., (2011) spirituality in the workplace beliefs and values associated with goals, as well as religious beliefs are known. In general, according to Nasyna and Doris (2011) defined three main viewpoints on spirituality in the workplace can be pursued: Religious approach, introspective and existential. Spirituality in the above-mentioned approaches in order to comply with the orders of a particular religion, it is considered within the meaning savings in the workplace. Dimensions of spirituality in the workplace in Table 1 are given.

Table 1: Dimensions of spirituality in the workplace

Source	Dimension
Milliman et al., (2003)	Significant work (individual level): a deep sense of meaning and purpose in individual work, the sense of community (the group): continuity and connect with others, to comply with the values of the organization (the organization): a strong sense of harmony between personal values and corporate objectives
Pandey et al., (2009)	Coordination with, in coordination with the social and natural environment; Excellence
Karakas (2010)	Model anchors 9 Spirituality
Rego and Cunha (2008)	Common sense of team; alignment between personal and organizational values, a sense of contribution to society, feel exposed and opportunities for inner life
Ashmos and Duchon (2000)	- The individual level include: at work, inner life, personal responsibility, positive connections with other people, thinking and reflection, the group includes: integration business unit, business unit positive values; organizational levels: organizational values, people and organization

In general, the machines, the complexities of life lead to a lack of balance and imbalance for employees on course to achieve the goals. As a result, spiritual and psychological pressures in the workplace. Alvani et al., (2013) based on the model developed based on religious principles are expressed human resources to improve productivity that organizations should act to develop a culture of moderation in the organization. The model presented in this study is one of the aspects of human resources, balancing spirituality and researchers noted consider culture of moderation. Jamshidi and Ghahfarokhi (2013) in a study to examine the relationship between organizational spirituality and labor productivity measure based on the results obtained positive correlation between spirituality and productive members of society was approved. In fact, spirituality in the workplace can provide productivity benefits for enterprises, including the promotion of human resources organization and thus facilitate the achievement of goals. Osman - Ghani (2013) the influence of religion and spirituality study aimed to evaluate the performance of employees in multicultural organizations and several religious piety and spirituality on positive and significant relationship have focused on employee performance.

Also in accordance with the vision of Karakas (2010) as well as spirituality in the workplace leads to several advantages such as improved staff attitudes job and thereby also the performance, profitability and organizational effectiveness and influence. Based on the view of Ahmadi et al., (2014) spirituality in the workplace is having a significant relationship with organizational citizenship behavior. In fact, in contrast to the concepts of spirituality in the workplace such as organizational cynicism by creating favorable working conditions can improve the underlying performance of the underlying obligation and employee productivity.

Leadership style can be used as a factor for direct and indirect impact on organizational efficiency and employee productivity in organizations. In fact, the *raison d'être* and responsibilities of managers in organizations can play a role of leadership in order to achieve better resource efficiency and human resources, particularly. As the transformational leadership through communication and navigation - support for the establishment of relations between the abilities of employees with futuristic goals,

as well as provide the context necessary to strengthen performance.

Also Vincent - Hooper et al., (2012) in another study, the significant impact of transformational leadership on career success have confirmed. On the other hand the theory of multifactor productivity and systematic model selection and development of human resources in the organization (Manabams), the most important factor that can increase productivity requirements for organizations providing human resources, transformative leaders, successful and effective organization. In this regard, (Ralph & Masi, 2000), in their study stated those transformational leadership behaviors can lead to high levels of productivity. House et al., 1988 in review studies on the relationship between transformational leadership and performance has underlined. In fact, transformational leaders tend to empower and motivate subordinates to influence their commitment in achieving their objectives (Ralph & Masi, 2000). Also according to Joanna (2010) can be said that transformational leadership is associated with higher levels of needs and focused on inspiring involvement because of the importance of intellectual stimulation transformational leadership. It can be based on this idea with the idea of trying to integrate rationality and soul in spiritual leadership and transformational leadership through the descriptors compatible inspire linked with spiritual leadership.

In general, there is no doubt that fundamental changes in the workplace are forming and spirituality will be one of the key issues. Slowly the small environment of economic and social organizations soon becomes an environment for spiritual growth. If viewed from this perspective led to dramatic changes in the method of measuring the effectiveness of leadership occurred.

Figure 1. The conceptual model

Mac et al., (2011) also aims to investigate the relationship of spirituality in the workplace, transformational leadership and employee welfare on the role of spirituality in the workplace mediator in the relationship between transformational leadership and employee well-being have emphasis. Karacas (2010) In moments of spirituality based model, multidimensional model of leadership styles and values individual differences as a new compass provided leadership in the 21st century which can provide useful insights for managers and practitioners in the field

of leadership with regard to the concept of spirituality in the workplace. Also in accordance with the Farhangi et al., (2009) the integration of spirituality and leadership in turbulent conditions stable source of meaning in the work environment provided for the creation and ongoing and the need for unity among spirituality, business leadership is an inevitable consequence of chaotic era and now leaders must respond to questions related to meaning. The leader inspires people to grasp the complexities of working capacity increase and inspiring vision. Ghadi et al., (2013) also on the positive role of transformational leadership have focused on the creation of meaning in the work of follower. Based on the conceptual model those previous research findings of the analysis and combination of models used in the research literature, (Figure 1) that the hypotheses of the study below are given.

### 3 Research Methodology

Hypotheses of the research are as follows:

- I. There is a significant relationship between transformational leadership and productivity of human resources.
- II. There is a significant relationship between spirituality in the workplace and productivity of human resources.
- III. There is a significant relationship between transformational leadership and spirituality at work.
- IV. Spirituality in the workplace in the relationship between transformational leadership and productivity of human resources plays a mediating role.

The purpose of the research and study in term of the nature is descriptive and survey. In order to collect information related to the theoretical foundations of library and to gather data to test the hypothesis-standardized questionnaire was used. The transformational leadership model to measure Besvavlio (1997), to measure spirituality in the workplace questionnaire Milliman et al., (2003) and to measure the efficiency of human resources of models Hersey and Goldsmith (1980) is used.

In this study, Cronbach's alpha was used to determine the reliability of the test. Moreover, its value is obtained for all questionnaires 0.96. Also in this study, the experts confirmed using Content validity. The population of this study includes employees of National Iranian Oil Products Distribution and in order to collect research data using simple random sampling of 195 people chosen as sample and collected data using SPSS 16 and Amos 18 software and using structural equation modeling approach were analyzed.

#### 3.1 Testing hypotheses

To test the hypothesis in this study, structural equation modeling approach was used. Therefore, you must model overall indicators related to test research hypotheses examined and then ensure proper fitting indicators necessary to test hypotheses. The results in Table 2 indicate good indicator of overall fitness and overall fit indices and it could be well supported by data from the model.

Table 2: Overall indicators structural equation models

	CMIN/ DF	P	GFI	CFI	RMR	RMSEA	PCLOSE
Acceptable value	$0 < X < 3$	$X > 5$	$X > 0.9$	$X > 0.9$	$X < 8$	$X < 8$	$X > 5$
The first hypothesis model	1.59	0.085	0.96	0.98	0.027	0.064	0.295
The second hypothesis model	1.21	0.186	0.94	0.98	0.037	0.038	0.65
The third hypothesis model	0.842	0.745	0.961	1.000	0.045	0.000	0.974
The fourth hypothesis model	1.74	0.061	0.903	0.951	0.043	0.072	0.051

After reviewing and confirming the overall fit of the model in terms of indicators, action research is to test hypotheses. To test the hypothesis that a significant part of the index P used must ensure that the level 0.95 is less than 0.05. According to Table 3, according to the partial value of p to three first hypothesis is less

than five percent ninety-five percent confidence level, it can be argued that a significant relationship between transformational leadership and human resource efficiency and spirituality in the workplace as well as spirituality in the workplace and the productivity of human resources has been approved.

Table 3: The results of the first to third research hypothesis

Hypothesis	Hypothesis	Impact factor	P	Result
First	Transformational leadership ← Spirituality in the workplace	0.67	***	Confirmed
Second	Spirituality in the workplace ← Productivity of human resources	0.88	***	Confirmed
Third	Productivity of human resources ← Transformational leadership	0.86	0.03	Confirmed

The fourth hypothesis to examine the mediating role of spirituality in the workplace in the relationship between transformational leadership and human resources was carried efficiency. Baron and Kenny logic for this purpose has been used. The Baron and Kenny take on the role of the following three conditions must be met through a variable: independent variables have a significant effect on the mediator (path A), it have a significant effect on the dependent variable mediator (path B) and if A and B are controlled by the significant relationships between independent variables already there was not significant and dependent on others. In fact, in this method, without the presence of the mediator investigate the relationship between the independent variable dependent and significant action if it can examine the role of mediator.

However, if the independent variable and because of the mediating role of mediator to be a significant variable related to verification and the independent variable significantly associated with the presence of the mediator through the mediation of minor and in the absence of significant independent variable associated with the presence of the mediator will be faced with a complete mediation. The first method presented in the paper Baron and Kenny in 1986 and quickly became the most common test method was a significant mediator in the humanities. Baron and Kenny article has been cited more than 46,000 times (Ghadi, et al., 2013).

Table 4: Test result mediator (fourth hypothesis)

The fourth hypothesis routes	Impact factor	P
Transformational leadership ← spirituality in the workplace	0.70	***
Spirituality in the workplace ← productivity of human resources	0.78	***
productivity of human resources ← transformational leadership	0.21	0.300

According to Table 4 and decision logic Baron and Kenny due to the significant relationship between the independent variable and the mediator's transformational leadership and spirituality in the workplace and significant relationship with the dependent variable, productivity mediator of human resources on the one hand and no significant relationship between the independent variable on the dependent variable can be claimed. The intermediary role of spirituality in the workplace entirely in the relationship between transformational leadership and human resource efficiency.

#### 4 Conclusion

The aim of this study was to investigate the relation between transformational leadership and productivity of human resources given the role of spirituality in the workplace by the National Iranian Oil Products Distribution. The results suggest it is that transformational leadership and productivity of human resources in the study had significant relationship and on this basis we can say. Once again, the primary responsibility of managers in taking leadership roles in order to provide the necessary conditions for improving the productivity of resources and especially human resources organization as the most important resources and capital has been emphasized. In fact, transformational leaders capable of creating the necessary conditions for the promotion of employee productivity through relationships between staff capabilities with future-oriented goals, directional communication - supporting and conveying a sense of confidence in them. In this context, improves attitudes in the organization. Moreover, increase their desire to extra-role behaviors can also result and antecedents transformational leadership and productivity of human resources, he said. In fact,

transformational leadership with high probability increase productivity platform.

In fact, employees with sense of personal achievement and organizational success and participation in order to achieve performance results will be committed to higher productivity. In accordance with the results of testing indicate no significant relationship transformational leadership and spirituality in the workplace also been approved and the importance of leadership in an atmosphere filled with spirituality has been reaffirmed in the organization. In this context, and based on the results, it can be stated transformational leadership in organizations that create an atmosphere where employees the opportunity to do meaningful work and a sense of integrity of organizational and human values have been effected and in this regard than the traditional style based on interaction style can be significantly more effective in this area. This is likely to feature in the constituent components of transformational leadership on organizational climate, which could pave the way to support the spiritual needs of health care organizations. The results of the study confirmed the significant relationship of spirituality in the workplace and the productivity of human resources and role of Spirituality in the workplace and approved intermediary in the relationship between transformational leadership and human resource efficiency.

Neck, C., & Milliman (1994) as well as attitudes and values based on spirituality not only in the personal lives of employees but also affect their job performance. In fact, to satisfy the spiritual needs of employees in the organization, a more positive attitude toward work and their commitment towards improving the performance goals can be promoted. In other words, human affinity and organizational values and the opportunity to do

meaningful work could eventually create conditions provide fields that serve employees wholeheartedly work and organization and most likely your work done with higher efficiency and on track to meet performance goals set to show more effort than before. Organizations with higher spirituality to make way for the further integration of individual self and professional self-involved in the organization and individual employees in the workplace is integrated with the totality. Naturally, by comparing this case with a condition the person has no opportunity do something meaningful sense of continuity in the organizations something great. There is doubt in human and organizational values can be learned more about the role and the importance of spirituality in the workplace as an important element to improve performance and realized productivity of human resources and the importance of the results of testing this hypothesis ... reflect the research. This research relevant to the investigation undertaken in this context the importance of National Iranian Oil Products Distribution spirituality in the workplace and increase employees' sense of integrity, opportunity to work with the meaning and value of human organization as important factors in improving productivity and human resource performance has stressed than before.

In fact spirituality through different mechanisms can also improve the underlying performance and efficiency of human resources organization. Finally, it can be stated that in addition to positively influence transformational leadership in creating the conditions for improving the efficiency of human resources, it will be necessary context for performance enhancement and productivity of human resources through the promotion of spirituality in the workplace provide more. In fact, leadership, inspiration and motivation to the people work at a higher level and expand the interests of their ability achieve the goals and mission of the organization's staff. On the other hand are able to gain insight induction followers and their beliefs and values shared their spiritual influence and thereby facilitate the achievement of the objectives and desired outcomes.

Email: <sup>a</sup>Abootaleb.yazdani1361@gmail.com,

<sup>b</sup>Yazdanishiri.abdolkh@gmail.com

**Abstract:** The aim of this study was to investigate the relationship between economic value added (EVA) with earnings per share and stock price in the companies operating in the cement, ceramic and tile industries and is listed on Tehran Stock Exchange. The respective data for analysis through financial reports and accompanying explanatory notes was collected and extract from Tehran Stock Exchange website and Rahavard Nowin software. To test the hypothesis, after determining the diagnostic method, regression analysis was used. The results showed that the relationship between EVA and earnings per share in the ceramic and tile industry is positive and in the cement industry is negative. The relationship between EVA and stock price in the ceramic and tile industry is significant and positive and in the cement industry is negative.

**Keywords:** EVA, earnings per share, stock price.

### 1 Introduction

Accounting is an information system, that the main users of the major part of this information are shareholders and managers of a firm economy. But management according to responsibilities for different groups of users of financial information, also according to legal requirements or requests for funds by businesses or firms, offer various information for the range of external users of financial information in a specific framework. The accuracy of these reports is confirmed by independent auditors. Financial reports is among the most important products from accounting information systems for different groups of external users of financial information are provided in the framework and the accuracy of these reports is confirmed by independent auditors (Bahrami, 1997).

The profits can be used to evaluate the profitability, ability to pay divisions, forecasting and assessing the risks of investing in the company's future earnings. Therefore, traditional performance evaluation measure is the most important earnings, but this standard is impaired. Earning is able to manipulation using different methods to assess inventory, research and development expenditures, depreciation and reserves. Also, in calculating earnings, capital expenditures order not to be. To overcome these drawbacks, a new measure called economic value added by Stern and Stewart was introduced in 1989 to evaluate the performance.

Economic value added is defined as operating income minus the cost of capital that is used to create it. In measuring performance based on traditional accounting profit, the only costs to be financed through debt, while in the calculation of economic value added, cost of debt and equity financing, both to be considered. The concept of economic value added, in addition to profit, it is also important quality, all profits with the amount of investments made and how much was the cost of capital?

In this study, investigate the economic value added and its relationships to earnings per share and the stock price in companies listed on Tehran Stock Exchange (cement and ceramic- tile industries).

### 2 Statement of the problem, the necessity and importance of research

With the advent of large enterprises and the formation of separation of ownership from management issues because of conflicts of interest between owners and managers, to evaluate

the company's performance and management issues of interest to various segments such as creditors, landlords, government and even the general manager. One purpose of accounting science is to provide information to investors and analysts to help them to assess the organizations and managers performance. Different groups, often with the use of financial ratios based on balance sheet information, benefits and disadvantages bills and statement of cash flows have been prepared, to evaluate the performance of companies. But each category of financial ratios, on the one hand because only one dimension of financial performance to assess (a class of their liquidity ability, teams can assess ability to grow earnings and the other part) and on the other hand the reason for using accounting net profit have misunderstandings. Net profit is a lot of uncertainty, including the possibility of smoothing, the use of estimates in calculating earnings as costs for bad debts, the use of management freely accepted accounting methods. Therefore, the new standard is needs to have fewer restrictions. So, the economic value added because accounts the opportunity cost as a cost in the accounting, different with other accounting standards. EVA examined actual profit companies, i.e. direct costs and indirect debt is considered 'equity (Nikbakht and Moghimi, 2011).

Earnings reflected in the income statement, wealth is created in a specified time interval to shareholders awarded. While the added value represents the wealth that by working groups of shareholders, lenders, employees and the government created a fiscal period is specified. Thus, each of the above groups received their share. This means that the value-added concept is broader than the profit. The company's added value as a measure of performance because calculate the value of the wealth generated by the company in a given period. So it is a measure for management performance. Investors who have a major role in the capital market, when deciding to purchase securities need to know the real value of the company and its stock. So, there are still doubts about this concept that the earnings per share is an appropriate measure to decide shareholders or not or whether economic value added have the relationship with earnings per share? Or even play a fundamental role in investors' decisions or not. Therefore, understanding the relationship between EVA and earnings per share (EPS) is too importance.

The aim of this study is to investigate the relationship between EVA and earnings per share and stock prices in Tehran Stock Exchange, according to the industry type.

#### 2.1 Theoretical Foundations

In this section, the theoretical foundations of economic added value, the earnings per share and the stock price is expressed.

#### 2.2 Earnings per share (EPS)

There are many articles and discussions about profit and EPS. Some researchers investigate the relationship between EPS and dividend per-share (DPS) and stock price. In many countries, the importance of this account is that it is effective as one of the basic criteria in determining stock prices and it has been used widely in the stock assessment models.

EPS are one of the most important financial statistics that are of interest to investors and financial analysts. Earnings per share reflects the potential benefit that income per ordinary share and is often used to evaluate the profitability and risk associated with profit and judge whether the stock price is used. Now, the companies listed in Tehran Stock Exchange, in accordance with the directives of stock, are required to provide information about real and predicted EPS and disclosure of subsequent changes in predictions, but there is not specific accounting standard on how to calculate and report EPS.

According to Irala (2005), EPS is a measurement of the company's per-share performance. Based on this definition, EPS is a performance measurement which assessed based on the value per share profit. Meanwhile, according to Sawir (2001), EPS is a ratio used to determine how much net income per share. For that in its calculations, EPS does not include the cost of capital for the use of debt will lead to a change in EPS and also changes in the risk - as these two factors will changes the company's stock price.

### 2.3 Economic value added (EVA)

Analytical tools EVA, in 1982 introduced by the Institute "Stern and Stewart" in New York ([www.EVA.com](http://www.EVA.com)).

EVA first time to identify, create and presented by Stern and Stewart's to provide consulting services to companies that want a proper level of compensation for managers. Innovators like Stern re-organize practical limit profits were revised accounting. Unlike traditional measures such as EBIT and NOPAT and ..., EVA was based on the firm's profitability.

Companies such as Coca-cola, Diago and SPX implement EVA as a guide to create value for the shareholders. Investment companies such as Management Global Asset and Oppneheimer Capital use from EVA for stock selection, portfolio construction and risk control process.

EVA is a measure that uses for the overall monitoring of value creation by firms. EVA is not strategy, but a way to measure the results.

EVA is the difference between net operating profit after tax and cost of capital.

EVA is evolved version from RI which is deducted all costs, including the opportunity cost of capital (Rau and Satish, 2007).

So, the EVA is different traditional tools to measure the accounting profit, such as EBIT, and EPS because EVA is the total cost of financing.

### 2.4 Stock price

It is believed that stock prices are determined by some macroeconomic variables such as interest rates, currency, and inflation. Several studies investigate the effect of economic forces on stock returns in different countries. For example, arbitrage pricing theory was used by Ross (1976), Chen et al (1986) to illustrate the effect of macroeconomic variables on stock returns in the capital markets in the United States. Their findings showed that industrial production, changes in the risk premium and changes in the term structure have a positive relationship with stock expected returns. However, the relationship between predicted and unpredicted inflation rate with expected stock returns is significant and negative.

Stephen Ross (1976) was presented Arbitrage pricing theory as a substitute for capital asset pricing model. Capital asset pricing model begins with this process that how investors can create an "efficient portfolio". However, Arbitrage pricing theory to look at risks of completely different perspective and measure stems and is not looking for efficient investment portfolios, but it's based on the assumption that stock price adjustment when shareholders are seeking Arbitrage profits. When the income Arbitrage disappears, say stock prices are at equilibrium. Definition of market efficiency in this theory means that there is no Arbitrage opportunity.

Arbitrage pricing theory knows the real return bonds, a function of the economic variables. Unlike the model capital asset pricing model makes it possible to provide more than one systematic risk factor. In the investment portfolio, stock specific risk for per share is not important. Error factor of individual stocks are not dependent, and their correlation coefficient is zero. In these

circumstances, the only risk factor is important and demonstrates that systematic risk can't be deleted, but unsystematic risk is eliminated with diversity in investment.

Chen et al., (1986) believed that the truth lies in the five economic factors and different stocks have different sensitivities to these five factors and these factors are a major part of the source of systemic risk in the portfolio account.

In their view, the five factors are:

Changes in inflation forecasting; 2) unexpected changes in inflation; 3) unexpected changes in industrial production; 4) unexpected changes in the differential between the yield to maturity bonds, junk bonds and preferred securities (bonds risk premium); and 5) unexpected changes in the yield to maturity the difference between long-term and short-term bonds.

Tests done on Arbitrage pricing model showed that the theory of competitive pricing model capital, in overwhelming abducted.

Poon and Taylor (1991), a similar study, Chen et al., (1986) conducted in the UK market. Their results showed no effect of macroeconomic variables on stock returns in the United Kingdom. This conclusion was contrary to the findings of Chen et al in the US stock market. Poon and Taylor believe this is due to their differing conclusions or other macroeconomic factors on stock returns have influenced the UK or the inefficient method has been used by Chen et al., The claim that economic variables such as inflation, exchange rates and stock prices are stimulating and affecting, as a theory has been accepted. However, in the past decade, efforts to study the impact of economic forces theoretically and empirically measure its effects, is done. Dynamic relationship between macroeconomic variables and stock returns has been widely studied. It is based on research on the theory that stock prices reflect the present value of future cash flows of a share (the present value). For this reason, the future cash flows and the expected rate of return is required (discount rate). Therefore, economic factors have on future cash flows and the expected rate of return is affected. Therefore, they can influence the stock prices (Elton and Graber, 1991).

### 3 The research literature

In the recent years, numerous studies have been made on the EVA and its relationship with other accounting variables and parameters. Also, the EPS and stock prices as well, have done extensive research into some of them, some of the researches mentioned in the following:

Heidari (2013) in a study entitled "effect of earnings per share (EPS) on stock price: a case study of Tehran Stock Exchange companies with average earnings per share" have been used for annual data and stock prices of 48 companies' earnings per share during the year 2007 to 2012 in the stock exchange to investigate this relationships. The results suggest that the effect of the earnings per share on the stock price as expected was positive.

Tamimi et al., (2013) in a study entitled "the relationship between changes in market added value with economic value added and return on capital and return on sales" use to assess the performance of listed companies in Tehran Stock Exchange during the period 1380 to 1388, with criteria for return on capital and return on buy and EVA's. For this, first a linear relationship between performance measures and market value added through regression models were evaluated and Pearson correlation coefficients were calculated to compare different criteria. The results show that the correlation between the market value and economic value is more than the correlation of market value and return on capital and return on sales.

Fathi and Shaybeh (2013) did a study entitled "economic value added and comparison with other methods of assessing the performance of companies in market value determination in different industries on Tehran Stock Exchange", the effect of

four variables included two traditional performance criteria (net operating profit after taxes, and the ratio of price to earnings per share) and two performance evaluation criteria (economic value added and free cash flow) the market value of their companies. The population consisted of four companies, industry (cement, automotive, pharmaceutical) listed in the Tehran Stock Exchange during the years 1998-2009. The results showed that the industry type is effective in determining the market value of the company. So can't introduce an accurate factor as the standard criteria for defining the market value of companies in all industries.

Ebrahimi et al., (2009) in a study entitled "the relationship between economic value added (EVA) with stock price and the price earnings (P / E per share) of companies listed on Tehran Stock Exchange", investigate the relationship between EVA and stock prices as well as the relationship between economic value and the price paid earnings per share between 2002 to 2006. The results showed that only in some years there is a relationship between the variables of the study. It is expected that the weak relationship and no relationship between the variables of the study, is due to market inefficiency and political and economic factors in the country. Therefore, the stock market price and its intrinsic value between the economic and financial analysis show this form.

Melbourne (2002) in a study entitled "the search for the best financial performance measure" investigated the correlation between EVA and REVA's criteria and concluded that REVA criteria in predicting the ability to create value, is higher than the standard EVA. In this study, were investigated the significance of EVA and earnings per share. So the relationship between economic value added and net operating profit after tax with the market value has examined. The results indicate that economic value added and net operating profit after tax was, respectively show 31% and 17% of the variation in the market value. As well as the EVA in explaining the changes in the market value operated better than traditional accounting criteria.

In this study, the Stock Exchange information about all companies in the cement industry, ceramic and tile output since the beginning of 2008 until the end of 2012 have been extracted and exploited.

### 3.1 The research hypotheses

According to the arguments, the study's hypotheses can be stated as follows:

H1: There is a significant relationship between the economic value added (EVA) and earnings per share (EPS) in the ceramic and tile industry companies.

H2: There is a significant relationship between the economic value added (EVA) and earnings per share (EPS) in the cement industry companies.

H3: There is a significant relationship between economic value added (EVA) and the stock price (P) in the ceramic and tile industry companies.

H4: There is a significant relationship between economic value added (EVA) and the stock price (P) in the cement industry companies.

H5: There is a significant relationship between earnings per share (EPS) and the stock price (P) in the ceramic and tile industry companies.

H6: There is a significant relationship between earnings per share (EPS) and the stock price (P) in the cement industry companies.

## 4 Research methodology

This research method due to the nature of it is the field and library. The population including of all companies active in the Tehran Stock Exchange in ceramic, tile and cement industries for the period 2008 to 2012 for a 5 years period. The required data for the study were collected from the financial statements and notes of 2008 until 2012 years in examined companies. After collecting data and calculating the main variables using the EXCEL and EVIEWS software, the correlation between EVA, EPS and P (stock price) is calculated by Pearson correlation coefficient. After calculating the Pearson correlation coefficient, significance test is performed.

In the following, the research variables and how they are calculated is shown.

### Economic value added (EVA):

To calculate the economic value operating as follows:

$$EVA = (r - c) \times \text{Capital} \quad (1)$$

In calculating the economic value added, in the above formula, the financial approach is used, because the selective approach in calculating r and modifications necessary to convert accounting profit on NOPAT, equity or assets has an impact on capital.

### Overall investment rate of return (r):

The rate is calculated using the following formula and is based on financial approach:

$$r = \text{NOPAT} / \text{capital} \quad (2)$$

Where NOPAT is Net operating profit after taxes.

The cost of the devaluation of inventories+ (saving tax interest expense - interest expense)+ accounting net profit after tax+ deferred expenses + cost of staff termination benefits+ bad debt expense + cost reduction in value of investments

In calculating NOPAT the tax savings interest expense= interest expense\* effective tax rate

Capital is calculated as follows:

### Capital:

Remember to reduce the value of their investment+ remember the devaluation of inventories+ interest-bearing liabilities+ equities+ (fees payable) debt for deferred costs+ reserve staff termination benefits+ bad debt provision

Interest-bearing liabilities= reception facilities from banks+ pre received sales + bonds payable

### The rate of capital cost (c):

For the calculation of capital cost rate, weighted average capital cost (WACC) is used. Using this method requires identifying the sources of corporate finance and then calculated the cost of each of these resources. Based on the company's balance sheet under test, these companies have used the following resources:

1. interest-bearing debt
- 2 new ordinary shares
3. Other components of equity

The formula weighted average capital cost rate and is calculated as follows:

$$C = W.C \quad (3)$$

$$C = W_1 * C + W_2 * C + W_3 * C + \dots + W_n * C_n$$

$P_1$  = Price in the first year,  $P_2$  = Price at the end year

### The method of calculating earnings per share (EPS):

To calculate EPS, it is required divided the profit (NOPAT) on the weighted average number of the company shares during the year. It the weighted average number of shares means that each share is considered according to the time of year when the spread.

### The method of calculating stock price (P):

Since EVA and EPS related to the performance of a financial year, so P should be chosen to maintain and calculate indicating the price of a stock in the financial year, For this purpose, the average stock price at the beginning and end of the period have to calculate:

$$P = \frac{P_1 + P_2}{2} \quad (4)$$

Table1. Descriptive statistics variables in ceramic and tile industry (2008-2012)

	EVA	EPS	P
Number of observations	50	50	50
The average	-513300.1	287	1771.88
Mean	2173171	291	1502.5
Max	1055850	1328	5021
Minimum	-80482798	-764	209
The standard deviation	13187965	365.98	941.37
Coefficient of skewness	-4.85	-0.103	1.55
Coefficient of kurtosis	28.74	3.92	5.68
Jarque-bera statistics	1576.53 (0.000)	1.85 (0.396)	34.81 (0.000)

Shows the descriptive statistics of the main variables (EVA, EPS, P) in the cement companies in Tehran Stock Exchange for 5 years (2008-2012), which includes 29 companies.

Table2. Descriptive statistics variables in cement industry (2008-2012)

	EVA	EPS	P
Number of observations	145	145	145
The average	11866861	1242.44	5746.34
Mean	8636958	787	3474
Max	91729416	8449	42904

Coefficient of skewness	3.4	2.833	3.08
Coefficient of kurtosis	16.39	12.29	14.08
Jarque-bera statistics	1362.411 (0.000)	717.5 (0.000)	970.84 (0.000)

Statistical hypothesis testing

To investigate the relationship between variables using Pearson's correlation coefficient, should be for each hypothesis, an experiment consisted of a one hypothesis against the null hypothesis. The Pearson correlation coefficient null hypothesis was not always associated and reject the null hypothesis implies the existence of a relationship between variables is statistically significant. The advantage of this method is that indicate the intensity of the relationship and the type of relationship. The positive correlation coefficient means there is a direct correlation between variables and negative correlation coefficient showed a reverse correlation. Whatever, the correlation coefficient distance of zero and closer to the numbers 1 and -1, the correlation (positive or negative) is higher.

Table3. The correlation between EVA and EPS in the ceramic and tile industry (2008-2012)

Hypothesis test	Correlation coefficient	T student test	The minimum level of significance	Test result
Test No. 1	0.672	5.498	0.000	Reject the null hypothesis

In order to do this test and other tests ahead, Pearson correlation coefficient and significance test was performed using software

## 5 Research findings

Variables such as economic value added (EVA), earnings per share (EPS) and stock price (P) have been considered as the main variables. In addition, by using these variables for 10 ceramic and tile companies and 29 cement companies active in Tehran Stock Exchange calculated for the period 2008 to 2012, to test research hypotheses that discussed above. Tables (1) and (2) respectively included descriptive statistics for ceramic and tile industry and the cement industry.

Table1. Shows the descriptive statistics of the main variables (EVA, EPS, P) in the ceramic and tile companies in the Tehran Stock Exchange for 5 years (2008-2012), which include 10 company.

### 5.1 The first hypothesis test:

H0: Pearson correlation coefficient between EVA and EPS in the ceramic and tile industry is zero.

H1: Pearson correlation coefficient between EVA and EPS in the ceramic and tile industry is not zero.

After testing the correlation between EVA and EPS in the ceramic and tile industry in period (2008-2012), results showed in table (3):

EvIEWS. In this case, the correlation coefficient between EVA and EPS in the ceramic and tile industry is equal to 0.672, and t-

statistic equal to 5.498 and the minimum level significance of it is estimated to be equal to zero. Due to the correlation coefficient value is positive, t-statistic is most of the t table (1.96), and least significant level is lower 0.05, the null hypothesis is rejected and it was concluded that the relationship between EVA and earnings per share in the ceramic and tile industry is significant and positive.

### 5.2 The second hypothesis test:

Table4. The correlation between EVA and EPS in the cement industry (2008-2012)

Hypothesis test	Correlation coefficient	T student test	The minimum level of significance	Test result
Test No. 2	-0.478	-6.478	0.000	Reject the null hypothesis

In this case, the correlation coefficient between EVA and EPS in the cement industry is equal to -0.478, and t-statistic equal to -6.478 and the minimum level significance of it is estimated to be equal to zero. Due to the correlation coefficient value is negative, t-statistic is most of the t table (1.96), and least significant level is lower 0.05, the null hypothesis is rejected and it was concluded that the relationship between EVA and earnings per share in the cement industry is significant and negative.

### 5.3 The third hypothesis test:

Table5. The correlation between EVA and P in the ceramic and tile industry (2008-2012)

Hypothesis test	Correlation coefficient	T student test	The minimum level of significance	Test result
Test No. 3	0.309	2.253	0.029	Reject the null hypothesis

The correlation coefficient between EVA and P in the ceramic and tile industry is equal to 0.309, and t-statistic equal to 2.253 and the minimum level significance of it is estimated to be equal to 0.029. Due to the correlation coefficient value is positive, t-statistic is most of the t table (1.96), and least significant level is lower 0.05, the null hypothesis is rejected and it was concluded that the relationship between EVA and P in the ceramic and tile industry is significant and positive.

### 5.4 The fourth hypothesis test:

Table6. The correlation between EVA and P in the cement industry (2008-2012)

Hypothesis test	Correlation coefficient	T student test	The minimum level of significance	Test result
Test No. 4	-0.586	-8.621	0.000	Reject the null hypothesis

In this case, the correlation coefficient between EVA and P in the cement industry is equal to -0.586, and t-statistic equal to -8.621 and the minimum level significance of it is estimated to be equal to zero. Due to the correlation coefficient value is negative, t-statistic is most of the t table (1.96), and least significant level is lower 0.05, the null hypothesis is rejected and it was concluded that the relationship between EVA and P in the cement industry is significant and negative.

### 5.5 The fifth hypothesis test:

Table7. The correlation between EPS and P in the ceramic and tile industry (2008-2012)

Hypothesis test	Correlation coefficient	T student test	The minimum level of significance	Test result
Test No. 5	0.549	4.551	0.000	Reject the null hypothesis

The correlation coefficient between EPS and P in the ceramic and tile industry is equal to 0.549, and t-statistic equal to 4.551 and the minimum level significance of it is estimated to be equal to 0.000. Due to the correlation coefficient value is positive, t-statistic is most of the t table (1.96), and least significant level is

H0: Pearson correlation coefficient between EVA and EPS in the cement industry is zero.

H1: Pearson correlation coefficient between EVA and EPS in the cement industry is not zero.

After testing the correlation between EVA and EPS in the cement industry in period (2008-2012), results showed in Table (4):

H0: Pearson correlation coefficient between EVA and P in the ceramic and tile industry is zero.

H1: Pearson correlation coefficient between EVA and P in the ceramic and tile industry is not zero.

After testing the correlation between EVA and P in the ceramic and tile industry in period (2008-2012), results showed in Table (5):

H0: Pearson correlation coefficient between EVA and P in the cement industry is zero.

H1: Pearson correlation coefficient between EVA and P in the cement industry is not zero.

After testing the correlation between EVA and P in the cement industry in period (2008-2012), results showed in Table (6):

H0: Pearson correlation coefficient between EPS and P in the ceramic and tile industry is zero.

H1: Pearson correlation coefficient between EPS and P in the ceramic and tile industry is not zero.

After testing the correlation between EPS and P in the ceramic and tile industry in period (2008-2012), results showed in Table (7):

lower 0.05, the null hypothesis is rejected and it was concluded that the relationship between EPS and P in the ceramic and tile industry is significant and positive.

### 5.6 The sixth hypothesis test

H0: Pearson correlation coefficient between EPS and P in the cement industry is zero.

H1: Pearson correlation coefficient between EPS and P in the cement industry is not zero.

After testing the correlation between EPS and P in the cement industry in period (2008-2012), results showed in Table (8):

Table8. The correlation between EPS and P in the cement industry (2008-2012)

Hypothesis test	correlation coefficient	t Student test	The minimum level of significance	Test result
Test No. 6	0.832	17.896	0.000	Reject the null hypothesis

The correlation coefficient between EPS and P in the cement industry is equal to 0.832, and t-statistic equal to 17.896 and the minimum level significance of it is estimated to be equal to 0.000. Due to the correlation coefficient value is positive, t-statistic is most of the t table (1.96), and least significant level is lower 0.05, the null hypothesis is rejected and it was concluded that the relationship between EPS and P in the cement industry is significant and positive.

### 6 Conclusion

The aim of this study is to investigate the relationship between EVA and earnings per share and stock prices in Tehran Stock Exchange, according to industry type (the cement, ceramic and tile industries).

The results show that the relationship between EVA and earnings per share in the ceramic and tile industry is significant and positive and in the cement industry is significant and negative. Due to the fact that the absolute value of the correlation coefficient in the ceramic and tile industry is most of the cement industry, it can be concluded that the relationship between two variables in the ceramic and tile industry is more severe.

The relationship between EVA and stock prices in the ceramic and tile industry is significant and positive and in the cement industry is significant and negative. Since, the absolute value of the correlation coefficient in the cement industry is most of the ceramic and tile industry, conclude that the relationship between EVA and stock price variables in the cement industry is more severe.

The relationship between stock price and earnings per share in both cement and ceramic and tile industry is significant and positive. Due to the fact that the correlation in the cement industry is more than the ceramic and tile industry, it can be argued that the relationship between stock price and earnings per share in the cement industry is more severe.

It was observed that in both ceramic and tile and cement industry, the absolute value of the correlation coefficient between earnings per share and stock price is more than the absolute value of the correlation coefficient between EVA and stock price. So, as a result, earnings per share variable than economic value added variable have closer relationship with the stock price.

**Abstract.** Although, according to the general rules of civil law, ownership is known as an inviolable and inalienable legal principle, but it is sometimes restricted in various ways, and sometimes this principle is generally denied by the legislator. Cultural heritage principles are considered one of the means of restriction and dispossession. Provisions of the cultural heritage, because of direct contact with the public rights of individuals, are effective in private property of owners in two ways. In some cases, these rules will lead to the dispossession that the general legal principles emphasize on establishing the ownership of persons in that way, and in some cases also, the rules sometimes restrict the ownership of the private owners. These restrictions limit the scope of the ownership dominance in many ways.

**Keywords:** ownership, dispossession, ownership restriction, cultural heritage laws

### 1 Introduction

Cultural heritage is a set of movable and immovable cultural works and properties left from the past which is very worthwhile. An important part of these works is possessed by individuals as their owner that they may either inherited as a legacy from their fathers or have possessed them through discovery. Today, preserving these works due to their cultural aspects, is one of the concern of the government. We face with two kinds of rules in the field of cultural heritage in Iran law: first category includes a set of domestic rules and regulations related to cultural heritage. Article 1 of the Law on Cultural Heritage Act of 1985 and Paragraph 12 of Article 3 of the Statute of the Cultural Heritage Organization considered one of the essential tasks of the organization as registration of movable and immovable properties which should be placed in the national index. Second category is part of the international regulations that should be respected and considered by the states as Iran joined the rules or due to interaction and international works (Emami, 2004; Bariklou, 2006).

The rules, which are legislated and applied mainly with an emphasis on the general aspect of cultural heritage have serious conflicts with the general rules relating to ownership including the jurisprudential and religious rule of Absolute Legal power of the Owner to Exercise Control Over property which is a jurisprudential certainty which is emphasized in Articles 22 and 47 of the constitution, and sometimes it is ignored under the ownership provision which is created under the ownership jurisprudential and legal generalities (such as ownership of the treasure) and sometimes an owner who under legal generalities and Absolute Legal power of the Owner to Exercise Control Over property, has the right to seize the property and prevent the transferring acts (Jafari Langroodi, 2001; Hayati, 2010).

Thus, this paper which is gathered using desk and descriptive methods, will first explain the concept of ownership and its elements, then discuss whether or not ownership can be restricted and finally it will seek to answer the main research question, "what is the restriction and dispossession in cultural heritage rules?"

### 2 Concept of ownership

Ownership in Persian is an Arabic word from fictitious infinitive and it is taken from the word MELK. Some have stated its literal

meaning as being owner and some to own etc. Farhikhte in his dictionary defines ownership as an adjective that is achieved based on being owner. In other words, ownership means to have, own and being eligible. Addressing the precise meaning of ownership and its nature is useless. The Civil Code also doesn't define ownership, but it just mentioned some of its features.

What is important is to understand its common concept and it is a sense that everyone understand it and use it in their conversations: "having" which is of course a universal meaning indicating a traditional interest between a (natural or legal) person and an object.

In the Iranian legal system, ownership right is not defined in laws, however, ownership assurance is greatly considered in the constitution. In addition to the special status in the constitution, legal rules also guarantee it. In accordance with articles 15, 16 and 17 of constitutional amendments to the constitution, ownership is respected and protected, and the general principle in the third chapter of the Islamic Republic constitution guarantees people's ownership in the general and privative context, is Article 22. In addition, Articles 40, 46 and 47 of the constitution guarantees ownership. Civil law does not provide a definition of ownership as well, but it spoke about its qualities and effects and limits in some Articles such as 30, 38, 130 and 131.

The area of ownership is widened in line with global developments and technology trends, so that intellectual property is now raised that was quite unfamiliar and unimaginable by a few decades ago. That's why the basis for ownership needs a proper definition to include all properties and assets even immaterial ones. In other words, it should be said that "anything other than material possessions includes intellectual property."

As noted above, without providing a definition of property, civil law at the beginning of the first book states that property has two types: movable and immovable which is given in Article 11 of the Civil Code. In other laws, there is no definition of property; as stated this may be because the concept of property is clear and in other words it is an obvious concept; but this seemingly obvious concept has raised debates among the scientific dialogue common in the faculties of law, so that one of the most important practical disputes among Iranian lawyers can be seen in the definition of property (Deilami, 2005; Safaei, 2014). Despite the silence of Iranian law on ownership, it can be stated that "ownership consists of entrusting commitment and allocation of a material or spiritual thing, an object or interest, financial or non-financial, movable or immovable, absolutely and authentically to the certain person or nation."

#### 2.1 Three elements of ownership

**Like French law, Iranian law has recognized three elements (application, exploitation, right to possess the property) regarding the ownership.**

Right to application means that the owner is entitled to use and benefit from his property without intermediary and others have no right to stop this right, this is explicitly expressed in Article 30 of the Civil Code (Katoozian, 2005 and 2015). The right to application is the most tangible direct right that the owner has toward the owned object. But sometimes using this property is not tangibly possible. It should be noted that the impossibility of using or not using the property, won't stop him from owning.

Right to exploit means the right to receive the fruit and result of the property, because the interests are created in the property of owner. This allows the owner to receive the result of his property. The effect of this right is that the interest can be used only with the owner's will.

The right to possess the property; owner can do all financial and legal acts about the property (Mohammadi, 1996; Mir Damad, 2001). That is, the right affirmatively means that the owner can do financial acts like, consuming the property or removing it or by legal acts such as: donation, peace or selling, remove the property of his ownership. And privatively he has the right not to accept the destruction of his property or not to be satisfied to sell his property. Of course, this discretion is limited and sometimes for various reasons, some limitations are created.

## 2.2 Ownership features

Ownership is the most complete financial right because unlike other financial rights that the owner of a right has the authority for a certain seizure, in ownership right, the owner will have the authority for a variety of possessions. In Article 30 Civil Code, the right of ownership is referred to a right whose owner can do all sort of possessions in the belonging property. Owner possessions in servient estate can be divided into three types: use, benefit and transfer of property, but in old Rome Rights and from the perspective of some French lawyer, it has attributes like being absolute, being exclusive, and perpetuity.

The absoluteness of ownership is clearly manifested in Iranian civil law. In accordance with Article 30 of the Civil Code, "every owner has the right to seize and benefit to his own property, except in cases where the law has exceptions." It is understood from the article that basically owner has the right of any seizure in his property and exceptions to this rule must be raised in the rules. One of these exceptions are Articles 40, 44 and 47 of constitution. According to the principles of ownership, it must be legitimate, in accordance with the law and causes the country's economy promotion, also the owner should not use the ownership right to harm others. So it can be concluded that ownership right is respected to the extent that it does not conflict with the law. Finally the principle of owner free boundary is that the ownership would not harm the society (land speculation, monopoly, etc.).

The absoluteness of property and that the owner can seize his possessions is indicative of its exclusiveness. The owner is entitled to do any sort of seizure in his property and in turn prevents the profit of others. Ownership is an individual rights that the law protects the right against aggregation of others. As a result of this issue, Article 31 of the Civil Code states that: "No property cannot remove from the seizure of its owner except in accordance with law". Among the exceptions entered to the description of property, we can refer to the public interests and private contracts which thereby ownership loses its monopolistic aspect.

Another feature of the ownership right is its perpetuity, i.e. it is not limited to a certain time. This means when a person owns something, as long as he is owner can use it without being bound to a specific time. One of the differences of owner with all people who can use and benefit from the property on behalf of him, is that the use and operation of the owner is not bound to a certain time but other people can benefit from it in a certain time. So, ownership is a perpetual right and perpetuity of ownership doesn't mean that the owner cannot transfer it to another person or heirs cannot own it if the owner is deceased, even in cases where the ownership is not apparently permanent like tenant ownership of the leased property interests, is in fact the perpetual ownership of the owner to the property interests which is granted to the tenant for a limited period. So, what is meant by perpetuity is not eternity, but is that time and duration of ownership of the owner is not limited to a specific period, unlike other financial rights which normally is limited to a certain time.

## 3 The nature of restriction and deprivation of ownership rights

About the ownership restriction, we can consider restriction as part of the government's unilateral action for the public interest

despite the everyday rules and given the increasing development of social thought and its reflection on rights and increased government involvement in the private relationships and rights, especially about the owner authority and scope of the private ownership.

These restrictions will not result in dispossession but restrict part of the ownership rights. For example, prey belongs to the hunter according to jurisprudential law, but the government apply some restrictions for the ownership like hunting license, hunting time, hunting place and type of hunting. If the restrictions are observed, prey will belong to the hunter. The owners will have some restrictions on construction if they are placed in the scope of some national monuments and buildings (Hashemi & Taghizadeh, 2012; Esfahani, 1997).

According to what was said recently, ownership is a right in which durability, applicability and exclusive nature are the main conditions forming the right. However, it may be restricted or withdrawn based on legislative frameworks and some interests related to the public order. According to some "dispossession for public interests, is also a kind of transfer of ownership."

It is worth mentioning the term dispossession literally means abstraction, robbing and coercive (forced) taking that its idiomatic meaning is very close to the term "forced taking" or compulsory possession.

Since the ownership is considered as a permanent right by which one can assign the seizure of his property to himself within the laws of [exceptions] and use all its benefits, so we can say that dispossession means coercive removal of property or exploration or its compulsory acquisition and leads to ignoring the ownership rights of the owner. If it is legally licensed, it is legitimate, otherwise it is unlawful and usurpingly.

Articles 30 and 31 of the Civil Code also while expressing the owner's ownership right show that the owner may be deprived of these rights only through the rule of law in some cases.

In Article 17 of the Universal Declaration of Human Rights of 1948, presence of ownership was recognized as one of the human rights and was considered as a guarantee against arbitrary deprivation of property, however, in accordance with Article 3 of the Declaration, ownership can be restricted for general needs, in accordance with fair rules and by paying fair compensation.

### 3.1 Methods of ownership restriction in Iranian law

Methods of restriction and dispossession are different in the Iranian legal system and based on the rules governing the different legal systems is different in various manifestations. Restriction and dispossession may take place based on a contract. For example, a person with commitments to sell his property during a contract, has deprived his ownership over a property and transferred it to another person or some contracts may cause restrictions on the use and possession of the property that time sharing contracts can be mentioned in this connection.

In such restrictions which are generally bilateral and are created based on the decision of the parties to the contract that sale and lease contracts or partnership are among them, time is somehow the criterion for ownership or how to profit is intended.

In another type of contractual restrictions which are also called unilateral administrative contracts, a person ownership is restricted or deprived using the law and the owner will be forced to accept the contract for a minimum use of the property, such as restrictions on property development in civil projects.

Another method of dispossession and restrictions in Iran's legal system is based on the law. In this type of restriction and dispossession, governments restrict properties by nationalization or confiscation of property or approving urban development projects or housing.

In general government try dispossession for the public interest or legal criteria. Given the public interests, it is more like a political rather than legal theory. Thus, the area of dispossession gets wider day by day and this is also due to the diversity of government functions and increased legal persons and public law that benefit from dispossession.

What is obvious is that it is not possible to use the property right indefinitely and dispossession is in fact a privilege that the government protects the public interest through it.

Nationalization that means the permanent transfer of private property and assets to public ownership which is done in pursuit of some political and economic objectives in return for compensation which finally, government is the successor to the original owner.

Nationalization of property is always associated with loss to the persons, in this action it is assumed that using sovereignty, government attempt restriction and deprivation to secure the public interest and to comply with public interest.

For example, to prevent inappropriate use and destruction of forests and rangelands, pursuant to Act 1924 of the government as well as the enactment of the Forest Act of 1942, and also forest nationalization law passed in 1962, government tried nationalization of forests and rangelands and applied some restrictions for allies and thereby caused the dispossession of some of them.

In another type of restriction and dispossession, the government attempted to confiscate property. Confiscation of property is: "an operation whereby government unilaterally transfers property of natural and legal persons to itself to meet exceptional and temporary needs". Confiscation includes, "permanent seizure of private property without compensation." That's why the most severe form of dispossession is done by the state. It is worth mentioning that the confiscation of property is considered as a source of financing for the government.

### 3.2 Ownership lack of restriction based on the general principles of civil rights

Ownership in civil law means the legal relationship between the human and the property. By virtue of this relationship, one has absolute authority and full ownership to his property. This prevents the seizure of ownership by others. Based on the principle of despotic dominion in Iran civil law, which has confirmed the full authority of owner in profit and seizure of his property, the effect of ownership is on the one hand positive and on the other hand negative. In fact, the owner has the right for any dispossession of his property positively and nobody has the right to seize the right negatively (Panahi, 2015; Ninam, 2005).

Articles 30 and 31 of the Civil Code explicitly stated the right to seizure and benefit of owner to his property and the protection of property rights. In the law of Islamic Republic of Iran, Articles 46 and 47 of the constitution refer to the rule in another way. Some lawyers believe that the ownership is absolute. Because under Article 30 of the Civil Code, "the owner has the right for any manipulation in his property except in cases where the law has exceptions." According to Articles 40, 22, 46 and 47 of the Islamic Republic of Iran's constitution and Articles 15, 16 and 17 of constitutional amendments to the constitution, ownership is respected and protected. In the case of immovable property, ownership is absolute, except in cases where the law has exceptions. Of course, absoluteness of ownership is allocated with things such as losses to others.

In contrast, other legal experts believe that in the current law, exceptions to absolute rule is so great that we can hardly speak of ownership rights. Realism requires to indicate the term law in its nature rather than using the ownership right and it is said "it is a right which gives the owner to benefit from or possess his property in accordance with the laws."

However the "Principle of despotic dominion" is mentioned with great respect, but the principle doesn't have the former concept. So in principle 44 of Constitution, it is said about ownership constraints that "Ownership in this three parts is protected by the Islamic Republic's law, as far as is consistent with other principles in this chapter and is not outside the scope of Islamic laws and results in the country's economic growth and prosperity and does not harm society". In the interpretation of this principle, it is said that ownership is not the natural rights of human personality, but a means to protect the public interest and the last frontier of freedom for owner is that it would not harm society.

In Islam, ownership is never absolute and there is no sign of absolute right of ownership. Religious morality knows wealth as God trust to human and the principle of "no harm" rules over the "principle of despotic dominion". Some legal experts believe in Islamic jurisprudence based on "principle of despotic dominion" ownership of some monuments is equal to absolute ownership in Roman law and the owner has the right to seize on his property. Some also believe that exceptions to Article 30 of the Civil Code, is highly developed in proportion to the economic and social developments, and abundance of these laws has raised the famous issue of maximum appropriation.

In respect of ownership on cultural properties, specifically treasure in Iranian law, it must also be stated that overall, in this context, we are faced with two kinds of attitudes by the legislature. First, treasures which are not considered national monuments and antiquities, that according to Article 173 of the Civil Code: "It is a property buried in a building or ground and is found by chance." Iran's law in this part respects the private ownership and according to civil law, if the owner is not known or found in permissible lands, it belongs to the finder. Second: treasures which are considered as a part of national monuments and antiques (treasure) that under the single article of bill in 1979 which is about prevention of measures done to discover antiques, treasures that they are at least a hundred years old, are considered antiques and national monuments.

Now given that, on the one hand, according to some legal experts and civil laws and constitution of Iran, the absolute ownership is exclusive and permanent and on the other hand, in some cases, such as cultural heritage laws, ownership is limited, in the following we will discuss the cases of restriction and dispossession in cultural heritage laws.

### 4 Restriction and dispossession in cultural heritage laws

Cultural heritage is a worthwhile treasure, containing thousands of buildings and hills, historical sites and hundreds of thousands of movable and immovable historical works that should be protected competently and given to the future generations. Therefore, in areas related to cultural - historical heritages, there are protection regulations such as Articles 1, 3, 5, 6 and 10, about preserving national monuments act of 3 November 1930, Single Article of National Heritage Act enacted in October 1973, Article 1 and statutes of the country's cultural heritage, single article of the law concerning the Cultural Heritage Organization Act of 1985. Also on the implementation of laws related to historical - cultural monuments that have regulations and protection conditions and regulations in the field of records and privacy of historical monuments, and clearly explain the method of administrative intervention in monuments or their privacy (about monuments), we can refer to Articles 1, 2, 3, 4, 7, 8, 9 of executive regulations to Preserve National Monuments Act - passed in 1932 of the Council of Ministers; sample of privacy and protection regulations of buildings, complexes and hills in historic sites, sample of public safety regulations, and sample of specific privacy laws and regulations (grade one, grade two). Given that the rules and regulations as well as regulations for protection of monuments regarding the restriction and dispossession of cultural heritage is different, in this review, we try to separate these two by an example and provide further clarification on these issues.

#### 4.1 Laws and regulations governing the ownership restriction

According to the rules relating to Preservation of National Monuments, the limitations arising from the implementation of protective rules of historical - cultural monuments that may be raised for their owners can be divided into two parts: moveable and immovable cultural - historical monuments that at first we analyze the limitations arising from the rules of Preservation of National Monuments regarding immovable monuments.

Regarding the limitations arising from immovable monuments protection regulations, it must be stated that according to relevant provisions of law relating to Preserving National Monuments, enacted in November 130 and Single Article of registration of Works approved in November 1973, the country's cultural heritage and the Statute of the Cultural Heritage Organization, works registered in the national index, are protected and supervised by the country's cultural heritage organization and are subject to protection regulations specified in the rules for monuments. So, considering the fact that after registration, any action that leads to the destruction of or damage to the monument, is prohibited. Therefore, registering a work in the national index also causes a limitation in performing some interventions in monuments. The most important of them is ban, destruction and renewal of immovable monuments.

In relation to ownership, ownership of monuments according to Article 3 and 5 of the Act relating to Preservation of National Monuments Act 1930 and Article 7 of the rules of procedure of the latter regulation, dispossession will not be done in monuments and the owner of the monument preserves the right of ownership or possession of property and only through registration of the monument in the national index and rules related to it, some limitations will be applied for owners through protective criteria, after recording the monuments by cultural heritage organization.

According to Article 12 of the Statute of the Cultural Heritage Organization, determining the Privacy and Criteria for Protection of Privacy of monuments registered in the national index is done by the Cultural Heritage Organization that based on the criteria regarding interventions and measures in areas of privacy of monuments which include areas surrounding historic monuments, some limitations, such as, restrictions in the height of construction in adjacent plaque or surrounding the immovable monuments or restrictions on the use of some materials in architectural design or building façade around the immovable monuments will be applied that by applying these rules and regulations, some property owners located in the historical monuments will face some restrictions.

In some cases, depending on the type of work, field size, height, etc., monument privacy is rated to grade 1, 2, ... by the Cultural Heritage Organization, and specific protective criteria will be separately defined and notified for each of the privacies, and in such cases the limits established for property owners differ in the privacy of Grade 1 and Grade 2, etc.

For example; determining the privacy of Ramsar cultural - historical complex that construction in the privacy grade 2 is strictly prohibited. Or privacy restriction for Baq Ferdows cultural heritage where the property is located, in the vicinity of this monument, construction over 3 floors and a height of 9 meters is prohibited.

About the limits arising from movable monument protection regulations, it should also be noted that based on relevant cases from statute law of Cultural Heritage Organization and the law of Preservation of National Monuments Act 1930, law for forming Cultural Heritage Organization and rules of procedure of the latter law, registration of historical monuments on the list of movable monuments also results in limitation for their owners.

According to Article 9 of the law relating to Preservation of National Monuments Act 1930 and Articles 15 and 16 of the rules of procedure of foregoing law, passed in 1932 by registering the monument in movable property, any transfer, sale and repair will be limited for the owner and the owner without the knowledge of the cultural heritage organization and receiving permission from the organization will not have the right to transfer, sell or repair the movable property registered in the national index.

#### 4.2 Laws and regulations supervising dispossession

According to paragraph 12 of Article 3 of the Statute of the Cultural Heritage Organization and Article 9 of the rules of procedure relating to Preservation of National Monuments Act, if a non-standing property is located in the hills or historical sites registered in the national index, due to the prohibition of construction in the area of monuments registered in the national index, building permits will be withdrawn from the owner. And if a property located in the hills or historical site registered in the national index, with a non-agricultural usage, is authorized to construct such as residential, commercial, service uses and so on, permission for the construction will be withdrawn from owner. In fact, the owner cannot benefit from his property interests, because he is not permitted to construct and by that ban, the monetary value of the property will be lost. Despite the fact that the owner can transfer or sell his property by informing and asking authorization from the Cultural Heritage Organization, but no buyer is willing to buy a property wherein there is no possibility of construction or any other intervention and thus, benefiting from the property is denied for the owner. The only way facing the owners of such properties is to transfer or sell it to the cultural heritage organization and due to lack of credit and other financial issues, this may take years and the owner will be still deprived of his property interests.

In other words, despite the rules for preserving ownership in monuments that have been previously discussed, by creating such conditions for the owners of these properties, we can consider a form of dispossession of the owner.

#### 4.3 Factors limiting private ownership in cultural heritage

**Factors like government, time and registering the work limit private property of people in property and cultural heritage. Government limits the private ownership in three ways:**

*State ownership: Anfal (property truly belonging to Prophet Mohammad or to any of the imam) is state-owned, so imposing conditions and requirements by the government on how to exploit it, is legally legitimate and follows the general reasons of ownership.*

*Public ownership: supervision of such ownership of cultural heritage is at disposal of the state and hence the content of the preceding paragraph is true about it. The difference is that here the interest of the ward should be observed. The owner of this kind of cultural heritage are all people. The government is obliged to observe interests of people in policy-making on how to take advantage of this property. In this case, restrictions of this type caused by the government, will have legitimacy. The legitimacy of government decisions in this sector, is a function of leadership general arguments.*

*Private property and endowment: The government can impose obligations on private ownership of cultural – historical monuments. So here specifically no separate discussion than what has already been said, seems to be raised.*

Time lapse is a legal interpretation that has found its way to our law from the West Legal Dictionary. Time lapse, in French law plays a role in two ways: acquisitive and landing place, so it is a way for the acquisition or acquittal, meaning that over a certain time, the legislator consider the owner rightful to own his property, and considers lack of main owner complaints a reason

for waiver or not being rightful. Likewise, he considers the debtor discharged and non-complaint of creditor in a certain period as a sign of waiver of right.

Since Islamic law doesn't consider time lapse in this form legitimate, former legislator considered time lapse as indicating cognizance, without any intervention in right and current legislator has accepted time lapse just in case of the preventive punishments that is considered a state constitute; punishment for crimes which are deemed crime by the government and are not crime in the principles of religion. And non-deterrent punishments, time lapse is not even accepted as cognizance. In Article 1039 of the Civil Code and Article 731 of the former civil procedures, cognizance, had been subject to the filing of it the legal deadline. The Guardian Council in Theory 7257 dated 16.02.1984 considers lack of cognizance after a legal period against the religious boundaries and voted to revocation of the cases. Therefore, as a general legal rule, time lapse has no place to prove or waive the right.

Now the question is raised whether contrary to the requirements of this public rule, cultural heritage has a special feature which can consider the time lapse as the reasons and causes of creating or transferring the right about the manifestations of cultural heritage? This means that when a cultural heritage is in the possession of a person, and the government has decided to take it for a long time and that person has not raised a claim against it, the government has the right, based on time lapse, to possess a monument?

It seems that if the mentioned monument is not so important that state ownership on it can be explained based on what is given in this chapter to justify the qualification of government for possessing private ownership to cultural works, time lapse will not be qualified per se to correct the government ownership. So, the object still remains in the possession of the person and he can set lawsuit and restore the right against the government.

Obviously, contrary is inconceivable, so that an inherited monument that is owned by the government, is in the hand of others for a long time and by recourse to time lapse, he can set lawsuit against the government over the acquisition of the object. Of course, we may state a reasonable meaning for this assumption, in this way that sometimes the inherited monument is among *Mobahat* (things without a known owner that may be possessed by any private citizen under paragraph 92 of the Civil Law of Iran) or *Anfal*. In the discussion of ownership we said that *Anfal* belongs to the government and based on generalities and predications indicating the *Anfal* ownership of possession or reclamation, if an inherited instance is acquired by a person and the government does not protest in a long time, if silence of government means permission for ownership, based on predications, it can be said that this person is the owner of the object. Of course, this is in the case that in the discussion of *Anfal*, we have accepted the evidence of ownership by means of restoration; but we raised a contrary debate and said that the requirement for evidences only permits individuals to take advantage of the *Anfal* and its ownership is dedicated to the state and restoration won't cause the right of ownership. This means that government ownership over *Anfal* is not a right to spoil it or his silence discoverer his satisfaction for the property of individuals; so the government cannot transfer *Anfal* to others, and at least it is suspected and as the first principle in trading, transferring *Anfal* will not be enforced. But the enjoyment of the *Anfal* is so sure that evidence proves it, so despite the evidence, we suffice the same amount of the principle.

The result is that time lapse doesn't create a right against people in private property rights of cultural heritage – the ownership that is not placed in custody or supervision of the government; as it has not considered a right by possession or recovery against the government and in favor of entities.

In Iran, there are many movable and immovable antiquities. Although each of these works are valuable, but their frequency

on the one hand and limited resources on the other hand, causes the government to act selective based on some criteria and protect works that have greater priority to maintain. One of the tools of the government to stabilize the selected items and notifying it to the government institutions and people is registration of the monument. Government does it by registering the works which have criteria for priorities to be classified as historical monuments, so the registration of work has an instrumental role. Through recording the work, government supports the selected monuments by creating restrictions for the owners; in the sense that if these works were not recorded, just government general restrictions like declaring the monument to the state would be applied to them, but now they have registered, they have more restrictions. The nature of registering a work is not hampered legally, but the consequences that appear following it eliminating the owner authority or custodian of the endowment, is contrary to the demands of the law.

## 5 Conclusions

Property is a right that someone has to a property (whether movable or immovable) that belongs to him and he has the right to any seizure and use of it. So they have three features like: being absolute, perpetuity and exclusivity. The ownership right is an inviolable right because of the privilege of owner than others in a property, and legislator should protect it to maintain social order. Under Iranian law, especially civil law and constitution, although there is no definition for this concept, but both laws have protected the ownership right and have guaranteed it. However, people private ownership is not absolute in all kind of properties and, in some cases including the historical-cultural property, it may be restricted or denied.

Ownership restriction means creating some restrictions for the owner to use the property without leaving ownership from its private status and based on Article 44 of the Iranian constitution, the preference of public law for economic growth and development has accepted private ownership and insists that in some cases, we can apply some restrictions to some properties. Preserving public interest is one of the main reasons to limit ownership right or in some cases it can lead to foreclosure; especially regarding cultural property that the property belongs to all nations and no one can claim ownership toward them.

In the Law of Islamic Republic of Iran, on the one hand, private ownership of people is respected and guaranteed and on the other hand, in some special laws, including statutes pertaining to Cultural Heritage in 1989, the Law to Preserve National Monuments Act 1930, the Single Article of Law concerning Registration of National Monument in 1974, and rules of procedure to preserve National monuments Act 1932, private ownership in the historical-cultural properties is restricted and in some cases has been negated.

**Abstract.** Managerial overconfidence causes them to show better performance while they terminate project whose net present value is negative and postpone bad news. In this regard, present value is to assess the effect of managerial overconfidence on the information asymmetry in 84 companies listed in Tehran Stock Exchange from 2009 to 2014. Therefore, extracted information is tested and analyzed by means of descriptive statistics and pattern of data panel. The achieved results suggest that managerial overconfidence causes information asymmetry to increase in investment market.

**Key Words:** managerial overconfidence, information asymmetry, earnings per share (EPS)

### 1 Introduction

The most important phenomenon that is discussed among executives about self-deception is overconfidence. There are many evidences, showing that many people trust their knowledge and capabilities more than what they have. Usually prediction of probability is too extravagant; in addition, the ability of prediction is low, or evidence and document are not clear. Managers and specialists have overconfidence than ordinary people, so the overconfidence causes managers to seek many ways in order to justify the results of their decisions, accordingly managers can gain appreciation and respect of other people. The managerial overconfidence causes them either to terminate project whose net present value is negative or to postpone bad news in order to show their good performance (Malmendier et al., 2011). Overconfidence is based on the theory of self-deception. This theory deals with a mechanism in which people try to gain respect by means of justifying the past decision (Khoshtinat & Nadighomi, 2009). The researches show that executives with high overconfidence put companies at risk of collapse more than managers with low overconfidence (Bonkim et al, 2013). The financial success and past imagery decision increase the confidence of manager and lead them to evaluate the conception and prediction, while the losses do not decrease the managerial overconfidence; because managers are inclined to attribute their failure to bad luck (Adam et al., 2012). The base of participants' decisions in securities markets is information that is published by stock exchange, securities issuers and active intermediaries in this market. Effective utilization of such information or accurate decision in securities market is possible when given information is proper (timely), relevant, important, complete, and intelligible. On the other hand, how and which information must be achieved are very important. If information is transferred among people asymmetrically and unequally, it can result in different outcomes about single subject. Asymmetric market is important subject, whose importance continually increases by complexity of product and trading mechanism, needs more attention and presentation of new solution by market players including sellers, buyers, managers, creditors, and government. Information asymmetry has undesirable outcomes such as reduction of market efficiency, increase of market cost, weakness of market, low liquidity, and finally reduction of profit from transaction of investment market (Khadamipoor & Ghadiri, 1389). Main role of accounting information is to provide necessary field for optimal resource allocation. After recent financial scandals, investors trust to and rely on the system of financial report and quality of profit emerges as main factor to determine the validity and

reliability of reported figures. Therefore, investors, managers, legislatures and accounting standards steering committee are interested in determination of accounting information quality and its results (Rahimian et al., 2009). Inappropriate selection is first information asymmetry that occurs when one or more parties have more competitive information than other parties. This issue gives policymakers and lenders necessary information to pay attention to information integration applied among users of financial statements. "Moral hazard" is second factor of information asymmetry according to which each of parties in actual or potential trade can see their performance in implementing or violating terms and conditions while one party cannot see other party's performance (Ghorbani and Adili, 2012). One of effective factors in making decision is to have appropriate information relevant to subject of decision. If the necessary information is distributed asymmetrically among people, this can cause different results to be raised. When information asymmetry about stock of company increases, its intrinsic value is different from value that investors recognize for intended stock in investment market. Consequently, actual value of company's stock is different from expected value of shareholders (Ghaemi & Vatanparast, 2005). Concept of biased beliefs about information asymmetry may depend on structure of market itself. The introduction of overconfident agents overturns fundamental relationships between observable variables in perfect-competition asymmetric information insurance models. In models of monopolistic insurance with asymmetric information, in contrast, the introduction of overconfident agents may be observationally equivalent to changes in the composition of risk in the economy. (Sandroni & Squintani, 2012).

This research studies effect of managerial overconfidence on the information asymmetry in companies listed in Tehran Stock Exchange. The previous findings show that managers' overconfidence has direct effect on the performance of securities market. When the overconfidence increases among managers, the company's stock market performance decreases. If board of directors controls the managers, then the quality of and efficiency of information published by manager increase. Improving the quality of corporate financial disclosure causes the information asymmetry to decrease. Decreasing managerial information asymmetry has less profit. Therefore, present study answers this question: Does managerial overconfidence have effect on the information asymmetry of companies listed in Tehran Stock Exchange?

### 2 Research Background

#### 2.1 Theoretical Background

One of effective factors in decision -making is the proper information relevant to subject. If necessary information is distributed asymmetrically (i.e., information is transferred unequally), it can cause different results to be raised. Therefore, before the information becomes important for decision makers, the quality of information distribution should be evaluated accurately. When information asymmetry about the company's stock increases, its intrinsic value becomes different from value that is recognized by investors in investment market. Therefore, actual value of company's stock is different from expected value of shareholders. What attracts attention in investment market is that many people who invest are ordinary people who gain information published by company. One kind of announcements in which proposed share is predicted and announced to public by company is declaration of the profit of every share. If among investors working in the investment market are people who has better conditions in terms of information, for example, they can affect market supply and demand by announcement declared about profit; on the other hand, they can create price spread. Its main reason is information asymmetry in investment market according to which people having information about profit (or any important news) get better condition for decision making

than other. One of important points that are raised about investment market especially stock exchange is “efficiency of market” according to which all information available in the market reflects its effect on the share price. “Efficient-market hypothesis”, maintains information asymmetry of accounting in which one of parties has more information than other. This is raised due to intrinsic information and quality of trading. Even if share price of stock exchange completely reflects the information, it may be possible that in-house people have more information than people outside the organization, and they can achieve profit due to this information. Here, one of subcategories of information asymmetry called “adverse selection” emerges. “Adverse selection” refers to a situation where sellers have information that buyers do not, or vice versa, about some aspect of product quality. This situation occurs before transaction, when traders know about unknowledgeable people in market, the issue of “adverse selection” increases. In this state, increase of information asymmetry is shown through expanding bid-ask spread of stock and market makers exploit the increase of this spread to compensate risk of selection. On the other hand, presence of unknowledgeable people in investment market may cause professional investors to get more rate of return. When new information about company’s condition is released, analysts, investors, and other users analyze the information; then they decide to buy or sell the share according to this information. This information and reaction toward them have effect on the users’ behavior especially actual and potential shareholders and causes price and volume of transaction to be increased or decreased, because people’s attitude toward the new information results in price volatility. Therefore, if information is released asymmetrically or secretly, we witness different reaction from investors due to information asymmetry in investment market. This causes incorrect and misleading analysis of current condition of market. Above matter can show the importance of information asymmetry and undeniable effect on the economic decision (Sandroni & Squintani, 2013).

Duellman et al., (2015), thinks of behavioral finance as simply “open-minded finance.” He states, “in order to find solution to an empirical puzzle, it is necessary to entertain the possibility that some of agents in economy behave less than fully rationally some of times.” Behavioral finance does not try to define ‘rational’ behavior or label decision making as biased or faulty. However, it seeks to understand and predict systematic financial market implications of psychological decision processes. Furthermore, overconfidence is one of modern financial concepts that have especial place in psychological and financial theories. Overconfidence causes man to overestimate his knowledge and to underestimate the risk, so the man thinks of his control over the problems, while it is not as he think (Fallahshams Layalestani et al, 2010).

Assessing effect of managerial overconfidence on the company’s procedure consists of main accounting procedures. Overconfidence can result in incorrect decision and imposes heavy cost on the company through distortion of investment, finance or accounting policies. However, managerial overconfidence can have profit in some conditions. For example, stimulation of overconfident managers for risks is cheaper than other managers. Overconfident managers overestimate the future returns from the invested projects of company. Therefore, they may delay the recognition of loss and have optimistic estimation in determining long term or present value of asset; thus, managerial overconfidence can result in lower level of conditioned and unconditioned accounting conservatism (Ramsheh & Molanazari, 2014).

Managers are inclined to overvalue the asset and undervalue the debt. For example, overconfident manager is inclined to overestimate the collection of accounts receivable and underestimate bad debt reserve. Accordingly, they overestimate net accounts receivable. Similarly, overconfident manager is inclined to overestimate long-term residual value and assets’ useful life; so the value of asset is overestimated. Such overestimation results in aggressive report of assets and

unconditioned conservatism (Ahmed & Duellman, 2013; Ahmed & Duellman, 2012)

## 2.2 Experimental Background

Hurwitz and Sun (2015) assess relationship between managerial overconfidence and audit wages. The results of study show that company with overconfident manager pays less wage to auditors. In addition, overconfident manager is less likely to apply industry specialist auditor.

Chyz et al (2015) assess the effect of managerial overconfidence on the tax avoidance in a study entitled “effect of managerial overconfidence on the tax avoidance.” The results of study show that managerial overconfidence has significantly positive effect on the tax avoidance. Furthermore, they find managerial overconfidence decreases cash effective tax rate (CETR) by 6.6 % and increases differences between accounting profit and taxable profit by 1.5%.

Chen et al (2014) in a study assess the effect of managerial overconfidence on the internal control. They conclude the possibility to preserve ineffective internal control is more among company’s managerial overconfidence. In addition, the possibility to preserve effective internal control is more in companies with overconfident managers and strong corporate governance structure.

Chen et al (2013) in a research entitled “managerial overconfidence and cost stickiness” show that when the sale reduces, managerial overconfidence causes cost stickiness to increase.

Presley and Abbott (2013) in their research entitled “manager’s overconfidence and representation of financial statements” conclude that there is significant relation between representation of financial report and manager’s overconfidence. They show that there is significant difference between overconfident managers in firms with representation and firms without representation.

In a study entitled “CEO overconfidence and dividend policy” Deshmukh et al (2013) conclude that positive stock reaction to announcement of increased profit is often seen in firms that do not trust manager’s overconfidence.

Peng He et al (2013) in a study entitled “information asymmetry and cost of equity capital” conclude that there is positive and significant relation between information asymmetry and cost of equity; this result is significant for financial sectors, health care, oil and gas. Furthermore, it shows that information asymmetry increases the cost of company’s capital.

Sandroni and Squintani (2013) study “overconfidence and asymmetric information about insurance” and conclude that overconfidence changes quantitative prediction in market of asymmetric information and may depend on the market structure. Overconfidence may overturn fundamental relations between observable variables in perfect-competition asymmetric information insurance markets. In monopolistic insurance markets, in contrast, they find that overconfidence may be observationally equivalent to variations in the risk composition of the economy.

In a study entitled “relationship of managers’ overconfidence and selection of financing policy in companies listed in Tehran stock exchange” Chavoshi et al (2015) show lack of relationship between overconfidence and financial decision. In addition to it, the result suggests that the relationships among growth opportunities, profitability, firm size and distress risk with financial decision are significant.

Arabsalehi et al (2014) assess effect of manager’s overconfidence on the sensitivity of investment – cash flow and concludes that senior managers’ overconfidence causes sensitivity of investment- cash flow to increase.

Malakian et al (2013) in their study entitled “assessment of relationship between managers’ overconfidence and conservatism in companies listed in Tehran Stock Exchange” conclude that there is significant relationship between managers’ overconfidence and conservatism in all companies under study.

Rahimian et al (2012) in their study entitled “relationship between profit quality and information asymmetry in companies listed in Tehran Stock Exchange” conclude that there is significant relationship between quality of profit and lack of information asymmetry; and then reduced quality of profit causes information asymmetry to increase.

Khani and Ghajavand (2012) in their studies entitled “effect of market competitive spectrum on the relationship between information asymmetry and the cost of capital in Tehran Stock Market” conclude that at level of competition there is no significant relationship between measurement criteria of information asymmetry and cost of capital. Furthermore, imperfect market competition as an effective factor on the relationship between information asymmetry and cost of capital will be ordinary.

Fadaeenezhad and Khoramnia (2012) study “information content of corporate profit disclosure and its effect on liquidity and information asymmetry in Tehran Stock Exchange” and conclude that three hypotheses of study – indicating the worthiness of information, reduced information asymmetry and increased market liquidity - are confirmed at 95% confidence level in case of bad news released by company, whereas only one hypothesis – concerning increased market liquidity – was confirmed in the case of good news.

Khadamipoor and Ghadiri (2010) in their study entitled “assessing relationship between accruals and information asymmetry in Tehran Stock Exchange” conclude that there is positive and significant relationship between abnormal accrual item and information asymmetry; so that, information asymmetry increase with increase of abnormal accruals.

Rahimian et al (2009) in their study entitled “relationship between some corporate governance mechanisms and information asymmetry in companies listed in the Tehran Stock Exchange”, conclude that there is not significant relationship among internal audit unit and the ratio of outside directors of the board and criteria of information asymmetry. However, there is negative relationship between percentage of institutional ownership and information asymmetry.

Islami and Tehrani (2007) in their research entitled “studying the relationship between individual investors’ overconfidence and volume of transaction in Tehran Stock Exchange” conclude that overconfidence theory is one of theories raised in financial and behavioral field; it is employed to explain the behavior of investors and market incongruent with traditional financial theory. According to this theory, the more the investors trust, the more the volume of transaction.

Ghaemi and Vatanparast (2005) in their research study “role of accounting information in decreasing information asymmetry in Tehran Stock Exchange”, and conclude that there is information asymmetry among investors in Tehran Stock Exchange. This problem is greater before profit announcement compared to the time following profit announcement. In addition, they recognized that information asymmetry was related to level of transactions and share price in such a way that before profit announcement, volume of transactions increases and the share price fluctuates.

### 2.3 Research Hypothesis

Present study examines the relationship between manager’s overconfidence and information asymmetry. Therefore regarding theoretical foundations and goal of research, the following hypothesis is raised:

Managers’ overconfidence has effect on the information asymmetry of companies listed in Tehran Stock Exchange.

### 3 Methodology

Data of this study is collected from financial statements of companies listed in Tehran Stock Exchange, database of stock exchange and Rahavard -Novin software. Gathered data are prepared by the Excel software. Then they are analyzed by Stata and Eviews. Since it is not possible to measure serial correlation and heteroskedasticity by Eviews software in state of panel data, so Stata software is used for both tests.

Time domain of the research is considered a period of 10 years according to financial statement from 2009 to 2014.

Research sample of those companies listed in Tehran Stock Exchange has the following properties:

1. The company whose fiscal year ends in Esfand.
2. The company listed in Tehran Stock Exchange before fiscal year of 2009
3. The company that does not have financial changes between 2009 to 2014
4. The company that is not among financial institute, Investment company and banks due to their different nature.
5. Required financial information is delivered to perform research during period of research.

With regard to performed research, 84 companies that have above- mentioned conditions are selected for statistical sample from 2009 to 2014.

### 4 Research Variables

Operational definition of research variables is as table1:

Table1. Operational definition of research variables

Name of variable	Kind of variable	Symbol of variable	Manner of calculation
Information asymmetry	Dependent	Asymmetric information	$SPREAD_{it} = \frac{AP - BP}{(AP + BP)/2} * 100$
Manager’s overconfidence	Independent	Overconfidence CEO	Three criteria, i.e. investment expenditures, regression residual error and earning per share (EPS) are used to measure it
Financial leverage	Control	Leverage	It is ratio of long term debt to the book value of assets
Size	Control	Size	Natural logarithm of total asset is used to measure the size of company

#### 4.1. Independent Variable

With regard to above-mentioned matter, independent variable of this study is managers' overconfidence and earning per share (EPS) is used to measure it.

#### 4.2 Earnings Per Share (EPS)

Earnings per share is a main statistic that attracts attention of investor and financial analyzer. After corporation tax deductions, EPS is calculated by dividing earnings. It indicates profit that company get per share during a period. In this study, if actual EPS is more than predicted EPS in company, it gets 0 (zero). This indicates lack of managers' overconfidence in the company. If actual EPS is less than predicted EPS, it indicates managers' overconfidence and gets 1.

#### 4.3 Dependent Variable: information Asymmetry

Given that proposed price fluctuates at any moment, in this study best price is used to calculate information asymmetry in bid and best ask prices during a day. To determine the price range of 1986 in Tehran Stock Exchange, the following model is used. This model is applied by Chiang and Venkatesh in proposed year for bid and ask prices of shares. Then other people use this model in their research. Given model is as follows:

$$\sum_{i=1}^N SPREAD_{it} \quad (1)$$

$$SPREAD_{it} = \frac{AP - BP}{(AP + BP)/2} * 100$$

where,

t= period under study

i= sample under study

spread= difference between the bid and ask prices

AP (ask price)= proposed average sale price for shares of a company i in period t

BP (bid price)= proposed average purchase price for shares of a company i in period t.

For calculation, first best bid and ask prices of shares are extracted for 21 days before and after announcement of

Table 2. Descriptive statistics of variables

Variable	Number	Average	SD	Minimum	Maximum
Mangers' overconfidence	504	0/4484	0/4970	0	1
Financial leverage	504	0/4950	0/2332	0/01	0/9967
Size of company	504	13/91	1/708	9/65	19/06
Information asymmetry	504	0/1342	0/2289	0/009	1/73

Since the criteria of overconfidence variable are in qualitative state (0 or 1), so instead of descriptive statistics of table, frequency distribution is presented.

Table 3. Frequency distribution of overconfidence variable with criteria of EPS

Amount	Frequency	Percent	Valid percent	The cumulative percent
0	270	55/16	55/16	55/16
1	226	44/84	44/84	100
Total	504	100	100	

With regard to table 3, the number of companies with managers' overconfidence is 226 that is 44%.

estimated EPS. After calculation of bid and ask spread, the average figures are gotten for every sample before and after announcement. If spread (difference) between bid and ask prices of share is zero, it indicates the information asymmetry toward profit announcement; otherwise, it indicates lack of information asymmetry.

#### 4.4 Research Model

Asymmetric information =  $\beta_0 + \beta_1$  Overconfidence CEO +  $\beta_2$  Leverage +  $\beta_4$  Size +  $\epsilon$

#### 5 Research Findings

##### 5.1 Descriptive Statistics

The results achieved from analysis of descriptive data are shown in table 2. As observed average, number, minimum, maximum, standard deviation of research are shown in the following table. With regard to achieved amounts, the second column presents the available variables and total number of variables are 504 during 6 years. Fifth and sixth columns show minimum and maximum amounts of variables respectively. For example, variable of average financial leverage is .04950. The fourth column is standard deviation (SD). Standard deviation, for example, is 1.70 for size of company.

##### 5.2 Hypothesis Testing

Table 4 shows the results achieved from estimation of model relevant to hypothesis (EPS as criterion of manager's overconfidence) by means of panel data model with fixed effects.

Table 4. Estimation of model by use of panel data model with fixed effect

Model	Unstandardized Coefficient		T statistic	Level of significance
	B	Std. Error		
Manager's overconfidence	01030.	00380.	67.2	00790.
Financial leverage	00580.	00970.	60110.	54810.
Size of company	00390.-	0330.	15.1-	24680.
Intercept	01070.-	05630.	19070.-	84880.

R <sup>2</sup>	44 percent		
Adjusted R <sup>2</sup>	33 percent		
Durbin Watson	2.1		
F Limer	0.000		
Hausman	0.000		
Normality of residuals	0.4606		
Co-integration test	0.000		
Wooldridge test	0.5182		
Adjusted Wald test	0.000		

As shown in table 4, adjusted coefficient is 33 percent, indicating that it is dependent variable of 33 percent dependent on the available variables in the model and 67 percent of it is related to other variables that is not considered in the model. Furthermore, amount of Durbin-Watson statistic is between 1.5 and 2.5 and it indicates lack of correlation. Probability level of F-Limer test is less than 5 percent, and then the data is panel data. Significance level of Hausman test indicates that effect of intercept is fixed. Then regression model is estimated by panel data method with fixed effect. In addition, significance level of Jarque-Bera test for residuals is more than 5 percent; it indicates normality of model's residuals, and there is no need to stationarity of individual variables. In addition, co-integration test (Chen et al., 2010) has significance level less than 5 percent for residuals and indicates stationarity of residuals. This indicates that there is no need to stationarity of individual variables. Furthermore, significance level of recognizing Wooldridge's serial correlation test is more than 5 percent for the model. It indicates lack of serial correlation in the model, and this is approved according to Durbin Watson statistic. The results of Adjusted Wald test indicates heteroskedasticity in residuals. This problem is obviated in the final estimation of model.

Variable of manager's overconfidence has positive coefficient. This indicates that managers' overconfidence has direct relationship with information asymmetry. Since the significance level of this variable is less than 5%, so it can be said that this direct relationship is statistically significant with 95% confident level. So research hypothesis is approved. Control variables of research has significance level more than 5 percent and does not have significant relationship with information asymmetry.

## 6. Conclusion

Overconfidence is defined as "overestimation of one's abilities and results related to personal situation." Managers' overconfidence has direct relationship on the performance of securities market; accordingly, its increase among managers results in decreased stock market performance of company in the future. Investors and owner of company are concerned about discovery of companies' operational and financial problems. Given that in an environment with obscure information, investors are able to recognize and discover profitless projects; this causes negative return of such projects to be continued and accumulated. Overconfidence in managers is new subject in behavioral finance. The subject raised in managers' overconfidence is that psychological prejudices and illusions in executives of company especially among senior managers causes them to trust their own abilities too much so they are reluctant to disclose and complete the profitless project. Since they trust themselves, so they believe that their weakness is covered by better performance in future. Hence, they overvalue the company and maximize the profit of shareholder. Many psychologists state that being overconfident in ability is related to information processing. They present two rational interpretations in this field. First, subjects do not use deductive methods sufficiently. They utilize their informational experience to approve the probable answers. When the answer of a question is discovered, they look for experiences to approve or reject. In this time, subject can get information to approve the primary results while using memory retrieval processes. Perhaps subjects believe that stored

information in memory is enough to select answer and there is no need to deduction process. If financial traders present bid price in the same way, this price arises from their last experience about similar cases. In this case, they search information to justify higher or lower price (Adam et al., 2010).

The main purpose of the study is to assess the effect of staff's overconfidence on the information asymmetry. We use criteria of EPS to determine the managers' overconfidence. Financial specialists pay less attention to social psychology. Financial theorists assess the effect of information on the share price and volume of transaction, but they perform less research about social interaction between people in the stock market. People are inclined to be in congruent with other's decision-making and judgments. Most of investors emotionally react in the market atmosphere; in other words, even when information signals say to people which purchase and sale patterns are correct. To answer the question which behavioral pattern is dominant in the market is dependent on the condition and context of information. The results achieved from estimation of criteria regression (EPS) indicate significant effect of overconfidence on the information asymmetry. This means that managers' overconfidence causes information asymmetry to be raised among users of accounting information. The result of study is in line with findings of Sandroni et al in 2012. It is suggested that investors and analyzers in their prediction should consider the behavioral factor of managers' overconfidence that is effective factor on the information asymmetry. Furthermore, it is proposed that future researches apply other criteria to determine managers' overconfidence and information asymmetry. In addition, future researches can assess the hypothesis of the project in different industries and determine the effect of managerial overconfidence on information asymmetry in different industries.

**Abstract.** The main purpose of this study is to investigate the effects of using knowledge management (KM) on increasing efficiency of Alborz Electricity Distribution Company. This study is a descriptive-survey research and in terms of purpose, this study is an applied research. Statistical population of this study consists of experts of implementing knowledge management in Alborz Electricity Distribution Company to 142 people. In order to estimate sample size, Morgan formula is used. Main hypothesis is as follows: using KM has significant effect on increasing efficiency of Alborz Electricity Distribution Company. Obtained results showed that the main hypothesis of this study is confirmed. Moreover knowledge socialization in process of KM can have significant effect on increasing efficiency.

**Key words:** knowledge management, efficiency, knowledge combination, knowledge externalization, knowledge socialization

### 1 Introduction

The current organizational world is a competitive and challenging world. High speed of changes and on the other hand, instability of the environment has threatened life of the organizations. Hence, those organizations that want to guarantee their sustainability and think about improvement of their position in the market have to use modern management approaches. The environmental turbulence has made organizations selecting perfectionism and continuous improvement as their competitive strategy at the current world and considering improvement of productivity as their pattern (Delavari et al., 2009). On the other hand, knowledge management of the organizations is the fundamental element in achievement and survival of competitive advantage in the organization and its concept presents different types of knowledge to support macro strategy of the organization, evaluation of current status of KM, transfer of current knowledge basis in organization to new and powerful databases and compensation of existing deficits in this field. Americas Productivity of Quality Center (APQC) that is a private educational and research institute has defined knowledge management as follows: strategies and processes to identify and gain power of influencing knowledge to raise competitive power. Lenard Barton (1997) has defined knowledge as a sustainable core including 4 factors including integrated system, managerial system, knowledge and skill of employees and valuation.

The global space of the current markets has different features from past time. Today, the conditions of the market are being changed constantly and the organizations are in relation with types of customers with different tastes. All of these conditions have made the organization be under different situation than before. Hence, to continue their life in such environment, the organizations should be able to achieve features such as meeting customer needs rapidly, innovation, cost reduction, improvement of quality and flexibility. Through investigating all of the said features, it could be found that their common point is knowledge. Knowledge lets the organization predict nature and capability of changes in the environment and also strategic decisions. As efficiency and productivity is a comprehensive concept that its enhancement is considered constantly by the scientists and politicians and economists as a necessity to increase welfare and life level of people (Mayel Afshar et al., 2012) and according to role of knowledge and knowledge management in organization, this study has investigated effects of using KM to increase efficiency of Alborz Province Electricity Distribution Company.

### 2 literature review

Knowledge is the real asset of the organizations trying to have successful presence in the global competitive domain and integration of systems, values and organizational resources (Ho, 2016). Knowledge management deals with technical tools and multiple human values. Hence, it can show that how intelligent and learning organizations can design their processes using a knowledge-based strategy again (Fat'hian and Ehsani, 2007). Scientific and commercial societies believe that knowledge-based organizations can preserve their long-term preferences in competitive fields. The references of analysis and competitive perspectives of the organizations show that effects of this attitude are in strategic fields of commercial organizations. Scholars and academics have different attitude to KM and consider a range of technological solutions to a series of academic instructions. According to some comments (Hassanzadeh, 2009), knowledge management as a methodology to produce and preserve and use all facilities is a wide collection of knowledge that is used by any organization in daily and routine activities (Yang, 2015). There is another view that considers KM as a set of processes supporting production and distribution and use of knowledge among relevant intelligent factors and technical tools such as information technology and decision support systems (Welbank, 2013).

Many theorists of KM have been responsible for completing discussion of management and distribution and among them; one can refer to brilliant people such as Peter Dracker, Paul Sterlos and Peter Sange from the U.S (King and Marks, 2012). Dracker and Sterlos have emphasized importance of promoting simple information and knowledge as organizational resources and Sange has emphasized learning organizations to create cultural dimensions of knowledge management (Okunoye, 2016).

Everett Rogers from Sanford University has influenced innovation field and Thomas Alen from MIT University have discussed on information and technology transfer (1970), which led to conducting many studies during 1971 that helped understanding this issue that what is Km; how it is produced, how it is used and how it can influence in the organizations (Shadbolt And Burton, 2011).

Majority of books related to field of technology are begun with several definitions; although it is difficult to define knowledge management. Different authors have defined knowledge management from different perspectives and using different approaches and different incentives (Davenport et al, 2002). Majority of them have defined KM generally and have defined it as everything that organization needs to be able to act based on its duties and activities (Ho, 2016). The definition of knowledge management includes Official knowledge, laws, programs and practices and intangible technical knowledge, skills and experiences of individuals. Moreover, the above mentioned definition of KM includes procedure of the organizations, communications, and status analysis, presentation of new solutions for problems and development of novel methods for business. Moreover, the definition encompasses cultural issues and racial discussions and values and relationship with suppliers and customers (Woo et al., 2016).

Knowledge management is a process, through which the organization produces wealth from knowledge or intellectual capital (Nonaka et al., 1995).

### 3 Knowledge Management

1. Knowledge management refers to achieving to organizational goals through creating incentives in knowledge workers and providing facilities for them according to corporate strategy, so that their ability is increased to interpret data and information (using available results of information, experiences,

skills, culture, individual characteristics, emotions and so on) through making information and data meaningful (Okunoye, 2016).

2. Knowledge management is explicit and systematic management of vital knowledge and processes related to create, organize, distribute and use and explore knowledge (Story and Barent, 2014).

Efficiency refers to the ratio of actual return achieved to the standard return (expected) or ratio of the work is being done to the work expected to be done (Rumesh, 2013).

The main scales to define and evaluate productivity include efficiency scales. Efficiency scales compare inputs or resources of an organization with final products or services. Efficiency refers to ratio of quantity of services and products to financial cost or required labor force. However, this scale and the method of measuring efficiency can't measure amount of customer satisfaction or amount of access to desired goal. For example, efficiency scales show ratio of number of treated people to work hours of doctors; although effectiveness scales are designed in such manner that they show how many patients under treatment have been successful in their treatment (Garcia, 2009). Here, some relevant studies are presented.

Razm Azma et al., (2015) have conducted a study under the title of effect of knowledge management on increasing human resource productivity in Companies of Oil, Gas and Petro chemical Consulting Engineers. Obtained results from Pearson correlation test showed that 5 components of knowledge management model (knowledge creation, knowledge acquisition, knowledge storage, knowledge distribution and knowledge use) are confirmed and efficiency of DMU units are measured and ranked.

Ghazizadeh and Ataei (2013) have conducted a study under the title of knowledge management as effectiveness factor of the

organizations (analysis on role of knowledge acquisition and experience in organizations). In fact, applied strategy in this study is modeling or designing conceptual framework using literature and abstraction (qualitative research method) and visualize the correlation analysis for the relationship between knowledge management and organizational effectiveness (quantitative research methods), which refers to use of mixed method in this study.

Shahbandarzadeh and Ghaemi (2012) have conducted a study to present a model to investigate factors affecting knowledge management deployment. Results of this study showed that the factors "participation of employees" and "organizational factors" have most effect on successful deployment of knowledge management among total scales and subscales of Culture belonged to organizational factors scale (Shahbandarzadeh and Ghaemi, 2012).

Kumaresan and Swarooprani (2015), Nosrati and Mighi (2011), Sherafat et al., (2012), Ghazizadeh Fard and Ataei (2013) have conducted study to investigate knowledge management as predictor of organizational effectiveness and role of demography and employment. Obtained results from the study showed that knowledge management activities are not under effect of demographic factors of individuals. However, this issue is under impact of their employment status, especially in organizational type. The results have been significant and refer to guidelines such as library, especially people from public institutes and they should consider essential instruments to be successful in field of knowledge management and to realize organizational effectiveness (Kumaresan & Swarooprani, 2015).

Fueki and Kawamoto (2009) have also conducted a study under the title of "can IT enhance productivity in Japan?" and have investigated the relationship between IT and increased efficiency during 1975-2005. Results of this study showed that large part of growth in productivity after 2000 is resulted from use of IT (Kumaresan & Swarooprani, 2009).

Figure 1: conceptual model of research (source: Ticachi, 1998)

The hypotheses based on conceptual model of research are as follows:

#### 4 Method

The main hypothesis is considered as:

H1: using knowledge management has significant effect on increasing efficiency of employees of Alborz Electricity Distribution Company.

Also, the second hypothesis is considered as:

H2: knowledge socialization in KM process has significant effect on increasing efficiency of employees of Alborz Electricity Distribution Company.

H3: knowledge combination in KM process has significant effect on increasing efficiency of employees of Alborz Electricity Distribution Company.

H4: knowledge internalization in KM process has significant effect on increasing efficiency of employees of Alborz Electricity Distribution Company.

H4: knowledge externalization in KM process has significant effect on increasing efficiency of employees of Alborz Electricity Distribution Company.

#### 4.1 Methodology

The main purpose of this study is to investigate the effects of using knowledge management on increasing efficiency of Alborz Electricity Distribution Company. This study is a descriptive-survey research, since the author tends to find nature of effects of using knowledge management to increase efficiency of Alborz Electricity Distribution Company. Type of data in this study is quantitative based on data collection instrument (questionnaire). In terms of purpose, this study is an applied research.

Statistical population in this study consists of executive experts of knowledge management in Electricity distribution Company of Alborz Province to 142 people. To estimate sample size, Morgan formula is used. Number of statistical sample is obtained to 103 people using Morgan formula. Sampling method in this study is available sampling.

In this study, library method is used to collect and codify the literature related to research subject and assessment of the literature.

In this field section, questionnaire is used to collect data and information for purpose of data analysis.

To measure validity of the instrument, content validity is used. The questionnaire is provided based on opinions of 10 senior directors of the Electricity Distribution Company of Alborz and experts of university.

Majority of test makers and scholars fell satisfied when they obtain reliability of 0.90 or higher reliability; although they are dissatisfied by the coefficient below 0.70. In this study, Cronbach alpha is used to measure reliability.

In this study, descriptive statistics are used to show demographic information and to test validity of the questionnaire, confirmatory factor analysis (CFA) is used and to test research hypotheses, structural equation modeling (SEM) is applied using SmartPLS-3 software.

Value of KMO index is obtained to 0.871, which is higher than standard value of 0.6. Hence, number of sample individuals (respondents) is enough to perform factor analysis. Moreover, significance level of Bartlett test is below 0.05 and this shows that matrix of data is not an identity matrix. In other words, there is sufficient correlation among data for factor analysis.

As results of KMO and Bartlett tests have shown that obtained data from the questionnaire is enough for factor analysis, exploratory factor analysis (EFA) can be implemented on the items of questionnaire.

For purpose of data analysis, descriptive statistics techniques are used to measure statistical sample in terms of variables such as gender, age, education level and work experience.

In studies group, 66% of the respondents (68 people) are male and 34.0% (35 people) are female; 3.9% of participants are below diploma; 11.7% have diploma degree; 4.9% have post-diploma degree and 2.9% have PhD degree. Moreover, 4.9% of participants are below 25 years old; 27.2% are in age range of 25-30 years old; 37.9% are in age range of 31-40 and 30.1% are over 40 years old. 4.9% of respondents have work experience below 2 years; 27.2% have work experience of 3-5 years; 37.9% to 6-10 years and 30.1% of respondents have work experience over 11 years (Table 1).

Table 1: results of Kolmogorov-Smirnov Test to test normality or abnormality

Variables	Sample size	Test statistics	p-value
Knowledge management	103	0.57	0.021
Socialization	103	0.81	0.010
Combination	103	0.16	0.031
Internalization	103	0.71	0.024
Externalization	103	0.43	0.025
Organizational efficiency	103	0.61	0.042

If p-value is higher than 5%, variable is normal; otherwise, the data distribution is abnormal. Therefore, all variables have normal distribution according to the table 2.

Table 2: results of one-sample t-test to assess existing status of studied variables

Variable	Theoretical mean value=3.0				
	Observed mean value	SD	t-stat	df	P
Knowledge management	3.4757	1.09226	32.295	102	0.000
Socialization	3.8544	0.96414	40.573	102	0.000
Combination	2.3689	1.25237	19.197	102	0.000
Internalization	3.2621	1.24429	26.607	102	0.000
Externalization	2.5534	1.36287	19.014	102	0.000
Organizational efficiency	1.7573	1.07981	25.915	102	0.000

Significant at level of 0.05

Obtained results from one-sample t-test show that:

- Independent variable of knowledge management and its components (socialization, combination, internalization) have mean value higher than 3.000; except variable "externalization"

that is lower than it. P-value is also below 0.05 and hence, mean value is in average level and H0 is rejected.

- Dependent variable of organizational efficiency has mean value below 3.000 and p-value is below 0.05. Hence, mean value is in average level and H0 is rejected (table 3).

Table 3: correlation matrix of main variables

Variable	1	2	3	4	5	6
Knowledge management	1.000					
Socialization	0.786	1.000				
Combination	0.544	0.554	1.000			
Internalization	0.686	0.567	0.605	1.000		
Externalization	0.181	0.457	0.526	0.533	1.000	
Organizational efficiency	0.636	0.366	0.514	0.491	0.685	1.000

\*all correlations are significant at the level of 0.05

All correlations had values below 0.8 and hence, existence of multiple common linear correlations between variables is rejected (Table 4).

Table 4: intensity of correlation between main studied variables

Variable	1	2	3	4	5	6
Knowledge management	1.000					
Socialization	Strong	1.000				
Combination	Strong	Moderate	1.000			
Internalization	Moderate	Moderate	Moderate	1.000		
Externalization	Weak	Moderate	Moderate	Moderate	1.000	
Organizational efficiency	Moderate	Low	Moderate	Moderate	Moderate	1.000

The highest correlation coefficient is possessed to socialization and knowledge management to 0.744 that is in strong level. Also, lowest correlation coefficient is related to externalization

and knowledge management to 0.181, which is in weak level (Table 5).

Table 5: reliability of research constructs

Knowledge management	0.875
Socialization	0.881
Combination	0.890
Internalization	0.792
Externalization	0.798
Organizational efficiency	0.888
All items	0.799

To test reliability of variables in Partial Least Squares Method, factor load test is used and here, the factor load should be higher than 0.6 (Table 6).

Table 6: coefficients of factor loads of research variables

Variable	Dimensions	Item or construct	Sig	Std. factor loads	Result
Knowledge management	Socialization	1-6	22.074	0.861	Confirmed
	Combination	7-11	21.493	0.813	Confirmed
	Internalization	12-16	11.439	0.767	Confirmed
	Externalization	17-23	8.916	0.501	Confirmed

According to the tables 1-6, all variables have factor load higher than minimum level of 0.6 that shows good reliability of the variables. In the Partial Least Squares Method, The average

variance extracted (AVE) is used to estimate convergence of structures. Least value for good convergence validity for each structure is obtained to 0.5.

Table 7: discriminant validity of structures

Variable	AVE
Knowledge management	0.8091
Socialization	0.8179
Combination	0.5509
Internalization	0.8022
Externalization	0.7866
Organizational efficiency	0.8021

According to table 7, it could be observed that average level of variance extracted for the variables of this research is between 0.5509 and 0.8179, which is higher than least value of 0.5 and this shows good convergent validity of the structures.

The level of AVE for all structures is higher than the correlations coefficient with other structures, which shows good discriminant validity of the structures.

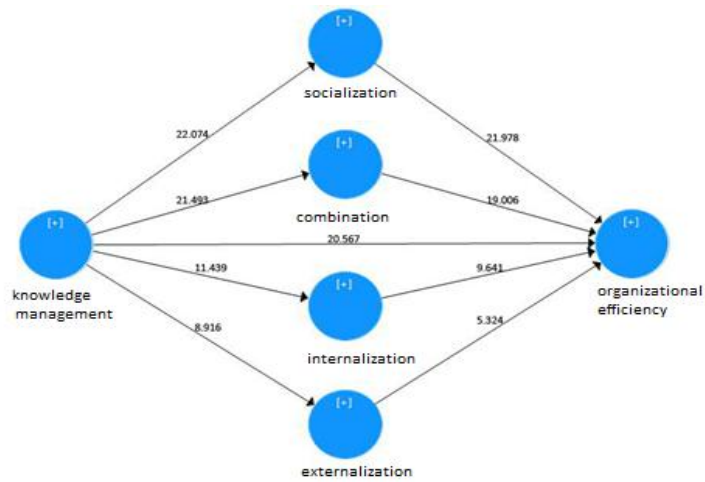

Figure 2: sig levels obtained from structural equation modeling for main hypothesis

According to figure 2, if t-value is between +1.96 and -1.96, the correlations between variables are insignificant at the confidence level of 95% and if the t-value is higher than +1.96 or lower than -1.96, the correlations between variables are significant at the confidence level of 95%. Therefore, is t-value is higher than

1.96, it can show the accuracy of correlation between structures and as a result, confirmation of research hypotheses at the confidence level of 95%. Accordingly, all correlations in model are significant.

Figure 3: values of standardized coefficients obtained from structural equation modeling for main hypothesis H1

Table 8: results of implementing structural equation modeling for main hypothesis (H1)

Correlations between research variables	t-value	Direct effect ®	Indirect 5grain	Total effect	Result
Using KM → organizational efficiency	20.567	0.847	-	0.847	Confirmed

According to table 8, structural equation modeling is used to test main hypothesis. Hence, according to path coefficient of variable of using KM to increase efficiency of Alborz Electricity Distribution Company to 0.847 and t-value to 20.567, it could be

mentioned that using knowledge management has significant effect on increasing efficiency of Alborz Electricity Distribution Company and this hypothesis is confirmed.

Table 9: model quality indices and their acceptance in Partial Least Squares Method

Row	Model quality index	Acceptance level	KM	Organizational efficiency
1	Common crossover validity	≥0	0.000	0.000
2	Combined reliability	>0.7	0.916	0.953
3	AVE	>0.5	0.823	0.849

Table 10: results of structural equation modeling for 6 organist hypotheses

Correlations of variables	t-value	Direct effect ®	Indirect effect	Total effect	Result
Socialization – 6organizational efficiency	22.074	0.861	-	0.861	Confirmed
Combination– 6organizational efficiency	21.493	0.813	-	0.813	Confirmed
Internalization– 6organizational efficiency	11.439	0.767	-	0.767	Confirmed
Externalization– 6organizational efficiency	8.916	0.501	-	0.501	Confirmed

Therefore, according to path coefficient of variable of knowledge socialization in KM process to increase efficiency to 0.861 and t-value of 22.074, it could be mentioned that knowledge socialization in KM process has significant effect on increasing efficiency and first secondary hypothesis (H2) is confirmed (Table 9 and 10).

According to path coefficient of variable of knowledge combination in KM process to increase efficiency to 0.813 and t-value of 21.493, it could be mentioned that knowledge combination in KM process has significant effect on increasing efficiency and secondary hypothesis (H3) is confirmed (Table 9 and 10).

According to path coefficient of variable of knowledge internalization in KM process to increase efficiency to 0.767 and t-value of 11.439, it could be mentioned that knowledge internalization in KM process has significant effect on increasing efficiency and secondary hypothesis (H4) is significant and confirmed (Table 9 and 10).

According to path coefficient of variable of knowledge externalization in KM process to increase efficiency to 0.501 and t-value of 8.916, it could be mentioned that knowledge externalization in KM process has significant effect on increasing efficiency and secondary hypothesis (H5) is significant and confirmed (Table 9 and 10).

Table 11: model quality indices and their acceptance level in Partial Least Squares Method

Row	Variable	Common crossover validity	Combined reliability	AVE
		Acceptance level $\geq 0$	$>0.7$	$>0.5$
1	Socialization	0.233	0.763	0.551
2	Combination	0.007	0.718	0.800
3	Internalization	0.147	0.734	0.783
4	Externalization	0.027	0.778	0.806

According to table 11, research model has good quality, since common crossover validity of research variables is positive and

hence, combined reliability of variables is higher than 0.7 and AVE is higher than 0.5.

Table 12: priority of variables in Freidman test

Degree		
Variables	Mean rank	Significance level
Knowledge management	3.24	2
Socialization	3.85	1
Combination	0.982	4
Internalization	3.21	3
Externalization	2.61	5

According to table 12, it could be found that at the confidence level of 95%, values of research variables in studied population are positive and in high level. In field of answering to research questions based on significance of variables, Friedman test is used to rank the variables. Obtained results showed that variable of knowledge socialization has highest rank and importance among all variables and variable of externalization has lowest importance. All hypotheses of the research have been significant and are confirmed.

## 7 Conclusion

The results of confirmation of this hypothesis are in consistence with findings of Razm Azma et al (2015), Kumaresan & Swarooprani (2015), Nosrati and Mighi (2011), Sherafat et al (2012) and Ghazizadeh fard and Ataei (2013).

H2: knowledge socialization in KM process has significant effect on increasing efficiency of employees of Alborz Electricity Distribution Company.

According to path coefficient of variable of knowledge socialization in KM process to increase efficiency to 0.861 and t-Value of 22.074, it could be mentioned that knowledge socialization in KM process has significant effect on increasing efficiency and first secondary hypothesis (H2) is confirmed.

Main hypothesis (H1): using knowledge management has significant effect on increasing efficiency of Alborz Electricity Distribution Company.

According to obtained results, structural equation modeling is used to test main hypothesis. Hence, according to path coefficient of using knowledge management to increase efficiency of Alborz Electricity Distribution Company to 0.847 and t-value of 20.567, it could be mentioned that using knowledge management has significant effect on increasing efficiency of Alborz Electricity Distribution Company and the hypothesis is confirmed.

The results of confirmation of this hypothesis are in consistence with findings of Razm Azma et al (2015), Kumaresan & Swarooprani (2015), Nosrati and Mighi (2011), Sherafat et al., (2012) and Ghazizadeh fard and Ataei (2013).

H3: knowledge combination in KM process has significant effect on increasing efficiency of employees of Alborz Electricity Distribution Company.

According to path coefficient of variable of knowledge combination in KM process to increase efficiency to 0.813 and t-value of 21.493, it could be mentioned that knowledge combination in KM process has significant effect on increasing efficiency and secondary hypothesis (H3) is confirmed.

The results of confirmation of this hypothesis are in consistence with findings of Razm Azma et al., (2015), Kumaresan & Swarooprani, (2015), Nosrati and Mighi, (2011), Sherafat et al., (2012) and Ghazizadeh fard and Ataei, (2013).

H4: knowledge internalization in KM process has significant effect on increasing efficiency of employees of Alborz Electricity Distribution Company.

According to path coefficient of variable of knowledge internalization in KM process to increase efficiency to 0.767 and t-value of 11.439, it could be mentioned that knowledge internalization in KM process has significant effect on increasing efficiency and secondary hypothesis (H4) is significant and confirmed.

The results of confirmation of this hypothesis are in consistence with findings of Razm Azma et al., (2015), Kumaresan & Swarooprani, (2015), Nosrati and Mighi, (2011), Sherafat et al., (2012) and Ghazizadeh fard and Ataei, (2013).

H5: knowledge externalization in KM process has significant effect on increasing efficiency of employees of Alborz Electricity Distribution Company.

According to path coefficient of variable of knowledge externalization in KM process to increase efficiency to 0.501 and t-value of 8.916, it could be mentioned that knowledge externalization in KM process has significant effect on increasing efficiency and secondary hypothesis (H5) is significant and confirmed.

The results of confirmation of this hypothesis are in consistence with findings of Razm Azma et al., (2015), Kumaresan & Swarooprani (2015), Nosrati and Mighi (2011), Sherafat et al., (2012) and Ghazizadeh and Ataei (2013).

In order to rank factors affecting increasing organizational efficiency (investigation of using KM and its components to increase efficiency), Friedman test is used. Obtained results showed that variable of knowledge socialization has the highest rank and significance among all variables and variable of externalization has possessed lowest rank. All research hypotheses have been significant and are confirmed.

## 8 Suggestions

In line with confirmation of main hypothesis (H1), the suggestions are as follows:

- It would better for managers of company to institutionalize organizational culture in such manner, so that they can encourage the employees to share their information and knowledge to achieve organizational goals.
- The managers should hold some meetings to make the employees familiar with each other.
- Managers should consider appropriate rewarding plans to encourage employees to participate in knowledge sharing.
- Managers of companies should consider technological innovations successfully as an essential issue for the organization.
- In line with development and strengthening self-esteem, the managers could provide good environment to appreciate and reward employees and managers in presence of their families and through acknowledgment papers.
- In line with confirmation of H2, following suggestions are presented:
  - Sharing knowledge and experiences of people with in organization should be promoted.
  - Encouraging people to share knowledge
  - Providing required facilities to share knowledge in the organization
  - Promoting team work in organization.
  - Enough trust in the organization to supply knowledge of individuals to entire organization

- Holding regular meetings to exchange information between authorities and employees
- In line with confirmation of H3, following suggestions are presented:
  - Making right decision according to the knowledge within the organization
  - Providing feedback loops between behavior and its results between organization and employees
  - Use of knowledge for organizational purposes by the employees
  - Key employees should be identified to record and maintain knowledge
- In line with confirmation of H4, the suggestions are as follows:
  - Providing adequate environment to implement new theories and ideas in the organization.
  - Idea management systems such as suggestions system, thinking room and consultation council should be existed in the organizations
  - Certain mechanism should be provided to change implicit knowledge to explicit knowledge within the organization
- In line with confirmation of H5, the suggestions are as follows:
  - To record and maintain the information related to knowledge of employees
  - To record and maintain researches and valuable experiences of employees
  - To register and maintain information related to referees
  - To register and maintain the information of projects and documenting them
  - The organization should be equipped to an electronic memory
  - Some mechanisms should be existed to update stored knowledge.

<sup>b</sup>hamidreza.kordlouie@gmail.com, <sup>c</sup>mbvarmazyar@gmail.com

**Abstract.** The present study intends to not only assess current calculation system of cost price of deposits at Sina Bank, but also prepare a new model for calculation of the same for banking deposits by the use of Costing Model based upon centralized activities at Sina Bank. For this purpose, all types of deposits were studied by the use of descriptive method and PFABC mechanism for calculation of cost price of deposits. Then a model were designed for calculation of any cost price. According to the results, Bank usually considers current account as free deposits. While the costs of this kind of deposit were considerable in 2014 and they were more than short-term investing cost deposits. Moreover, total bank deposits, have suitable profitability, so, the real cost price of deposits is lower than funded cost price.

**Keywords:** Traditional costing, Activity Based Costing, Performance Focus on Activity Based Costing, Cost price of Banking Deposits, Sina Bank

### 1 Introduction

At present, there are many companies in developed countries that are changing their Information systems, rejecting traditional models and moving to better costs management with a realistic view. Certainly, any success and continuous activities in such a new competitive environment need some modern methods for changing a simple business into a world level one. This is also true for banking industry.

Price and determining the cost price of products are the most important competitive tools in this field. There are some important cases for determining of correct and real cost price of products/ services. Activity Based Costing (ABC) method will enable the banks to find out an exact image of profitability of various services and customers. This method provides a good chance for finding out better motivators of costs and then put companies in to better situations for making managerial decisions at minor and major levels. In addition, ABC method makes it possible to determine the efficiency and profitability of employees at various branches of bank and headquarters.

Commercial banks in Iran classify equipping costs and allocation of resources under two general titles as Operational or Direct costs (profit of long-term & short-term investments and granted awards to owners of free-interest deposits) and indirect costs accordingly. Therefore, each one of the major services of banking system and the resources of financial supply for banks, all banking deposits include some costs in return. There is a question here how much the cost of mentioned banking deposits? and how we should calculate the cost price of banking deposits according to ABC method?

One of the main goals of designing this information system at the bank and financial institutes are preparing outer-organizational statements and foreign reporting. In case of profit & loss of banks, the cost price of activities calculates base upon traditional methods but there is not separate and exact information about the cost price of special activities or other services and products. (Sepoo et al., 2005).

Meanwhile managerial accounting systems of banks should focus on inter-organizational items in a way to provide better customer satisfaction, international competition and further success at world scale and measurement of people functions at

various departments and sectors. By the way, there are little information about cost price of activities through the mentioned systems. Furthermore, the above-mentioned systems are unable to make any relationship between costs motivators and products of services delivery or the mentioned situation will reduce possibilities for making decisions according to acceptable information. Therefore, it is necessary to establish an efficient cost price system and base upon the latest changes and base on in compliance with various conditions of financial services units, like banks.

According to a complete study of current banking system in Iran, it is obvious that active domestic banks have no more written and applicable costing system and this is a weak point of managerial accounting systems at banks. On the other hand, all banks need exact and correct information about the costs because of newly competitive market that is resulted from privatization policies of the state through establishment of financial institutes and private banks and applying of monetary policies for reduction of profit rates of banking credits.

There is a double need for applying of Activity Based Costing system because of variety of banking services and increase of overhead costs. In addition, with regard to all legal necessities about value of services that are presented to banks, applying of a correct cost price determining system can prepare exact profit margin of the services and according to this profit margin the bank manager will find out variety of services and move the bank to more profits and better activities in new competitive market. Therefore, making a wide scope survey in this field is an effective way for promotion of banking system. As a result, the general purpose of this research is to design a model through which we may calculate the cost price of various banking deposits by Activity Based Costing (ABC) as well.

### 2 Theoretical basics & research history

The real and clear difference between producing institutes and banks is raw materials to produce goods for selling. Cash amounts are the real raw materials of the banks and financial institutes, which is borrowed from customers and other resources. Due to lack of producing of a real product in banks, services are presented to customers through giving loans and absorption of deposits and relevant services.

There are three major groups of banking products (Anvari Rostami & Rezayat, 2007):

1. Different types of deposits
2. Different types of loans and facilities
3. Different types of non-monetary services such as electronic banking (ATM, POS, terminals of branches and telephone-bank)

Regarding the importance of cost price and little evidences that are existed in the banks and wide scope of cost price from various volumes of banking services, the present study has focused on banking deposits.

There are various researches about costing in accordance with banking industry in different countries. For the first time, Kaplan (1987) illustrated that ABC is applicable at American banks for promoting current services and improving new services.

In 1999, an assistant professor at Montreal University of Canada and editor of CMA magazine, Alexander Mercer made a research project at National Bank Card Services Dept. of Canada and illustrated that Activity Based Costing system at Credit Card Section is the best managerial and strategic tool for determining of cost price of services.

In 2004, Olega Lostic could measure cost price of services at Tarto University through E-banking channel and by the use of ABC method and also she could illustrate that Electronic banking has higher profits than traditional one.

Kaplan & Anderson (2007) not only introduced a new generation of costing titled as Time Activity Based Costing", but also they presented some practical steps for calculating of cost price in each banking transactions especially the cost price of Electronic banking transactions. They used time for allocation of costs.

Fuster (2007) illustrated that about 96.2% of sample banks at Spain are familiar with the concept of ABC 31% have used it, 34% have analyzed it but 27% have not used it anymore.

According to the study of Alnasser & Lee (2008) about Chinese banks, there are so many important reasons that never let Chinese banks to implement ABC in this country such as lack of a clear goal, lack of enough knowledge about Activity Based Costing, Weak planning, lack of partnership, resistance of humane force against changes and present of little foreign resources.

Upon evaluation of Portugal banks, Karniz & Sels (2008) illustrated that ABC method is very limited among the banks of this country and most of banks prefer to use Variant Costing method for customers and Absorbed Costing method at branches.

In Iran so many studies about cost price of banking services including deposit services and grant of facilities and e-banking have been done. For instance, upon studying current costing systems of services at state's trading banks, Arab MazarYazdi & Nasser (2003) presented a model for calculation of cost price of banking deposits by the use of ABC at Refah Bank. They illustrated that there was a considerable difference between the results out of ABC and the expected digits by managers of Refah Bank.

Hoshi & Mansouri Ghenaie (2009) studied any feasibility of calculating the cost price of deposits and issued drafts by ABC method at Mellat Bank.

Rahnamay Rouposhti and the other researchers (2009) operational and financial study in West Azerbaijan Province illustrated that calculation method of cost price at both banking systems is not suitable from practical viewpoint and Islamic Banking Rules. In addition, they illustrated that there is a significant different between calculated cost price based upon ABC and traditional method as well.

Namazi & Nazemi (2012) compared both traditional costing system and ABC at electronic services sector of Keshavarzi Bank in Iran. According to the studies, there is a significant difference between both systems and ABC system is more useful in calculation of cost price than traditional one. The cost price resulted from ABC system in 264 out of 470 branches was more than the same out of traditional one.

Nazemi and Seyedi (2012) calculated the cost price of banking services at 14 selected branches of Mehr Bank in Khorasan Razavi Province by ABC method, and then they compared the results with stated rates in banking system. According to the results, the cost price of 1 Rls. granted facilities has a significant difference with average profit rate without calculation of internal transactions of branches (in the format of borrowing or granting any credits to other branches). However, in Iran nobody has studied about cost price of banking deposits by Performance Focused Activity Based Costing method, which is the subject of the present research.

### 3 Methodology

Since the real goal of this study is to find any rules and regulations for real and practical situation and promotion of

products and efficiency of executive methods, it is possible to claim that this research is an applicable one.

On the other hand, this study includes data collection for testing of hypotheses or answering to relevant questions of current situation. According to the data collection method, this research is a descriptive and case study. There is a posteriori method of reasoning. Therefore, we should apply the findings out of sample groups into the statistical population.

The present study is a case survey, so Sina Bank has been studied as a sample of all Iranian trading banks. Sina Bank, Mother Sq. Branch (as a great branch of Sina Bank either from submission of different services or from viewpoint of high volume of banking activities) has been selected. We studied all financial statements and financial documentation of this bank that was related to year 2014. Excel software was applied for any required classification and data analysis.

Library and field methods were applied in this survey for necessary data collection:

1. Benefiting from current statistics and information at headquarter units of the bank
2. Benefiting from current statistics and information at various branches of the bank
3. Interview

#### Executive steps of PFABC

Followings are relevant steps of performance focus on Activity Based Costing in servicing organizations such as producing companies.

There are 9 executive steps in this model:

#### Step I) Recognition of major activities

Due to two important reasons, this step is important: 1- Nature and behavior of costs for any activity is usually different from others. 2- It is one of the major parts of ABC model, which should be maintained for continuity of production process.

#### Step II) Determining of real required resources for any activity:

All personnel who may perform a designed activity should specify the type and necessary resources of each activity according to its behavior with other information systems especially accounting information system. Resources may be time, direct materials and other criteria. This step includes real behavior of resources for the subject from two resources: Reflective resources and committed resources.

#### Step III) Determining the real rate of activities

Real rates of costs will be determined separately in PFABC for any activities and based upon different motivators through current information systems and according to real data and according to relevant resources and behaviors.

#### Step IV) Determining the price of PFABC activities

The price of activities is determined with regard the behavior of costs resources. When there is a variable source, the costs of input factors are obtained by multiplying of real resources that are used in each activity (AR) in real price of used resources (AP).

#### Step V) Calculation of standard rate of activities

In this step, standard rate of each activity should be estimated. It should be calculated exactly because of further application for comparing the real rates and real costs of operations.

### Step VI) Calculation of price violation

Costs managers obtain price violation by calculating real necessary resources multiply in standard price of consumed resources and minus the same from real costs as well. There is no change for committed resources because of their fixed rates.

### Step VII) Calculation of applied costs rate

The first job for calculation of reflective resources is to determine standard rate of consumed resources in an activity. The permitted reflective budget for real job from the viewpoint of reflective resources capacity is obtained by multiplying of required resources of product standard (SR) in real made job (AW) in standard price of resources (SP). In order to calculate any committed resources, we should firstly determine programmed level of budget (BL). It is usually in accordance with practical capacity as well. Therefore, we have  $SP \times BL$  (SIRVA) as the price of committed resources. The difference of

both equations is related to reflective resources, which are applied as various costs and related to standard price of activities.

### Step VIII) Calculation of violation rate

Violation rate illustrates whether the manager of a producing company has used more than standard rate of production resources or Not. In fact, it is about operation of producing managers.

### Step IX) Output of the activities

It means total amount of efficiency and effectiveness. Efficiency of resources is defined as the efficiency of an activity resulted from price violation and quantity violation. Meanwhile the effectiveness of an activity means any difference between real made jobs and budget job related to committed costs.

Table 1- Practical steps for Performance Focus on Activity Based Costing and comparing it with other ABC systems

PFABC (Third generation)	TDABC (Second generation)	Traditional ABC (First generation)
Step 1- Activity recognition	Not available (At first step of system performance)	Available
Step 2- Determining of Consuming resources of activities	Not available for all activities, just for the whole circle	Available
Step 3- Calculation of cost rate of consuming resources	Not available for all activities, just for the whole circle	Available
Step 4- Determining the costs of activities	Not available	Available
Step 5- Calculation of standard rate of activities	Not available	Not available
Step 6- Calculation of price violation of consumed resources	Not available	Not available
Step 7- Calculation of absorbed costs of activities	Not available	Not available
Step 8- Calculation of violation in consumed activities	Not available	Not available
Step 9- Calculation of the output of activities	Not available	Not available

## 4 Hypotheses

Followings are the hypotheses of research:

1. It is possible to design a model based upon PFABC for costing of banking deposits.
2. In comparison with traditional methods, PFABC Model may present a better image about banking deposits costs.

## 5 Findings

Equipping of resources

According to the Usury-free Banking Law (Approved in 1983), all Iranian commercial banks are entitled to accept any one of the following deposits:

1. Interest-free deposits

1-1-Current account

1-2- Saving account

2. Deferred investment deposits

2-1- Short-term investment deposits

2-2- Long-term investment deposits (1 year to 5 years)

Rather than these deposits as the major resources of banks, there are some other deposits such as deposit for letter of guarantees, advance payment of letter of credits, advance payments for transactions and so on against some banking services. The above-mentioned deposits are included in the group of financial supply resources.

**Sina Bank** is providing all above-mentioned services besides saving interest-free deposit, which is the major issue of this study. Later we will analysis the cost price of above-mentioned services.

Since the banking deposits (even long-term investment deposits) are immediate extradition, therefore there are various types of these deposits. So it is better to be used in relevant calculations of cost price of various remained deposits at the end of the year from average monthly deposits.

Table 2- Average remained deposits at Sina Bank- Mother Sq. Branch- Tehran in 2014 (Digits in Million Rls.)

Year	Current interest free deposit	Short –term deposit	Long-term deposit	Other deposits	Total	
2014	Amount	47,871	328,464	331,838	72,023	780,196
	Percentage	%6.1	%42.1	%42.6	%9.2	%100

### 5.1 Classification of costs at banks

There are two major groups for any costs at commercial banks:

## 1. Direct costs

It means any payable interest to investors either short-term or long-term (1 to 5 years) and awards of saving interest-free deposits.

## 2. Indirect costs

- Costs related to human force: It means the costs related to bank staff in any branches. With a glance to ledgers of sample branches of bank it is obvious that most of the mentioned costs are: Salary & allowances, additional work, redemption years of services, allowances, awards, assistants, insurance and coming and going
- Non-personnel costs: It means any costs related to branch operations such as: Publication and stationary and necessities, salaries & consultancy fees, communications and telecommunication and satellite band width and TDM data lines.
- Bad debts: They are obtained through deduction last year reserved facilities from current year reserves (calculated reserve pursuant to Circular Letter of Central Bank) as well.
- Overhead of headquarter & supervisor: It means personnel costs of headquarter and supervisors that are allocated in accordance with number of people in each branch (Supervisor costs have been allocated in accordance with number of occupied employees in branch and under the same supervisor).

- Charges costs & currency exchange: It means charges costs and results of currency exchanges of each branch and price acceleration costs of card branch and currency branch of central department that will be classified in accordance with the resources of each branch.

## 5.2 Analytical pattern of costing

For allocation of above-mentioned costs, firstly it is necessary to recognize which part of these costs is attributable to the mentioned services. For this purpose, any costs allocation is defined from two different aspects. The first part is traditional costing method and the second aspect is costing method based upon performance focus on activity based Costing. Later both mentioned aspects will be evaluated in details.

## 5.3 Calculation of cost price of deposits by traditional method

Usually there is not any problems in traditional and new costing methods for allocation of direct costs of products and services, because it is easily possible to browse them for considered goals.

The cost prices of amounts in Sina Bank have been obtained in compliance with considered indexes of Central Bank and according to the relevant statistics and information from General Accounting Management, budget, and IT management as follows:

Table 3- Profit (Loss) of Sina Bank- Mother Sq. Branch- Tehran for the year ended 20. Mar.2014

No.	Description	Price (Million Rls.)	Price (Million Rls.)
Incomes			
1	Operational income (Rls.)	448,396	
2	Operation income (Currency)	39	
3	Dept. of Currency, Card and Welfare	2,548	
4	Investments and projects and treasury	0	
5	Charges incomes & result of currency interactions	17,883	
6	Income of banking deposit & miscellaneous income	58	
7	Award of legal deposits	787	
Total income			469,711
Costs			
1	Personnel costs	2,798	
2	Bad debts	23,292	
3	Non-personnel costs	795	
4	Overhead of headquarter & supervisor	3,428	
5	Deposits interests costs	107,452	
6	Charges and results of currency transactions	2,195	
Total costs			139,960
Profit (Loss)			
1	Operational profit/loss	357,516	
2	profit/loss	329,752	
3	extra/shortage resource	(1,062,016)	
4	Resources in come/cost	(257,008)	
Profit (Loss) of branches after exchange of resources			72,744

Table 4- Cost price of amounts at Sina Bank- Mother Sq. Branch- Tehran-ended 20. Mar.2014

Average rates			
No.	Description		Percentage
1	Average interest rate of deposits (%)		20
2	Average interest rate of facilities (%)		25.7
3	Cost price of amounts (%)		22.4
4	Rate of resources to consumption (%)		255.4
Average of resources & consumption			
No.	Description	Price (Millions Rls.)	Price (Millions Rls.)
1	Total average of resources		763,783
2	Average of free resources		683,496
3	Average of facilities (Rls.)		1,745,512
4	Average of facilities (Currency)		-
5	Average of deposits & investments		-

**5.4 Calculation of cost price of deposits by PFABC method**

Firstly, in accordance with Responsibility Measuring Centers, we should extract any costs from financial ledgers. Since it is impossible to make any relationship between costs and activities in ledgers, usually we should classify the costs in a framework of costs reserves. Here we have made a classification in three resources:

- Any costs which are directly or indirectly based upon working activities of personnel.
- Any costs which are affiliated of deposits volume.

- Depreciation costs.

In addition, the base of allocating the costs to activities is based upon responsibility centers. This type of costs is usually each related activities that is time base on time or output of activates. (Maberli, 2009)

Since the overhead costs include a set of heterogeneous subject heading, it has been divided into five sections as well. Regarding the selection base, followings are proposed motivators for dividing of these costs throughout the branches:

Table 5: Proposed motivators for dividing of indirect costs of excellent branch

Proposed motivator for dividing of costs	Costs
Required time for performing of relevant activities to deposits	Personnel costs
Required time for performing of relevant activities to deposits	Administrative costs of personnel activities
Average balance of deposits	Administrative costs of deposit volume
Average balance of deposits	Bad debts
Number of issued documents	Depreciation costs

Firstly, it is better to allocate indirect costs to three reserves of major ones as follows:

1. First reserve includes any costs, which are affiliated, directly or indirectly, with personnel activities. It includes the followings:

A- Personnel costs including: Salary, Subsidy, and Allowances.

B- Administrative costs including: Publication, Necessities, Stationary, Personnel training, Personnel insurance, Fuel & Lightening, Rent, Repairs, Communications & telecommunications, and Clothing.

The second reserve includes various costs in compliance with volume of deposits. This cost group includes the following costs:

A- Other administrative costs including: fund Insurance, Transportation of monies, and Maintenance costs

B- Bad debts

2. The third reserve includes depreciation costs. As it was mentioned before, one of the most important characteristics of PFABC is that depreciation costs would be inserted in a special method in cost price of product. Depreciation is considered in costing procedure based upon consumption rate.

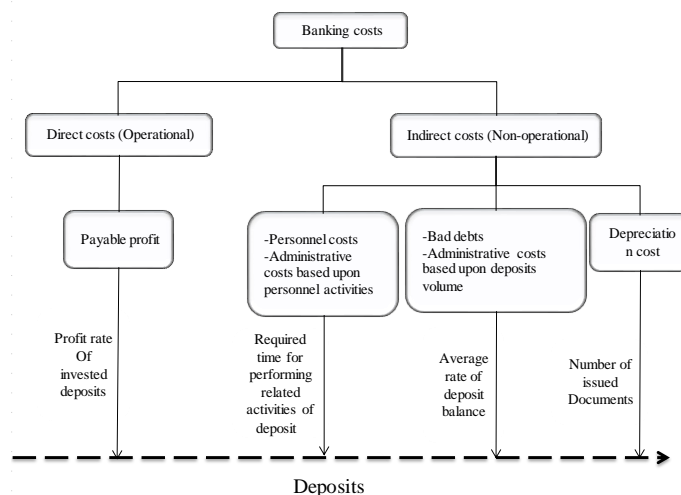

Figure 1: Allocation of banking costs method to any forms of deposits

The real reason of selecting these motivators is that all mentioned costs are affiliated with personnel costs, and therefore we should consider suitable bases with activities of human force in all branches. Firstly, in this study, we allocated personnel and administrative costs in compliance with personnel activities and previous study by Anvari Rostami & Rezayat (2007). Then we divided the same in accordance with real time. In addition, all administrative costs are allocated in accordance with deposits

volume and bad debts are allocated in accordance with average balance of deposits, and Arab Mazar Yzadi and Naseri (2003) would allocate Depreciation costs in accordance with number of issued documents with a glance to the previous study.

Before allocating costs, it is necessary to define real situation of branch costs. Followings are five classification of above-mentioned costs in table 6.

Table 6- Indirect costs of Sina Bank- Mother sq. branch- Tehran in accordance with classification (Digits in Million Rls.)

Year	Personnel costs	Administrative costs based upon personnel activities	Administrative costs based upon deposits volume	Bad debts costs	Depreciation costs
2014	3,950	1,050	3,275	23,292	941

As it is obvious in table No. 6, the major part of branch costs includes bad debts, then personnel costs, and other administrative costs. Salary is the major form of costs, which should be divided in accordance with the time of performing the activities by human force. For this purpose, it is necessary to specify relevant services to human force at first.

Further to the pre-determined cases, the time of banking procedures are the bases of proposed activities for allocation of human force costs. The term of activities are tested on experimental form in this sample branch.

Table 7 illustrates any information about number of issued documents for all deposit accounts as well.

Table 7- Number of issued documents related to various types of deposits in 2014

Term-Deposit	Current Account	Short-term account	Long-term account	Other deposits	Total documents
spring	11,018	1,521	101	25	12,665
summer	13,458	2,291	145	46	15,940
fall	13,649	1,883	119	37	15,688
winter	18,718	2,582	172	43	21,515
Total	56,843	8,277	537	151	65,808

Because of different activities for regulation and issuance of different documents, therefore we adjusted the number of documents by allocation of various weights for issued documents related to various deposits. In this step and with regard to the idea of bank specialists, the average weights of issued documents

were applied for calculation of allocation rate of costs. Table 8 illustrates the allocation rate of costs according to the number of issued documents and relevant information of table 7 and after applying the applicable coefficients and further adjustments.

Table 8- Allocation rate of indirect costs according to the number of issued documents and applicable coefficients

No.	Type of deposit	Current Account	Short-term account	Long-term account	Other deposits	Total documents
1	Number of issued documents	56,843	8,277	537	151	65,808
2	Applicable coefficient	9.13	10.63	10.63	3.96	-
3	1*2	518,977	87,985	5,708	598	613,267
4	Allocation rate (%)	84.62	14.35	0.93	0.10	-

$$\text{Allocation rate of current interest - free deposits} = \frac{518977}{613267} \times 100 = 84.62 \quad (1)$$

### 5.5 Model design

As it was mentioned before, banking deposits costs include two forms of direct/indirect costs. Direct costs mean the interest rate of investing deposits, which are directly effective in calculation of cost price. Firstly, we calculate the relevant shares of various deposits out of total indirect costs in order to find out the indirect rate of deposits. For this purpose, the share of each deposits will be obtained through multiplying of reserve costs in relevant motivating rate, which is obtainable by adding overhead costs to deposits and total allocated overhead to any deposits accordingly.

Finally, in order to find indirect costs rate for various forms of deposits, we divide indirect costs that are related to various deposits according to their shares out of total deposits of free resources. (Applicable deposits for investment)

Regarding the nature of various banking deposits, all banks are obliged to keep a percentage of their either banking deposits sight or insight as deposit in Central Bank. They are named as "Legal deposits" or "Legal reserves".

Legal reserves of banks may be changed according to the types of deposits by lawmaker in a fixed form or according to final decision of Central Bank and in specific conditions it will be in minimum or maximum levels as well. In addition, it is possible

to have equal amounts as legal reserves for all deposits or different cases for sight or insight (Saving & long-term) deposits. In case of different legal reserves, the relevant reserves of sight deposits (Current accounts) would be determined more than relevant legal reserves of non-sight deposits (Saving & long-term accounts) due to more circulation and monetary nature of deposits.

All banks in Iran are obliged to deposit a part of their own deposits in Central Bank of Iran as legal deposits, and customers would keep a percentage in cash in banks for responding to withdrawal of amounts.

Since a part of bank deposits would be closed as legal deposits, therefore the banks are cannot use them for any investment, and it may cause some costs for the banks which should be reflected in cost price of banking deposits accordingly. Moreover, Central Bank pays an annual interest percentage to legal deposits of banks, which should be reflected in cost price calculation as well.

It is necessary to mention that designed model for calculation of cost price of banking deposits is based upon the following hypotheses:

- All banking services and facilities are delivered just to investors and through current interest –free and short-term investing accounts.
- Cash coefficient for all deposits is considered as %2 in order to define some free resources of bank.

### 5.6 Calculation model of cost price for current interest-free deposits

Due to lack of any interests for current interest-free deposits and no more awards, they have not any direct costs. But they include a great part of indirect costs in return. Therefore, more than %70 of indirect costs at **Sina Bank** are based upon personnel activity and current interest –free deposits. This is because most of banking services like payments and receipts, letters of credit, granted facilities and so on are granted through the same deposits. On the other hand, any lack of transfer of suitable services may cause transfer of deposits to any bank (s) which present suitable and quick banking services.

Regarding previous classifications for indirect costs and allocation rates for various deposits and regarding all previous items, following formulation is applied for calculating the cost price of current interest-free deposits:

$$R_{t,DD} = R_{DD} = \frac{\left[ \left( C_a \times \frac{T_{DD}}{T_t} \right) + \left( C_v \times \frac{\bar{V}_{DD}}{\bar{V}_t} \right) + (C_d \times r_{DD}) \right] - (\bar{V}_{DD} \times S_{DD} \times r_s)}{\bar{V}_{DD}[1 - (S_{DD} + L_{DD})]} \quad (2)$$

Where:

$R_{t,DD}$  = Costs rate of current interest – free deposits

$R_{DD}$  = Indirect costs rate of current interest – free deposits

$C_a$  = Indirect costs based upon personnel activities

$T_{DD}$   
= Required time of relevant activities of current interest – free deposits

$T_t$   
= Total time for performing of related activities to deposits

$C_v$  = Indirect costs related to deposits volume

$\bar{V}_{DD}$  = Average rate of current interest – free deposits

$\bar{V}_t$  = Total balance of deposits

$C_d$  = Depreciation cost

$r_{DD}$  = Allocation rate of  $C_d$  to current interest – free deposits

$S_{DD}$  = The rate of legal deposit for current interest – free deposits

$r_s$  = Interest rate of legal deposits

$L_{DD}$  = Maintenance rate of current interest – free deposits for cash

Following is the relevant method of calculation the cost price of a current interest-free deposit by the use of designed model and relevant statistics and deposit information in 2014.

$$R_{t,DD} = R_{DD} = \left\{ \left[ \left( 5000 \times \frac{91.5}{95.5} \right) + \left( 26567 \times \frac{47871}{780196} \right) + (941 \times 0.8462) \right] - (47871 \times \%17 \times \%1) \right\} / 47871 [1 - (\%17 + \%2)] = 0.184 \quad (3)$$

### 5.7 Calculation model of cost price of short-term investment deposits

This type of deposits has some direct (payable profit to depositors) and indirect costs. Following formulation is used for calculation of cost price of these kind of deposits:

$$R_{t,SHD} = R_{SHD} + R'_{SHD} \quad (4)$$

Where:

$R_{t,SHD}$  = Costs rate of short – term investment deposits

$R_{SHD}$  = Indirect costs rate of short – term investment deposits

$R'_{SHD}$  = Direct costs rate of short – term investment deposits

Indirect costs rate is obtained through following formulation:

$$R_{SHD} = \frac{\left[ \left( C_a \times \frac{T_{SHD}}{T_t} \right) + \left( C_v \times \frac{\bar{V}_{SHD}}{\bar{V}_t} \right) + (C_d \times r_{SHD}) \right] - (\bar{V}_{SHD} \times S_{SHD} \times r_s)}{\bar{V}_{SHD}[1 - (S_{SHD} + L_{SHD})]} \quad (5)$$

Where:

$T_{SHD}$  = Performance time of relevant activities of short – term investment deposits

$\bar{V}_{SHD}$  = Average rate of short – term investment deposits

$r_{SHD}$  = Allocation rate of "Cd" to short – term investment deposits

$S_{SHD}$  = Legal deposit rate for short – term investment deposits

$L_{SHD}$  = Maintenance rate o short – term investment deposits for cash

(Because of definition of  $C_a$ ,  $T_t$ ,  $C_v$ ,  $\bar{V}_t$ ,  $C_d$  and  $r_s$  in previous formula, it will not be defined in this formula and next formulations).

Following is calculation method of the cost price of short-term investment deposit in 2014:

$$R_{SHD} = \left\{ \left[ \left( 5000 \times \frac{56.25}{95.5} \right) + \left( 26567 \times \frac{328464}{780196} \right) + (941 \times 0.1435) \right] - (328464 \times \%15.5 \times \%1) \right\} / 328464 [1 - (\%15.5 + \%2)] = 0.051 \quad (6)$$

$$R_{t,SHD} = 0.051 + 0.10 = 0.151$$

### 5.8 Calculation of Cost price of long-term investment deposits

Also there are two types of direct (payable profit to depositors) and indirect costs for long-term investment deposits (1-year, 2-year, 3-year, 4-year and 5-year).

Following formulation is used for calculation of long-term investment deposit costs:

$$R_{t,LID} = R_{LID} + R'_{LID} \quad (7)$$

Where:

$R_{LID}$  = 1 – year long – term investment deposit costs rate

$R'_{LID}$  = 1 – year long – term investment deposit indirect costs rate

$R'_{LiD}$  = 1 – year long – term investment deposit direct costs rate

Following formula is used for calculation of long-term investment deposits indirect costs rate:

$$R_{LiD} = \frac{\left[ \left( C_a \times \frac{T_{LiD}}{T_t} \right) + \left( C_v \times \frac{\bar{V}_{LiD}}{\bar{V}_t} \right) + (C_d \times r_{LiD}) \right] - (\bar{V}_{LiD} \times S_{LiD} \times r_s)}{\bar{V}_{LiD}[1 - (S_{LiD} + L_{LiD})]} \quad (8)$$

Where:

$T_{LiD}$  = Required time for performing of related activities of long – term investment deposits

$\bar{V}_{LiD}$  = Average of 1 – year long – term investment deposits

$r_{LiD}$  = Allocation rate of Cdto 1 – year long – term investment deposits

$S_{LiD}$  = Legal deposit rate for 1 – year long – term investment deposits

$L_{LiD}$  = Maintenance rate of 1 – year long – term investment deposits for cash

For instance, it is possible to calculate the cost price of a 2-year long-term investment deposit according to the designed model of 2014 as follows:

$$R_{LiD} = \left\{ \left[ \left( 5000 \times \frac{9.25}{95.5} \right) + \left( 26567 \times \frac{247352}{780196} \right) + (941 \times 0.0069) \right] - (247352 \times \%11 \times \%1) \right\} / 247352 [1 - (\%11 + \%2)] = 0.040 \quad (9)$$

$$R_{tLiD} = 0.040 + 0.185 = 0.225 \quad (10)$$

**5.9 Calculation of cost price for other deposits**

Other deposits include deposit of Letters of Guarantee, advance payments of Letters of credit, advance payments for transactions

and so on without any direct costs. But they may include a part of indirect costs as well.

Following formula is applied for calculation of cost price of other deposits:

$$R_{tOD} = R_{OD} = \left[ \left( C_a \times \frac{T_{OD}}{T_t} \right) + \left( C_v \times \frac{\bar{V}_{OD}}{\bar{V}_t} \right) + (C_d \times T_{OD}) \right] - (\bar{V}_{OD} \times S_{OD} \times r_s) / \bar{V}_{OD} [1 - (S_{OD} + L_{OD})] \quad (11)$$

Where:

$R_{tOD}$  = Cost rate of other deposits

$R_{OD}$  = Indirect costs rate of other deposits

$T_{OD}$  = Required time for performing of relevant activities of deposits

$\bar{V}_{OD}$  = Average of other deposits

$R_{OD}$  = Allocation rate of Cdto other deposits

$S_{OD}$  = Legal deposit rate for other deposits

$L_{OD}$  = Maintenance rate of other deposits for cash

$$R_{tOD} = R_{OD} = \left\{ \left[ \left( 5000 \times \frac{4.75}{95.5} \right) + \left( 26567 \times \frac{72023}{780196} \right) + (941 \times 0.0010) \right] - (72023 \times \%17 \times \%1) \right\} / 72023 [1 - (\%17 + \%2)] = 0.044 \quad (12)$$

**5.10 Calculation of cost price of deposits at Sina Bank for 2014**

In this part we calculate the cost price of any deposits at Sina Bank in 2014 with regard to all data collected and also prepared models and statistics as well. Excel software has been applied for required calculations the results of calculation are inserted in table 9 as follows:

Table 9- The cost price of any deposits of Sina Bank-Mother Sq. Branch-Tehran in 2014

Year	Current interest –free deposit	Short-term investment deposit	Long-term investment deposit					Other deposits
			1-year	2-year	3-year	4-year	5-year	
2014	18.4	15.1	20.9	22.5	22.8	23.3	23.8	4.4

Figure 2- Cost price of deposits at Sina Bank-Mother Sq. Branch-Tehran in 2014

Regarding table 9, all real cost prices of deposits have been obtained through current information systems and according to real data resources. In this step, the standard rate for activities should be estimated. This step has been omitted in ABC and TDABC. But it is assumed as a major step in PFABC as well.

According to table No. 5, all proposed motivators for division of costs include: necessary time for performing activities that are related to deposit, average of deposit balance and number of issued documents. In this step we should estimate the motivators. The first motivator is necessary time for performing relevant activities of deposits. Standard time has been extracted in accordance with bank specialists' ideas.

The second motivator is average balance of deposits, which has been calculated through received reports (Report of financial

information for the fiscal year ended on 20. Mar.2014) about average balance of deposits in 2014 that is illustrated in table 10.

Table 10- Average budget of deposit balance at Sina Bank- Mother Sq. Branch-Tehran in 2014 (Digits in Million Rls.)

Year		Current interest free deposit	Short –term deposit	Long-term deposit	Other deposits	Total
2014	Amount	41,000	285,000	293,000	67,000	686,000
	Percentage	%5.98	%41.55	%42.71	%9.76	%100

The third motivator is number of issued documents that are as follows for 2014.

Because of different activities for preparing and issuance of various documentation, therefore we adjusted the number of documents through allocation of various weights to issued documents related to various deposits.

In this step and with regard the ideas of banking affairs specialists; we consider the weight balance of issued documents by the use of applicable coefficients for further calculation of allocated rate to a part of costs. Table 11 illustrates the allocation rate of costs according to the number of issued documents with regard to the relevant information and applying of necessary coefficients and required adjustments.

Table 11- Allocation rate of indirect costs according to the number of issued documents and applicable coefficient

No.	Type of deposit	Current Account	Short-term account	Long-term account	Other deposits	Total documents
1	Number of issued documents	60,550	9,430	770	250	71,000
2	Applicable coefficient	9.13	9.13	10.63	3.96	-
3	1*2	552,821	552,821	8,185	990	662,237
4	Allocation rate (%)	83.48	15.14	1.2	0.18	-

$$\text{Allocation rate of current interest – free deposits} = \frac{552821}{662237} \times 100 = 83.48 \quad (13)$$

After obtaining the standard rate of resources, price violation should be calculated for activities. For this purpose, firstly, the real required resources for activities should be calculated and

then multiply the real resources in standard price of them due to above-mentioned model and deduct from the real costs accordingly.

$$\text{Violation cost} = (\text{Standard price of resources} \times \text{real necessary resources}) - \text{real costs of activities}$$

Table 12- Calculation of violation cost in 2014

Description	Deposit of current interest-free account	Short-term investment deposit	Long-term investment deposit					Other deposits
			1-year	2-year	3-year	4-year	5-year	
Real resources x standard price	19.5	14.9	21.5	22.9	23.4	23.8	24.3	4.6
Real costs	18.4	15.1	20.9	22.5	22.8	23.3	23.8	4.4
Violation cost	1.1	-0.2	0.6	0.4	0.6	0.5	0.5	0.2

In next step it is necessary to determine standard amount of consuming resources for further calculation of reflective resources. For this purpose, we may use job evaluation system or statistical tools like regression analysis. Permitted reflective budget is obtainable for calculation of real made jobs through multiplying of required standard resources, obligation of job

performance and standard price of resources. In order to calculate pre-determined consuming resources firstly we should determine programmed level of budgets. Then we should specify standard price of pre-determined consuming capacities through dividing of funded costs to funded level.

Table 13- Indirect costs of Sina Bank- Mother sq. branch- Tehran in accordance with classification (Digits in Million Rls.)

Year	Personnel costs	Administrative costs based upon personnel activities	Administrative costs based upon deposits volume	Bad debts costs	Depreciation costs
2014	3,650	972	3,196	23,944	979

Table 14- The cost price of any deposits of Sina Bank-Mother Sq. Branch-Tehran in 2014

Year	Current interest –free deposit	Short-term investment deposit	Long-term investment deposit					Other deposits
			1-year	2-year	3-year	4-year	5-year	
2014	17.6	15.1	21	22.6	22.9	23.4	23.9	4.5

Each deposits calculating is the final step. Total efficiency and effectiveness are illustrated as relevant output. The output of resources is defined as the output of any activities and resulted from price violation and violation rate accordingly. In fact, the output is specified and introduced as any differences between

real made jobs and costing one related to pre-defined costs. Output violation illustrates that whether the programming of resources is used suitably or not? The other factor of output violation illustrates situation that whether a manager be successful in finding any pre-determined goals or not?

Output of activities = Real made jobs – Costing job of predefined costs

Table 15- Calculation of output in 2014

Description	Deposit of current interest-free account	Short-term investment deposit	Long-term investment deposit					Other deposits
			1-year	2-year	3-year	4-year	5-year	
Real job	18.4	15.1	20.9	22.5	22.8	23.3	23.8	4.4
Funded job	18.8	15	21.6	22.9	23.4	23.9	24.4	4.7
Activity output	-0.4	0.1	-0.7	-0.4	-0.6	-0.6	-0.6	-0.3

## 6 Conclusion

In this part we may submit some results out of our investigations and evaluations, data analysis and responding to research hypotheses and finally propose our proposals accordingly.

Followings are the results of the present study:

1. It seems that the costs of short-term investment deposit are more than current interest-free deposit. But as it is obvious in table No. 9, the costs of current interest-free deposits at **Sina Bank** in 2014 was more than short-term investment deposit. This bank may usually consider its current interest-free deposits included in free of charge deposits. Meanwhile, there are considerable costs in 2014 and even more than short-term investment deposit.

2. According to table No. 12, it is obvious that besides short-term investment deposit with non-suitable price violation (Real costs are more than standard one), the remained deposits have suitable price violation (real costs are lower than standard one). In addition, and according to table No. 15, all bank deposits, besides short-term investment deposit, have suitable output while the real cost price of deposits is lower than funded cost price.

3. The other considerable point in this research is the effects of contraction/expansion monetary policies on the cost rate of deposits. Therefore, in case of applying any contraction policies for reducing of monies, there is an increase in cost price of deposits due to the reduction of free resources of banks. In contrast, when there is an increase in monetary policies for increase of monies, there is a reduction in volume of free deposits and cost price of it.

4. According to the researches, applying ABC method based upon banks' activities makes bank have better understanding about profitability of their customers and various services. In addition, this method will determine the efficiency and effectiveness of branches and headquarter administrations of the bank. Really it is a good chance for manager to make better financial decisions including any decisions related to granted facilities and their output rate, controlling of indirect costs, relevant decisions about cash structure, combination of capital and banking deposits and salary rate of granted services to customers as well. According to the results, no more correct bases have been applied in traditional classifications and related to various deposits or banking services. This will endanger any correct decisions.

## 7 Responding to hypotheses

1. It is possible to design a model based upon PFABC for funding any banking deposits.

One of the common methods around world is Activity Based Costing for funding any banking products. In our own country and with regard to considerable percentage of overhead costs (Indirect) out of total bank costs, it is possible to benefit from a variety of operational activities and banking services and also banking mechanization through computer and further registration and recording of accounting activities and also it is possible to use PFABC system for funding any banking deposits.

2. In comparison with traditional costing methods, PFABC model is able to present an exact image of any banking deposits.

According to the researches, PFABC method will enable the banks to find better understanding about profitability of customers and services. In addition, this method will determine the efficiency and effectiveness of branches and headquarter administrations. It may provide a good chance for manager to make better financial decisions including any decisions related to granted facilities and their output rate, controlling of indirect costs, relevant decisions about cash structure of banks and also combination of capital and banking deposits in better situation.

According to the results, it is obvious that there is not a correct base for some traditional classifications about type of deposits (For instance it was revealed that current interest-free deposits need considerable costs while it was assumed that they are free from any costs for the bank).

According to the results, there are some proposals for improvement of funding methods and making better concepts for financial decisions and necessary fields for any competition among the banks through reduction of costs and better management of them.

1. Applying a multiple accounting system at the bank

Today most of financial institutes in the world started to use multiple accounting systems. It may include the following sub-systems:

- A traditional and somehow suitable accounting system with an acceptable operation, which may provide a basic accounting system through common methods in registration of transactions and allocation of costs and submission of financial statements in compliance with common accounting principles for foreign beneficiaries.

- An Activity Based Costing system or other new accounting methods for measuring of real costs of services, customers and organizational units for presenting of exact and correct information (Financial & non-financial) to managers and in order to make better decision. Meanwhile the major role of accounting system and financial affairs in most organizations is controlling of receipts, payments, and registration of accidents for better responding any legal necessities with little attention to management accounting as a managerial tool for controlling of costs and programming.

2. Establishment of an integrated information system about costs & income of the bank

The real requirement for a successful establishment of an Activity Based Costing system (and generally a good and effective accounting system) is an integrated information system of costs and income in compliance with information needs. Meanwhile the current accounting system of the banks are with lack of satisfying any required information needs for measuring and controlling of activity costs.

In order to meet any necessities of both groups (Accountants & decision makers), they should make common items accordingly.

### 3. Creating a floating rate for granted facilities and salary of banking services

There are different financial funding systems in the banks because of any differences in indirect costs from one side and due to various facilities of management and job skills of personnel in presenting of suitable banking services to depositors as well.

Therefore, in such a condition if banks have no chance just to allocate their deposits and facilities without considering their own costs, there is no more place for further competition. However, if they grant any facilities with regard to their costs, it is possible to have a good competition through reducing of costs and increasing of banking deposits for minimizing of cost price and equipping of resources and finally maximizing of the wealth of shareholders. As a result, estimated independence of banks in determining of banking facilities and salary rate of services play an effective role in competition and increasing of efficiency through reduction of their own costs.

As a result, it is necessary for Central bank, as the executor of monetary and credit policies, to consider major economic goals of country and equipping of banks' resources and create a floating rate for granted facilities and salary rate of banking services. Then it is not only possible to meet profitability goals of banks but also allocate banking resources without any differences with client and lawyer of banks and depositors.

### 8 Some proposals for future researches

1. Because of wide range of cost price calculations for banking services, the present study focused on banking deposits services. Therefore, it is proposed to implement ABC systems in other sectors of banking services including e banking and grant of facilities and then compare the results.
2. It is proposed to calculate cost price of banking services in accordance with other new methods of funding such as ideal funding, Kaizen funding, Activity Based Costing and comparing them with each other.
3. Costing of banking services by the use of other quantitative methods such as regression advanced parameters, Data Exclusive Analysis and ...
4. Implementation of costing system based upon activity in other servicing institutes
5. Designing a suitable accounting system for calculation of cost price of different banking services based upon ABC system and other costing methods.

**Abstract.** Current research aims at comparing professional ethics, psychological empowerment and job performance of physical education teachers in Karaj. Descriptive research methods were applied and the research was conducted as field study using questionnaire. Reliability of the questionnaires was obtained as 0.80, 0.85, and 0.78 respectively for professional ethics, psychological empowerment, and job performance variables using Cronbach's alpha. Findings showed that professional ethics in female physical education teachers is higher than male. Average of truthfulness, justice and fairness is higher in female physical education teachers than male. It is suggested that education organization create such environment for employees so that they attempt to realize organizational goals by developing fair treatment.

**Keywords:** professional ethics, psychological empowerment, job performance, physical education teachers.

### 1 Introduction

The teacher directly influences academic achievement of students considering his critical role in improvement of the schools, because in interaction process, teachers have highest involvement with students and impose highest influence on them, thus job performance of the teacher is influenced by structural meta-structural factors (Ogava, 2005). One of the main elements in this relation is presence of efficient teachers which have professional ethics. Importance of the teacher in education and his various tasks in knowledge development and education depicts role of teachers and significance of having professional ethics for them more than ever. Accordingly, root and origin of many activities and behaviors of the teachers should be looked for in the ethics and ethical values. Ethics contains principles and values which govern individual and collective behaviors entitled as wrong or right (Mahmoodi Shan et al., 2009). Today discussion of ethics has gained special status in management literature, and it is regarded as one of the elements of welfare in material and spiritual life of human being, because ethical criteria leads to strengthening social relations (Kiyani et al., 2008). Also, the issues of ethics in education and teaching have been neglected in most cases and there are rare research works in this regards. Investigation of educational ethics observance by faculty members (Arasteh et al., 2010), status of professional ethics in education (Alevi and Gehshin, 2011), necessity for paying attention to ethical issues (Gudarzi et al., 2011), and investigation of teaching ethical components are among rare cases of research works in this area. Meanwhile, paying attention to professional ethics and its consequences is one of the basic research subjects in organizational fields. Considering ethical and competent teachers have higher efficiency and productivity, empowerment issue, which is the healthiest way of contributing employees in the power, should be taken into account. Considering above mentioned materials, Conger and Kanungo (1998) defined empowerment as motivational concept of self-efficacy. Following review of related literature, Tomas and Velthous (1990) argued that empowerment is a multifaceted concept and its nature cannot be explained by a single concept (Ostovari, 2009). Extensive studies and research works on organizational behavior has showed that empowerment manifests employees' perceptions and behaviors such as using innovations or increases them (Spreitzer, 2008). In the social perspective, the interesting point for organizations is that their employees perform their tasks well. Good performance increases organizational productivity and finally leads to increased

national economy (Spector, 2008). Psychological empowerment and job performance are two variables which considerably influence effectiveness and success of the organization. Rothman (2002) defines job performance as a multifaceted construct which indicates the employees' performance, their innovation and solutions for problem solving, and the way of using available resources as well as using time and energy in performing job tasks. Valentine and Fleischman (2008) maintain that professional ethical standards encourage social responsibilities, because these measures are associated with improvement and development of employees' ethics. Adler (2014) studied ethical challenges in instructors and students and effective policies. Research findings suggested three types of intermediates affecting individuals' professional ethical behavior in the work place. Nazim et al., (2013) state that followers feel empowered and finds ethical identity when they perceive charisma of the leader based on the constructive narcissism rather than destructive narcissism. Chiang and Tsung-Sheng (2011) in their studies showed that perceived organizational support alone cannot be much effective on job performance. Gerhard et al. (2008) in their work stated that political skill as one of the constructs of social skills is positively related with job performance. Somech (2004) in his work entitled "leadership style impact and team process on performance and innovation in performance of heterogeneous teams" showed that there is difference in views and beliefs in highly heterogeneous teams. Considering what mentioned above, professional ethics is one of the basic issues in all human communities and it seems that professional ethics is less considered in our community. On the other hand, review of past studies indicate that there is no comparative study regarding professional ethics, psychological empowerment and job performance of male and female physical education teachers. Thus, necessity for this research is felt. The question established by the author is as follows: is there any difference between professional ethics, job performance and empowerment in male and female physical education teachers? The author hopes that findings in the current research provides useful information for education organization of the country and makes grounds for more comprehensive research works at national level.

### 2 Methodology

Research statistical population included all male and female physical education teachers in Karaj city (N= 750, 455 females and 295 males). 245 ones were randomly selected and considered as statistical sample. Data collection tool included questionnaires of professional ethics by Ghasemzadeh et al., (2014), Spreitzer's psychological empowerment (1995) and job performance questionnaire. Descriptive research method was applied and it is a survey research using standard questionnaire as the tool. 245 ones were randomly selected based on Morgan table (150 females and 100 males) and considered as statistical sample. Three types of questionnaires were used for measurement of variables.

**Professional ethics questionnaire:** This questionnaire was developed by Ghasemzadeh et al., (2014) including 16 items based on five-point Likert scale with accountability, honesty, fairness, loyalty, excellence and competitiveness, empathy with others, respect, and respect for social values and norms components. In this study reliability of professional ethics variable was calculated using Cronbach's alpha coefficient as 0.8.

**Psychological empowerment questionnaire:** This questionnaire was developed by Spreitzer (1995) in 12 items. These items were based on five-point Likert scale including meaningfulness, competence, choice and effectiveness. In the present study, reliability of psychological empowerment variable was calculated using Cronbach's alpha as 0.9.

Job performance questionnaire: This questionnaire was developed by Paterson and contains 15 items. The way of scoring in this questionnaire was as follows: very weak (rarely), weak (sometimes), good (often), and excellent (always). In the current research, reliability of job performance variable was calculated using Cronbach's alpha as 0.9.

In order to data analysis, firstly descriptive statistics was investigated and frequency table of the questionnaire was

evaluated and frequency percent, standard deviation, and average of items was obtained. Also, in order to answer to hypothesis, multivariate variance analysis and one-way variance analysis was used for comparison of variables.

### 3 Findings

Table 1 gives descriptive statistics related to research variables.

Table 1. Descriptive statistics related to research variables in terms of gender

Variable	Statistical indexes							
	Mean		SD		Min.		Max.	
	Female	Male	Female	Male	Female	Male	Female	Male
Professional ethics	4.12	4	0.39	0.47	2.94	2.75	4.88	4.81
Accountability	4.33	4.2	0.54	0.58	3.	2.5	5	5
Honesty	4.7	4.27	0.54	0.57	1.5	2.5	5	5
Fairness	3.2	2.96	0.86	0.93	1	1	5	5
Loyalty	4.22	4.1	0.67	0.58	1.5	2.5	5	5
Excellence	3.69	3.68	0.9	0.9	1	1	5	5
Respect	4.19	4.15	0.65	0.69	2.5	2	5	5
Empathy	4.43	4.35	0.61	0.59	1.5	3	5	5
Respect for norms	4.23	4.31	0.67	0.69	1.5	2.5	5	5
Empowerment	3.99	3.85	0.55	0.63	2.67	2.47	5	5
Effectiveness	3.82	3.8	0.72	0.74	2	2	5	5
Choice	3.79	3.44	0.67	0.81	2	1.67	5	5
Competence	4.1	4.1	0.65	0.7	1	2.67	5	5
Meaningfulness	4.27	4.12	0.53	0.62	2.67	3	5	5
Job performance	4.53	3.98	0.52	0.54	2.4	1.73	5	4.87

Table 2 gives results related to one-way variance analysis regarding professional ethics and its aspects in male and female physical education teachers. According to results in Table 2, there is significant difference between male and female physical education teachers in terms of professional ethics. There is significant difference in terms of honesty between male and

female physical education teachers. Fairness aspect showed significant difference between male and female physical education teachers. Considering results in Table 3, mean of fairness aspect in female physical education teachers is higher than male physical education teachers. Significant difference was one observed in other aspects.

Table 2. One way variance analysis results regarding professional ethics and its aspects in male and female teachers

Source of changes	Sum of squares	Degree of freedom	Mean of squares	F statistics	Sig. level	Mean		
						Female	Male	
Gender	Professional ethics	0.89	1	0.89	4.88	0.02	4.12	4

Table 3 gives results related to one-way variance analysis regarding job performance, empowerment, and its aspects in male and female physical education teachers. According to results in Table 3, there is significant difference between male and female physical education teachers in job performance. Considering results in Table 3, mean of job performance in female physical education teachers is higher than male physical education teachers. There is significant difference between male and female physical education teachers in terms of mean of choice aspect. Considering results in Table 3, mean of choice

aspect in female physical education teachers is higher than male physical education teachers. There is significant difference between male and female physical education teachers in terms of mean of meaningfulness aspect.

Considering results in Table 3, mean of meaningfulness in female physical education teachers is higher than male physical education teachers. There is no significant difference between male and female physical education teachers in terms of psychological empowerment and its aspects.

Table 3. One-way variance analysis results regarding job performance, empowerment, and its aspects in male and female teachers

Table 4 gives results of one-way variance analysis regarding professional analysis and its aspects and job performance in male and female physical education teachers. According to results in Table 4, there is significant difference between male and female physical education teachers in terms of professional ethics. Considering results in Table 4, mean of professional ethics is higher in female physical education teachers than male teachers. There is significant difference between male and female physical education teachers in terms of honesty aspect. Considering results in Table 4, mean of honesty aspect is higher in female physical education teachers than male teachers. Given results in Table 4, there is significant difference between male and female

physical education teachers in terms of fairness aspect. Also, in above table it is observed that mean of fairness aspect in female physical education teachers is higher than male teachers. There is no significant difference between other aspects.

According to Table 4, significance level of gender effect for job performance variable is below 0.05, and it is significant at level  $P < 0.05$ . Thus, job performance shows significant difference in male and female teachers. Given results in Table 4, mean of job performance in female physical education teachers is higher than male physical education teachers.

Table 4. Results of one-way variance analysis regarding professional ethics, job performance in male and female teachers

Source of changes		Sum of squares	Degree of freedom	Mean of squares	F statistics	Sig. level	Mean	
							Female	Male
Gender	Professional ethics	0.89	1	0.89	4.88	0.02	4.12	4

	Job performance	17.8	1	17.8	62.9	0.0	4.53	3.98

#### 4 Discussion and Conclusion

According to results, there is significant difference between attitude of male and female physical education teachers in terms of professional ethics and its aspects. There is significant difference between all aspects of professional ethics in instructors expect human and organizational relationships, and also there is no significant difference between views of male and female students, humanities and basic science students regarding five aspects of professional ethics. Some findings are consistent with findings in the current research. Adler (2014) introduced three types of intermediates which influence professional ethics in individuals in the work place. Payne and Landry (2006) studied business and professional ethics and research findings indicated ethics is not yet prevalent and common among professional individuals in IT field, which is not consistent with findings in this work. Reason for significant findings can be due to various factors such as religion, family, environmental conditions, social status, age, gender, race, etc.

Other findings showed that there is significant difference between attitude of male and female physical education teachers regarding job performance, empowerment and its aspects. Results of the current research are inconsistent with findings by Chiang and Tsung-Sheng (2011). They studied impacts of perceived organizational support and psychological empowerment on job performance and concluded that perceived organizational support alone cannot be much effective on job performance. Gilboa and Shirom (2008) comprehensively investigated relationship between stressors and job performance of employees. They found that there is significant relationship between stressors and job performance, which is not consistent with findings in the current work. Rubina et al., (2008) shoed there is inverse relationship between occupational stress and job performance, that is, high occupational stress leads to low job performance. Also, it was shown that male officers are more affected by stressors than female officers, which is not consistent with findings in the current research. Possible reasons for this difference may be related to research by Hersi and Goldsmith

(2004) who considered effective performance management subject to seven variables. These variables include ability, motivation, environment, reliability, evaluation, clarity, organizational support or help. According to Spector (2008) individual can act well in their job when they have necessary ability and motivation for having appropriate performance. In fact, he believes that ability and motivation leads to optimal job performance.

Research findings indicate significant difference between attitude of male and female physical education teachers in terms of professional ethics and its aspects and job performance, which is consistent with findings by Valentine and Fleischman (2008). They showed that standards of professional ethics encourage social responsibilities, because these measures are associated with development and improvement of employees. Abdul-Rahman and Wang (2010) studied impact of professional ethics on construction quality and found that professional ethics is an important factor for achieving acceptable quality and stability in construction, which is not consistent with some findings in the current work. Possible reason for this inconsistency can be due to difference in the fields and statistical samples in two research works. Findings of most studies related to this subject are rare and it can be stated there is no comparison between all variables of this research. Overall findings in the current research suggest significant difference between attitude of male and female physical education teachers regarding professional ethics and its aspects including honesty, fairness, and female teachers outperformed male teachers. Mean of job performance was higher in female teachers compared to male teachers, and even mean of having right of choice was higher in female physical education teachers than male teachers. Thus, it is suggested that suitable grounds are provided for male physical education teachers for motivating them and increasing their empowerment so that job performance is improved. Also, it is recommended that education organization provides such environment so that employees attempt in peace for realization of organizational goals which can be obtained by fair treatment with all male and female employees.

## STRATEGIC PLANNING OF TOURISM DEVELOPMENT DURING THE SANCTIONS WITH BALANCED SCORE CARD (BSC) APPROACH, CASE STUDY: SHIRAZ CITY

<sup>a</sup>GHOLAMREZA NIKOOKAR <sup>b</sup>MAHDIYEH FATEHI

<sup>a</sup>Associate professor in Imam Hossein Comprehensive University

<sup>b</sup>MA of MBA management, strategy trend, Tehran University,  
Instructor at Payameh Noor University

Email: <sup>a</sup>ghniko@ihu.ac.ir, <sup>b</sup>fatehi.mahdiye@gmail.com

**Abstract.** Today, tourism is one of the most dynamic economic activities today and plays an important role in local permanent development. The goal of the present research is identifying the capacities and editing the proper strategies for organizing the tourism during the sanctions. We tried to identify the components affect the tourism, its problems and the blockages in its development over the sanction by providing proper management strategies to improve the tourism capacities. The experimental test of the model conducted by using the interviews, the sample size of the expert population and all people who are active in tourism industry of Shiraz. The findings of the research indicate that the current research is effective regardless of its tough implementation and it's more efficient than the simple models in tourism industry during the sanctions.

**Keywords:** strategic planning, sanctions, Balanced score card, them analysis.

### 1 Introduction

Tourism turned to be the biggest industry in the service unit and it's considered the first industry around the world in terms of importance. It's also one of the most dynamic economic activities today and plays an important role in local permanent development. Tourism is considered as an important developmental tool for national economy. The importance of tourism highly depends on economic cycle which has a high capability in national and international economy dynamic in a way that the tourism consumptions, government and private investment and also export in this realm in 2004 had growth equal to 9.5 % and round 5.5 trillion dollars (Lee, 2008).

Therefore, the government policies in the recent decades have been focused on tourism development as a way of battling unemployment and creating income. The importance of tourism industry and its role in social, cultural and economic development led many local, regional and national managers and planners to plan for its development (Batler, 2002).

Currently, there are various implemental and theoretical experiences around the world for studying, analyzing, planning and managing the tourist regions which have an ascending flow synchronous with technology developments (Tesay et al., 2010). This flow and also the global issue of tourism complexities caused that the comprehensive, techniques and mixed models be taken into consideration (Jerry Ho et al., 2011).

Planning as a scientific tool helps the tourism workers to specify the best way of development in a region in a scientific and consistent process and to place it in path of developing other economic sections (Long, 1990). After the Second World War, the lack of confidence, consistency and evolving environment showed up more than before and the strategic planning was introduced as a solution.

The strategic planning is a framework for applying strategic thinking and leading operations in order to reach to certain goals and results. In other words, it's an organized effort for fundamental decisions which orients the organization's activities in a legal framework. The organizations can provide strategies which are proper with power points and they can remove the weak points and use the opportunities for facing with threats (Brison, 1993).

Now, due to the fact that Iran is considered as the most wonderful country in the work in case of different cultural attractions, arts, environment, having various attractive cities and because it's among the tenth countries of the world in terms of

the tourist attraction, developing tourism as a new strategy can play an important role in making the economy variable and it can provide new opportunities for Iran.

Tourism as an efficient economic factor has been taken into the consideration during the recent year and provided economic development in some countries and regions. Creating different jobs and its variety is in a way that both skillful and simple workers can find jobs. Many countries consider the tourism industry as the main source of income, growth of private section and develop of infrastructures. Today, this industry is very important in economic and social development of the countries in a way that economists called it "invisible export" (Batler, 2002).

Shiraz is one of the most important tourism center in Iran and it has varied potentials in this realm. It's considered as one of the most attractive cities in terms of tourism among Iranian people and all over the world. This city is very important for foreign tourists and they normally considers it as a tourist destination when they visit Iran. Due to the importance of foreign tourism industry in Shiraz and Iran, it should be stated that there's a high distance between the status quo and the proper situation in case of attracting foreign tourist in Shiraz city. This shows the importance of a comprehensive planning. The studies show that due to the fact that the potentials of tourism industry are present in Iran and specially in Shiraz, attracting foreign tourists should be tenfold and even centesimal.

The tourism industry faces the political and security problems including the sanctions on one hand and the politician's deficiencies on the other hand led this stable economic source be weak and unknown. Therefore, a question arises is that what are the weak and power points of the tourism industry and what threats and opportunities does it face. Then, based on the weak and power points, threats and opportunities, the strategic planning should be conducted for developing tourism which help overcoming such limitations.

The research tries to answer the following questions:

What are the challenges of tourism industry during the sanctions?

What are the components affect the tourism industry development?

What are the most important weak and power points, opportunities and threats?

Then, we provide strategies for developing tourism in Iran even during the sanction.

### 2 The importance of the research and the motivation

Today, creating tourism in cities, exploring rural attractions, recreating historical places and monuments, focusing on natural resources and etc. led many countries to a huge wealth and they are considered a consistent economic source for them. Today, many countries can improve their situation by this way and they can decrease unemployment, decreasing the capitation and foreign exchange income. Establishing and building hotels, restaurants and all recreation and sport centers increases income and decreases unemployment and poverty (Kandeloyi, 2011).

Since the strategic planning is adherent to values, ideologies, policies and strategies of the society (which most policy makers decide for it) tries to solve the main problems of the society and its growth, it's based on prediction and forward-looking and it had a developed and oriented perspective.

Therefore, the present research tried to analyze the strategic planning during the sanctions by using BSC approach in Shiraz so that we can identify the weak and power points, opportunity and threats during the sanctions and providing strategic guidelines for developing Iran.

The main goals of the research are as follows:

1. Identifying the capacities and editing the proper strategies in order to organize tourism during the sanctions
2. Identifying and analyzing the weak and power points, opportunity and threats of tourism during the sanctions.
3. Providing proper management strategies in order to improve tourism capacities during the sanctions.
4. Identifying the components affect the tourism development
5. Identifying the problems in realm of tourism industry
6. Identifying obstacles in tourism development during the sanctions
7. Identifying ways for developing tourism during the sanctions

### 3 Method

The research method composed of rules, tools and valuable ways for analyzing the realities, exploring the unknown and achieving the problem solving. Using the scientific method is the only way for achieving the scientific results (Khaki, 2005).

The qualitative method is used by sing thematic analysis and interviewing the experts. The thematic analysis is a method for determining, analyzing and stating the patterns (thematics) of data. This method at least organizes data and describes them in details. However, it can go beyond and explain various aspects of the subject.

The qualitative methods are very complex and the thematic analysis should be considered as a fundamental way for qualitative analysis. The thematic analysis the first qualitative method that the researchers must learn because it provides main skills which are necessary for implementing many other qualitative methods (Braun & Clarke, 2006).

The data analysis process by using thematic analysis:

The process of thematic analysis starts when the analyst considers conceptual patterns and subjects which are potentially attractive. This process includes a continual sweep among data sets, coded sums and data analyses which occur. Recording the analysis starts in the beginning and totally, there's not unique way for starting thematic analysis study.

The six procedures of thematic analysis are explained in the following section. The thematic analysis is a recursive process in which there are moves forward and backward. Moreover, it's a process which is done during the time.

Stage 1: becoming familiar with data: the researcher needs to overwhelm himself into the data in order to become familiar with the depth of data content. Overwhelming into data usually include "repeated reading of the data" and the reading of data is in an active form (i.e. searching for concepts and patterns).

Stage 2: creating the initial codes: the second stage starts when the researcher reads the data and becomes familiar with them. It includes creating initial codes of data. The codes introduce a feature of data which is interesting for the analysts. The coded data are different from the thematic analysis units. Coding can be done manually or through software. If it's done manually, the data can be done by writing on a text which is going to be

analyzed or by using color pencils. The codes can be specified and they can be matched with the data extracts which show the codes. The important point in this process is that all data extracts are coded and ordered in forms of each code.

Stage 3: searching themes: this process includes categorizing different codes in potential thematic forms and ordering all coded data in forms of specific themes. In fact, the researcher starts his codes and considers how the different codes can be mixed in order to create a whole theme.

Stage 4: reviewing themes of stage 4 starts when the researcher created sets of themes and analyze them. This process includes two stages of reviewing and arranging themes. The first stage includes reviewing in coded sums level. In the second stage, the themes validity is considered in relation to data sets. If the theme's plan works well, then we can go to the next stage but if the plan does not correspond the data sets, the researcher should return and continue its coding till a satisfying theme plan is created. At the end of this stage, the researcher should be notified about the different themes, the way they are proper together and all the story that tells about the data.

Stage 5: defining the themes: the fifth process starts when we have a desirable plan of themes. The researcher defined themes for analysis and reviewed them again. Then, he/she analyzed the data. What nature the theme explains about is determined and it becomes clear that what aspect of data the theme has by defining and reviewing.

Stage 6: providing report: the sixth stage starts when the researcher does not have the tempered themes. This process includes final analysis and writing reports. The current research is applied in terms of goal and it's descriptive and it's a survey and descriptive type in terms of method.

#### 3.1 Statistical population

The statistical population includes sets of people, objects and etc. which are at least common in an attribution (Kiakajoori, 2010\_).

The statistical population of the research: expert's population (those work in tourism realm in Shiraz) is used and they are selected through snow ball sampling method.

#### 3.2 Sample

The sample is sets of signs which are selected from a bigger part, a group or a population in a way that it introduces the properties of that bigger part, group or population (the same source).

The sampling method the snowball sampling to the point of information saturation

#### 3.3 The instruments used for data collection

Questionnaire is the most prevalent method used for data collection in survey typed research.

A questionnaire created by SWOT method is used in the present research.

1. Studying the resources and interviewing the experts are used for data collection (if necessary).

2. The interview is used by considering the following properties:

a. The university experts in the field of tourism or other fields who published a paper related to tourism.

b. The M.A graduators in tourism organization with at least 5 years experiences in this work

c. PhD students of Tourism

### 3.4 Validity and reliability

Validity means that a measurement tool can assess the considerable feature. In other words, the concept of validity answer to this question: to what extent the measurement tool can assess the considered feature (Sarmad et al., 2006).

In the present research, in order to increase the validity of the questionnaire, the questionnaire was distributed among 30 experts and based on expert and instructor's suggestions about the questionnaire, the content validity of the questionnaire was confirmed.

### 3.5 The data analysis method and information

In order to analyze the data and to test the hypotheses, the qualitative thematic analysis method was used.

## 4 Defining the variables and keywords

### 4.1 Strategic planning

The strategic planning is an organized effort for using fundamental policies and works which shapes the activity's orientation of a system in an organized frame. The process of systematic planning is more ordered and cooperative way than other processes (Brison, 2002).

### 4.2 Sanction

Sanction can be defined as a punishment done by a country against another country in order to compensate prior unaccepted behavior.

Henry Benin and Robert Gilpin describe sanction as a manipulation of economic communications in order to achieve political goals that occurs to force the society to change the policy or its government by economic punishment.

The sanction is a collective and criminal action which requires diplomatic, economic or martial activities against a country that is conducted against the United Nations (Vesali, 2010).

### 4.3 Balanced score card (BSC)

In 1990, the BSC was initially introduced as a new method of analyzing performance and then as a tool for realizing strategy by Robert Kaplan, the professor of Harvard University and David Norton, the prominent consultant in USA. It's considered as a tool for achieving the organization's strategic goals.

### 4.4 Thematic analysis

The thematic analysis is a technique for analyzing and reporting the patterns in data. This technique describes the set of data in details and a simple way. However, it almost goes beyond and describes different aspects of the research. The qualitative approaches are very complex and the thematic analysis should be regarded as a fundamental technique for the qualitative analysis.

In the present research the data are collected by using questionnaire and interviewing with experts.

The interview method is done by considering following qualities:

- a. University instructors in tourism or other fields who have a scientific paper related to tourism.
- b. The M.A graduators in tourism organization with at least 5 years experiences in this work
- c. PhD students of Tourism

Although tourism cannot merely lead to the development of the country but the need of change and creating facilities for inhabitancy, relocating, other activities and development will gradually occur by entering the tourism in a country and in a long run, it will increase the facilities and installations. The tourism experts emphasized that there's a relationship between tourism, consistency and security. They believe that there's enough security in Iran for tourism but the main problem in attracting tourists is the lack of advertisement in Iran and the ill advertisement of other countries against Iran. The development of industry in each country shows its consistency of national security. The role and impact of tourism industry in the national security is in a way that the most developed countries prefer to focus on tourism industry despite having macro-economic resources; because, the presence of visitors and tourists in a country introduces that country as a secure center of tourism to the world other than economic development and cultural exchange. Today, the tourist activities are taken into consideration in less developed regions in Iran. The investors are persuaded to provide bank facilities and tax exemption in a way that up to 50% of the tax exemption is predicted for tourist activities in the fourth planning of social-economic development.

Shiraz is located in sou'wester of Iran with 40 kl length and a different width between 15 to 30 kl and 1267kl space. It's surrounded with high mountains as a firm wall which are strategically important in maintaining the city. Shiraz is the center of Fars which is geographically located in the center of province. The geographical features of Shiraz include: 33 degree and minute of eastern length, 36 degree and 29 minutes of northern length and height from sea is more than 1500 meter. Shiraz is the third city in Iran (after Tabriz (1908) and Tehran (1910)) in which municipal was established in 1917. Shiraz is the bright diamond of Iran and it's one of the most beautiful and famous cities of Iran. Shiraz composed of sets of civil history in the world and the heritor of Persian civilization and a sign of historical identity and the worthy share of Iran.

### 5 Data analysis using interviews

In the present research, the data were collected through interviewing with 10 experts who are familiar with strategic planning and 7 experts who are active in the realm of tourism in Shiraz. Conducting interviews started in 2014 and it was finished in June- July 2014. The questions were designed in two sections of analyzing the status quo and analyzing the differentiation Strategy.

The status quo questions analyzes the most important needs of foreign and native tourists, their qualities, the tourist management style and internal processes of the related organizations, the cooperation and familiarity of the role and effect of educational facilities inside the organizations, the budget required for them and finally the income resource of tourism.

The questions related to the differentiation strategy analyze the capacity of internal processes, learning plans, customer's needs and financial resources needed for realizing the differentiation strategy goals.

The time of interview lasts around 30 to 150 minutes and they were all noted, recorded and the key points were extracted for analysis. All of them were written and the thematic analysis was used to analyze the data.

In order to analyze easily based on coding rules, the codes received from each interviews were placed in table. In this table, the key points of data were extracted as a proposition and a distinctive code was specified for each. After comparing the codes, the items which point to a shared aspect of the phenomenon receive a concept and also some concepts are introduced in form of the main themes.

In this process, the key points of the interviews were offered in form of preposition. Each code is specialized for a preposition. For example, code (5.2) points to preposition 2 of the fifth interview and code (12.3) points to the preposition 3 of the 12<sup>th</sup> interview. It should be noted that the strategists were interviewed first and then the tourist experts were interviewed.

The second coding of concepts and themes

In this process, the initial codes are changed to secondary codes due to the frequency. It means, the initial codes with the same

concepts of remove or merge are categorized in a group. The concepts which were categorized in a domain form the final themes. In this section, the themes are divided into 17 sections based on the concept's frequency:

- a. Developing the micro and macro infrastructure of tourism industry
  - Theme of the information received from the current research for question 1

Table 1. The theme of information received from the current research for question 1

Row	What are the most important power points of tourism development in Shiraz?
1	The existence of attraction and potentials of national and international tourism
2	The group cooperation of employees in activities related to tourism
3	Believing in more entrepreneurship through developing tourism
4	The fame of historical and cultural tourism attraction of Shiraz
5	The environmental variety, environment attraction and the four seasons
6	Protecting historical, cultural and natural attractions after the years
7	Locating in important communicational ways
8	The cultural, social and ethnical variety and traditions

The theme of information received from the current research for question 2

Table 2. The theme of information received from the current research for question 2

Row	What are the most important weak points of tourism developments in Shiraz?
1	the low quality and quantity of service and lack of proper infrastructure
2	Lack of proper advertisement, awareness raising regarding the attractions
3	Lack of public transportation service in tourist areas
4	Lack of investment and cooperation in non-public section of tourism
5	The social insecurity for tourists
6	The season nature of tourism
7	The pollution and destruction of tourist centers

The information theme received from current study for question 3

Table 3. The information theme received from current study for question 3

Row	What are the most important weak points of tourism development?
1	Improving the facilities near the tourism attraction
2	The necessity of government in using unknown tourism capacities in Shiraz
3	Creating facilities in terms of visas for foreign tourists
4	Using the variable eco-tourist and historical attraction
5	Trying to maintain historical monuments as national identities
6	The government attraction toward investing on private section
7	The culture mutual interactions
8	Creating opportunity for private section investment
9	Proper opportunity for expert's suggestions
10	The high risk coefficient of earthquake in Shiraz

The information theme received from current study for question 4

Table 4. The information theme received from current study for question 4

Row	What are the most important weak points of tourism development?
1	The existence of bureaucracy, lack of presenting government's justification for tourism
2	The development of tourism and the growth of population and crime in the region
3	The unidimensional perspective toward tourism.
4	Inability and inefficacy of tourism organizations
5	The statistic increase of accidents in pathways of cities
6	Advertising against Iran and destructing minds in other countries
7	The lack of political consistency among neighbor countries
8	The development of tourism in foreign countries
9	The lack of clear logic regarding Iran's policies in international communications
10	The high risk coefficient of earthquake in Shiraz

The information theme received from the current research for the question 5

“Are the strategic planning of BSC proper for tourism during the sanction?”

In the current environment, the tourism industry should compete based on the information and its capacity for asset's exploitation is increasingly more important than organization's capacity for physical asset's exploitation. More evaluative systems of organization's performance are formed from financial goals which do not analyze strategic goals in a long run. Therefore, there's a gap between the strategy and its implementation. Creating an evaluative card which assesses the financial-

traditional criteria from customer's perspective, business internal processes, learning and growth is necessary. Moreover, 4 new processes related to long run strategic goals with the short run ones (performance criteria): changing or translating perspectives, impartation, business planning, feedback and training.

Figure 1 shows the relationship between the four BSCs approaches. Each approach is defined in forms of a key term.

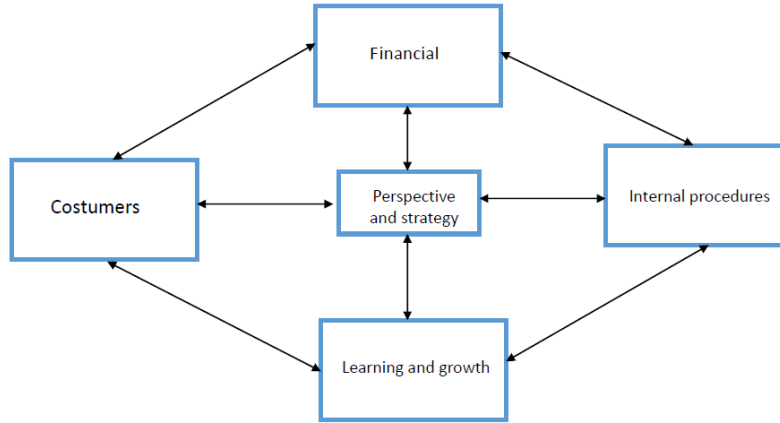

Figure 1: the relationship between the four approaches of BSCs

The criterion based on this perspective should relate the quality of the relationship between the high policymakers, the associate managers of cultural heritage organizations and tourism units. The senior managers should consider 4 procedures in designing BSC:

Business planning: integrating the business and financial planning of the industry.

Feedback and learning: analyzing the industry strategies in terms of current performances.

**6 Conclusion**

Figure 2 shows the interaction between this process and BSC.

Communication and impartation: letting the beneficiaries to impart their strategies to higher and lower levels of industry and their communications for personal goals.

Figure 2: the management strategy: four processes

- Theme of the information received from the current research for question 6

“What points are emphasized in the comprehensive strategic planning of tourism based on BSC?”

Internal process: development of micro and macro infrastructure of tourism industry, editing and implementing comprehensive strategic plan of tourism industry, the effective interaction between different units of tourism industry, empowering human resource structure and developing meritocracy in tourism industry, establishing and editing the comprehensive rule of tourism, the accurate supervision toward the private section's violations, stabilizing the situation and improving the work condition of tourism industry.

As we can see in figure 3, financial aspect: taking tourism industry into consideration, the special support of the government, the private section's comprehensive support of tourism industry, internal, purposeful and efficient marketing.

Growth and learning: developing the professional perspective toward tourism industry, empowering and updating the educational system of tourism in Iran and updating the tourism industry with technology and new standards of the world,

Customer's perspective: developing tourist's host culture in national level, ease of stuffs such as visas and foreign tourist's inhabitancy, proper cost policies

empowering the international intimate relationship and presenting a good image of Iran.

They are taken into the consideration based on the extracted 17 themes.

Figure 3: themes of comprehensive strategic planning of tourism attraction based on BSC

## 7 Suggestions

### Suggestions to tourism industry managers

- The complex models must be used in complex and competition environment of tourism industry. It means, the greater the complexity is (regarding the environment and system under the management), the greater the control complexity will be and based on the complexity in implementing the suggested model, this model is effective.
- Based on the results of the research, the present model is efficient regardless of difficulty in implementation and it's better than the simple models which are prevalent in tourism industry during the sanctions.
- The themes of the current interviews must be considered.
- 

### Suggestions for further research

- The present research was conducted in Shiraz. In order to increase the result's generalization, similar researches must be conducted in other cities and countries which have tourism attraction.
- Developing the model through grounded method.
- Based on the possibility of strategy planning (based on BSC in tourism industry), the feasibility of the research model is suggested to other researchers regarding the key industries during the sanctions.
- It's suggested that the key role of the government in the industry be studied specially in resolving the sanctions and presenting a good international image.

**Abstract.** Strategic thinking creates motivation and commitment to the organization and its stakeholders. The motivation and commitment creates through the power in fact is simple and attractive. Manager's strategic thinking toward rapid learning of the business environment and the use of creativity to create new values engaged. The idea for the organization's survival and growth in today's competitive environment will be inevitable. Therefore, this study aimed to investigate the role of strategic direction to improve IKCO company performance is designed. The results of the study hypotheses based on the results of the Pearson correlation coefficient showed that in the univariate (correlation of each dimension of strategic orientation of the company's performance) all aspects of strategic orientation have a significant relationship via firm performance.

**Keywords:** Strategic direction, performance, innovation-oriented, competition-oriented, cost-oriented, employee-oriented, customer oriented, entrepreneurial oriented

### 1. Introduction

One of the most known and most widely used models of type of strategic relationship between strategic direction and performance of the company described, by Miles and Snow is provided. We live in a time when it is very changeable and complex undoubtedly, we need to continue nations and the human world that his weapons knowledge, expertise and knowledge, and above all they are a logical fit with our management. One of expertise led managers to assist organizations with the right strategic knowledge (Ansoff, 2002). As the first scientist who described the strategy as a comprehensive and meaningful. He believes that while the goals and activities of the organization is more consistent growth rate of development, will be larger and more regular. Managers must know what strategic thinking is and how this tool can be used for scoring goals. According to the environmental changes that have already taken a rapid pace and complexity of organizational decisions, the need to implement a comprehensive program to deal with these issues becomes more tangible than ever. It is not nothing but a strategic plan. Strategic management with dynamic mentality, forward-looking, holistic and contingency solution is

many things today's organizations. The foundations of strategic plans based on the understanding that managers from competing companies, markets, prices, raw material suppliers, distributors, governments, creditors, shareholders and customers who are located around the world and these factors are determinants of business success in today's world. After one of the most important tools for success in the future, organizations can benefit from "strategic plans". William Dirdon of Hershey's success and says his company considered strategic management ((life path is determined now by planning for long periods and no doubt that we are going in the future to rely on this process and to strengthen it.)) The aim of this study to know the relationship between strategic oriented on what affect the performance of IranKhodro Industrial Services Engineering company?

### 2. Research theoretical foundation

In today's dynamic environment, organizations gradually concluded that competitive advantage today for tomorrow's survival is not guaranteed. This will cause the pressure to impose organizations they learn how they can best improve their performance and their leading competitors. The strategic orientation of the company to use strategic guidelines for appropriate behavior refers to performance. Important aspect of this orientation can create shared values and behaviors within the organization noted. When this direction at all levels of the organization into an organization's culture will be expanded (slater et al., 2001). Performance should be defined as business results, because these results are the strongest relationship with the organization's strategic objectives, customer satisfaction and their economic participation (Bernadin et al., 1995). Three strategic directions that the researchers had the most attention to their work (Narver and Slater, 2005) and (Olsen et al., 2005) are: customer orientation, cost, rivals. It is based on a thorough review of the research literature on the six sides that include orientation, customer orientation, competitor-oriented, innovation-oriented, cost-oriented, employee-oriented, and entrepreneurial-oriented. Considering numerous studies conducted on factors affecting the performance of organizations but in the absence of strategic orientation of research are necessary (Morgan & Strong, 2003). According to the studies olson et al., (2005), the ultimate goal of superior performance in the long-term consolidation strategy based on this conceptual model was developed and is presented in Figure 1.

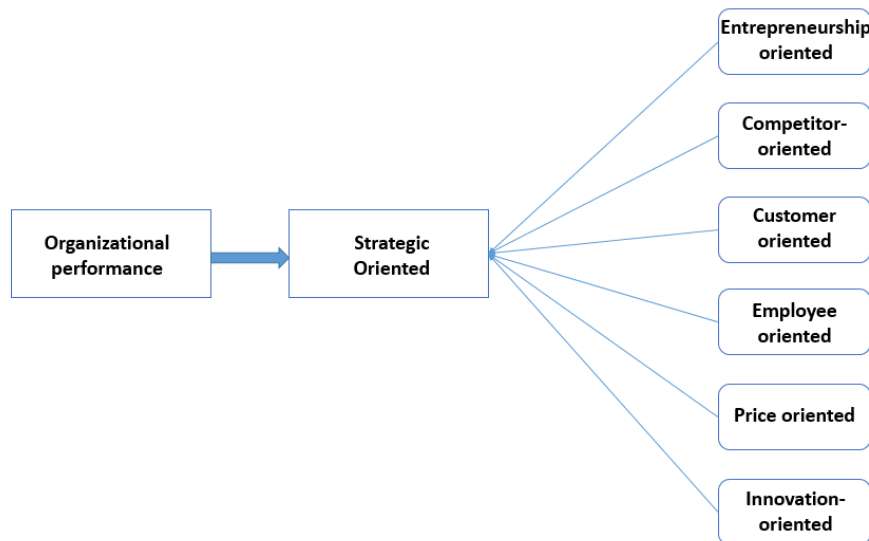

Figure 1. Research Conceptual Model

Based on the conceptual model, the study was designed to evaluate the following hypotheses:

- There is relationship between customer oriented and performance of Iran Khodro Industrial Engineering Services Company.
- There is relationship between employees oriented and performance of Iran Khodro Industrial Engineering Services Company.
- There is relationship between entrepreneurial oriented and performance of Iran Khodro Industrial Engineering Services Company.
- There is relationship between cost oriented and performance of Iran Khodro Industrial Engineering Services Company.
- There is relationship between competitor oriented and performance of Iran Khodro Industrial Engineering Services Company.
- There is relationship between innovation oriented and performance of Iran Khodro Industrial Engineering Services Company.

### 3. Research methodology

This study, descriptive and relational and in term of purpose is applied research. The population of this research managers and employees of Iran Khodro Industrial Engineering Services Company. The number was 1368 people. Cochran formula to determine the sample size and sample consisted of 300 people was used. In this study, the main tool for data collection is required. The questionnaire (Slater, 2001) containing 22

questions related to strategic orientation and 6 components of cost-oriented, innovation-oriented, employee-oriented, cost-oriented, competition-oriented, entrepreneur-oriented evaluated and 7 questions on the performance of each component is 3 to 4 questions. Moreover, during the various stages of its reliability and validity were examined and approved. Cronbach's alpha coefficient for both scale and all its dimensions higher than 7.0 were obtained. Overall, 60.7% of the sample were male and 39.3% were female. Based on the results of studies 14.7% of the studied sample has an associate degree and a lower, 54% bachelor and 31.4% are Masters and PhD. In the sample of the 54.7% between 31 and 40 years of age, then 24% of the studied sample are between 30 years and younger; the age of the sample was examined in 22 years and maximum age is 60 years and the average age of the respondents in the sample is 36 years. 20% of respondents in the sample have less than 10 years of experience, 66% of respondents have between 10 and 20 years of experience, 4.6% of respondents have a history of serving more than 20 years. The standard deviation of the average work experience of respondents 9.77 and 5.67 is to analyze the data, SPSS-20 and AMOS-20 software was used. (Bernadin et al., 1995)

### 4. Findings

To investigate the hypothesis, the correlation coefficients between examined the relationship between strategic orientation and performance and then examine the conceptual model was discussed.

Table 1. Pearson correlation coefficients between the variables

Relationship	Correlation coefficient	significance level	Coefficient of determination	Hypothesis
Customer oriented $\leftrightarrow$ firm performance	0.49	0.000	0.24	First hypothesis
Employees oriented $\leftrightarrow$ firm performance	0.54	0.000	0.29	Second hypothesis
Entrepreneurial oriented $\leftrightarrow$ firm performance	0.31	0.000	0.09	Third hypothesis
Cost oriented $\leftrightarrow$ firm performance	0.26	0.001	0.05	Fourth hypothesis
Competitor oriented $\leftrightarrow$ firm performance	0.23	0.004	0.05	Fifth hypothesis
Innovation oriented $\leftrightarrow$ firm performance	0.27	0.001	0.07	Sixth hypothesis

As the results in Table 1 show that there is a significant relationship between customer oriented with performance such that 24% of the variance is explained by loyalty ( $r=0.49$ ;  $0.05 > P$ ). Thus, the first hypothesis is confirmed.

Based on the results obtained in relation to the second hypothesis, there is a significant relationship between employees oriented and performance, so that 29% of the variance is explained by employee orientation ( $r=0.54$ ,  $0.05 > P$ ).

The third hypothesis results of the survey also showed that there is a significant correlation between entrepreneurial oriented and performance and 9% of the variance can be explained by entrepreneurial oriented ( $r=0.31$ ;  $0.05 > P$ ).

The results of the fourth hypothesis, the research also showed that there are significant correlations between cost-oriented and performance and 5% of the variance can be explained by the cost oriented ( $r=0.26$ ;  $0.05 > P$ ).

The results of the study of the fifth competitor-oriented research showed that there is a significant correlation with performance and 5% of the variance is explained by competitor-oriented ( $r=0.23$ ;  $0.05 > P$ ).

After examining the correlation between different aspects of strategic direction at the same time to study the role of Amos structural equation modeling software was used. Figure 2 shows the results of the study show relationships in the conceptual model.

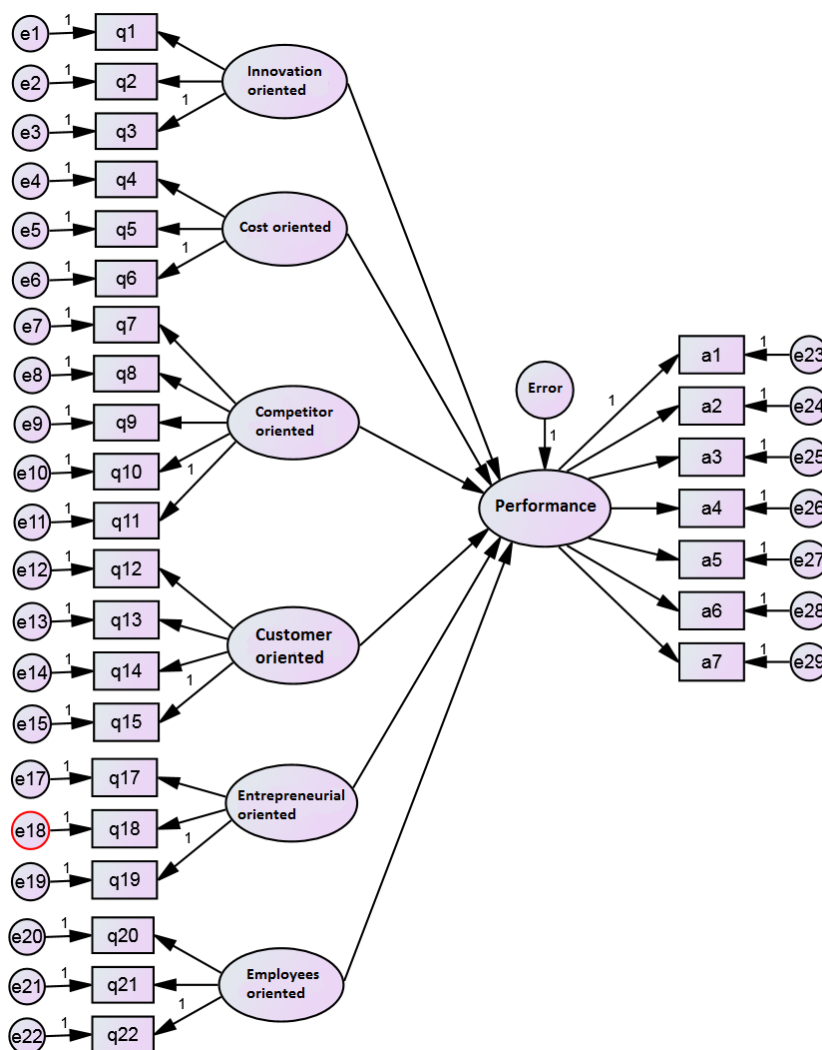

Figure 2. The overall indicators conceptual model and the final research model

Table 2 & Figure 2 shows the calculation of model parameters.

Table 2. Abstract indicators fitted to the model presented in Figure 2.

Fit indices	Absolute indicators			Comparative Indices		Parsimony indices	
	CMIN	DF	Sig	TLI	CFI	CMIN/DF	RMSEA
Limit	-	-	0.05 $\geq$	0.90 $\geq$	0.90 $\geq$	Less 5	0.08 $\leq$
The basic model (Figure 2)	1004.634	344	0.00	0.63	0.66	2.92	0.12
Revised model (Figure 3)	419.515	293	0.00	0.91	0.93	1.43	0.05

The results in Table 2 in term of static between proposed pattern of conceptual model with relationships pattern based on the data collected, there have been significant levels of difference (0.05 > P). The RMSEA value outside the limit (0.08 < RMSEA) as well as the values of CFI; TLI is outside the limit. However, in general, the model suggests have the sole indicator DF: 5 > DF. Proposed indicators AMOS software was used to develop a conceptual model and index based on the theory that there was a possibility of building relationships, were included in the model. In the conceptual model, none of the indicators except for the chi-square goodness-normalized level is not allowed and so need

to reform model. Modified conceptual model involves the removal of non-significant relationships in addition, statistically significant relationships and also added that, with the underlying theoretical foundations, respectively. Survey Estimates and the proposed amendments indices showed Amos software, at the same time review all aspects of strategic direction, some factors are not directly significant effect on IKCO company performance; so with the use of corrective measures as well as the theoretical foundations of the model of Figure 2 were modified. The results of the model parameters modified in Table 2 show that after

correction model, revised model fit indices were at a satisfactory level generally be considered.

Figure 3 the results show that the modified model based on these proposals.

As the results in Table 3 also show a modified version of the Model 2 had a better fitness.

Figure 3 Modified model

As Figure 3 shows, the coefficients between the levels are very weak to strong. In Table 3, the results of the present study were to estimate the model's parameters.

Table 3: Summary of results of significantly improved relations between the variables in the model study

	Parameter	Estimated non-standard	Significant	Estimates Standard
1	Innovation oriented ← firm performance	0.07	0.21	0.07
2	Cost oriented ← firm performance	-0.08	0.08	-0.10
3	Competitor oriented ← firm performance	0.01	0.85	-0.01
4	Customer oriented ← firm performance	0.14	0.00	0.18
5	Entrepreneurial oriented ← firm performance	0.21	0.01	0.15
6	Employees oriented ← firm performance	0.74	0.00	0.89

Estimates in Table 3 standard, non-standard and the significant level of relationships between variables in the modified model proposed research; as can be seen from the study, the role of innovation-oriented, cost-oriented and competitor-oriented on corporate performance, no statistically significant, but the role of entrepreneurship-oriented, customer oriented and employee-oriented on firm performance is significant. Moreover,

employee oriented has the highest role in the performance of the company. Thus, according to statistical insignificance of the three dimensions of innovation-oriented, cost-oriented and competitor-oriented research on corporate performance in the final version omitted these three dimensions and so the final research model with the three strategic orientations affecting the company's performance in the form of 4 and the results of the estimation parameters are presented in Table 4 & figure4.

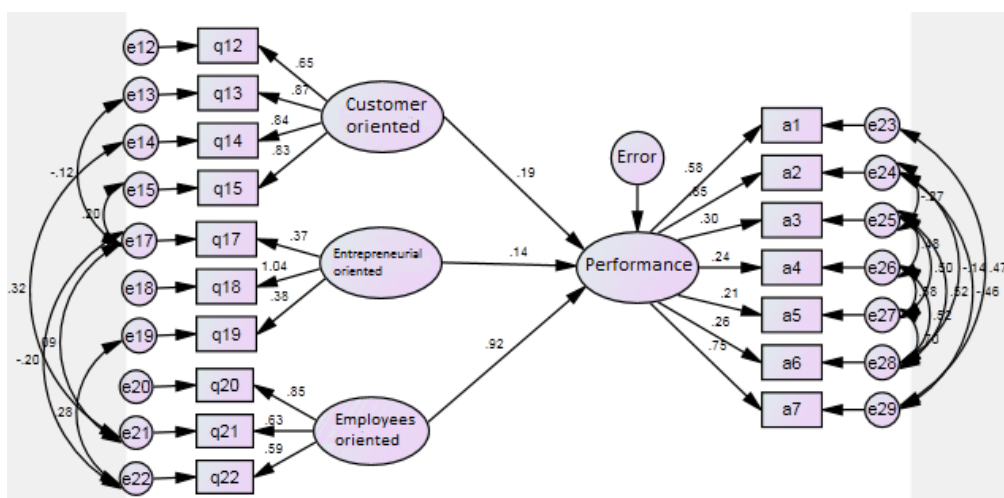

Figure 4: The final research model

Table 4: Summary of significant relationships between variables in the final model study results

	Parameter	Estimates Standard	Significant	Estimates Standard
4	Customer oriented $\leftrightarrow$ firm performance	0.13	0.00	0.18
5	Entrepreneurial oriented $\leftrightarrow$ firm performance	0.19	0.03	0.13
6	Employees oriented $\leftrightarrow$ firm performance	0.76	0.00	0.92

As seen in Table 4 from the perspective of the company's employees IKCO, the highest among its six aspects of strategic orientation of the company's performance, respectively, related to employee orientation, customer oriented and entrepreneurial oriented with standardized coefficients 0.92, 0.18 and 0.13. Therefore, the simultaneous assessment of various aspects of strategic orientation, the results showed that the three dimensions of innovation-oriented, cost-oriented and competitor-oriented are no statistically significant.

**5. Discussion and conclusion**

This study aimed to investigate the role of the relationship between strategic direction and performance of the Iran Khodro industrial service engineering company was done. The results of the research showed that among the four components of crisis management, loyalty to the highest level of correlation with the results of the strategic orientation of all sizes were correlated with corporate performance 99% confidence level and so the hypothesis is confirmed.

The results showed that the highest correlation relationship with the company's performance and employees oriented and then the relationship with the company's performance is customer orientation. The results showed the coefficient of determination and employee oriented and customer oriented 0.29 and 0.24 respectively. It explain the variance in performance. After entrepreneurship oriented 0.09 and innovation-oriented 0.07, explain the variance in corporate performance. Finally, the results showed that among the various dimensions of strategic direction, each competitor-oriented integration costs and performance are only able to account for the variance 0.05. The purpose that was drawn based on the relationship between the predictor variables and criteria, in the same study showed that not all factors IKCO contribute directly to company performance. The results of this study showed that not all of the factors noted in a level, but they are in a hierarchy of predictive and criterion variables. Specific basis, these results showed that employees of IKCO, among the highest of the six strategic orientation of the company's performance, respectively, related to employee oriented, customer-oriented and entrepreneurial oriented with standardized coefficients 0.92, 0.18 and 0.13. So the simultaneous assessment of various aspects of strategic orientation, the results showed that the three dimensions of

innovation-oriented, no statistically significant are cost-oriented and competitor-oriented. Therefore, due to the lack of a statistically significant role in the three dimensions of innovation-oriented, cost oriented and competitor-oriented research on corporate performance in the final version omitted these three dimensions. Finally, based on the results of this study, more attention to the strategic direction of the company and the strategy and target, the company's reminded of this orientation in life has been an example in the Middle East and vision of the company is to achieve the same goal. Moreover, suggested that the lack of a culture of strategic or parts of the company trimmed its special attention. As well as ways, to strengthen the monitoring and analysis of internal and external enterprise systems addressed

**Abstract.** This study was done for the purpose of examining the stock insurance in capital market of Iran. The biggest problem which is existent in the capital market is the people's lack of confidence toward stockholding. Basic and fundamental measures and evolutions should be done for the purpose of removing this problem to develop more this market and obtain stockholders' confidence toward this market. The samples of this study were selected randomly from the experts of the capital market. Also, the return of 30 great stocks was compared with a loss coefficient of 16 insurance fields during the years of 2009 to 2012. The results of this study showed that a design of an instrument in a stock insurance will attract economic activists' pay attention toward this instrument and prepare insurance companies with the stock insurance design.

**Keywords:** Derivative Stocks (subordinate option securities), Insurance, Return, Risk, Stock Insurance

### 1 Introduction

Investors are always worried about the ventures of a capital market. These ventures make the capital markets of the world introduce the ways of risk management and make institutes and different tools for the purpose of removing this kind of risk. Various financial tools of a stock exchange are very effective in attracting most of the people toward a capital market. This affair will lead to the stock exchange's growth and stabilization. Therefore, stock exchange has a stable position in the economics. This study is an attempt to study the role of insurance companies as a money supporter. Therefore, the stockholders' interests will be preserved and a capital market will be converted to a secure place. One of the major achievements of world capital markets was to attract people's pay attention toward a capital market through making a secure place for people. Economic and non-economic developments which require adequate mechanisms for the development of risk taking will affect the capital market variations. Insurance companies will ensure people to study the situation of companies in the stock exchange. Also, they will attract people's trust toward investing in a capital market through supporting the companies' stocks.

With the setting up a stock exchange organization in Tehran, the share holders' rights specially, the stockholders' rights who were under the danger of systematic risks were preserved. Measurements such as giving consultants to people were done in this domain. Most people do not like to invest in a capital market due to the risks resulting from the variations in stock prices. A risk of stock price variations will make people not to invest in the capital market. Therefore, insurance as one part of financial industry should make a correct mutual relationship with the capital market. On one hand, an efficient capital market is needed to develop the insurance activities. On the other hand, insurance has an important role on the growth of capital market. To make a stable mutual relationship, a capital market should be developed and new tools should be made based on the insurance design of stocks. The most important purpose of this study is to minimize the risks of stock price variations by insurance companies. In fact, insurance companies support people against the loss of some assets such as car, buildings, and stocks. The amount of money that insurance companies pay people is related to the loss of stockholders. Therefore, the stock price should be calculated if one person insured his or her stock during the last

four years. In this study, the amount of stock loss can be compared with the amount of firing loss, and other events.

### 2 Theoretical background

#### 2.1 Stock exchange

It is one kind of market for transacting financial instruments which companies and institutes would participate in if all the necessary conditions were obtained. Therefore, some part of financial capital can be obtained by insurance companies.

#### 2.2 Insurance Contract

Based on the article 1 of Iran insurance law, insurance contract is a kind of contract that insurance companies are responsible against people who insure their assets. Therefore, insurance companies should compensate or pay people's loss at the time of occurring an event. The liable companies are insurers and the people who insure their assets in the insurance companies are called the insured and the amount of money which will be paid by people to the insurance companies is called an insurance premium and a thing which will be insured is called an insurance subject.

#### 2.3 Risk

Risk is considered as possible negative variations of economic efficiency in the future.

#### 2.4 Portfolio insurance

Portfolio insurance is one kind of applied method for removing the risk of investments in stock exchange. This method is good for investors who like to invest on risky assets and cannot tolerate its loss. Since an expected interest of these kinds of assets is high, most people like to invest in these kinds of assets.

#### 2.5 Derivative Securities

In recent years, various financial instruments were designed and presented to the financial markets. The purpose of designing these kinds of instruments is to control the investing risk of portfolio instruments and increase the efficiency of a capital market. Various securities should be presented with different risks and returns. Two sample of these kinds of derivative securities are option contract and future contracts. These kinds of securities are transacted in large amount in all the world financial markets.

#### 2.6 Subordinated Option Bonds in the Stock Market of Iran

After the approval of subordinated option bonds in the stock market, modified instructions were performed by the board of directors on June 2013 for the stocks of accepted companies in Tehran stock exchange to support the investors and decrease the risk of this kind of investment. Subordinated option bonds are one kind of option contract which a buyer can sell a certain amount of stocks based on the specified price of announcement.

### 3 Theoretical framework of the research

Abdo Tabrizi studied the effect of insurance industry on the global capital markets. With regard to the globalization of an insurance industry, insurance convergence, and a capital market, major trends were used in the insurance industry. A researcher introduced briefly new products which were in relation with a capital market. In this study, risk transfer, derivative tools, and their conversions to securities were regarded. Rahmani (2001) studied the economic role of insurance on the relationship between a risk transfer and a capital market. Also, he studied the role of insurance as a risk transfer mechanism, saving tool, and a

capital market developer. A researcher reached to this conclusion that there were financial risks such as inadequate variations in the foreign exchange rates, product prices, and interest rates. Companies can decrease the effect of financial risks through protecting the financial derivatives (Subordinated securities). KadKhodae (2001) studied the insurance role as an assurance base in all the markets such as a financial market. In financial markets of Iran which money and capital markets are developed a lot, these two markets cannot be expanded without the development of insurance market. A practical strategy is to investigate the role of insurance more accurately in a national market and use the advanced insurance tools. Making specialized insurances in the domain of financial markets such as deposit insurance, stock insurance, debt insurance, and insurance of other financial materials will lead to the development of money and capital markets. Dr. Hoshmand and Tashakori Saleh studied the risk reduction possibility of stock purchasing in a stock market with the insurance contracts on their article which its topic was the role of insurance industry in reducing the risk of investing in the stock market. He gathered the data from the questionnaires he distributed among present stockholders of Mashhad stock exchange. He reached to this conclusion from the statistical analysis that the stockholders were willing to insure their stocks and believed that the interference of an insurance industry in the capital market can increase the amount of investments. Aminian and Asadi (2012) calculated a final insurance rate for each of the examined funds under the study of the mechanisms designed to provide insurance services for the joint investment fund portfolio stock exchange with the traditional pricing methods of insurance contracts and measuring different risks of joint investment funds.

Test results shows that the insurance companies can enter this domain and make themselves and investors reach to a win-win situation. A thing that is discussed in most foreign studies of stock insurance is related to the portfolio insurance. Researchers examined constant proportion portfolio insurance (CPPI) and option based portfolio insurance (OBPI) methods a lot in the studies of stock insurance. Balder, Brandi, and Mahayni (2005) studied the efficiency of CPPI strategies under the time limitation of transactions and understood that if they use CPPI method more, their studies will be more valuable. CPPI and OBPI methods were compared by different researchers. Researchers such as Bratrand and Prignet (2002) compared CPPI and OBPI methods in their study which its name was portfolio insurance strategies.

#### 4 Research questions

- 1) Is it possible to design a stock insurance tool in a capital market?
- 2) Do economic activists agree with the stock insurance tools?
- 3) Can insurance industry perform the plan of stock insurance?

$$n = \frac{NZ\alpha^2 p(1-p)}{\epsilon^2(N-1) + Z\alpha^2 p(1-p)} \quad n = \frac{(145 \times (1/96)^2 \times 0.5 \times 0.5)}{144 \times 0.05 \times 0.05 + (1/96)^2 \times 0.5 \times 0.5} = 106 \quad (1)$$

The data were gathered for the first and second research questions through a field method and a questionnaire. Therefore, the questionnaires were distributed among the experts of a capital market. Also, the necessary data for the third research question were gathered from existent information in the codal.ir, seba.ir.

A research methodology is consisted of rules, instruments, valid and systemic methods for the purpose of studying the facts, discovering fabulous things, and reaching a solution. The present study is applied. Applied studies are kind of studies which are done based on the information of fundamental studies and used for satisfying the human necessities. This study was descriptive because it was done based on the theoretical backgrounds and a questionnaire. With the use of past studies, quantitative data of 30 great stock exchange were gathered for measuring the stock return of 2009 to 2012 and extracting the number of insurance majors during the mentioned years. In general, this study is quantitative and descriptive. The statistical population of this study is included of two groups with regard to the research questions.

- 1) Statistical population of first and second research questions: All the experts of capital markets such as the managers of the brokerage firms accepted in the stock exchange, the managers of the investment companies accepted in the stock exchange, The managers of the investment companies, the managers of the portfolio companies accepted in the stock exchange, and the investment consultants accepted in the stock exchange. Since accessing to all the experts of a capital market was not possible, the statistical sample of this study was selected from the experts of 107 brokerage firms which were active in the stock exchange and 16 public investment companies accepted in the stock exchange, eight investment companies, five portfolio companies, and nine consulting investment companies. In sum, 145 companies were selected in this study.
- 2) Statistical population of the third research question: In this study, 30 great companies of stock market and the performance of insurance industry in 16 things along with their loss coefficients were considered. Therefore, the following criteria were regarded for the purpose of selecting big companies.

In this study, the companies which were only the members of the stock exchange during 2009 to 2012 were considered. Since it is possible to access to the announcements such as the decision of annual general assemblies in relation to the profit division and the decision of extraordinary general assemblies in relation to the investment increase during the mentioned years in www.codal.ir, the stock returns of companies can be calculated. Also, the capital of each of these companies during the mentioned years was at least 200,000 milliard rial. Data was gathered randomly from the mentioned companies for the first and second research questions. Also, the statistical population of the study was calculated for identifying the sample of the third research question.

#### 5 Research method

The sample size of this study was identified with Charles Cockran's formula.

After identifying a validity and reliability of a questionnaire in the frame of a field method, a researcher gathered primary information with that questionnaire which was consisted of 20 questions. Also, in this questionnaire, two dimensions were studied (Table 1).

Table 1. Questionnaire dimensions

Number	Questionnaire Dimensions	The Number of Questions
1	A design of stock insurance tools	11
2	Economic activists' agreement with the stock insurance tools	9

In this study, a researcher used a questionnaire which was consisted of five options to measure the main variables of Likert scale. Also, descriptive and inferential statistics were used in this study for analyzing the data. Therefore, the results of the questionnaire were analyzed with the test validity and reliability, Kolmogorov–Smirnov test, and one sample t-student test.

**The validity of the Questionnaire:** The validity of the questionnaire was identified by some professors and experts of financial markets. Then, the final modifications were done for the improvement of the questionnaire.

**The Reliability of the Questionnaire:** In this study, the reliability of the questionnaire was measured with Cronbach's alpha. In the present study, a questionnaire which was consisted of 15 questions was designed. Then the coefficient of Cronbach's alpha was obtained for the two dimensions of the questionnaire. The coefficient amount of Cronbach's alpha was identified 0.768 for the design of the stock insurance tool and 0.786 for the economic activists' agreement of stock insurance tools. Also, the coefficient amount of Cronbach's alpha was calculated 0.809. Therefore, all the coefficient amounts of Cronbach's alpha were suitable and acceptable. Next, the reliability of the questionnaire was confirmed. Finally, the statistical data of the study which were gathered with SPSS 21 and Excel 2010 were processed.

**The Sample of the Study:** In the present study, a questionnaire which was consisted of questions about the individual features of the participants was designed. Therefore, the individual features of the participants are as follows:

- 1) **Participants' age:** Most participants (%48) were 20 to 29 years old. Also, 43 percent of participants were 30 to 39 years old. Nine percent of participants were 40 and more than 40 years old.
- 2) **Educational Level of Participants:** 66 percent of participants had a master of art and 14 percent of participants had PHD and more than PHD. Also, 20 percent of participants had bachelor of art.
- 3) **Participants' experience in the capital market:** 59 percent of participants worked in the capital market between 1 to 10 years. Also, 39 percent of participants worked in the capital market of Iran between 10 to 19 years. Only two percent of participants worked in the capital market more than 20 years.

**Normality Test:** In this study, a Kolmogorov–Smirnov test was used for normalization of variables such as the design of a stock insurance tool and the economic activists' agreement of stock insurance tools. The results of this test are shown in the table 2.

Table 2. Kolmogorov–Smirnov test results

A Kolmogorov–Smirnov test	The Amount of the Test	Freedom Degree	P-value
A design of stock insurance tools	0.079	106	0.105
Economic activists' agreement with the stock insurance tools	0.085	106	0.060

As it is observed from the above table, p-value is more than 0.05. Therefore, the variables such as the design of the stock insurance tools and economic activists' agreement with the stock insurance tools are normal.

The results of one sample t-test for the first research question show that p-value is less than 0.05 and is equal to 0.001. Also, a mean of stock insurance tool designs is 3.1. Therefore, a zero assumption will be rejected in the significant level of 0.05 and will be stated with 95 percent that it is possible to design stock insurance tools in the capital market. Also, the results of one sample t-test for the second research question show that the amount of economic activists' agreement with the stock insurance tools is about 3.8. In the above test, p-value is less than 0.05. Also, a zero assumption in the significant level of five percent will be rejected. Therefore, it can be stated with a confidence level of 95 percent that economic activist agrees with the stock insurance tools. The third research question results showed that the mean of the stock return was 0.548 based on the information of total return of 30 great stocks of stock exchange during the years of 2009 to 2012. Then, the results of this study were compared with the loss coefficient of 16 insurance fields. The test results showed that p-value is more than 0.05 for insurance fields such as engineering, responsibility, credit, Life span, automobile, and other kinds of insurance.

It means that there is not a significant difference between the mean of the total return of stocks and the mean of the loss coefficients of some insurance fields at the error level of 0.05. In other words, a mean of the total return of stocks is approximately equal to the mean of loss coefficient of some insurance fields such as engineering, responsibility, credit, life span, automobile, and other kinds of insurance. P-value is less than 0.05 for some insurance fields such as events, airplane, firing, transportation, money, petroleum, energy, and driving events. Also, the mean of coefficient loss of these kinds of fields is smaller than the mean of the total return of stocks which is 0.548. In other words, a mean of a total return of stocks is bigger than the coefficient loss of some insurance fields such as events, airplane, firing, transportation, money, petroleum, energy, and driving events. Therefore, it can be observed from the comparison of this study and 16 insurance fields that the mean of the total return of the stocks is bigger or equal to the loss coefficient of 13 insurance fields. Therefore, it can be answered to the third research question with a confidence level of 95 percent.

Table 3. Results of t-test

Number	The Insurance Fields	The Coefficient Loss	The Amount of Insurance	The Degree of Freedom	P-Value
1	Firing	0.31	2.604	119	0.010
2	Transportation	0.29	2.822	119	0.006
3	Events	0.33	2.385	119	0.019
4	Treatment	1.13	-6.364	119	0.000
5	Ship	1.12	-6.255	119	0.000

6	Airplane	0.35	2.166	119	0.032
7	Engineering	0.46	0.936	119	0.337
8	Money	0.21	3.697	119	0.000
9	Responsibility	0.53	0.198	119	0.844
10	Credit	0.44	1.182	119	0.240
11	Petroleum and Energy	0.17	4.135	119	0.000
12	Life Span	0.66	-1.224	119	0.223
13	Third Party Insurance	0.90	-3.849	119	0.000
14	Driving Events	0.31	2.604	119	0.010
15	Automobile	0.66	-1.224	119	0.223
16	Other Kinds of Insurance	0.45	1.072	119	0.286
		Mean		Standard Deviation	
The Total Returns of Stocks		0.548		1.002	

### 5.1 The Overall Results of the Study

This study shows that a risk of purchasing stocks through the insurance process of stocks can be controlled. In this study, one questionnaire was presented for the possibility of designing the insurance tools of the stocks and economic activists' agreement with insurance tools of stocks. Also, the stock returns of selected companies during the years of 2009 to 2012 were compared with the performance of 16 insurance fields for the purpose of measuring the readiness of insurance industry.

Therefore, the present study showed that it was possible to control the risk of purchasing stocks through the insurance process of stocks with the confirmation of research questions.

### 6 Conclusion

With regard to the results of this study, it is suggested that insurance companies do something for the stock insurance and consider it as a suitable opportunity for the development of insurance activities. Also, if insurance companies like to invest in the stock market, they will study the situation of accepted companies in the stock exchange for the purpose of controlling their risk of investment. Therefore, they should insure first the big firms of the capital market which are of the longer experiences and better management. These insurance companies should introduce these big companies to investors with insuring their stocks in order to make people's trust toward investing in the capital market. It is suggested that a central insurance of Iran and the private insurance firms study the stocks of big firms for the purpose of insuring them. Therefore, a scientific instruction should be codified and given to the board of assembly and association. It is suggested that the future researchers should study on the portfolio insurance without considering the sanctions and the political and economic situations of the country and consider many things for calculating the return of stocks. Therefore, insurance firms should do something toward identifying the fair insurance rate of stocks. It should be mentioned that future researchers should study the technical and structural dimension of portfolio insurance in the stock exchange.

From the structural and technical points of view, export forces, software, clearing house, transaction and ownership transfer are respectively necessary for the management of transactions, showing the transactions, recording, and designing and applying new financial tools.

**Abstract:** This study mainly aimed at examining the role of employing virtual social networks and the learning process of the girl students of the first grade of secondary school in Eslamshahr in 2015-2016. The statistical population included 390 students were selected as the statistical samples through random cluster sampling. The data were collected using the questionnaire for virtual social networks and the questionnaire for learning process. Reliabilities of the measuring tools using Cronbach's alpha were respectively reported 0.72 and 0.81. Pearson correlation coefficient, regression analysis, and ANOVA were used for data analysis. Research results indicated a significant and negative relationship between employing virtual networks and learning process of the girl students of the first grade of secondary school in Eslamshahr district.

**Keywords:** virtual networks, learning process, the first grade of secondary school, students

### 1 Introduction

Today, one of the factors considered by experts and scientists for the development and survival of each country is the use of new technologies in the field of education in general and educational achievement in particular. The issue has caused major changes in the learning nature of students and the optimal use of the capacity of technologies provides learning with a specific scope and enrichment (Afzalnia, 2008). Combining technology with class curriculum is the integral part of an appropriate teaching (Pierson, 2001); however, the use of technology as a tool for teaching and learning in a classroom should provide assignments, which develop data recovery for problem solving, promote deep processing of ideas, and increase engagement of a learner with curriculum and teacher-learner and learner-teacher interactions. Therefore, the use of the Internet and virtual networks has been developed extensively among children and adolescents nowadays. When today's generation of children reach the age of maturity, they become familiar with the devices introduced to market easily and equip themselves with the latest knowledge in proportion to knowledge advancement. Hence, the future generation is the generation, which grows up with the Internet and other modern communication technologies and depends on them strongly. This makes parents, managers, and planners of different cultural and training sectors attempt to find solutions for the negative consequences of such technologies, particularly the Internet (Bidi *et al.*, 2013).

Therefore, we are witnessing significant developments with the spread of mass media and emergence of virtual social network among young people in educational system. Today's students never have the previous limitation and they are connected to any point across the world and interact with the teachers and students out of school environment. The emergence of the Internet has affected learning process. E-learning is one of the new training methods, which is used for training. The positive aspects of social network sites (SNS2) and their usage are being revealed. At present, students use SNSs as an assistant for their education in teamwork (Zavaraki *et al.*, 2015). On the other hand, with an extensive access of students to the Internet and virtual networks, we are witnessing a kind of dependency on networks and virtual environments. This increases relations of individuals in the virtual world; in contrast, their relations in the real world reduce (Samson and Keen, 2005).

Reviewing the studies on national education process indicates that the educational growth and development has always been one of the fundamental discussions, which has gained attentions of education experts, scholars, and researchers. Obviously, educational achievement of students in an educational system depends on several factors such as the use the Internet and virtual social networks (Afganeh, 1998). Studies show that the first online social network "Six Degees.com" was created in 1997. Despite its success with 90 million users in late 90s, it terminated its activity in 2000. As an online social network such as Asian Avenue<sup>1</sup>, Black-plante<sup>2</sup>, and Livejournal<sup>3</sup>, it could not provide different combinations of technical features such as profiles, list of friends, visitors' log in its service. In 2001, the first business network was created with the emergence of Ryze<sup>4</sup>. This network established business relations between users and supported the communications. Finally, it was considered as a pattern for business networks. A few years later, it was converted into a sync network. Soon after, in 2002, the well-known Friendster network was established as a rival for the online profitable websites of Dating Online<sup>5</sup> Mag.com. Although Friendster was considered the greatest social network in the Internet by early 2004, it lost a large number of its users due to technical and social problems. For this reason, this network is called "one of the biggest losers in the world of the Internet". The early years were finally converted into a basis for the emergence of other online and popular social networks such as Myspace, Facebook, or Studivz, which have highlighted constantly the phenomenon of online social networks since 2003. Clay Shirky - a social software analyst - describes the growth and development of online social networks based on their early emergence using YASNS (Yet another Social Networking Service) term. Myspace network was established in America in 2003 and it has been known as the biggest and most famous networks in the world in music since then. Another network - Facebook - was emerged in 2004, which has had considerable achievements since then. It was designed and created by Mark Zuckerberg in Harvard University. Only Harvard University students were its audience at the beginning, but some steps were taken toward network development and it was converted into a global network (Mahmoudi *et al.*, 2014).

Social networks can be divided into two groups of *virtual social networks* and *non-virtual social networks*. Different definitions have been proposed for social networks. The major definition is that the social networks or Internet social network is a site or a series of sites, which allow users to share their interests, thoughts, and activities. The social networks have been developed with unparalleled speed in a short period during recent years. In fact, virtual social networks are a combination of the hardware and software tools, which allow individuals to exchange information in a convenient, instant, extensive, cheap, and confident manner. Specifically, the social networks allow accessing to the specific data related to different fields. In virtual social networks, individuals may present information (by placing some posts on blogs or other social networks) or obtain some information (the same).

Internet social networks, especially those with conventional and non-business applications, are some places in the virtual world in which individuals introduce themselves in brief and provide conditions to establish communications with like-minded people in different fields (Oftadeh, 2011). The opinion poll of USA Today in 1997 indicated that 86 percent of teachers believed that the Internet made students fail to do their assignments, as they spent more time on the Internet, web surfing or online games instead of doing their assignments. Another opinion poll « Kimberly Young » shows that 58% of the students who use the Internet and virtual networks

<sup>1</sup> AsianAvenue.com

<sup>2</sup> Black-plante.com

<sup>3</sup> Livejournal.com

<sup>4</sup> Ryze.com

<sup>5</sup> Dating Online

excessively are placed at risk of school failure. In conclusion, it can be stated simply that extravagance in any aspect of life requires underachievement in other aspects of life. *Excessive indulgence* in the glamorous world of the Internet and virtual world hinders and aborts other affairs of users. Evidently, they slip farther behind those who have normal lives, they move away from the everyday life and social life, and they can never play the role expected by family, friends, and society (Bidi et al., 2013). Thus, it is of paramount importance to realize if there is a relationship between the use of virtual social networks and students' learning process, which is discussed in this research. Therefore, this research mainly focuses on the extent learning processes are influenced by virtual social networks.

## 2 Methodology

### 2.1 Population, Sample, and Sampling Method

This is a descriptive correlational research, as it aimed to examine the role of employing virtual social networks with the learning process of the girl students at the first grade of the secondary school in Eslamshahr district. Research statistical population included all the girl students of the first grade of the secondary

school in Eslamshahr in 2015-2016 academic year (8600 students in 32 schools in 10 sections). Therefore, cluster random sampling and Morgan's table were used for selecting 390 students at grade one as the statistical samples among 13 secondary schools for girls.

### 2.2 Research Tools and Data Collection Method

Two standard questionnaires including A) the *questionnaire for virtual social networks* and B) the *questionnaire for learning process* comprising three sections of Introduction, Research Demographic Variables, and Research Questions were prepared for testing research hypotheses. The Weinstein learning process questionnaire comprises 10 components including anxiety, attitude (students' interest in school and continuing education), concentration, data processing, motivation (level of persistence), self-assessment (attempt to review and exam preparation), main idea selection (ability to realize the major points of a lesson), study, time management, and examinations (exam preparation). Reliability of the measurement tools was calculated using Cronbach's alpha. Reliability values for the questionnaire of virtual social networks and the questionnaire for learning process were 0.72 and 0.81, respectively.

## 3 Research Findings

Table 1. Frequency distribution and percentage of research sample for any visual social network

Statistical Index Virtual Social Network	Frequency	Percentage
Facebook	34	8.7
Viber	39	10
WhatsApp	38	9.7
Line	71	18.2
Telegram	90	23.1
Instagram	85	21.8
Bee Talk	33	8.5
Total	390	100

As Table 2 shows, students mostly use Telegram virtual social network (23.1%). The percentages for Instagram, Line, Viber,

WhatsApp, Facebook, and Bee Talk are 21.8%, 18.2%, 10%, 9.7%, 8.7%, and 8.5%, respectively.

Table 2. The descriptive statistics for research variables

Variables	Mean	SD	.Min	.Max
Application of Virtual Social Networks	72.08	12.89	30	92
Learning Process	180.71	54.88	88	322
Anxiety	26.80	5.86	10	36
Attitude	23.12	4.33	11	29
Concentration	22.23	6.66	11	37
Date Processing	23.66	5.86	14	35
Motivation	22.78	5.71	11	36
Self-assessment	20.16	5.46	10	36
Idea	20.68	5.11	9	30
Study	18.86	4.91	10	32
Time Management	17.56	4.71	10	34
Examinations	20.07	4.38	30	34

Table (2) indicates the mean, standard deviation, minimum, and maximum of the tests on the application of virtual social networks, learning process, and its subscales. Table (2) shows that the means of test for applying virtual social networks and learning process are 72.08 and 180.71, respectively. Among the subscales for the learning process, the maximum mean (26.80) was related to

anxiety and the minimum mean (17.56) was related to time management. Before discussing the research hypotheses and normality of the frequency distribution for research variables, the Kolmogorov-Smirnov test for goodness of fit was used for specifying its distribution.

Table 3. The Kolmogorov-Smirnov test based on normalization of data

Test	Quantity	Kolmogorov-Smirnov	Level of Significance
Application of Virtual Social Networks	390	0.95	0.32
Learning Process	390	0.92	0.36

The results of the Kolmogorov-Smirnov test indicate that the distribution of research variables was normal and the parametric statistics can be used for analysis assuming that the variable is within the interval scale.

Pearson correlation coefficient and multiple regression were used for examining the major hypothesis and minor hypotheses and the results are as follows:

Table 4. Pearson correlation coefficient test for the relationship between research variables (n=390)

Variables		Correlation Coefficient	Level of Significance		
Independent Variable	Dependent	-.131**	0.01		
Social Networks	Students' Concentration				
	Motivation			-0.27**	0.001
	Study			-0.155**	0.002
	Time Management			-0.124**	0.01
	Examinations			-0.188*	0.001
	Anxiety			0.04	0.34
	Attitude			0.06	0.18
	Self-assessment			0.06	0.17
	Processing			0.01	0.83
	Main Idea			0.064	0.20
Total	Learning Process	-0.164**	0.001		

The overall correlation coefficient in Table 4 shows that there is a negative significant relationship between the use of virtual social networks and the processes of students' concentration, motivation, study, time management, and examinations at the confidence level

of 0.001. Therefore, the higher the use of virtual social networks, the weaker is the learning process in students. Research results show no relationship between the use of virtual social networks and the processes of anxiety, attitude, self-assessment, and process.

Table 5. The results of regression analysis to predict the variable of learning processes

Independent Variable	R	R <sup>2</sup>	Adjusted R <sup>2</sup>
Virtual Social Networks	0.164	0.027	0.024

The R<sup>2</sup> values in Table (5) show that the use of virtual social networks approximately clarifies 3 percent of the changes of learning process. The one-way ANOVA is used for regression

significance, i.e. to check whether the predictor variable (the use of virtual social networks) may be effective in predicting the variable of learning process criterion. The test results are provided in the following table.

Table 6. The one-way ANOVA for the predictor variable

Model		Sum of Squares	df	Mean of Squares	F	Level of Significance
1	Regression	31604.681	1	31604.681	10.75	0.001
	Error	1139995.155	388	2938.132		
	Total	1171599.836	389			

As Table (6) shows, the F (10.75) is significant at the level of 0.001 and the predictor variable plays a crucial and significant role in predicting learning process.

Table 7. The results for the regression coefficients of learning process

parameters				t	Level of Significance
	$\beta$	Error	Beta		
Constant Value	231.101	15.607		14.808	0.000
Use of Virtual Social Networks	0.699	0.213	-.164	3.280	0.001

Table (7) shows a negative and significant relationship between the use of virtual social networks and learning process. With respect to the coefficients in the table, it is possible to write the following regression equation for the criterion variable (learning process) as follows:

$$b_1x_{1+a} = \text{Constant value of } \hat{y} \quad (1)$$

Learning process = 231.101+0.69 (the use of virtual social networks)

#### 4 Discussion and Conclusion

The present research discusses the role of the use of virtual social networks and the learning process of the girl students of the first grade of secondary school in Eslamshahr district. Research results

proved that the correlation coefficient between the use of virtual social networks as the predictor variable and learning process (concentration, motivation, study, time management, and students' examinations) as a criterion is negative and significant with respect to the confidence level of 0.01. That is, the higher the use of virtual social networks, the weaker is the students' learning process. The univariate regression proved that use of virtual social networks is a negative and significant predictor of students' learning processes. The result is consistent with the studies of Abadi (2009), Javadinia et al., (2012), Hasanzadeh et al., (2012) and Hashemi (2009), Habibi (2015), Bolen and Harry (2000), Yong (1996), Young (1998), and Gustavmesh (2012). It is inconsistent with the studies of Kian, et al., (2015), Mansouri (2012), and Lokin et al., (2012). Based on the research results, it is recommended that parents allocate a short time for connection to the Internet as per a preplanned schedule to prevent it from influencing students' learning processes.

<sup>b</sup>ramin.mousavi61@yahoo.com

**Abstract.** The current study aimed to investigate and study the relationship between the Motivational Potential score and Job involvement in banks of Pars Abad. The sample size of the study obtained via applying Cochran sampling formula which involved 155 participants. To analyze the study's hypothesis, Pearson's correlation coefficient, T-Test, and correlation of two independent societies were used. Results of data analysis indicated that: there was a significant relationship between motivational potential score and job involvement among staffs. There is no significant difference among public and private banks in dimensions of job's motivational potential score and job's involvement, and also in comparative study of variables of public and private banks there is no significant difference.

**Keywords:** Motivational Potential, Job involvement, job's motivational, public and private banks

### 1 Introduction

Banks as one of country's large organizations formed in order to serve community, play key role in development of the country, and this factor causes managers and staffs as a skilled and expert manpower in this section, be a key element which requires attention and research (Mousavi Mohammad Rezalou, 2015). Banks as a main economic resources play vital role in development and economic growth of a country, because they act as a provider of liquidity in services and manufacturer of information (Sofian & Habiballah, 2010), and play key role in the fostering of economic and social conditions of a country. Due to this issue that banks staff organize economic system, and play their role at public and private sectors as an economic core with mobilizing household savings; however the current study investigates the relationship between motivational potential score with Job involvement among staffs, and whether there is a relationship between jobs motivational potential score with job involvement? Why someone in the company with owning the same possibilities and benefits are active and motivated, but in the other hand why someone else with many problems are persistent? In which condition staffs use their maximum capacity to do their responsibility? Answering to such questions will be accessible by recognizing what factors motivate staffs. Consequently, with regarding the importance of subject in this domain, this study was conducted with the aim of recognizing effective factors on motivational potential score and job involvement among Pars Abad's private and public banks staff, in which on the basis of obtained results we steps towards suitable planning and increasing job motivation and staff's capability and also to achieve organizational goals. Job involvement recognized as one of the effective tools to increase staff's efficiency with increasing their participation and obligation. Organizations are facing with intense competitive pressure, to survive and develop in the changing and unstable business world. Therefore, organizations require energetic, active staffs which completely are involved in their jobs. Because, quality of human resources is vital for organization's success especially in unstable working conditions. Business partnership has a positive effect on staff's individual and organizational performances (Lu et al, 2014). Also job's motivation has been one of important effective factors in success or mustiness of system, and if we neglect it will waste organization's resources. Result of a study indicated that 20% effort and 80% motivation reported as a success factor in organizations, and nowadays managers' great challenge is facing with staffs which have low motivation and low responsibility (Bahadori et al, 2014). Recognizing causes and consequences of job involvement for managers of organization is important. Job

involvement has a positive effect on indicators of job's performance such as efficiency (Emery & Barker, 2007), job performance (Rottenberry & Moberg, 2007; Chugtai, 2008), job satisfaction (Zupiatis, et al., 2014; Linz, 2010), desertion (Zupiatis, et al., 2014; Wickramasinghe & Wickramasinghe, 2010; Lambert, 2010; Nancy & Kely, 2011), participation in decision-making (Siegel & Ruh, 1972; Ruh & Wood, 1975; Hollon & Gemmill, 1976), and organizational obligation (Zupiatis, et al., 2014; Karim, 2010; Ting, 2011; Iqbal Khan, et al., 2012). From the according to Lodhal and kejnjob involvement points to degree which persons psychologically identify themselves with their current job (Tastan & Turker, 2014). Lubakaya (2012) defined job involvement as person's belief toward his/her current job. He also stated that job partnership performs as a catalyst to meet individuals' needs. Khaled & Rahman (2011), described job involvement as a motivation for doing activity, and he knows very appropriate those individual and organizational objectives which causes motivation among staffs to reach production and creating positive business results. Job involvement is fulfillment of individuals cognitive needs, which helps him/her at harder work and his/her performance speed. In fact a higher degree of job involvement among participants of an organization in order to increase organizational effectiveness is necessary. Of the factors that create job involvement we can point to the job's characteristics, education, motivation, and staffs personality (Seyfi, 2015).

The main point in management of motivation is that we recognize that staffs are motivated with such tools, which they believe it's substantiation, and this substantiation can create motivation among staffs not by a managers promises but by required three conditions of motivation, such as self-confidence, confidence, and satisfaction via creating such an environment which those three conditions be reinforced. Motivational factors are divided into two categories: internal factors and external factors. In order to which managers motivate their staffs, at first they must recognize factors of their staffs dissatisfaction, and then in accordance with status of staffs, they select appropriate motivational factors (Naily, 2013). According to the model, motivation and job's satisfaction and job's characteristics such as skill variety, careers, importance of work, independence, and works feedback according to the job and work are related with one another (Oldham & Hakman, 2010). Above mentioned five central dimensions for creating a stock unit as a motivational potential score for a job can be combined (Yavarbum & kulpan, 2011). According to Malek (2010) motivation can improve performance of staffs, and motivation of staffs is away to return towards organization's development. According to David Man (1989) effective motivation causes increasing in output and decreasing in costs, and as a result profit increases (Navaz & Yasin, 2014). Therefore, in an overview we can claim that: Job's motivational potential score can be created when staffs feel job security and stability, partnership, effective role in organization and also there be a sense of freshness and vitality. Having job motivation in the direction of healthy motives is one of necessities in correct application of human resources.

Hackman and Oldham (1974, 1975) has been prescribed a method by detecting opportunities for calculating the overall rating based on the measured characteristics of an individual's career, Motivational Potential score (MPS) expression reflects the potential motivation of a job. Five variables of the main model can be seen as a work-related dependent variable (Skill variety, nature of work, importance of working) or related to management of the work (independence, feedback). Theoretical model forms a cross connection between the main components, in computing the overall motivational scores, average of work-related main variable was computed and then multiplied by the independence and then multiplied by the feedback scores (Figure.1). This relationship means that when each of the components is low has a remarkable effect on MPS scores,

therefore only maximum results can be achieved in which all the characteristics are maximum.

$$MPS = (\text{Skill variety} + \text{Task Identity} + \text{Task Significance}) \times \text{Feedback} \times \text{Autonomy} \quad (1)$$

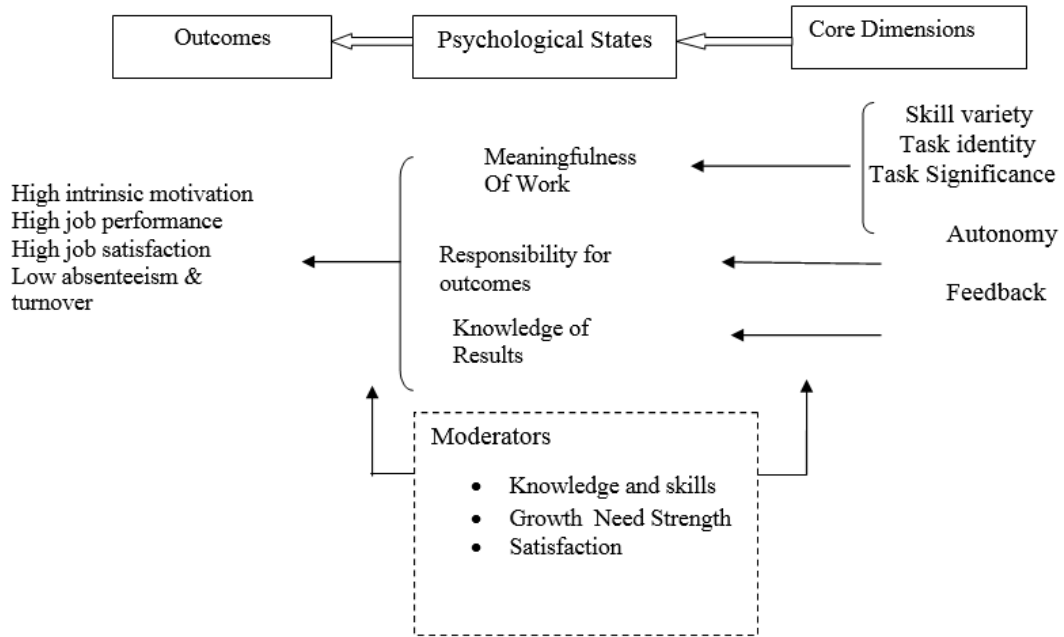

Figure 1. Job Characteristics Model (Hackman & Oldham, 1974)

**2 Research Methodology**

The current study is an applied research. Statistical society of this study includes Pars Abad's private and public banks staffs which their population is 260 participants. As regards, society consists of two private and public classes, Stratified random sampling method with applying Cochran formula conducted, and 155 participants was selected as samples for doing the study. In the current study for investigating motivational potential score Linda and Ann scale (199) was used. This scale consists of five dimensions in which it has 15 items, and different dimensions of

the motivational potential score which has 3 questions about Skill variety, 3 questions about the Task Identity, 3 questions about feedback from supervisor, 3 questions about Task Significance, and 3 questions measure the independence, subjects in a four options scale from 1 (completely incorrect) to 4 (completely correct) answer to each of items in overall scale and each of its dimensions get a score, therefore in overall scale maximum score is 4 and minimum score is 1. As well Meggins on and Clutter buck job involvement questionnaire (2006) with 20 questions was used.

Figure 2: conceptual model

**2.1 Research Hypotheses**

1. There is a significant relationship between Motivational Potential Score and staffs Job involvement among public banks.
2. There is a significant relationship between Motivational Potential Score and staffs Job involvement among private banks.

3. There is a significant difference between private and public banks from the Motivational Potential score dimension.
4. There is a significant difference between private and public banks from the Job involvement dimension.

5. In comparative investigation between Motivational Potential Score and Job involvement among private and public banks there is a significant difference.

In the current research to find out that the variable distribution is normal, Kolmogorov-Smirnov test was used. Result of this test is presented at table.1. The significance level greater than 0.05 represents the normal distribution of data. For all variables, because the level of significance is greater than 0.05, we can conclude that these variables are normal.

**3 Results**

Table 1: One-Sample Kolmogorov-Smirnov Test

Variable	Kolmogorov-Smirnov Z	Asymp. Sig. (2-tailed)
<b>Motivation Potential scores</b>	1.062	0.326
<b>Job Involvement</b>	1.314	0.109

**The First Hypothesis: There is a significant relationship between Motivational Potential Score and Staffs Job involvement among public banks.**

Table2. The correlation coefficient test dimension Motivation Potential scores and job involvement "state banks"

Variable		Motivation Potential scores	Skill variety	Task Identity	Feedback	Task Significance	Autonomy	Job Involvement
Motivation Potential scores	Pearson Correlation	1						
	Sig. (2-tailed)							
Skill variety	Pearson Correlation	0.857**	1					
	Sig. (2-tailed)	0.000						
Task Identity	Pearson Correlation	0.628**	0.520**	1				
	Sig. (2-tailed)	0.000	0.000					
Feedback	Pearson Correlation	0.676**	0.320**	0.315**	1			
	Sig. (2-tailed)	0.000	0.004	0.004				
Task Significance	Pearson Correlation	0.763**	0.472**	0.439**	0.309**	1		
	Sig. (2-tailed)	0.000	0.000	0.000	0.005			
Autonomy	Pearson Correlation	0.576**	0.420**	0.315**	0.592**	0.339**	1	
	Sig. (2-tailed)	0.000	0.000	0.000	0.005	0.000		
Job Involvement	Pearson Correlation	0.700**	0.460**	0.439**	0.463**	0.490**	0.473**	1
	Sig. (2-tailed)	0.000	.001	0.000	0.000	0.000	0.001	

The Pearson correlation coefficient between motivational potential score and job involvement among public staffs is 0/700. Because the significance level of correlation coefficient (0.000) is less than the error level 0.05, we can conclude that there is a significant relationship between motivational potential score and staffs job involvement among public banks. Also, due to the positive correlation coefficient, we can claim that there is a direct and significant relationship between motivational potential score and staffs job involvement among public banks. In other words, by increasing staffs motivation, job involvement also increases. Therefore, according to the previously mentioned materials and existence of a significant relationship between motivational potential score and staffs job involvement among public banks, with 95% confidence (because the significance level is less than 0.01, with 99% confidence) we can claim that

the first hypothesis " There is a significant relationship between motivational Potential Score and Staffs Job involvement among Public Banks" is confirmed (Table. 2.).

Also Motivational Potential Score has five dimensions, according to the significance level of motivational potential score, we can conclude that between dimensions of skill variety, Task identity, feedback from supervisor, Task Significance, and job's independence with job involvement among public banks there is a direct and significant relationship.

**The Second Hypothesis: There is a significant relationship between Motivational Potential Score and Staffs Job involvement among Private Banks.**

Table 3 - Test correlation coefficient of Dimension potential motivations job involving "private banks"

Variable		Motivation Potential scores	Skill variety	Task Identity	Feedback	Task Significance	Autonomy	Job Involvement
Motivation Potential scores	Pearson Correlation	1						
	Sig. (2-tailed)							
Skill variety	Pearson Correlation	0.775**	1					
	Sig. (2-tailed)	0.000						
Task Identity	Pearson Correlation	0.789**	0.376**	1				

	Sig. (2-tailed)	0.000	0.000					
Feedback	Pearson Correlation	0.524**	0.420**	0.524**	1			
	Sig. (2-tailed)	0.000	0.000	0.000				
Task Significance	Pearson Correlation	0.615**	0.328**	0.554**	0.571**	1		
	Sig. (2-tailed)	0.000	0.001	0.000	0.000			
Autonomy	Pearson Correlation	0.553**	0.330**	0.655**	0.324**	0.688**	1	
	Sig. (2-tailed)	0.000	0.000	0.000	0.000	0.001		
Job Involvement	Pearson Correlation	0.381**	0.352**	0.585**	0.459**	0.879**	0.359**	1
	Sig. (2-tailed)	0.000	0.003	0.000	0.003	0.004	0.000	

The Pearson correlation coefficient between motivational potential score and staffs job involvement in private banks is 0/381. According to the significance level of correlation coefficient (0.000) which is less than the error level 0.05, we can conclude that there is a significant relationship between motivational potential score and staffs job involvement in private banks. Also, due to the positive correlation coefficient, we can claim that there is a direct and significant relationship between these two variables. In other words, by increasing motivation, job involvement also increases. Therefore, according to the presented material and existence of a significant relationship between motivational potential score and staffs job involvement with 95% confidence (because the significance level is less than

0/01, with 99% confidence) we can claim that the second hypothesis "There is a significant Relationship between Motivational Potential Score and Staffs Job involvement in Private Banks" is confirmed (Table. 3.) Also according to the significance level of motivational potential score we can conclude that between dimensions of Skill variety, Task identity, feedback from the supervisor, Task Significance and independence, and job involvement in private banks there is a direct and significant relationship.

**The Third Hypothesis: There is a significant difference between private and public banks from the Motivational Potential score dimension.**

Table 4-t-test result on the different dimension potential motivations state and private banks

Mean comparison test					Levene's Test for Equality of Variances		
t Std. Deviation	Mean Difference	Sig. (2-tailed)	df	t	Sig. (2-tailed)	F	
2.5	1.79	0.366	143	0.748	0.772	0.089	Equal variances assumed
2.5	1.79	0.451	137.134	0.739			Equal variances not assumed

The test results about the hypothesis testing are presented at the above table. At the above table to reaching the correct answer, two testing carried out the first has been done about the equality of variance between groups and the second has been done about the comparison of potential scores mean. According to the obtained significance level for equality of variance testing which is 0/672 and is greater than 0/05, thus the equality of variance assumption is accepted. With 95% confidence can be said that the variance between public and private banks is equal. As a result, all numbers obtained is considered in the line corresponding to an equal variance. In comparing two samples mean it's possible that the difference between public and private

bank will be random or maybe actually it exists. Achieved significant level for the t-test is 366/0, and because this amount is greater than predetermined amount of 0/05, therefore the main null hypothesis is which there is no difference between public and private banks is not rejected. The amount of difference between studied groups is 0/73, and with 0/95 confidence this difference can be random. Therefore between private and public banks from the motivational potential score there is no significant difference.

**The Fourth Hypothesis: There is a significant difference between private and public banks from the Job involvement dimension.**

Table 5. Results of t-test on the difference between private and public bank job involvement

Mean comparison test					Levene's Test for Equality of Variances		
t Std. Deviation	Mean Difference	Sig. (2tailed)	df	t	Sig. (2tailed)	F	
1.92	2.26	0.224	153	1.178	0.755	0.1070	Equal variances assumed
1.94	2.26	0.224	139.8	1.169			Equal variances not assumed

The test results conducted on the hypothesis is presented in the above table. Two testing to reach the correct answer is conducted on the above table, the first is about the equality of variance and the second is conducted about mean comparison of job's involvement. According to the significance level for equality of variance which is 0/755 and greater than 0/05, thus equality assumption is confirmed. With 95% confidence we can claim that variances of two groups of public and private banks are equal. As a result, all the obtained numbers considered in the corresponding level with equality of variance. In comparing two samples means it is possible difference between public and private banks be by random or maybe it really exists. Achieved significance level for t-test is 0/244, and because this amount is greater than predetermined amount of 0/05, therefore the main null hypothesis which there is no difference between public and

private banks is not rejected. Amount of difference between studied groups is about 2/66, and with 95% confidence this difference can be random. There is no significant difference between private and public banks from the job involvement dimension.

**The Fifth Hypothesis: In comparative investigation between Motivational Potential Score and Job involvement among private and public banks there is a significant difference.**

Table 6: compares the Fisher test

Result	Sig. (2-tailed)	Z	Pearson Correlation	N	communities
The difference is not acceptable	0.471659	0.71	0.700	78	State bank
			0.381	77	private bank

To indicting whether correlations in two different communities have a significant difference or not Z (Fisher) test was conducted. Correlation between motivational potential score and job involvement in order is 0.700 and 0.381. Also achieved significance level is 0.471659. Now we must investigate that is this correlation in both public and private banks are different? Test results in order to investigate the hypothesis and answer to the question are presented in the following table.

Information on the above table indicates which at significance level of 0.05 in the correlation between motivational potential score and job involvement among two groups of private and public banks there is no significant difference.

#### 4 Conclusion

Low job's motivation can has a negative effect on organization's growing trend, with using motivating potential index we can compute the overall index of each job for creating motivation among staffs, and following that with using diagnosis investigating of job we can identify jobs which have low or high level of motivation, and finally to reach organizational growth, jobs which their MPS is low be determined and separated in order to redesigning and increasing of motivational ability. According to the results of the current study, there is a positive significant relationship between motivational potential score and job's involvement. Also there wasn't any significant difference between private and public banks from the motivational potential score and job involvement dimensions.

#### 5 Suggestions

As regards the research hypothesis which there is a significant relationship between motivational potential score and job involvement was confirmed, but suggestions presented in which banks managers by noticing this point that motivational potential dimensions (diversity, identity, importance, independence, and feedback), education (because education can improve increasing of staffs job's involvement, decreasing updating of skills, increasing a sense of belonging, benefitting from welfare, maximizing commitment to the organization, creating organizational competition, and there is a positive relationship between educational programs and staffs job's participation), creating motivation among staffs for increasing participation in activities especially participation in decision-making which creates a kind of obligation among decision-makers which support taken decisions, and noticing to the personality style of staffs can increase participation or job involvement of staffs. Also with sharing of staffs in organization's success (need for sociability, need for success, and hope for power), c Hosing a formidable staffs (feedback from supervisor, Task Identity, Task Significance), accurate assessment of activities and performances, noticing to the organizational structure and job (independence) and promoting staffs knowledge (skills diversity), have a conviction to a management of motivation as an inevitable rule.

**Abstract.** The purpose of this article is to study the effect of five different dimensions of price image on shopping intentions in different kinds of stores. In this study, 306 participants of three Isfahan stores were selected from a list consisted of 18 retailers. Based on these data, a multi-group analysis was done on Mplus with the use of covariance structure in order to examine the direct and indirect effects of five dimensions of product price image on shopping intentions. It shows the differences resulting from the structures of the stores. The effect of product price image is different in various stores. The results is related to some applied concepts of commodity pricing in retails. For instance, retailers should not only focus on the price level. Also, retailers should allocate different priorities to each dimensions of price image.

**Keywords:** Pricing, Price Image, Store, Customer's Behavior

### 1 Introduction

Retailers compete with each other on the price of goods. Empirical studies show that price is an important factor in selecting a grocery store (Tigert, 1983). Also, a price perception is an inseparable part of retailers' price image (Lindquist, 1974/1975).

Current development in food retail will raise the importance of the price. Particularly in Europe, traditional retailers are subject to the rapid development of auctions (Colla, 2003). From customers' point of view, auctions give lower price in relation to traditional retails (Mitchell and Kiral, 1999; Morschett et al., 2006).

Therefore, retailers will maintain their positions with introducing economical store brands (Moreau, 2006c, 2007). In such a situation, it is very important that the retail managers measure the price image of their own store. This task will help the retail managers to identify the difference between their suggested price and customers' suggested price. A measurement of price image is very important in recording the effects of different strategies of pricing (Downs and Haynes, 1984). However, retailers should not only measure the price image because one researcher showed that price image and satisfaction of price are multi parameters (Zielke, 2006). Therefore, retailers should make a decision that which dimensions are more important. Some retailers should pay more attention to the image of price level, but other ones should pay attention to the customers' perception of the money value. An image of price level will point to the customers' perception of expensive or cheap selling of a store. Money value is referred to a customer's perception of his or her payments (Price-performance ratio). Also, retailers should be aware of the effect of price perceptibility, price processing, and price evaluation certainty on shopping intentions. This study replies to the above questions with analyzing the efficacy of five dimensions of a price image on shopping intentions. Previous studies showed approximately the behavioral effects of price image dimensions (Zielke, 2006). In the previous studies, the elements were not completely developed and prices were used as a central dependent variable. Therefore, this study will expand the previous study with the use of new methods of measuring the price image and modelling the direct effects of price image dimensions on shopping intentions.

Different dimensions of a price image are in relation with each other. Therefore, if only direct effects were analyzed on the shopping intentions, the results of this analysis are illusive. For instance, a perceptibility of a price level is prior to the perceived value. This task would affect significantly the perceptibility of the price level which was moderated with the perceived value.

Therefore, being awareness of such indirect effects needs gathering information about real parameters relating to the price image. This article will study these effects. In previous studies, only the relationship between the selected price images was analyzed. Therefore, in this article, a researcher is aimed to complete those studies with analyzing some indirect effects in a comprehensive model. Analyzing these direct and indirect effects is illusive without considering the differences of store structures. Structure of different stores are different in price and pricing (Morschett et al., 2006). This study shows that the dimension effects of price image can be different in different stores. In the previous studies, researchers did not regard the moderating role of store structures. Managers should be aware of the moderating effect of the store structures. For instance, if a value perception for a shopping intention were very important in auctions, managers of such stores should use their energy on this dimension and not on the perceptibility of the price level. Therefore, this study will analyze the effect of store structures on moderating the effects of price image dimensions on shopping intention to develop the previous studies. In summary, this article will analyze the direct and indirect effects of five price image dimensions on the shopping intention in different structures of stores. In this article, the researchers expanded the previous studies with the following steps.

- 1) Finding a new way for measuring the price image
- 2) Building a model for direct effects of price image dimensions on shopping intentions
- 3) Analyzing some indirect effects in a comprehensive model
- 4) Considering the moderating effects of a store structure

### 2 Theoretical Background

Nystrom (1970) was the first person who studied on the price image of the retail. He defined a price image as a buyer's reaction toward a price of goods. Similarly, most researchers defined a price image with a single dimension such as a low price or an image of price level. In recent studies, a price image is defined as a multi-dimensional hidden variable (Zielke, 2006). Based on this belief, a price image is a multi-dimensional hidden variable which is included of various perception dimensions which are in relation to a retailer's prerequisites on pricing and its results. It seems that this definition shows the price image better than other definitions. Previous studies will help people in understanding the price image of retailing. In the first study, researchers showed the effect of different groups of products in price image of retailing and defined a price image as a price of stores. In the second study, researchers explained what retailers should do at the time of low prices. In this study, the prerequisites of the price image were explained in retailing. In the third study, researchers paid attention more to the analysis of structures relating to the price rather than the perceptibility of the price level. Therefore, they paid attention more to the money value (Zeithaml, 1988; Sweeney and Soutar, 2001) or the fairness of prices (Campbell, 1999; Homburg et al., 2005 e.g. Kahneman et al., 1986). A final study was mixed with a third study in a way that the perceptibility of a price and a price image were assumed in a multi-dimensional way (Zielke, 2006).

Recent studies are based on the multi-dimensional studies specially, the results of Zielke who identified some dimensions of the price image such as the perceptibility of a price level, money value, perceptibility of a commodity price, price processing, and evaluating certainty. The present study is aimed to expand this study with improving measurement of a price image and the analysis of direct and indirect effects of price image dimensions on shopping intentions in a comprehensive model and moderating effects of a store structure.

### 3 Price Image Dimensions

It is essential to define these kinds of dimensions before expanding the assumptions relating to the behavioral effect of

price image dimensions. Based on over-viewing the previous studies and an empirical study, five dimensions of a price image were selected. These five dimensions were included of the perceptibility of a price level, money value, price perceptibility, price processing, and evaluation certainty. Based on the obtained results of the previous studies, other suggested dimensions such as an image of special suggestions, fairness of a price, and emotional factors were removed. The previous study showed that these parameters cannot be clearly independent of five dimensions of a price image. Five dimensions of a price image can be defined as follows:

1) Perceptibility of a price level means perceiving a price without considering a difference in product quality. In stores and retails, perceptibility of a price level is like the image of a price level. For one kind of product, perceptibility of a price level is obtained from comparing the product prices with a standard price which is called a reference price. This result can be in accordance with the image of a price level of retails. Most authors have suggested some rules for this case.

2) Money value is usually defined with a difference in received and paid goods or services (Emery, 1969; Dodds and Monroe, 1985; Zeithaml, 1988). In a domain of retailing, money value is equal to the gain and loss obtained from a product and qualitative attributes of a store. Customers may regard nonfinancial expenses of a purchase process as a loss like the price of goods (Zeithaml, 1988; Gijsbrechts, 1993; Baker et al., 2002). Although it seems that perceptibility of a price level and a money value are related to each other, a retailing store can have completely different behavior on these two dimensions. For instance, meat price seems cheap for a major buyer like an owner of a restaurant, but the meat itself is not worthwhile. However this person may find expensive drink prices of his or her favorite store acceptable.

3) Perceptibility of a price is as easy as accessing to the prices of goods in stores. Previous studies showed clearly the importance of price tags in improving the perceptibility of a price (Zielke, 2006).

4) Price processing is as easy as analyzing the prices specially, when the price of similar goods are compared (Zielke, 2006). While labeling is prior to the perceptibility of a price, price processing are dependent to the announcement of commodity prices of the stores. Therefore, if big and red price tags are used in the stores, great achievements will be obtained in the domain of perceptibility of a price. On the other hand, no achievement will be accessed in the domain of price processing.

5) Evaluation certainty means that how customers do the process of price evaluation (Zielke, 2006). Since the price evaluation of products is difficult for customers, overall evaluation of prices of one store is more difficult. In retailing stores, there are no clear way for evaluating the prices because the customers' knowledge of prices are not a lot and being aware of various prices is very difficult (Desai and Talukdar, 2003). If prices were perceived and processed, evaluation certainty would be weak due to the overtime changes in prices or price differences between different products. Therefore, evaluation certainty is dependent from other dimensions of a price image in retailing.

#### The structure of Retailing Stores

The structures of stores are defined as the special advantages that the stores give to the customers for satisfying their needs.

In Europe, auctions and different kinds of big stores are identified as retailing market. In addition, structures such as weekly markets and organic grocery stores are existent. These structures will be analyzed in the following part. As you can see, the effect of different dimensions of a price image is potentially different in auction structures, big stores, organic grocery stores, and weekly markets. In auctions, foods are sold with a very low price.

Products that are of high inventory turnover and limited categories, sizes, and brands are usually sold in the auctions. An area of these kinds of stores is less than 1500 square meters. Also, in these kinds of stores, less than 1500 products are presented to people. Sometimes, auctions are called as a big store which less various products are sold in. Some kinds of these stores are like Aldi, Dia, Lidl, and US-chain Save-a-Lot (Zentes et al., 2007). Big stores are included of different subsets. In conventional big stores, a lot of foodstuffs which are 30000 kinds are sold. The area of these kinds of stores is between 400 and 1000 square meters. There are some differences among superstores, hypermarkets, and big stores. In superstores, approximately 30000 to 40000 kinds of products are presented, but in hypermarkets, more than 40000 kinds of products are presented. The area of supermarkets is between 1000 and 5000 square meters, but the area of hypermarkets is more than 5000 square meters. Some of these stores are like Auchan, Carrefour, and Metro (Zentes et al., 2007).

Although clear differences are identified among big stores, superstores, and hypermarkets in many books, it is sometimes difficult to that in practice. For instance, retailers such as Edeka, Rewe, Swiss Coop, and Tesco use the name of their company in different kinds of stores. A difference between different kinds of stores is not clear and it is different in various sources. Organic grocery stores are stores which present specified kinds of products with a based price level. Organic products are produced with processes are adoptable with nature. These kinds of products are not included of pesticides, preservatives, and other chemical materials (Chinnici et al., 2002). Like big stores, different kinds of these stores are existent. Traditionally, a size of these kinds of stores is small. Also, these kinds of stores are controlled with independent retailers. Nowadays, more organic products are produced in industrial farms. Also, these kinds of products are sold in chain organic grocery stores (Thompson and Coskuner-Balli, 2007). For instance, in Alnatatura which is one kind of Germany store and its area is 550 square meters, 6000 kinds of products are presented. In northern America and British, 20000 kinds of food stuffs are sold in stores which their areas are 3000 square meters. Anyway, in Europe, normal organic grocery stores are kinds of stores which organic products are sold exclusively in. Public markets are places which small and dependent sellers sell different kinds of products. Since these kinds of markets are held weekly, these kinds of markets are also called weekly markets. In weekly markets, some of the farmers, local producers, and independent traders sell fresh groceries like fruit, vegetable, flower, meet, fish, egg, and dairy products. Farmers' markets are one subset of weekly markets in which local farmers sell fruit and vegetables. Although the product variety of these kinds of markets is limited to fresh products, a customer can buy the products from different producers. Prices in these kinds of markets are between low prices which are identified by independent traders and based prices which are identified by the farmers of organic products. The size of these kinds of markets is based on the place that they are held in. Recent studies show the difference among four kinds of stores such as auctions, stores, organic grocery stores, and weekly markets. Table 1 shows the difference among these four kinds of stores.

Table 1. Difference among auctions, stores, organic grocery stores, and weekly markets

style	Auctions	Stores	Organic Grocery stores	Weekly Markets
Price	Very low	Low-Average	High	Low-High
The Amount of Decoration	Less	Moderate- a lot	Less-Moderate	Moderate- a lot
Variety	Less	Moderate-A lot	Less-Moderate	Less-Moderate
Size	Small	Average-big	Small-Average	Small-Big

This table can be used for stores like usual stores, superstores, and hypermarkets.

#### 4 Assumptions

In the previous part, five dimensions of the retailing price image which were perceptibility of the price level, money value, price processing, and evaluation certainty were defined. In fact, these dimensions are not independent. This phenomenon is not unusual. Other multidimensional structures are of separated and related dimensions. In this part, these correlations are discussed and the assumptions toward these dimensions are expanded. Based on the previous studies, it seems that these five dimensions have direct effect on the shopping intention. Price level is an important criterion in selecting the stores (Tigert, 1983). Price level is now regarded a lot in Europe due to the achievements obtained in auctions (Colla, 2003). Also, these things show that the decisions are made by retailers and people who give services to people are affected by the money value. Price perceptibility and processing are related to the easiness in buying and non-cash expenses in buying process. Previous studies focus on this idea that shopping intentions are affected by the easiness in buying and non-cash expenses in the buying process. Since uncertainty will lead to the risk in buying, evaluation certainty has an effect on the shopping intention. Customers can decrease this kind of risk with buying from stores which their prices are exact.

**H1:** Price level, money value, perceptibility of a price, price processing, and evaluation certainty have a direct and positive effect on the shopping intention of people.

Also, a lot of indirect effects are existent in the process of forming the price image. Therefore, it seems that analyzing the relationships among these five dimensions is important. First, perceptibility of a price should have a positive effect on the money value. Such relationship is adoptable with the definition of the value and its samples can be seen in this study.

**H2:** Perceptibility of a price level has a positive effect on the money value.

Money value will overlap financial losses. Therefore, perceptibility of the price, price processing, and evaluation certainty will decrease moral, physical, and non-cash expenses. These expenses are the nonfinancial elements of the price. Therefore, these kinds of expenses should have effect on the money value. It should be mentioned that the previous studies were unsuccessful in studying the relationship between the non-cash expenses and the money value (Baker et al., 2002).

Also, the results of Baker and his coworkers' study should be proved in different situations. Baker and his coworkers studied these kinds of relationships on a card and gift store with the use of a CCTV camera. They understood that in these stores, there were less relationships among moral, physical, and non-cash expenses in relation to small supermarkets because economical prices are more important in small supermarkets (Babin et al., 1994).

**H3:** Price perceptibility has a positive effect on the perception of money value.

**H4:** Price processing has a positive effect on the perception of money value.

**H5:** Evaluation certainty has a positive effect on the perception of money value.

In addition, different relationships among perceptibility of a price, price processing, and price estimation should be discussed. In the first step, we can say that the perceptibility of a price has a positive effect on the price processing. This hypothesis was concluded from the processing model of information (Zeithaml, 1988).

**H6:** Perceptibility of the price has a positive effect on the price processing.

Also, it is assumed that perceptibility of the price and price processing are effective on the evaluation certainty. Difficulty in learning and processing information in relation to the price will lead to the price uncertainty. This assumption is proved with the previous writings. A researcher whose name was Zeithaml proved that brands will lead to the accuracy increase in price remind. Also, an organized list of product prices will lead to the accuracy improvement in comparison of prices. Zielke also observed the significant effect of price perceptibility and processing on the estimation certainty.

**H7:** Price perceptibility has a positive effect on the evaluation certainty.

**H8:** Price processing has a positive effect on the evaluation certainty.

One of the effects of price level image on the evaluation certainty is formulated into a hypothesis. This hypothesis is based on this discussion that low prices can be processed very easy, but the higher prices should be processed with the quality estimation of services and goods.

**H9:** Price level perceptibility has a positive effect on the evaluation certainty.

Previous relation will affect the price level and processing. Studies which were done on the unit price showed that the utility of the unit price will lead to the selection of an economical product and customers will buy cheaper products. Other authors proved that in the stores, the structure of shelves will affect selecting the cheaper products. Therefore, if cheap products of the stores were not hidden in the beneath shelves, the relation between the price of one product to the overall price level could be affected a lot at by the customers.

**H10:** Price processing has a positive effect on the perception of price level.

In figure 1, you saw a model which was build based on the tenth hypothesis. This structural model shows that there should be indirect effects as well as direct effects. Therefore, the first assumption cannot be expanded. Also, it would be considerable if the first hypothesis were rejected by some data.

**H11:** Price level perception, money value, price perceptibility, price processing, and evaluation certainty have great direct and indirect positive effects on the shopping intention of people.

Assumptions were already based on this idea that the dimensions of a price image have various direct and indirect effects on the shopping intention of people in retail stores.

Although some of these effects were discussed in previous studies, a comprehensive model was not prepared for all of these effects.

In addition, the effect of store structures on changing the relationships is not discussed here. It seems that the relations among dimensions of price image in different store structures like auctions, big stores, organic grocery stores, and weekly stores are different. Although we considered all of the above assumptions into our model, it would not be possible to discuss each effect in these four stores. Therefore, in the following paragraphs, it is discussed about the general idea toward the moderating effects. In auctions, the effect of price level is less than other kinds of stores. Since a low price is a main criterion of such stores, customers and people who are not customers look at this kind of stores as cheap stores. Also, in organic grocery stores, there should not be a lot of variations in the price level. Possibly, all customers think that the prices of organic grocery stores are higher than other stores. In big stores, conditions are

very different because a price level and pricing tactics are different in these kinds of stores. Weekly stores act like big stores. In big stores and weekly stores, a price level is more important than auctions and organic grocery stores. In auctions, money value is important because some of the customers have a bad view toward the relationship between the low price and the quality of goods. Therefore, this view will lead to the decrease in money value. Price perceptibility and processing is important in big stores because more stuffs are sold in these kinds of stores. Therefore, purchasing from big stores is time-consuming. Also, comparing the prices in big stores is difficult. Price perceptibility and processing are very important in weekly markets because setting a price is more unclear in these kinds of stores and a customer may be make a decision to compare a price of different sellers. Here, predicting the difference of the evaluation certainty is difficult. Therefore, these kinds of effects should be analyzed too because the effect of the parameters is a lot.

**H12:** Behavioral effects resulting from the price level money value, price perceptibility and processing, and evaluation certainty are different in various stores.

### 5 Criteria

In the previous studies, a measuring tool was used for evaluating the five dimensions of the price image (Zielke, 2006). Some of

the price dimensions are measured analytically with the measuring tools, but other price dimensions are measured structurally with the measuring tools. This subject is a little complicated because structural and analytical measurements should be analyzed differently. Therefore, researchers make a decision to expand the analytical measurements with the existent measuring tools. One of the measuring tools was expanded based on the dimensions of the price image and previous studies. In the first pretest, researchers studied the clearness of all parameters. The second pretest was conducted with 75 students. Based on the results of the second pretest, some of the parameters were amended, substituted, or removed. In the final step, all the dimensions of the price image are measured with three, four, or five parameters. Also, seven options were considered for these measurements. The first option is completely disagree and the seventh option is completely agree. Measuring tools of this example are as follows:

In sum, prices were very low (Price level). With regard to the money that I had and a commodity that I wanted to buy, prices were suitable (Money value) and very easily readably (Price perceptibility). In this kind of store, a comparison of different commodity prices is very difficult (Price processing). Therefore, I can easily evaluate this store based on its commodity prices (evaluation certainty). A complete list of measuring tools is shown in table 2.

Table 2. Measuring Tools

Price Level	In sum, Prices of goods were very low.
	In sum, prices of goods were very high.
	You can buy your groceries from here with cheap prices.
	In this store, prices are cheaper than other stores.
Money Value	In this store, prices are more expensive than other stores.
	With regard to the money that I have and a commodity that I want to buy, prices are suitable.
	With regard to the money that I have and a commodity that I want to buy, prices are high.
	In this store, money has a good value.
Price perceptibility	In this store, a ratio of a price to the store efficiency is very good in relation to other stores.
	In this store, a ratio of a price to the store efficiency is very low in relation to other stores.
	Prices are easily readable.
	You can easily understand that what the price of your product is.
Price Processing	In this store, we cannot easily identify the prices of goods in relation to other stores.
	In this store, comparing different commodity prices is very difficult.
	It takes a lot of time to find the most suitable commodity.
Evaluation Certainty	In this store, the prices are more than other stores.
	I can easily evaluate the efficiency of this store based on its commodity prices.
	I cannot easily evaluate the efficiency of this store based on its commodity prices.
Shopping Intention	In this store, evaluating the prices of goods is difficult.
	I should buy most of my stuffs from this store.
	I should buy most of my stuffs from other stores.
	I should consider this store for buying my stuffs too.
	I should not consider this store for buying my stuffs.

### 6 Methodology

Assumptions were examined manually. Information was gathered by the students of European university. These students interviewed with people who bought regularly groceries and considered their age, sex, the number of their family members, and their income. Also, some of the participants filled the questionnaires at home. Then, these questionnaires were gathered by the students or sent by the post to the research team. Therefore, participants could answer these questionnaires without any haste.

It is asked participants to choose three retail stores which their prices are very different in relation to other stores. Then, these participants should rank these retail stores with a measuring tool. The order of questions was in a way that they did not have any effect on the participants' answers. Also, participants did not understand of multidimensional aspect of price image. It was not obligatory asked participants to choose the stores that they know

and buy from because this task will make closer this situation to the real situation in practice. In real conditions, a customer will face some options which know some and does not know others. For instance, if a customer bought regularly his or her stuffs from one auction, he or she would have a price image from that store. Therefore, when he or she wants to buy something from that store, he or she will consider the prices of other stores. Customers should buy their stuffs from a store which their prices are suitable for them even if they buy or do not buy their stuffs from that store. Also, customers have a price image from the stores they buy or do not buy their stuffs from. Although 306 questionnaires were gathered, 918 measurements were obtained from the price image because each participant had to answer to questions about three stores. 21.7 percent of people chose the stores which they always bought their stuffs from. 27.6 percent of people chose the stores which they sometimes bought their stuffs from. 50.7 percent of people chose the stores which they rarely bought their stuffs from. Questions relating to daily and repetitive purchases show that participants have the competency

to answer the questions. The participants' age average was 36 years old. 62 percent of participants were women and 61 percent of participants were from families which their members were two or more than two persons. Participants' income average was 1 to 1.5 million Toman.

## 7 Results

### 7.1 Descriptive Statistics

Table 3 shows the amount of average and standard deviation of five dimensions of a price image and shopping intention. Descriptive statistics shows that a perception of a price image is

very different among different structures of the stores. Considerably, auctions had the best price image and other stores were similar to each other with a little difference in their structures. For instance, the prices of big stores were identified cheaper than weekly markets and organic grocery stores. Also, a money value of these three stores is similar. From the perspective of price perceptibility and processing, weekly markets were set in the lower rank than other kinds of stores. In weekly markets and organic grocery stores, Evaluation certainty was similar, but it was less than auctions and big stores.

Table 3. Descriptive Statistics for Dimensions of Price Image and shopping Intention

Dimensions	Total N=918		Auctions N=339		Big Stores N=364		Organic Foods N=143		Weekly Markets N=72	
	Average	Standard Deviation	Average	Standard Deviation	Average	Standard Deviation	Average	Standard Deviation	Average	Standard Deviation
Price Level	4.28	1.95	6.29	0.78	3.61	1.26	1.95	0.89	2.78	1.22
Money Value	5.01	1.32	5.94	0.90	4.47	1.22	4.42	1.29	4.57	1.04
Price Perceptibility	5.23	1.29	5.53	1.28	5.30	1.16	4.89	1.30	4.20	1.36
Price Processing	4.84	1.53	5.76	1.14	4.41	1.41	4.36	1.43	3.69	1.67
Evaluation certainty	5.14	1.43	5.86	1.05	5.05	1.24	4.17	1.62	4.13	1.57
shopping Intention	4.98	1.72	6.01	1.25	4.53	1.63	3.89	1.83	4.50	1.27

### 7.2 The Validity of Convergence and Separation

In the first step, the convergence validity of each price image dimension and shopping intention were confirmed with their Cronbach alphas. The validity of these dimensions were more than 0.7. Researchers such as Nunnally and Bernstein (1994) stated that an appropriate amount for price level (PL), money level (VAL), price perceptibility (PPC), price processing (PPR),

evaluation certainty (EC), and shopping intention (SI) are respectively 0.97, 0.89, 0.825, 0.86, 0.84, and 0.92. Then, the separation validity of the price image dimensions were tested with an analysis of a confirmed factor. Also, Mplus program was analyzed by the MLR estimator. Based on the writings, the amount of processing indexes are acceptable. Table 4 shows that the variance of a price image dimension is more than the correlation square of this dimension and other dimensions.

Table 4. Separation Validity

Dimensions		PL	VAL	PPC	PPR	EC
Price Level	PL	84.5				
Money Value	VAL	56.7	63.1			
Price Perceptibility	PPC	11.1	22.4	60.6		
Price Processing	PPR	32.8	39.3	35.2	67.4	
Evaluation Certainty	EC	31.1	33.9	22.2	32.6	64.3

### 7.3 Behavioral Relationships among Price Image Dimensions

Behavioral effects of price image dimensions were first tested without considering the store structures. Some of the separated states were removed from the list. The results were shown in the left hand side of table 5. The amount of processing indexes are very satisfied.

In addition, it was proved that all measuring models with factors of 0.74 to 0.94 are convergent. A hidden variable of R-square is 0.70 for the buying intention. There are direct, great, and positive effects for a money value (0.70), price level (0.11), and evaluation certainty (0.10). Therefore, H1a, H1b, and H1e were confirmed and H1c and H1d were rejected. It will be shown in the next part that price perceptibility and processing have indirect effects on the shopping intention. The second hypothesis was based on the positive effect of the price level on price perceptibility. This relationship is very strong. Since a standard fixed path between two structures is 0.55, the second hypothesis is confirmed. As it was said in the third, fourth, and fifth hypothesis, price perceptibility, price processing, and evaluation

certainty have an effect on the value perception. Since the coefficient of these dimensions were respectively 0.11, 0.16, and 0.13, the third, fourth, and fifth hypothesis are confirmed. Also, a price perceptibility has a positive effect on the price processing which is 0.59. Therefore, the sixth hypothesis will be confirmed with this point. In addition, the effects of price perceptibility and processing were great and positive on the evaluation certainty. Also, the amount of their effects were respectively 0.22 and 0.25. This point will confirm the seventh and eighth hypothesis. Another positive relationship which is considerable is a relationship between the price level and evaluation certainty. The coefficient of this relationship was 0.34. Therefore, the ninth hypothesis will be confirmed with this point. Finally, we talk about the effect of price processing on the price level. The effect of price processing on the price level is considerably great and is equal to 0.59. Therefore, the tenth hypothesis will be confirmed with this point. Also, the effects of five price image dimensions were examined for the purpose of studying the eleventh hypothesis. Therefore, H11a and H11e were confirmed with the effect of price level (0.56), price processing (0.49), price perceptibility (0.38), and evaluation certainty (0.19).

Table 5. The Results of a Path Model

	Total		Auctions		Big Stores		Organic Foods		Weekly Markets

#### 7.4 Moderating Effect of Store Structure

The twelfth hypothesis was based on this fact that the amount of price image dimension effect was different in different structures of stores. This subject was studied with a multi-group analysis which there were a difference among auctions, big stores, organic grocery stores, and weekly markets. The amount of processing indexes was weaker than the overall sample.

This point can be understood easily because the variance which was made with the structure differences of stores was removed from the model. A hidden variable of R-square is 0.50 percent in auctions, 0.74 percent in big stores, 0.52 percent in organic grocery stores, and 0.73 percent in weekly markets. Researchers compared a multi-group of a confined model with an unlimited model. In a confined model, all the coefficients of a model were similar in all the structures of stores. On the other hand, these parameters were estimated separately in an unlimited model. Both models were compared with a chi-square test and the suggested method by Satorra and Bentler (2001). The results show that the difference between the chi-square test of confined and unlimited models were positive and considerable.

$$\Delta\chi^2 \frac{1}{4} 103.27 > 58.12, \Delta df = 42, p = 0.05 \quad (1)$$

Therefore, the twelfth hypothesis will be confirmed because an unlimited model is better than a confined model. After proving the differences among the store structures, patterns of the fixes were studied in three store structures. In auctions, a great effect of money value on a shopping intention will dominate the fixes of a pattern path (0.99). Also, a price level has a negative and

inappreciable effect (-0.24). Although the overall effect is positive and considerable (0.39), these observations can be understood with regard to the great effect of a price level on a money value (0.52). Therefore, the effect of a price level on a shopping intention will be done with a money value. This means that a price level cannot justify purchasing from auctions. Customers will relate the prices to the things that they want to buy. Then, they go to the auctions and buy their things. A price level in auctions has a great effect on the evaluation certainty (0.39). Therefore, it makes us to focus more on this assumption that a low price in auctions will lead to the increase in evaluation certainty. Moreover, in auctions, evaluation certainty has a great effect on the money value (0.35) and an overall effect on the shopping intention (0.30). Therefore, evaluation certainty play a serious role in price image of auctions. Although a price perceptibility has a negative and direct effect on the shopping intention (-0.20), the overall effect is positive (0.22). In auctions, big tags of prices does not lonely have effect on the shopping intention of customers. These tags would have an effect on the customers if they are used along with the money value, price processing, and evaluation certainty. With regard to the overall effect, we can understand that a money value is the most important dimension (0.99) in auctions. Then, a price level (0.39), evaluation certainty (0.30), price processing (0.29), and price perceptibility (0.22) are important.

Pattern of big stores is more different than auctions. In big stores, a money value has less direct effect (0.69) than other price image dimensions, but a price level has little positive direct effect (0.115). When we look at the overall effects of price image dimensions in big stores, we understand that an overall effect of a price level is less than a money value effect (0.69). Therefore, a money value is a moderating factor of a price level perception. Like auctions, the effect of a price level is a lot on the perception of a money value (0.71). Unlike auctions, evaluation certainty is very low. Direct effect of an evaluation certainty is very low and is equal to 0.06. Also, an effect of an evaluation certainty on a money value is very low and equal to 0.527. The overall effects of evaluation certainty is very low and equal to 0.08. The effects of price perceptibility (0.47) and price processing (0.34) are strong and considerable. Price perceptibility has a great effect on the money value (0.26), but a price processing has a great effect on the price level perception (0.45). We can easily perceive the great effect of price image dimensions on the big stores and hypermarkets because the

variety and classification of their goods is a lot. Therefore, price perceptibility and price processing are related to each other a lot. With regard to the relative significance of five price image dimensions, we can say that a money value perception is the most important dimension in big stores and hypermarkets (0.69). Then, a price level perception (0.62), price perceptibility (0.47), price processing (0.34), and evaluation certainty (0.08) are important in big stores and hypermarkets. In organic grocery stores, a direct effect of a price level and a money value are like big stores and are respectively 0.13 and 0.60, but their overall effect is different. An overall effect of a money value (0.60) is more than a price level (0.25). We can reach to this point with regarding the insignificant relationship between a price level and a money value (0.13) and an insignificant effect of a price level on the evaluation certainty (0.244). When participants evaluated a money value in organic grocery stores, they did not pay attention a lot to different elements of a price. Although a price level does not have a great effect on the evaluation certainty, its overall effect is considerable and equal to 0.004. In organic grocery stores, an effect of an evaluation certainty on the money value is a lot and equal to 0.007. Finally, a pattern of organic grocery stores can be described with an insignificant overall effect of a price perceptibility which is 0.09. Like big stores, the effect of a price perceptibility in organic grocery stores is

considerable and equal to 0.35. Small and flat shelves of organic grocery stores will justify this issue. In organic grocery stores, price perceptibility is not problematic because a price processing is problematic and a customer cannot compare the price of organic and inorganic products. In sum, we can say that a money value with an overall effect of 0.60 is the most important dimension of price image in organic grocery stores. Then, the overall effect of a price processing (0.35), evaluation certainty (0.34), a price level (0.25) and a price perceptibility (0.09) are important in organic grocery stores. In weekly markets, a price level perception (0.34) and a price perceptibility (0.38) have a considerable direct effect on the shopping intention of people. The effect of a money value is insignificant and equal to 0.27. This is like the effect of a price level perception on the money value (0.27). Anyway, both effects of money value and price level are considerable in the surface of 10 percent. Since price perceptibility has a great effect on the price processing, it has a key role in the results of a weekly market (0.62). Since price perceptibility will lead to the increase in price level perception (0.39), it has the most significant overall effect on the shopping intention of people (0.65). Then, a price level perception (0.43), price processing (0.41), money value (0.27), and an evaluation certainty (0.07) are important.

Figure 1. Structural model of Hypothesis

## 8 Discussion

The results of the study confirmed most of the assumptions relating to the effects in an overall model. In this study, not only the direct effects of price perceptibility and processing were identified, but also the effects of other dimensions of the price image were identified. The results of this show that disregarding the price image dimensions are a mistake. Price perceptibility and processing have indirect effects on the shopping intention and the overall effects of price image dimensions. Price perceptibility and processing will become clearer with considering the structure of big stores and weekly markets. In summary, a multi-group analysis will lead to the identification of some of the structural differences of stores in the domain of direct, indirect, and overall effects. Since we cannot study all the effects of the price image dimensions, we only point at the important and basic cases.

In auctions, the amount of price is the most important dimension of a price image. In auctions, a price level perception has stronger effect on the accuracy of price estimation. Also, the overall effect of evaluation certainty is a lot on the shopping intention of people.

In big stores, an overall effect of price level perceptibility and the amount of price are like each other. In big stores, the effect of a price level on the amount of a price is more than other stores and a price perceptibility and processing have a close relationship with each other.

In organic grocery stores, an overall effect of a price amount is more than a price level perception. There is no relation between a price level perception and the amount of a price. Also, the overall effect of the price level perception is weaker than the price perceptibility and evaluation certainty.

The results obtained from weekly markets are different in relation to other stores. Price perceptibility has a key role in justification of a shopping intention. In weekly markets, a price level perception has a direct and overall effect in relation to a price amount.

## 9 Management Concepts

The results of this study are related to some management concepts in retail stores. The results of this study show that the retailers should not only compete with each other in the domain of a price level. Price amount, price perceptibility, price

processing, and evaluation certainty have great direct and indirect effects on the shopping intention. Therefore, it is told retailers to measure a customer perception from a price image dimension point of view. These measurements are necessary for decreasing the price distance of different stores. Also, they are necessary for the customers' reaction toward prices. In addition, measuring different dimensions of a price image is of special importance for observing the effect of different pricing strategies on the customers' behavior (Downs and Haynes, 1984). This study will suggest a measuring tool which can be used for measuring different dimensions of a price image.

The results obtaining from a structural model will make the management relationship among different dimensions of a price image clear. The results of this study show that a price level perception has a great effect on the money value. Although a price perception, a price processing, and evaluation certainty have important direct effects on the money value, price processing has an indirect effect on the money value. Therefore, retailers can increase customers' price level perception and money value perception without decreasing the prices. Retailers can make the concept of price perceptibility and processing easier for the customers with price tags, organized lists of prices, and product arrangement. Although price perceptibility and processing will have direct and indirect effects on the evaluation certainty, a price level has more effect on the evaluation certainty. This point shows that the stores which their price levels are low are better than other stores because their prices can be easily estimated. Retailers who their price levels are medium or high should try to decrease the effect of a price level with warranting the prices of brand products or continuous amendment of a based price based on the product quality change.

Also, retailers should be aware that the relation among different dimensions of a price image will be affected by the structure of the stores. Therefore, retailers should change their own priorities toward managing the price image. In auctions, sellers should focus on the money value perception of people because money value is an important price image dimension in this kind of store. Apparently, it is not adequate to sell cheap products. Recently, most sellers in auctions are on attempt to improve the money value with servicing better food products such as organic food products (Moreau, 2006b). Sellers should pay attention to this point that they should not increase the prices with every little change in the price level. We can say that a price level is a basic element of auctions. When a price level cannot be estimated in auctions, it should be regarded. Therefore, in auctions, sellers do not need to improve their price levels, but they have to satisfy their customers' expectations. In big stores, a price level and a money value are important. In Britain, retailers were more successful than auctions with selling brand and general products (Moreau, 2006a). In addition, sellers pay attention to the efficiency of a money value too. For instance, they sell brand products which their quality is better than the internal products (Burt, 2000). This case is more important than the improvement of the money value perception in auctions. In addition, big stores' sellers should not disregard the price perceptibility and processing. If sellers put their cheap products in the beneath shelves, they cannot compete with other sellers in the plaza. In organic grocery stores, a shopping intention of people can become increased a lot with people's perceived value because price processing and evaluation certainty are of high importance in organic grocery stores. Retailers should constantly improve their prices. They can moderate actively the price differences of internal products and announce the added amounts of product prices to the customers clearly. Since price perceptibility is the most important price image of weekly markets, sellers should pay attention more to the announcement of prices specially, with a price tag. Since price level perception seems more important than the money value perception in weekly markets, sellers should improve their price levels.

#### 10 Future Theories and Studies

This study expanded the previous studies from different aspects. In this study, different price image dimensions were measured with a clear measuring criteria and the behavioral effect of these dimensions were identified with the analysis of direct, indirect, and moderating effects of price image dimensions. The results show that disregarding the indirect and moderating effects of these price image dimensions is incorrect and illusive. Anyway, the results of this study are good for future studies. The things that should be regarded in the next studies are as follows:

First, price image dimensions should be studied from different factor point of view (Gijsbrechts, 1993).

Secondly, researchers should consider more mediating and moderating parameters of price image dimensions on the shopping intention of people. Satisfaction can be considered as a mediator (Varki and Colgate, 2001) and being awareness of prices (Drichoutis et al., 2007) can be considered as a moderator.

Thirdly, the results of this study should be generalized in the future studies with examining price image dimensions in different geographical areas and with different methods of gathering data.

Finally, this study can be done in the future in the real condition of purchasing.

## IDENTIFYING AND PRIORITIZING AFFECTING FACTORS ON HUMAN FORCE EFFICACY IN TABRIZ MASKAN BANK

<sup>a</sup>NADER BOHLOULI, <sup>b</sup>MAGHSOUD MOSAYYEBZADEH

*Department of Management, Bonab Branch, Islamic Azad University, Bonab, Iran.*

*Email: <sup>a</sup>nader.bohlouli.a1986@gmail.com,*

*<sup>b</sup>masoud.mosayyebzadeh@hotmail.com*

**Abstract:** To achieve sustainable success, bank organizations need to change and improvement in different fields. Among them, human resources has more important role due to its impact on change and improvement in all fields of employments. The main aim of the present paper is to identify and prioritize affecting factors on human force efficacy. We used a structured questionnaire method based on research literature and elites' opinions to gather data for this research. A 174 subject sample of Tabriz Bank Maskan employees are investigated by using a questionnaire and simple random sampling method. The results show that among five major identified variables, change strategy management, organizational process improvement strategy and employees' strategic capabilities have significant association to employees' efficacy.

**Keywords:** efficacy, human resource efficacy, affecting factors on employees' efficacy

### 1 Introduction

In recent years, by joining to WTO, domestic banking system is encountering with new challenges like the entrance of foreign banks, starting the operation of private banks and increases in the activities of financial and credit institutes. Therefore, such challenges have urged domestic banks to improve their performance in order to survive and compete in a dynamic environment and to improve status quo by identifying weaknesses and strengths (Manandhar & Tang, 2002). Today, organizations are facing with high pressures to improve performance and using market competitive opportunities that neglecting them can endanger their survival and effectiveness (Namasivayam et al, 2007).

"Efficacy" is used more in three scopes of management, economy and politics. Undoubtedly, human resource is the most valuable capital for organizations so that they shape organizational decisions and provide solution, resolve organizational problems, realize productivity and signify efficiency and effectiveness. Therefore, human resources spend most part of their life as employees, worker or manager in organizational environment which is highly important to respect them (Alavi, 1995; Aghabakhshi, 2000). Efficient and capable human force creates capable and efficient organization. According to Drucker, economic growth owes to empower competent staff (Abedini & Poursalehi, 2009). Although a set of organizational factors are effective in transformations, one can say that the role of human force in official transformation as one of the most important priorities for a dynamic and continuous movement.

HR development means to generate idea by organizational employees and its new concept necessitates that employees are equipped with those qualities and skills and full commitment and empathy by which they use their abilities, energy, and expertise and thought to realize organizational missions and create new thinking and qualitative values for organization. To this end, many organizations worldwide invest on knowledge management (Moosakhani et al, 2013). Overall, HR development includes:

- Scientific awareness and improving employees' knowledge;
- Scientific and balanced behaviors in employees;
- Improving employees' capabilities;
- Developing employees' skills;
- Updating employees' information;
- Improving the ability of resolving problems scientifically;
- Proper job performance;
- Logical decision making (Nilipour Tabatabaei & Soltani Dehkordi, 2014)

Organizations use different styles for managing their employees. HR management style is a pattern of decisions adopted and executed for human resources and includes HR supply (planning, finding employees, selection, career development, training and development), performance appraisal and payment (job analysis, performance evaluation, payment combination and structure) and job relations (creating and fostering relations between individual and organization, monitor and control, organizational identity) (Bamberger & Meshoulam, 2000). Employees' strategic capability is a concept on employees' abilities to design and execute strategies which generate sustainable competitive advantage for company. In strategic capabilities patters, two measures are respected:

- **Strategic value:** it is the ratio of strategic advantages from an individual's specialty created for customers to all costs endured by organization for that individual. It directly depends on competitive advantages or core competencies (Purcell & Ahlstrand, 1994).
- **Uniqueness:** Employees' strategic importance to generate such distinguishes are two highly competitive. Likewise, employees' uniqueness impacts directly on their capabilities to be considered as a competitive advantage source. Employees' uniqueness can be defined to some extent that their expertise is unreplaceable and cannot be mutated by potential and de fact rivals (Lepak & Snell, 1999)

Productivity is to maximize the utilization of resources, human force and initiatives scientifically in order to reduce costs and to satisfy employees, managers and customers. One of the important pillars of any entity/organization is its HR productivity and efficacy. HR productivity is the ratio of performed works by organization (goods production or service providing) within a given time to consumed human resources (total employees of the organization) based on hour/person, week/person or month/person (Azadeh et al, 2011).

There are different views on determining affecting factors on productivity. Affecting factors on productivity include:

- Continuous job training for employees and managers;
- Promoting the motivation of employees for better and more working;
- Paving the ground for employees/managers' initiative and creativity;
- Establishing proper performance based payment;
- Establishing reward/punishment system;
- Governance promotion;
- The domination of organization's policies on affairs (Pedram, 2011).

Despite of extraordinary importance of HR empowerment in organizations, due to different reasons such as ambiguity of organizational goals, lack of a proper definition to measure HR productivity and efficacy and some existing factors in market emanated from business environment non-competitiveness have caused that a certain mechanism is not defined to make HR qualitative and even this mechanism is not taken seriously (Abedini & Poursalehi, 2009). Since productivity improvement in organizations depends on HR efficacy and productivity, one should identify and prioritize affecting factors in HR efficacy and productivity in organizations. Therefore, the main problem in this research is to identify and prioritize affecting factors in HR efficacy in Tabriz Maskan Bank employees.

### 2 Research necessity and importance

Due to its thinking power, creativity and innovation, human resource is seen as the greatest property of any organization because that any improvement in organizational and technical systems is done by human resources. Thinking power of

employees in organization is seen as a hidden capital. Any organization and management which can use this hidden capital most would make it possible for growth and development. On the same basis, finding ways to improve efficiency and utilizing employees' maximum abilities to realize the goals of individual, organization and society have always been the concerns of managers and management science connoisseurs so that in recent years, "empowerment" is used a part of daily management language (Abtin et al, 2011).

Attempts to use different sources such as HR, capital, materials, energy and information effectively and efficiently should be the goal of all managers in economic, industrial and service organizations. The existence of proper organizational structure, efficient executive methods, healthy equipment and instruments, balances working environment and, more importantly, competent workforce are the requirements which should be considered by managers to achieve desired productivity.

Today, the value of many organizations especially service ones is highly depended to the knowledge and skills of their human force. Human force is prior to capital and independent from it since added value from existing capital depends on human force's knowledge and skill which uses this capital. Therefore, human resources are superior to capital and need more attention. On the other hand, one of the most important tasks of managers is to use all existing resources to achieve short and long term goals of the organization. Efficiency and effectiveness of management in any organization means managers' ability to prepare, develop, allocate, retain and utilize their resources and it requires correct information on organizational resources. As the most important resource of any organization, human force is not exclusion (Afiouni, 2007). Considering the important of human force in organizational productivity and its undeniable role in service organizations, it is too important to study affecting factors in human resource efficacy. Therefore, present study is highly important and necessary since it investigates such factors.

### 3 Literature review and research background

#### ▪ Efficacy

Any discussion on organizational goals makes it necessary to pay attention to efficacy concept. Efficacy is the ability to achieve predetermined goals (Aghabakhshi, 2000). Efficacy concept refers to personal beliefs and judgments on his/her capabilities in performing tasks and responsibilities in terms of famous psychologist, Albert Bandura's social recognition theory. Based on this theory, people impact on their motivation and behavior in a triple casualty system. Bandura refused unilateral impacts by environment on an individual's behavior which was an import hypothesis of behaviorism psychologists. Humans have self-refining and self-regulation power and by which, they monitor their opinions, feelings and behaviors and play a vital role in determining their fate (Bandura, 1997).

According to Bandura, knowledge, skills and past achievements are not proper predictors for individuals' future performance; rather, human belief on his abilities influences on his performance. There is an explicit difference between varied skills with the ability to combine them properly to perform tasks in different circumstances. People fully know to conduct which tasks and they need which skills but they are not often successful in executing such skills (ibid: 75). Conceived efficacy plays a vital role in self – motivation since efficacy belief impacts on selecting challenging goals, the amount of efforts in doing tasks, perseverance in encountering the problems and enduring the pressures (Locke & Lathan, 1990)

Usually, efficacy is used with efficiency. Efficacy is synonymous to efficiency and proximity to goal. Efficacy is the amount of achieving defined goals (Zahedi & Alvani, 2004). Effectiveness means to study the impact of conducted initiatives to achieve predetermined goals. In other word, effectiveness shows that to what extent conducted effort has lead into expected

results. How to use sources to achieve goals relates to efficiency (Deft, 1998).

Peter Drucker believes that effectiveness is to do right things (Robins, 2002). According to him, effectiveness is the key of organizational success. Executive institutes and organizations with any mission, goal and perspective are acting in a national or international territory and are required to answer customers, clients and stakeholders so that they are seen as accountable companies whose goals is profit and customer satisfaction or organizations whose aim is to implement determined tasks by carefully in order to help the achievement of national development goals. Therefore, performance appraisal and management quality and effectiveness as well as managers' performance in establishing performance management play a vital role in realizing the plans of agencies in macro level. Providing services and manufacturing the products with proper quality has created sufficient sensitivity to realize the goals. If performance is appraised by rightly and constantly in organizations, it would yield to efficiency and effectiveness of the organization and then it would improve promotion and accountability of executive organs. To measure the efficacy of a machine, usually its produced energy is compared to needed energy to run it (Husseini pourfard et al, 2012).

#### ▪ Human resource efficacy and its aspects

To learn an individual's efficacy, his/her performance should be measured and then the result should be compared with a proper measure. Computing human efficacy cannot be computed as ways as machines. Humans should be urged to work in similar conditions and their results should be compared. Someone who can work better than others in similar conditions is more efficient than others. Humans' efficacy depends on their talents, used tools, passed trains and their work conditions (Husseini pourfard et al, 2012). According to Bandura, efficacy has three levels:

a. Efficacy in individual level: efficacy concept in individual level has become very important in recent two recent decades. Bandura defines personal efficacy as an ability to organize and execute set of actions needed to achieve determined goals. More personal efficacy would increase the possibility of being involved and sustainability in behavior on tasks. Based on self – efficacy theory, those people who think they can perform their tasks better will act better than those ones who think they will fail (Gist & Mitchell, 1992).

b. Efficacy in collective level: social recognition theory has expanded human factor concept to collective factor. People's joint beliefs on their collective abilities to achieve desired goals are, *inter alia*, key collective factors. Group members would aggregate resources, capabilities and knowledge, create mutual backup and cooperate with each other to resolve problems and to improve the quality of their life. Collective efficacy includes social, interactive and synergic dynamics and is defined as a special trait of collective group. One cannot consider it as the algebraic aggregation of personal efficacies (Fernandez et al, 2002). Collective efficacy is a function of collective behavior and influences over their behaviors, namely, if members of group observe that their peers show (or do not show) collective behaviors, collective efficacy will be increased (decreased). Such evaluation on other people's abilities is a predictor of collective efficacy (Tasa et al, 2007).

c. Efficacy in organizational level: as the main pillar of organizational development, human plays a vital role in organizational framework. Today, organizational growth and development depends on using human resources rightly (Alhuseini, 2000). An organizational efficacy plan is a long term, planned and sustainable effort based on a comprehensive strategy and attempts to transform the organization by logical and regular recognition of difficulties and mobilizing all existing forces and resources (Toosi, 2011).

▪ Lotfollahzadeh and Assadi Sarjalu (2014) studied affecting factors on HR empowerment in organizations. In this paper, empowerment concept is defined and then the impact of organizational variables such as organizational conditions, self-

efficacy and self-management strategies on empowerment is studied. The results show direct impact of organizational conditions, self-efficacy and self-management strategies on employees, empowerment.

- Ebrahimzadeh et al (2010) found that affecting factors on human force's performance among the employees of Payam Noor University in Golestan Province include: personal motivation (69.4) has the highest impact on performance improvement followed by job enrichment (69.1), designations (68.9), job training (64.4), contributive management style (54.5) and job attitude (48.3).

- Employees' efficacy was measured by psychological theories by Arayi and Sfidani in 2014. The sim of their research was to measure employees' efficacy, to provide guidelines and the policies to promote it. Research findings indicate that such variables as job motivation, job satisfaction, organizational justice and management style have significant impact on employees' efficacy. Among these variables, employees' job satisfaction has the highest impact on employees' efficacy.

- In their study, Hendyani et al (2014) investigated the relationship between organizational trust and employees' efficacy of Police stations. Their findings indicate that there is a significant link between the aspects of organizational trust and employees' efficacy in police stations. Therefore, one can say that one can improve employees' effectiveness by creating and developing organizational trust aspects.

- In their research, Labaf and Shamiri (2000) studied affecting factors on HR effectiveness. The main goal of this research was to determine affecting factors on HR effectiveness and the impact and importance of al individual, occupational, organizational and environmental factors on HR effectiveness in the surveyed company. Overall, research findings indicate that the impact of these factors is not the same. The opinions by subjects indicate that organizational factors and individual factors have the highest impact on their effectiveness. Likewise, the findings indicate that occupational and environmental factors have the lowest impact.

- Aghayi (2014) studied the role of job behavioral aspects in efficiency and effectiveness of human force. In this research, the relationship between job stress variables, job satisfaction, job dependency and job turnover with employees' efficiency and effectiveness. Findings indicate that job stress, job satisfaction, job dependency and job turnover impact on HR efficiency and effectiveness.

- Labaf & Ranjbar (2002) studied the impact of contributive management style on employees' employees. The aim of this research was to study contributive management style and its impact of employees' effectiveness. In this research, the impact of contributive management on employees' effectiveness was analyzed based on the insights of 80 employees in an Iranian manufacturing company in 1999 for whom this style was utilized. The findings gathered in statistical analyses show that contributive management style has remarkable impact on employees' effectiveness.

- Khoshbakhti (2004) studied the relationship between leadership styles and work-life quality with managers' effectiveness in physical education schools and training groups at domestic governmental universities. Their findings indicated that there is a significant difference between managers' selected leadership styles and their effectiveness while there is significant relationship between leadership styles and work – life quality and managers' effectiveness. Likewise, Mascall et al (2002) introduced leadership style and Azadmarz Abadani and Tarkhurani (2007) as affecting factors on employees' efficacy.

#### 4 Proposed hypothesis

This is a descriptive survey-type study which identifies and prioritizes affecting factors on employees' efficacy in Tabriz Maskan Bank. Research population consists of all managers and employees of Mskan Bank branches in Tabriz (n=300) of whom 174 were selected as research sample by Cochran formulation randomly. Questionnaire was used to gather data. Of 86 items, 11 items relate to employees' strategic capabilities, 16 items in management styles, 18 items on change strategy and 9 strategies on organizational process and 16 items on improvement and effectiveness strategy. HR efficacy questionnaire is devised by Bandura's introduced factors.

The main hypothesis according to the previous studies in thr background are as: the human capital has significant influence on Absorption of resources in Maskan bank, Marketing has significant impact on absorption of resources in Maskan bank, and the services have significant impact on Absorption of resources in Maskan bank. So, in present study, the opinions of management group instructors are used to determine the facial and content validity of the questionnaire so that they can state appropriateness of questionnaire items based on definitions and identified affecting factors on employees' efficacy. The findings indicated that questionnaire enjoys needed validity. Its reliability was computed by SPSS software package in which Cronbach's alpha was 0.94 after deleting two questions. It indicates high reliability of the questionnaire. To analyze data, descriptive (frequency) and deductive statistics (Pearson correlation coefficient and multiple regressions) were used in SPSS software package.

#### 5 Findings

Present research aims at identifying and prioritizing affecting factors on employees' efficacy of Tabriz Maskan Bank. Therefore, we review research hypotheses by gathering the information from a 174 – subject sample. The results form data analyses for each hypothesis are provided as below:

##### 5.1 Sample demographical analysis

Sample demographical status is shown in table 1 as frequency.

Table 1: sample demographical situation

Education		Job record in Bank		Age range		Gender	
13.8	Diploma	2.3	5 years and lesss	6%	25 years and less	88.5	Male
59.8	Undergraduate	28.2	6 – 10	8%	26 – 30	11.5	Female
25.9	Graduate	53.4	11 – 20	37.5%	31 – 35		
6%	Postgraduate	16.1	21 years and more	6%	36 – 40		
				44.6%	41-45		
				6.3%	46 years and more		

As seen in table 1, most responding employees had 41 – 45 year-old and people with 11 – 20 years of job records allocated most rate of respondents. Most respondents had bachelors while most of them were men,

##### 5.2 Inductive results

Here, research hypotheses are tested by inductive statistics. Initially, questionnaire's sub-constructs normality is tested by Kolmogorov – Smirnov test. According to results, since achieved

significance is more than 5% for research variables and Kolmogorov – Smirnov test is between +1.96 and -1.96%, one can accept the assumption on population distribution normality. Parametric tests are used to review hypotheses.

Pearson correlation coefficient is used to review the correlation of independent and dependent variables of efficacy while a regression model is used to predict changes in employees' efficacy variables. In present study, the correlation between main independent variables (employees' strategic capabilities,

management style, change strategy, organizational process improvement strategy and effectiveness improvement strategy) and dependent variable of employees' efficacy are all supported. Likewise, the correlation between all minor independent variables except than return style is supported for employees' efficacy.

Hypothesis 1: employees' strategic capabilities impact on employees' efficacy of Tabriz Maskan Bank.

Hypothesis 2: Management styles impact on employees' efficacy of Tabriz Maskan Bank.

Hypothesis 3: Organizational change strategies impact on employees' efficacy of Tabriz Maskan Bank.

Hypothesis 5: organizational processes development strategies impact on employees' efficacy of Tabriz Maskan Bank.

Hypothesis 2: Organizational effectiveness improvement strategies impact on employees' efficacy of Tabriz Maskan Bank.

In table 2, correlation coefficients (R) is 0.697 among variables which indicates that there is a good correlation between main independent variables and dependent variable (employees' efficacy) while mitigated ratio (0.471) shows that 47/1% of efficacy changes among Maskan Bank employees in Tabriz depends on main identified variables in this research. In other words, main independent variables estimate mostly half of employees' efficacy.

Table 2: main multivariate regression statistics for employees' efficacy

Standard error	standard R <sup>2</sup>	R <sup>2</sup>	R	Step
4.93931	0.471	0.486	0.697	1

Table 3 shows the results on the impact of each variable in model. To describe regression ratios, Beta is used. Therefore,

relative share of each independent variable is determined in model. Comparing main variables indicate that:

Table 3: the ratios of inserted in multivariate regression equation for employees' efficacy

Sig	T	Standardized ratios	Not standardized ratios		Main variables
		Beta	Standard error	B	
0.000	5.391		3.897	21.008	Fixed
0.002	3.321	0.213	0.094	0.300	Employees' strategic capabilities
0.100	-1.654	-0.137	0.086	-0.143	Management styles
0.000	4.293	0.351	0.064	0.276	Change strategy
0.338	0.91	-0.110	0.119	-0.115	Organizational process improvement strategy
0.000	4.160	0.497	0.091	0.380	Organizational effectiveness improvement strategy

Three main variables including employees' strategic capabilities, change strategy and organizational effectiveness improvement strategy have significant impact on employees' efficacy dependent variable. However, management styles and organizational process improvement strategy variables are not significant since their significance ratio is greater than 0.05. In other words, these two variables have not impact on employees' efficacy. Organizational effectiveness improvement strategy with regression ratio of 0.479, change strategy with ratio of 0.351 and employees' strategic capabilities with ratio of 0.213 has the highest regression impact on employees' efficacy. In fact, one can say that by one standard deviation increase in "organizational effectiveness improvement strategy", employees' efficacy increases 0.479, one standard deviation increase in "change strategy", employees' efficacy increases 0.351 and one standard deviation increase in "employees' strategic capabilities", employees' efficacy increases 0.213.

Sub-hypothesis 1: employees' strategic value impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 2: employees' uniqueness impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 3: using commitment style impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 4: using contribution style impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 5: using return style impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 6: using obedience style impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 7: organizational culture impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 8: organizational structure impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 9: intra-organizational environment impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 10: personal development impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 11: organizational development impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 12: social process impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 13: quality promotion strategy impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 14: cost management strategy impacts on HR efficacy in Tabriz Maskan Bank.

Sub-hypothesis 15: persuasion and innovation strategy impacts

on HR efficacy in Tabriz Maskan Bank.

In table 4, correlation coefficients (R) is 0.759 among variables which indicates that there is a very strong correlation between minor independent variables and dependent variable (employees' efficacy) while mitigated ratio (0.539) shows that 53/9% of efficacy changes among Maskan Bank employees in Tabriz depends on minor identified variables in this research. In other words, minor independent variables estimate more than half of employees' efficacy.

Table 4: minor multivariate regression statistics for employees' efficacy

Standard error	standard R <sup>2</sup>	R <sup>2</sup>	R	Step
4.60899	0.539	0.577	0.759	1

Table 5 shows that four variables including employees' strategic value, organizational culture, quality promotion strategy and organizational development have significant impact on

employees' efficacy while other minor independent variables are not significant since their significance ratio is not greater than 0.05. In other words, it has no impact on employees' efficacy.

Table 5: the ratios of inserted in multivariate regression equation for employees' efficacy

Sig B	T	Standardized ratios	Not standardized ratios		Main variables
		Beta	Standard error	B	
0.000	4.058		4.081	16.561	Fixed
0.001	3.252	0.204	0.157	0.510	Employees' strategic value
0.582	0.552	0.037	0.142	0.079	Uniqueness
0.574	-0.563	-0.042	0.199	0.112	Commitment style
0.816	-0.234	-0.015	0.197	-0.46	Obedience style
0.726	0.351	0.028	0.229	0.081	Contributive style
0.000	5.823	0.397	0.146	0.852	Organizational culture
0.645	0.461	0.039	0.167	0.077	Organizational structure
0.857	0.180	0.013	0.113	0.020	Intra-organizational environment
0.596	-0.531	-0.049	0.217	-0.115	Personal development
0.086	1.725	0.194	0.302	0.521	Social process
0.030	-2.193	-0.218	0.375	-0.823	Organizational development
0.696	0.391	0.036	0.164	0.064	Persuasion and innovation strategy
0.001	3.526	0.339	0.155	0.546	Quality promotion
0.526	0.636	0.042	0.204	0.130	Cost management

Organizational culture with regression ratio of 0.397, quality promotion with ratio of 0.339 and organizational development with ratio of -0.218 (reverse relation) and employees' strategic value with ratio of 0.204 have the highest regression impact on employees' efficacy depended variable. In fact, one can say that one standard deviation increase in "organizational culture", employees' efficacy increases 0.397, one standard deviation increase in "quality promotion strategy", employees' efficacy increases 0.339, one standard deviation increase in "employees' strategic value", employees' efficacy increases 0.204 and one standard deviation increase in "organizational development", employees' efficacy increases 0.218.

To compare and rank identified affecting factors on employees' efficacy, Freedman test is used. According to table 6, Freedman test significance ratio was less than 0.05 in surveyed sample therefore, the priority of average impacts was not the same for three main indicators (employees' strategic capabilities, change strategy management and organizational effectiveness improvement strategy) and they have significant differences. Hence, Wilcoxon test is used to determine the impact of each main indicator in surveyed sample.

Table 6: Freedman test to rate the impact of main variables on employees' efficacy

(Sig)	Used sample quantity for sampling	Average	Main indicators
0.000	174	1.06	Employees' strategic capabilities
	174	2.95	Change strategy management
	174	1.99	Organizational effectiveness improvement strategy

Findings from Wilcoxon test indicate that the ranks of impacts by the employees' strategic capabilities, change strategy management and organizational effectiveness improvement strategy on efficacy among employees of Tabriz Maskan bank include respectively: (1) change strategy management; (2) organizational effectiveness improvement strategy; and (3) employees' strategic capabilities.

According to table 7, significance ratio of Freedman test in surveyed sample is less than 0.05. Therefore, the priority of impacts for three minor indicators (employees' strategic value, organizational culture, organizational development, quality promotion) is not the same and they have significant difference. Hence, Wilcoxon test is used to determine the rate of impact by each main indicator in surveyed sample.

Table 7: Freedman test to rate the impact of minor variables on employees' efficacy

(Sig)	Used sample quantity for sampling	Average	Main indicators
0.000	174	2.61	Employees' strategic value
	174	3.61	Organizational culture
	174	1.00	Organizational development
	174	2.78	Quality promotion

Wilcoxon test results indicate that the rates of impacts by employees' strategic value, organizational culture development and quality promotion on efficacy of employees at Tabriz Maskan Bank include: (1) organizational culture; (2) employees' strategic value; and (3) quality promotion.

## 6. Conclusion

Considering the limitation of resources and unlimited human needs, population explosion and hyper and brutal competition in global economy, productivity improvement is not only a choice but also a necessity. Undoubtedly, today economic growth and development of different societies is rooted in the rate of their productivity growth. Attempt to increase productivity rate is an attempt for better life and welfare. In today competitive world, those companies are successful which can generate productivity knowledge, vision and behavior in their managers and employees (Mirzaei, 2012). Thus, culture spirit should be inspired in organization to improve productivity in which human force is the core nexus. One of the most important goals of any organization is to promote its productivity level. Since human plays a vital role in productivity generation, his/her demands would have key impacts on organization. In fact, employees' contribution in affairs and their smart and aware efforts along with job discipline can influence on productivity in a dynamic environment. Therefore, one should particularly respect human force in organizations (Ostadzadeh, 2008). The aim of present

research is to identify and prioritize affecting factors on employees' efficacy in Tabriz Maskan Bank; therefore, research findings indicate that there is a relationship between employees' strategic capabilities, organizational change strategies and organizational effectiveness improvement strategies with employees' efficacy. In other word, these three factors influence on employees' efficacy while there is no significant relationship between leadership styles and organizational process strategies with employees' efficacy. These results are consistent with findings of Mascall et al., (2002) and Arayi and Sfidani (2014) that introduced management styles as one of the affecting factors on employees' efficacy.

Research findings for sub-hypotheses show that there is a significant relationship between employees' strategic value, organizational culture, organizational development and quality promotion strategy with employees' efficacy. The results of hypothesis on organizational development and organizational culture are consistent with the findings by Labaf and Shamiri (2000) and the results of hypothesis on quality promotion strategy with the findings by Khoshbakhti (2004). Likewise, research findings indicate that there is no significant relationship between uniqueness, commitment style, return style, contributive style, obedience style, organizational structure, intra-organizational environment, personal development, social process, persuasion and innovation strategy and cost management with employees' efficacy; it means that by one deviation in each variable, employees' efficacy in Tabriz Maskan Bank is not changing; in other word, these variables have no impact on employees' efficacy in surveyed sample. In present study, hypothesis on the relationship between structure and efficacy was not supported which is not consistent with the results by Labaf and Shamiri (2000) which introduced organizational structure as one the affecting factors on employees' efficacy. The results on refusing the hypothesis on the relationship between intra-organizational environment and employees' efficacy are not consistent with results by Azadmarz Abadani and Tarkhurani (2007) who confirmed the relationship between workplace and employees' effectiveness. Likewise, the lack of relationship between contributive management and employees' effectiveness is not consistent with results by Labaf and Shamiri (2000) that supported the relationship between contributive management style and employees' effectiveness. Not supporting persuasion and innovation strategy hypothesis is not consistent with the research by Hashemi et al (2012). Hashemi et al introduced the generation of thinking and innovation in organization as an affecting factor on human force effectiveness.

## 6.1 Recommendations

- Improving employees' work life quality in Maskan Bank due to high importance of this factor in employees' efficacy;
- Building proper organizational values to impact more on employees;
- Recognizing desired culture and creating proper cultural grounds to develop different aspects of organizational culture among Maskan Bank employees;
- Changing the culture in service organization like a secure environment for efficient individuals and promoting employees;
- Utilizing and increasing organizational structures including organizational effectiveness improvement and organizational change strategy;
- Bank employees' categorization based on strategic capabilities and periodical and continuous inspection of this categorization based on company's strategies;
- Assigning non-key and side jobs and tasks to those employees whose skills are not seen as strategic capabilities for company and preventing the assignment of key and strategic tasks to such employees;
- Utilizing modern technologies and creating conditions to train employees;
- Creating facilities and opportunities for employees' growth and improvement;
- Increasing the dignity of employees to improve their work quality and, finally, to promote employees' efficacy

**Abstract.** For a sample of 43 countries in the period of 1999-2014, we investigate the effect of de facto exchange rate regimes on exchange rate misalignment. To this end, a panel smooth transition model is used. In contrast to recent studies, our finding indicates that non-floating exchange rate regimes lead to a reduction in the misalignment level and its volatility. However, the result is sensitive to the lagged of misalignment. Moreover, our visual inspection demonstrates a relationship between a higher misalignment and the subsequent crisis. Hence, the extent of misalignment in relation to fundamentals could be a leading indicator to anticipate a crisis.

**Keywords:** Exchange rate regimes, Real exchange rate misalignment, Fully Modified Ordinary Least Squares, Panel Smooth Transition Model

### 1 Introduction

The economic implications of exchange rate arrangements are always a debate among economist. Especially, the effect of exchange rate regimes on exchange rate misalignment and its volatility has been a subject of considerable interest.

Although a currency's value in the floating regime is determined by the foreign exchange market, in a fixed exchange rate system, a country's government decides about the worth of its currency. Regarding literature, fixed regimes are considered more stable. Floating exchange rate regimes, on the other hand, show a greater degree of uncertainty and volatility.

There is some theoretical and empirical evidence that exchange rate misalignment is lower in fixed exchange rate regimes than in flexible ones. To put it another way, sometimes it is argued that fixed exchange rate regimes help to reduce exchange rate misalignment and its volatility. However, opposite evidence has been provided by more recent studies (David M. Kemme and Saktinil Roy (2005), Virgine Couderc and Cecile Couhard (2008), Oliver Holtemöller and Sushanta Mallick (2008, 2013), Rodrigo Caputo and Igal Magendzo (2009) and Rodrigo Caputo (2015)), i.e. high misalignment is more strongly associated with fixed regimes than floating ones. Moreover, as to literature, numerous factors may set the stage for a nonlinear adjustment mechanism in the response of misalignment to economic factors (particularly, exchange rate regimes).

The objective of this paper is to contribute to the literature by investigating the impact of defacto exchange rate regime on both the misalignment level and its volatility. Moreover, in order to account for nonlinearities in the linkage between exchange rate misalignments and economic determinants, we use a panel smooth transition model.

The results indicate that the introduction of fixed exchange rate regime helps to reduce the misalignment level and volatility only when the latter are already low. The difference between our results and recent studies may then stem from different methodology and sample to investigate the mechanism. In essence, by using Panel Smooth Transition Model (PSTR), it is possible to assess the dependence of misalignment fluctuations on exchange rate regimes.

The remainder of the paper is organized as follows. After the Introduction, model and methodology are discussed in Section II. Data and the results of the study are elaborated in Section III. The conclusion and proposed suggestion are presented in the last Section.

### 2 Model and Methodology

Following Holtmoller and Mallick (2013), we employ a panel version of a fundamental equilibrium exchange Rate or FEER model to obtain the long-run equilibrium REER for each country and then residuals from these regressions use to measure the extent of misalignment.

According to Holtmoller and Malick' (2013) statements in their paper, a simple model which supports our selection of variables to be included in the long-run real exchange rate equation is outlined as follows.

The current account (CA) as the difference between exports (volume X at price  $P_x$ , in national currency) and imports (volume M at price  $P_m$ ) is defined. Meaning that:

$$CA = P_x \cdot X - P_m \cdot M \quad (1)$$

Since other components of the current account are supposed to be exogenous with respect to the real exchange rate, the primary current account balance is considered in this paper. Moreover, when the exchange rate is in its long-run equilibrium position, the net capital flows might be zero. Hence, the interest income component is ignored.

FEER implies a flow-equilibrium. The REER is defined as the ratio of domestic prices and world prices ( $P^*$ ), measuring the price of home country goods (P) in terms of foreign goods. World prices are trade-weighted US-Dollar price averages and have to be converted to domestic currency using the nominal exchange rate (e), which is defined as the home currency price of currency i.

$$REER = \prod_{i=1}^n \left( \frac{P}{e_i P_i^*} \right)^{w_i} \times 100 \quad \sum w_i = 1 \quad (2)$$

The exponential weights for each currency i are the  $w_i$  terms, representing effective trade weights and sum to unity.

The price equations are defined as functions of the real exchange rate. While import prices only rely on world prices, export prices can be defined as a weighted geometric average of world price ( $P^*$ ) and domestic price (P),

$$P_x = (e P^*)^{-\alpha} \cdot P^{1+\alpha} = REER^\alpha P \quad (3)$$

$$P_m = \left( \frac{e P^*}{P} \right)^{-\beta} = REER^\beta \quad (4)$$

whereas real imports depend on domestic demand, Y, Real exports can be explained by world demand,  $Y_f$ . Both exports and imports volume depend on the REER as follow:

$$X = REER^\tau (Y_f)^\varphi TP^\omega TT^\rho, \text{ where } \tau < 0 \quad (5)$$

$$M = REER^\delta Y^\theta TP^\psi TT^\theta, \text{ where } \delta > 0 \quad (6)$$

where TP is trade policy and TT is terms of trade. The impact of terms of trade on the trade balance (CA) is considered, because if the exchange rate regime is non-floating, it cannot neutralize the impact of TT shocks on trade, if not it would offset any TT

shock. Owing to a negative income effect, negative terms of trade shock can worsen the trade balance, so it is important to control for such variations. According to Holtmoller and Mallick (2013), many emerging market economies grew significantly faster than industrial countries in recent years. Therefore, the national level for import demand (Y) and the world level for export demand ( $Y_i$ ) are important for the explanation of long-term REER development.

Now for internal equilibrium, a simple domestic price formation equation is included and defined as a function of the ratio of output to its potential level  $Y/\bar{Y}$ . The internal equilibrium is determined as follows:

$$P = \left(\frac{Y}{\bar{Y}}\right)^{\kappa} \quad (7)$$

Upon substitution of Eq. (3-7) in Eq. (1) and under the assumption of a zero normal current account balance, a reduced-form relationship for the long-run equilibrium real exchange rate ( $\overline{REER}$ ) is derived as follows:

$$\overline{REER} = \left( \frac{Y^{\theta} T^{\psi} \bar{Y}^{-\omega} T^{\theta - \rho}}{\left(\frac{Y}{\bar{Y}}\right)^{\kappa} Y_f^{\varphi}} \right)^{\frac{1}{\alpha + \tau - \beta - \delta}} \quad (8)$$

A very simple model with a relatively small set of fundamental variables is given, which can be monitored over time. The variables included here are similar to the behavioral models in this literature. For a non-zero constant level of current account,  $CA = \bar{CA}$  (external equilibrium), an analytical solution for REER does not exist. All the same, the equilibrium REER can be computed numerically for any given level of CA. Under the usual assumptions on export and import elasticities, a negative relationship between the REER and the current account is obtained to achieve a higher current account, the REER has to depreciate making exports more attractive for foreigners and imports less attractive for the domestic population.

All in all, for our purpose, the following model relates the REER to a set of fundamental variables:

$$REER = f(TOT, OPEN, DGDP, WGDP, PCA, YGAP) \quad (9)$$

Where REER, TOT, OPEN, DGDP, WGDP, PCA, and YGAP are log real effective exchange rate, log terms of trade, log degree of openness, log domestic GDP, log world GDP, Primary current account balance as percent of GDP and output gap (HP-filtered GDP), respectively. As to the literature, other variables have been included in equilibrium exchange rate regressions. However, only we relay the variables which they are necessary to achieve stationary residuals.

A wide range of modern econometric techniques is used to study the existence of a long-run relationship among variables. The Fully Modified Ordinary Least Squares or FMOLS approach is applied to investigate the relationship between REER and its long-run determinants. Reliable estimates for small sample size are produced by the FMOLS method. Besides, the mentioned method provides a check for robustness of the results. FMOLS method was introduced for estimating a single co-integrating relationship that has a combination of I(1). FMOLS method utilizes Kernel estimators of the nuisance parameters that affect the asymptotic distribution of the OLS estimator. In order to achieve asymptotic efficiency, this technique modifies least squares to account for serial correlation effects and controls the endogeneity. (Rukhsana Kalim and Mohammad Shahbaz (2008)).

The FMOLS estimator for the i-th panel member is given by,

$$\beta_i^* = (\hat{X}_i' X_i)^{-1} (\hat{X}_i' y_i^* - T\delta) \quad (10)$$

Where  $y_i^*$  is the transformed endogenous variable,  $\delta$  is a parameter for autocorrelation adjustment, and T is the number of time periods.

In addition, there is also the possibility of nonlinear adjustment, for instance, in Taylor et. al., (2001) point of views the REER adjusts in a nonlinear fashion, in the sense that the speed of adjustment varies with the extent of the deviation from parity. Moreover, there is the possibility of an asymmetric type of adjustment, in which the speed of adjustment varies depending on whether the exchange rate is above /below its equilibrium level. Thanks to different benefits and costs of having an undervalued or overvalued exchange rate, some countries would like to live with an undervalued exchange rate in order to foster exports, while others may prefer an overvalued rate to avoid inflationary pressures. This type of nonlinearity in our empirical model is considered.

The nonlinear analyses let us investigate the slowness of the adjustment process towards the long-run equilibrium. Numerous factors explain a nonlinear dynamics. All these factors imply, either a nonlinear adjustment mechanism with time-dependence properties, or a nonlinear relationship between the economic fundamentals and the exchange rates. Hence, the Panel Smooth Transition Model (PSTR) is used for testing the nonlinearity link between misalignment and some economic factors.

Bruce E. Hansen (1999) developed a regression- dependent the panel threshold regression (PTR) model. If  $\{MIS_{it}, S_{it}, x_{it}; t = 1, \dots, T, i = 1, \dots, N\}$  is considered as a balanced panel then t denoting time, i the individual,  $MIS_{it}$  the exchange rate misalignment or the dependent variable,  $S_{it}$  the threshold variable and  $x_{it}$  a vector of k exogenous variables. Therefore, the PTR model can be written as follows:

$$MIS_{it} = \begin{cases} \mu_i + \beta_1 x_{it} + \varepsilon_{it} & S_{it} \leq c \\ \mu_i + \beta_2 x_{it} + \varepsilon_{it} & S_{it} > c \end{cases} \quad (11)$$

In the model, the observations in the panel are divided into two regimes, depending on whether the threshold variable is lower or larger than the threshold c. The error term  $\varepsilon_{it}$  is independent and identically distributed. Regarding the time series context, the transition from one regime to another is abrupt and the model implicitly assumes that the two groups of observations are clearly identified and distinguished, which is not always feasible in practice.

Anders Gonzalez, Timo Terasvirta, and Dick van Dijk (2005) introduced a panel smooth transition regression (PSTR) model, by considering the case of two regimes, the PSTR model is given by:

$$MIS_{it} = \mu_i + \beta_0 x_{it} + \beta_1 x_{it} g(s_{it}; \gamma, c) + \varepsilon_{it} \quad (12)$$

where  $g(s_{it}; \gamma, c)$  is the transition function, normalized and bounded between 0 and 1,  $S_{it}$  the threshold variable which may be an exogenous variable or a combination of the lagged endogenous one,  $\gamma$  the speed of transition and c the threshold parameter. In a panel framework, the logistic specification can be used for the transition function:

$$g(s_{it}; \gamma, c) = [1 + \exp(-\gamma \prod_{j=1}^m (s_{it} - c_j))]^{-1} \quad (13)$$

with  $\gamma > 0$  and  $c_1 \leq c_2 \leq \dots \leq c_m$ . When  $m=1$  and  $\gamma \rightarrow \infty$ , the PSTR model reduces to a PTR model. As to Gonzalez et al. (2005), it is sufficient to consider only the cases

of  $m = 1$  or  $m = 2$  to capture the nonlinearities due to regime switching.

It should be noticed that the coefficients of the explanatory variables in Equation (12) are given by:  $c_x = \beta_x + \beta_x^* g(s_{it}; \gamma, c)$  with  $x=1, \dots, 4$ . When  $g(s_{it}; \gamma, c) = 0$ , then  $c_x = \beta_x$  and the estimated coefficients correspond to those of Regime 1. At the other extreme, i.e. when  $g(s_{it}; \gamma, c) = 1$ , then  $c_x = \beta_x + \beta_x^*$ . Between those two points,  $c_x$  takes a continuum of values depending on the realization of the nonlinear transition function  $g(s_{it}; \gamma, c)$ .

Moreover, Gonzalez, Trasvirta, and van Dijk (2005) suggested there is a three step strategy to apply PSTR models: (1) specification, (2) estimation and (3) evaluation and choice of the number of regimes. The aim of the identification step is to test for homogeneity against the PSTR alternative. Turning to the estimation step, nonlinear least squares are used to obtain the parameter estimates, once the data have been demeaned. Also, the evaluation step consists in (i) applying misspecification tests in order to check the validity of the estimated PSTR model and (ii) determining the number of regimes. To this end, González, Trasvirta, and van Dijk (2005) suggest a sequential procedure starting by estimating a linear model, then a PSTR model if the homogeneity hypothesis is rejected, a PSTR model with 3 regimes is no remaining heterogeneity hypothesis is rejected in PSTR 2 regimes model, and so on.

### 3 Results

Firstly, the long-run equilibrium relationship between the REER and its fundamental determinants for 43 countries is estimated. The countries in the sample are listed in the appendix. About the country selection, we rely on the availability of data for all the variables mentioned. The frequency is annual, from 1999 to 2014. Consequently, we implement a panel version of FMOLS approach. The countries included in our sample have experienced alternative exchange rate regimes. While over the time most eastern European countries moved from peg regime to a flexible one in 2007, other countries, usually middle east ones such Iran, Pakistan have done the opposite and experienced different changes in their exchange rate regimes during the period of investigation.

Based on the framework outlined in the previous section, the extent of REER misalignment from an equilibrium is calculated. The selected variables reflect broadly the most important determinants of real exchange rates though certainly not all of them. A similar approach is taken by Holtmoller and Mallick (2013). Even so, on account of the stationary problem, they didn't use the primary current account in the right-hand-side variables. Besides, following Holtmoller and Mallick (2013), we are not interested in the average size and sign of a particular coefficient here. Also, deviations of the REER from its long-run equilibrium are interpreted as a measure of REER misalignment.

Unit root tests results<sup>1</sup> for all variables except for YGAP, are similar and exhibits non-stationarity. The mentioned tests confirmed stationary of YGAP variable in its level. To obtain the extent of exchange rate misalignment, the following equation is estimated by FMOLS:

$$REER_{it} = \theta_{1i} TOT_{it} + \theta_{2i} OPEN_{it} + \theta_{3i} DGDP_{it} + \theta_{4i} WGDP_{it} + \theta_{5i} PCA_{it} + \varepsilon_{it} \quad (14)$$

Where REER, TOT, OPEN, DGDP, WGDP, and PCA are logarithms of the real effective exchange rate, terms of trade, the degree of openness, domestic GDP, world GDP and Primary current account balance as percent of GDP, respectively. In

addition,  $i=1, 2, \dots, N$  denotes countries and  $t=1, 2, \dots, T$  time periods. All variables are measured in logarithms.  $\theta_{it}$ s are country-specific coefficients. The results are presented in Table (1). For testing the cointegration, Pedroni and Kao's panel cointegration tests are used. With reference to the mentioned tests, the null hypothesis of existence of the long run relationship could not be rejected. The results are presented in Table (2). As the deviations of the REER from its long-run equilibrium are interpreted as a measure of REER misalignment, then residuals from the equation (14) represents the extent of the misalignment.

Table (1): Panel cointegration regressions (1999-2014) with FMOLS.

Variable	Coefficient	t-Statistic
OPEN	-0.290	-17.627
TOT	0.064	2.384
DGDP	-0.303	-5.216
WGDP	-0.049	-0.851
PCA	373000000	4.106

Notes: Here the dependent variable is the logarithm of REER and other variables are measured in logarithms too.

Table (2): Panel cointegration tests.

Test	Statistic	Prob
Pedroni group rho-Statistic	8.497	1.000
Pedroni group PP-Statistic	-8.536	0.000
Pedroni group ADF Statistic	-1.289	0.098
Kao test	-6.897	0.000

Notes: The null hypothesis is that estimated residuals from the long-run equation indicate a unit root. If the null hypothesis is rejected, we have a cointegration relationship.

In the next step, the level of REER misalignment is explained according to the theoretical framework. As to the literature, if adjustment of domestic prices relative to nominal variables shocks is slowly, REER dynamics could be affected by non-fundamental variables in the short-run, including the currency regime in place. Moreover, many factors imply the possibility of nonlinear convergence process of the real exchange rate towards its long run equilibrium value or moving misalignment to its long-run equilibrium value. Furthermore, by using the former notations for the PSTR model in the previous section, the model can be specified as follows:

$$\begin{aligned} Mis_{it} = & \mu_{it} + \beta_1 Mis_{it-1} + \beta_2 YGAP_{it} + \beta_3 DH_{it} \\ & + \beta_4 LREER_{it} \\ & + [\beta_1^* Mis_{it-1} + \beta_2^* YGAP_{it} \\ & + \beta_3^* DF_{it} + \beta_4^* LREER_{it}] g(s_{it}; \gamma, c) \\ & + \vartheta_{it} \end{aligned} \quad (15)$$

where, DH is a dummy variable that takes value 1 if the country has fixed and managed exchange rate regimes and 0 otherwise. Besides,  $s_{it} \in S = \{Mis_{t-1}, LREER_{t-1}, DLREER_{t-1}\}$ .

By selecting the set S for  $s_{it}$ , we assume that what determines the adjustment speed of the real exchange rate misalignment towards its long run equilibrium may be either the fact that the currency appreciates or depreciates (through the sign of  $DLREER_{t-1}$ ), the size of the past currency misalignment ( $Mis_{t-1}$ ), or the precious magnitude of the REER.

The linearity in the mentioned model is tested by using the González, Trasvirta, and van Dijk (2005) test with different possible transition variables. First, we use the lagged estimated cointegrating vector as the appropriate threshold variable. The linearity test and results show in Table (3) and Table (4), respectively. The results show that when the past misalignment is used as the threshold variable, linearity is strongly rejected for our sample. Besides, the smallest p-value is obtained by using the past misalignment as the transition variable. Also, the main

<sup>1</sup> Unit root tests are not reported in order to save space, but they are available upon request.

parameters of interest are the coefficients in two extreme regimes  $\beta$  and  $\beta + \beta^*$ , the threshold parameter ( $c=283500000$ ) and the speed of transition ( $\gamma = 0.20$ ). The estimated speed of transition indicates a very smooth movement between two of linear and nonlinear parts.

According to the estimation, the coefficients of the output gap and the lagged REER change respectively from -0.85 to -6.68 and from 0.18 to -0.36 according to the model. Hence, by comparing the coefficients of the output gap and the lagged REER in the linear and nonlinear parts, our findings indicate that the output gap and the past level of REER have a significant effect on the misalignment in both parts, but their impact are stronger in the nonlinear model.

More importantly, despite a significant and negative influence of fixed exchange rate in the linear part (-0.028), once the misalignment crosses the threshold, the significant effect of it is not confirmed.

Table (3): Linearity Test and Tests of no remaining Non-Linearity

<b>H0: Linear Model</b>		
<b>H1: PSTR model with at least one Threshold Variable (r=1)</b>		
Test	Statistics	pvalue
Wald (LM)	W = 45.238	0.000

<b>H0: PSTR with r = 1</b>		
<b>H1: PSTR with at least r = 2</b>		
Wald (LM)	W = 4.418	0.352
Fisher (LMF)	F = 1.011	0.401
LRT Tests (LRT)	LRT = 4.434	0.350

Notes: according to the mentioned tests, not only linear model is rejected but also it is showed that nonlinear model with r=1 is the best model.

Table (4): PSTR result for the level of misalignment

<b>Linear Part</b>		
Variable	Estimated Parameters	T-statistics
Mis(-1)	0.001	18.751
YGAP	-0.852	-3.300
LREER(-1)	0.186	2.374
DH	-0.028	-2.602
<b>Nonlinear Part</b>		
Mis(-1)	-0.001	-2.261
YGAP	-5.831	-4.535
LREER(-1)	0.179	2.371
DH	0.033	0.497
Gamma	0.200	
Threshold value	283500000	

Notes: the dependent variable is the estimated residuals of Eq. (14).

Furthermore, we investigate whether fixed exchange rate regimes help to reduce exchange rate volatility. As a consequence, the squared misalignment, which is a proxy for the volatility of the misalignment, is regressed on the exchange rate regime dummies. (Tables (5), (6)). As to the results, the fixed exchange rate not only has a significant but also a negative relationship with the volatility of misalignment in both linear and nonlinear regimes. However, its effect declines in the nonlinear part, i.e. its coefficient is -1.53 in linear part and -0.20 in the nonlinear one.

Threshold value	283500000	

Notes: the dependent variable is the squared of misalignment that is estimated residuals of Eq. (14).

However, there is limited focus on linking fundamentals based real exchange rate misalignment and currency crisis. Using the extent of misalignment in relation to fundamentals could be an indicator to anticipate a crisis. In Fig. 1. We have visual inspection about the relationship between misalignment and the subsequent crisis.

Fig.1. Misalignment and currency crises graphs for selected countries.

Notes: Shaded bars, lines, and the upper and lower axes indicate misalignments of the exchange rate, currency crises, floating exchange rate regime and non- floating ones, respectively. In this paper, we used exchange market pressure (EMP) as an indicator to show the market movements of the exchange rate and currency crisis. The definition of the EMP is related to the movements in exchange rates as well as in the reserves. By

following Aizenman and Pasricha (2012), exchange market pressure is defined as,

$$EMP_t = \left( \frac{e_t - e_{t-1}}{e_t} - \frac{ir_t - ir_{t-1}}{ir_t} \right) \times 100 \quad (16)$$

with  $e_t$  denoting the local nominal exchange rate per 1 unit of

the IMF's SDR (an increase denotes depreciation) and  $ir_t$  denoting international reserves (minus gold) in U.S. dollar in time  $t$ .

Intuitively, by examining the plots of misalignment, we find that misalignment correctly acts as a prelude to the currency crisis in the many cases. For instance, the misalignment was high, meaning the currency was overvalued immediately preceding the Iranian (2002) and the Slovakian (2009) crises.

Our results suggest that currencies in the most European countries especially emerging economies and in Asian regions as Malaysia, Pakistan, and Russia and from South American, Paraguay and Tunisia among African countries were substantially overvalued during the period prior to the currency crisis of 2008 leading to sharp depreciation. Besides, in all mentioned economies, the least misalignment was achieved in non-floating exchange rate regime.

The results for German, Malta, France, Cyprus, Ukraine, Dominican Republic and Paraguay suggest that misalignment increased from 2002 up to the onset of the crisis in 2008.

Following the severe financial crisis in 2006, Finland, German, Italy and Portugal dismantled their exchange rate anchor and switched to a regime of free float. However, except for Italy, in three others the highest misalignment has occurred in 2008 when the floating regime was dominated. As opposed to the mentioned countries, in some countries such as Luxembourg, Malta, Netherlands, France, Cyprus, Greece, Croatia, Czech Republic, Hungary, Latvia, Romania, Malaysia, and Pakistan, after changing their exchange rate regimes from non-float to float one, they experience the currency crisis and the highest misalignment.

In the case of Iran which encountered the currency crises in 2002, 2011 and 2013, are shown in Fig. 1 and the Rial were overvalued before the financial crisis of 2002. More importantly, the minimum misalignment was achieved under the floating regime in 2003, but the maximum values of misalignment and exchange market pressure were shown under non-floating exchange rate regime, respectively in 2001 and 2002. As well as that, the recent currency crises occurred under non-floating rate regime in this economy.

Furthermore, our results show that there is declining evidence of crisis under a float in many economies of our dataset. What is more, the minimum values of exchange market pressure are seen more under floating regime. As a consequence, it can be confirmed that under a more flexible exchange rate regime, the vulnerability of the exchange rate regime to external shocks can decline.

#### 4 Conclusion

Since real exchange rate fluctuations are important for competitiveness and the adoption of suitable fiscal and monetary policies, in this paper, we have studied the behavior of exchange rate misalignments under different exchange rate regimes by means of a panel smooth transition model. Based on 43 countries during the period of 1999-2014, we assess the misalignment of the real effective exchange rate (REER) from its equilibrium level, defined according to various macroeconomic fundamental on the type exchange rate regime.

Strong evidence of nonlinearity in the adjustment of the misalignment to fundamentals and the exchange rate regime is found. In particular, when the lagged misalignment is lower than its threshold level, the output gap and the lagged exchange rate level have less influence on the misalignment than when above the threshold. More importantly, only when the misalignment is low, fixed exchange rate regimes end in reducing the misalignment level and volatility. Our evidence shows that estimated misalignment could be a warning indicator of a currency crisis.

**Abstract:** Banks basically due to the type of activity that they do have a lot of desire, to improve their business by utilizing from higher levers. The basel committee that has the responsibility to develop a healthy banking standards, has developed several provisions in the form of multiple principles for better leading of banks. The results of this study shows that according to approximate startup about the issue of capital adequacy ratio and declarations of basel Committee, the conducting investigations and determining the relationship type and correlation of various financial indicators, are necessary. So in this research the type and size of relationships between capital adequacy ratio, as the independent variable and profitability variables and stock returns-as dependent variables- were estimated in separate equations and using regression techniques.

**Keywords:** capital adequacy ratio, the bank's net profit, operating profit of banks, stock returns of banks, the basel Committee

### 1 Introduction

The profitability and stock returns, are known as two valid criteria for assessing the performance of companies. This article is also true about banks. Because as Bank's profitability is higher, indicates the health of the bank's operations and activities and level of profitability, reflects and reports of all activities and financial and managerial system and ... of banks. In addition, in the current competitive period in the banking system, these two indicators of profitability and return on equity can be considered as a parameter and index for stakeholders and an increase in the amount of them, encourages the shareholders and can also be effective even in the absorption of the deposit (as the main activity of bank in the profitability).

On the other hand, capital factor is considered as a factor affecting the performance and activities and profitability of bank. Capital is an important element of financial support in any bank, which enables banks to repay its debts when faced with economic difficulties. Therefore, in addition to playing an effective role in the financial stability of banks and risk-taking incentives, is also very effective in positive competition among banks. (Anvari Rostami, 2007)

Considering that ensuring the maintenance of funds and valid sources of capital reduce the risk of bank deposit, therefore, one of the main index for assessing banks' is capital adequacy ratio which was introduced for the first time by the basel Committee to World Banks in 1988. (Hajivali Zadeh, 2007)

In 1988, the basel Committee, introduced the appropriate minimum capital measurement system in a statement called number one statement of basel capital (or what is known as basel 1). Since then, this system not only widespread among the member countries, but also in other countries of the world was introduced and implemented and could create major developments in banking supervision methods and literature. In the late 1990s, the weaknesses of the first statement, the way was paved for the review and reconsideration of it and in June 1999 the first draft of the second capital statement known as basel number2 (or briefly basel 2), was released to be replaced instead of the previous statement at the end of 2006. (Pahlevanzadeh, 2009)

BAL Committee based on an advisory opinion and preliminary tests concluded that should determine standard ratio of capital to weighted assets according to risk in the level of 8% and ask the International Banks to achieve it. In this way judgment about capital adequacy of a bank that is done through investigating the ratio of capital to weighted assets according to risk and comparing it with determined ratio, was formed. It is evident that the banks that have adequate capital lower than prescribed ratios, will be to a decision according to banking supervisors discretionary and requirements of regulations in the country concerned. This decision includes restored base capital up to risks limitation of bank and it may be combined with the requirements and punitive measures (depending on the regulations of the country and bank type in terms of governmental and private and some other considerations). But anyway in evaluation of domestic and international markets the situation of desired bank is effective and bank cannot refrain negative consequences of insufficient capital (regardless of the type of collision monitoring device and the central bank). (Shiva, 2004).

So three variable factors of capital adequacy ratio, return on equity and profitability can be attributed as performance evaluation index of banks. Despite the importance of higher capital adequacy ratios and the role and impact of it in other accounting and financial ratios, unfortunately, there hasn't been any significant research associated with this variable and reviewing its correlation and relationship with other factors and macroeconomic variables and accounting indicators (particularly in our country). Therefore, in this research we seeks to examine the relationship between capital adequacy ratio and profitability (net profit and operating profit) and stock returns of accepted banks in the Tehran Stock Exchange.

### 2 Research hypotheses

First hypothesis: there is a significant relationship between capital adequacy ratio and net profit of accepted banks in Stock Exchange.

Second hypothesis: there is a significant relationship between capital adequacy ratio and operating profit of accepted banks in Stock Exchange.

Third hypothesis: there is a significant relationship between capital adequacy ratio and return on bank stocks of accepted banks in Stock Exchange.

### 3 Research method

The research method is correlation type, because it explores the relationship between independent and dependent variables. Also this research is classified in the category of applied researches in terms of purpose. Due to the limited community, statistical samples include all the banks of statistical population. Also main method of data collection tool in this study is based on library form. To investigate the significant or pointless relationship of variables and discover correlation coefficient the following authentic parametric and nonparametric tests will be used: Spearman correlation coefficient and regression. Also SPSS and Eviews software's are used to analysis statistical hypotheses.

**4 Theoretical foundations and research background**

**4.1 Theoretical Foundations**

**4.1.1 The general structure of basel 1**

In July 1988 the basel Committee published first statement concerning the capital arrangements. In basel 1 the major risk, is credit risk. In a statement, the credit risk, is defined as risk of non-performance by the other side. In fact the other types of risk such as investment risk, interest rate risk, exchange rate risk and the risk of focused activities of a bank is posed, but the main focus of the statement framework is on credit risk. Only in 1996, a new amendment was added to original statement to calculate market risk which was used without any significant change during the development of the next statement (BAL 2). In structure of the basel three main parts are designed that according to the Preliminary Statement includes Capital structure, classification of assets with determining the coefficients of risk and finally the part of determining the standard ratio of capital maintenance.

**4.2 The general structure and conceptual framework of basel 2**

Unlike the previous statement, the basel 2 has quite complicated structure. In fact, the arrangements laid down in the new statement has been expanded by evolution of standards used in the previous statement and has been rearranged within the framework of new pillars. In the statement structure 3 main pillars were anticipated including: 1- minimum required capital, 2- regulatory review process and 3- market discipline and are designed in a way that are communicating systematically and mutually reinforce each other. The three pillars of basel 2 can be investigated as follows: Pillar 1 or minimum capital requirements (as opposed to credit, market and operational risks) - Pillar 2, the supervisory review process - Pillar 3, market discipline.

**5 Research background**

Shultens and Jacob de (2009) in an article entitled "Relationship between the degree or type of ownership defaulted bank loans

and capital adequacy ratio" investigated relationship and intensity of degree and type of ownership relation (private, public, etc.) with two valid indicators in field of risk and bank hazards so capital adequacy ratio and default facilities. Statistical sample of research included 500 trading banks from 50 countries in the world (between 2005 and 2007). Research results show a significant relationship between capital adequacy ratio and default facilities with the type of bank ownership. While the percentage of bank ownership is more private; bank losses will be lower and a lower percentage of defaulting facilities and capital adequacy ratio will be in better situation (closer to the standard.

Babaian (2001) explored "the relationship between the changes of the items making up the balance sheet and changes in stock returns. The results of his research showed that there is not a significant relationship at 95% confidence level between rate changes of stock returns of listed companies in Tehran Stock Exchange for the period 1994 to 1995 and changes in balance sheet items. It should be noted that balance sheet items that were selected as the independent variable included: Changes in current assets, changes in long-term assets, current debt changes, changes in long-term debt and special value changes.

Mirmehrabi, (2002) in a thesis entitled "Investigation of the relationship between the increase in capital stock and stock returns of stock companies", considering the companies that had increased capital or not, tests assumptions and concludes that the capital increase is not a positive factor to increase stock returns and it is neutral.

**6 Data Analysis**

**The first hypothesis is defined as follows**

There is a significant relationship between capital adequacy ratio and net profit of banks listed on the Stock Exchange.

$$H_0 : \rho_{(y_1,x_1)}=0, \rho_{(y_1,x_1)} \neq 0 H_1 \tag{1}$$

Spearman nonparametric test statistic is used for doing this test that its results are shown in the table below.

Table 1. First hypothesis testing correlations

Spearman nonparametric test		X1	Y1
$_1X$	correlation coefficient	1000	0.795
	confidence level	0	0.012
	number of samples	54	54
$_1Y$	correlation coefficient	0.795	1000
	confidence level	0.012	0
	number of samples	54	54

Due to the smaller significance level of test from error of  $\alpha=0.05$  the null hypothesis is rejected. Therefore the first hypothesis is accepted, means:

With confidence of 95% we can say that there is a significant relationship between capital adequacy ratio and operating profit of accepted banks in the stock exchange.

Using linear regression to examine the relationship between capital adequacy ratio and net profit of banks:

The purpose of regression analysis is to find the logical relationship of the dependent variable based on independent variables that by using this relationship can offer solutions to improve variable assuming fixed conditions. (Ross and Zimmerman, 1986) This method defines for this variable that share of affecting dependent variable is separately with specified

significant coefficients. This model is a shortcut to guide managers for the allocation of costs and efforts to achieve the company's ultimate goal.

In regression models following assumptions are being tested against each other: In lieu of  $i$  a member of the set  $\{0, 1, 2, 3\}$ , we have:

$$H_0: b_i=0, H_1: b_i \neq 0 \tag{2}$$

This assumption means that the intercept coefficients and variables remains in the model or not. With zero coefficient for each of the variables, mentioned variables is omitted from the model and the concept of this issue is that no significant effect on the dependent variable and can it be ignored. Assuming there is a causal relationship between two quantitative variables and the amount of dependent variable is estimated by the

independent variable, the following simple regression model is used.

$$Y_1 = a + bX_1 \tag{3}$$

Where Y1 is net profit of banks listed on the stock exchange and X1 is the capital adequacy ratio. The first output of actually shows independent variable of model (capital adequacy ratio).

The second output (see chart below), respectively provides, correlation, coefficient of determination, adjusted coefficient of determination and the standard error of estimation.

If the sample size be small the adjusted coefficient of determination is appropriate for interpretation.

Table 2. Coefficients of the first hypothesis test

Model	correlation coefficient	coefficient of determination	Adjusted coefficient of determination	standard error of estimates
1	0.527	0.277	0.233	6.11370E11

The third output of regression analysis of variance (ANOVA) is for certain existence of a linear relationship between two variables. That defines significant of whole model through F statistic.

There is not a linear relationship between two variables: H0 and H1.

Table (3) analysis of variance of first hypothesis test

Model	Total coefficient of determination	freedom degree	Average of determination coefficient	F test	confidence level
regression	2649E24	1	2549E24		
Residual	1568E25	52	5476E23	5346	0.023
Sum	1367E25	53			

Since Sig =0.023 and is less than 0.05 the assumption of linear relationship between the two variables is confirmed.

Regression rows in the table represent the rate of dependent variable changes which is explained by the independent variable or variables. Residual row also indicates the amount of changes

of dependent variable which is defined by other factors (random). In the fourth output the regression equation is estimated.

Table 4. Coefficients of first hypothesis regression

Model	Non-Standardized coefficients		Standardized coefficients	T test	confidence level
	line slope	Standard deviation of error standard	Beta		
Limitation1 X*	9889E11	2365E11	0.0536	4181	0.001
	3053E10	9478E9		3221	0.023

$$-X10E11+3.053E9.889= Y \tag{4}$$

Since Sig (Constant) = 0.001 and is less than 0.05, so assumption of constant coefficient equality to zero is rejected. Also, since the Sig (x1) = 0.023 and is less than 0.05, so assumption of equation coefficient equality with zero is rejected.

There is a significant relationship between capital adequacy ratio and operating profit of banks listed on the Stock Exchange. In this section, as in the previous section, in order to test this hypothesis, the correlation coefficient was used.

$$H_0 : \rho_{(Y_2, X_1)} = 0, \rho_{(Y_2, X_1)} \neq 0 H_1 \tag{5}$$

**Second hypothesis is defined as follows**

Table 5. Correlation Coefficient of second hypothesis test

Spearman nonparametric test		X1	Y1
iX	correlation coefficient	1000	0.425
	confidence level	0	0.019
	number of samples	54	54
iY	correlation coefficient	0.425	1000
	confidence level	0.019	0
	number of samples	54	54

Due to the smaller significance level of test from error of  $\alpha=0.05$  the null hypothesis is rejected. Therefore the first hypothesis is accept means:

Using linear regression to examine the relationship between capital adequacy ratio and operating profit of banks listed on the Stock Exchange:

With confidence of 95% we can say that there is a significant relationship between capital adequacy ratio and operating profit of accepted banks in the stock exchange.

Assuming there is a causal relationship between two quantitative variables and the amount of dependent variable is estimated by

the independent variable, the following simple regression model is used.

$$Y_2 = a + bX_1 \quad (6)$$

Table 6. the coefficients of the second hypothesis test

Model	correlation coefficient	coefficient of determination	Adjusted coefficient of determination	standard error of estimates
1	0.399	0.159	0.123	778848E11

The third output of regression analysis of variance (ANOVA) is for certain existence of a linear relationship between two variables. That defines significant of whole model through F statistic.

There is not a linear relationship between two variables: H0 and H1.

Table 7. variance analysis of second hypothesis test

Model	Total coefficient of determination	freedom degree	Average of determination coefficient	F test	confidence level
regression	2885E24	1	2815E24	3879	0.025
Residual	1567E25	52	7612E23		
Sum	1758E25	53			

Since Sig =0.025 and is less than 0.05 the assumption of linear relationship between the two variables is confirmed.

or variables. Residual row also indicates the amount of changes of dependent variable which is defined by other factors (random).

Regression rows in the table represent the rate of dependent variable changes which is explained by the independent variable

In the fourth output the regression equation is estimated.

Table 8. Regression coefficients of first hypothesis

Model	Non-Standardized coefficients		Standardized coefficients	T test	confidence level
	line slope	Standard deviation of error standard	Beta		
Limitation1	1238E12	2754E11	0.401	4495	0.018
<sub>1</sub> X	2129E11	8314E10		2561	0.025

$$X_{10E11} + 2.129E1.238 = Y$$

Since Sig (Constant) = 0.018 and is less than 0.05, so assumption of constant coefficient equality to zero is rejected. Also, since the Sig (x1) = 0.025 and is less than 0.05, so assumption of equation coefficient equality with zero is rejected.

There is a significant relationship capital adequacy ratio and stock returns of banks listed on the Stock Exchange.

$$H_0 : \rho_{(Y3,x1)} = 0 \quad \rho_{(Y3,x1)} \neq 0 \quad H_1 \quad (8)$$

In this section, as in the previous section, in order to test this hypothesis, the correlation coefficient was used.

### Third hypothesis is defined as follows

Table 9. Correlation coefficients of third hypothesis test

Spearman nonparametric test		X1	Y1
<sub>1</sub> X	correlation coefficient	1000	0.512
	confidence level	0	0.011
	number of samples	54	54
<sub>1</sub> Y	correlation coefficient	0.512	1000
	confidence level	0.011	0
	number of samples	54	54

Due to the smaller significance level of test from error of  $\alpha=0.05$  the null hypothesis is rejected. Therefore the first hypothesis is accept means:

With confidence of 95% we can say that there is a significant relationship capital adequacy ratio and stock returns of banks listed on the Stock Exchange.

Table (10) coefficients of third hypothesis test

Model	correlation coefficient	coefficient of determination	Adjusted coefficient of determination	standard error of estimates
1	0.645	0.416	0.395	1.58872

The third output of regression analysis of variance (ANOVA) is for certain existence of a linear relationship between two variables. That defines significant of whole model through F statistic.

Table (11) variance analysis of third hypothesis test

Model	Total coefficient of determination	freedom degree	Average of determination coefficient	F test	confidence level
regression	70454	1			
Residual	43025	52	70845	27498	0.009
Sum	113479	53	3349		

Since Sig =0.009 and is less than 0.05 the assumption of linear relationship between the two variables is confirmed.

Regression rows in the table represent the rate of dependent variable changes which is explained by the independent variable

or variables. Residual row also indicates the amount of changes of dependent variable which is defined by other factors (random).

In the fourth output the regression equation is estimated.

Table (12) regression coefficients of third hypothesis

Model	Non-Standardized coefficients		Standardized coefficients	T test	confidence level
	line slope	Standard deviation of error standard	Beta		
Limitation 1	2238E11	2547E10	0.315	8126	0.004
$_1X$	1999E10	0.314E10		6366	0.009

$$_1X10E11+1.999E2.238 =_3Y \quad (9)$$

Since Sig (Constant) = 0.004 and is less than 0.05, so assumption of constant coefficient equality to zero is rejected. Also, since the Sig (x1) = 0.009 and is less than 0.05, so assumption of equation coefficient equality with zero is rejected.

## 7 Conclusion

In the test of first hypothesis using Spearman nonparametric test was observed that there is a positive and significant correlation between capital adequacy ratio and net profit by confidence of 95%. Regression line equation is in the following form:

$$_1X10E11+3.053E9.889=_1Y \quad (10)$$

In which 1Y is net profit and 1X is capital adequacy ratio. The first hypothesis is confirmed in results.

In the second hypothesis test using the Spearman nonparametric test it was observed that there is a positive and significant correlation between capital adequacy ratio and operating profit by confidence of 95%. Regression line equation is in the following form:

$$X10E11+2.129E1.238=_2Y \quad (11)$$

In which 2Y is operating profit and 1X is capital adequacy ratio. The second hypothesis is confirmed in results.

In the third hypothesis testing using the Spearman nonparametric test was observed that there is a positive and significant correlation between capital adequacy ratio and operating profit by confidence of 95%. Regression line equation is in the following form:

$$_1X10E11+1.999E2.238 =_3Y \quad (12)$$

In which 3 Y is stock returns and 1X is capital adequacy ratio. The third hypothesis is confirmed in results.

In new capital adequacy framework that was published in 2001, there have been three main pillars as follows: 1- minimum requirements of Standard capital adequacy. In this part capital adequacy requirements are calculated and measured through focusing on credit risk, market risk and operational risk. 2- Evaluation and monitoring that is focused on capital adequacy continuous assessment and evaluation process inside the bank or financial institution. It is expected from banks and other financial institutions to set their capital adequacy ratio in a higher range of defined lower limit, and at the same time, use the policies, guidelines and internal processes for continuous assessment of capital adequacy in a way that be coordinated with different levels of risk be compatible with business and functional strategies. 3- Effective use of the market as a lever to improve information disclosure and expand health and stability within the banking system and financial institutions. The aim is to create appropriate incentives for banks and financial institutions to establish the safety and stability of operation range and efficiency in activities. New framework provided by rules committee and procedures for banking regulation is designed to provide the field of improvement in way of risk type's reflection in terms of legal capital requirements and at the same time, to make the possibility of a proper strategy on financial innovation. (Omran & Ragab, 2004)

In general, there are three main approaches for the issue of capital adequacy: 1- Standard method, in this method the minimum ratio of capital to assets is 8% that its risk is calculated through dividing to capital (market risk + operational risk+ credit risk) as follows (fifty per cent of capital must be main or initial capital). Market Risk is usually calculated by statistical method and value method due to the risk that is listed in 1996 agreement and has not changed. Credit risk calculation has been also changed. Also operational risk was not in previous agreements that is added. 2- Internal ranking basic method, in this method banks and financial and credit institutions are ranked based on risk. Symptoms AAA, AA, A, A-, B BB, BB, etc., are used from lowest risk to highest risk. Capital adequacy ratio of banks and major financial institutions with first grade investment is more than 3 billion euros on average of 3 to 4%. In the US, there is only 20 banks and large financial institution in this category. But around the world there is 188 banks and large financial

institutions whom the majority are in Europe and Japan. 3- Advanced ranking method, in this method trickier criteria are determined for risk ratings. Mostly minimum capital adequacy ratio is 36% and the maximum is 46%. In fact, compliance with capital adequacy requirements of the basel committee, causes increased bank credit and leasing companies and ability of providing their financing with low rates.

Currently basel 2 is considered as the most comprehensive document agreed in the oversight of banks on sufficient capital in professional associations and international banking supervision. In this document the criteria for capital adequacy of banks, the methods for estimating credit risk, market risk, operational risk of banks, the requirements in evaluating adequacy of capital and regulations on the disclosure of relevant procedures, in three pillars of the statement is designed with administrative purposes. Privacy raised in the capital preliminary statement of the basel Committee is expanded in the field of weighted asset calculation methods of risk and has been flexible as much as possible. So in light of this flexibility and be with introduction of different approaches for calculating risk assets, banks are accepted in selecting the most appropriate option to achieve national supervision in each country as essential in carrying out its statement by the committee.

Therefore, although the listed factors cause disagreements in approach and run-time of statement in recent years, but all countries and banking supervision bodies welcome and their readiness to implement different pillars of statement shows the importance made by those organizations. Communities are responsible to provide standards for Islamic banks activities also by understanding the growing importance of the preparation in implementation of precautionary measures using approaches of statements and the regulations monitoring Islamic banks activities.

Range of statement in areas that raises advanced techniques in calculating intended risks, despite leading better cover of risks and hazards that threaten a bank, somewhat has also added to the complexity of the new statement. However attention to the basel Committee to present technical and regulational differences in banking and monitoring systems of different countries has caused the discretion of national regulatory authorities to be accepted in each country as essential in carrying out its statement by the Committee. So, although the mentioned factors caused controversy in approach and statement execution time in recent years, but all countries and banking supervision bodies welcome and their readiness to implement different pillars of statement shows the importance made by those organizations. Communities are responsible to provide standards for Islamic banks activities also by understanding the growing importance of the preparation in implementation of precautionary measures using approaches of statements and the regulations monitoring Islamic banks activities.

**Abstract.** The aim of this study is to investigate a core stabilization exercise on static and dynamic balance Spastic diplegia. For this study, 20 volunteers were selected and randomly divided into two experimental and control groups. For data analysis, descriptive statistics to describe the data in each group and the test of Shapiro, one to determine the normality of the data and the analysis of covariance to test hypotheses and significance level  $0.05 > p$  was considered to computer software spss version 20 was used. The results showed that the static balance with eyes open and closed Romberg test, significant difference were observed but significant difference was seen in dynamic balance test Y. It can be concluded that postural control and as a result, the balance in patients with cerebral palsy Spastic diplegia by core stability training can be improved.

**Words Balance:** cerebral palsy, Spastic diplegia, static balance, dynamic balance, core stability, and proprioception.

### 1 Introduction

Since the beginning of human life have been countless accidents. Past and present significant proportion of people because of disability, of the pleasures of life, and are deprived of power production and construction (Chagatai et al., 2002). The first of the late nineteenth century, called LITTLE orthopedic described the disease and spastic rigidity of the term used to describe the disease (Tonekaboni 2010 and Qadiri and Mashallah 2008). Disability is one of the most important challenges for all countries regardless of their economic situation and policies of each country is to fix their problem, represents the culture and civilization of their people. Disabilities by increasing the number and severity of accidents remarkable growth, wars and acts of terrorism, economic weakness, limitation of motion activity, drug abuse and many other factors linked (Gharabaghi 2011 and Asmyrnva 2003). Undoubtedly special needs of persons with disabilities in your life that are much more difficult if not resolved. These problems usually over self-mutilation, between culture and awareness level of the community. According to a principle other biologically important, compensatory mechanisms to stimulate and launch. But research community such compensation to pay special attention to the problems people with disabilities. In contemporary humanitarian thinking, every human being has the right, not like the other. Cerebral palsy include non-progressive disease of the brain is growing which leads to a bunch of defects, neurological, motor, and about the state of the body and in the course of development of the brain (infants and children) occurs. Different causes such as brain development disorders, genetics, metabolism, ischemia, infection and acquired causes of cerebral palsy and can manifest in a neurological phenotype. The incidence cerebral palsy 1.4 to 2.4 per 1,000 live births and prenatal care despite technological advances in the last two decades and is still one of the main causes of childhood developmental disorders remains prevalent (Stanley et al., 2001). In developing countries, factors such as infections, accidents and trauma, malnutrition, maternal causes paralysis but the exact number of these countries are not available, but it looks at about 6 per thousand live births is (Lawson et al. 2003). CP based on the type of spastic muscle

tone, including the highest prevalence (75/0), Hyper Connecticut, ataxia and mixed (case Smith et al., 2009). Among the causes of balance disorders in children, impaired muscle tone, difficulty in organizing symptoms of sensory and sensory-motor data integrity (Ryan et al, 2013). Liao (2007) observed that children with mild cerebral palsy in school age can walk independently, but walking ability compared to healthy peers that this problem increases with age and Loss of ability to walk leads hence effective intervention for children with mild cerebral palsy in order to maintain or improve the ability to move at school is very important (Liao et al. 2007). Different causes such as brain development disorders, genetics, metabolism, ischemia, infection and acquired causes of cerebral palsy and can manifest in a neurological phenotype. The incidence cerebral palsy 1.4 to 2.4 per 1,000 live births and prenatal care despite technological advances in the last two decades and is still one of the main causes of childhood developmental disorders remains prevalent (Stanley et al., 2001). Although this figure has been stable for 30 years, but the underlying causes of the disease has changed. Because of the increased survival of premature infants with low birth weight or very low incidence of cerebral palsy spastic diplegia for prematurity and low birth weight is often accompanied by increased bilirubin and brain is reduced in developed countries (Pellegrino, 2002). Cerebral palsy treated by a team of experts includes doctors, occupational therapists, physiotherapists, speech therapists, social workers and psychologists, possible. Parents are important members of the team must do chores in the training of these children (Wilson et al. 2007). This study investigates the effect of an exercise period of stability on static and dynamic balance in girls with cerebral palsy spastic diplegia will be discussed.

### 2 Research purposes

The overall goal:

The effect of core stabilization training on static and dynamic balance of girls suffering from cerebral palsy spastic diplegia

#### 2.1 Specific objectives

1. The effect of core stabilization training on balance and girls suffering from cerebral palsy spastic diplegia.
2. The effect of core stabilization training on dynamic balance in girls suffering from cerebral palsy spastic diplegia.

#### 2.2 hypotheses

1. One of the core stabilization training on static and dynamic balance of girls with cerebral palsy spastic diplegia implications.

#### 2.3 specific assumptions

1. One of the core stabilization training on Static balance with spastic diplegia cerebral palsy affects girls.
2. One of the core stabilization training on dynamic balance with spastic diplegia cerebral palsy affects girls.

#### 2.4 Research presuppositions

1. The validity and reliability of measuring devices is acceptable.
2. The participants have cooperated in the investigation appropriately.
3. The experimental group did the exercises correctly and under the supervision of a researcher.
4. The subjects of nutrition during training appropriate.

5. The subjects had to be motivated to participate in the study.
6. Participants do not have the mental and emotional problems.

### 2.5 Range and areas of research

1. All research population with spastic diplegia cerebral palsy girls make up rehabilitation centers in the city of Karaj.
2. The research Range girls with cerebral palsy spastic diplegia 10 to 15 years.
3. Both the experimental and control groups in terms of age, height and weight are in the range are homogeneous.
4. Subjects' ability to sit alone or with its support.
5. The perception enough to understand the subjects' verbal requests and instructions during the test and its practice.
6. Failure to orthopedic surgery in the past year.
7. Researcher the strict implementation of training and tests as much as possible and control.

### 2.6 Conceptual and operational definitions research words

#### 2.6.1 Conceptual definitions:

1. Cerebral Palsy: This term is used to describe brain damage as a static non-progressive encephalopathy caused by abnormal development of the brain or brain damage each time before, during, or after birth occurs. Musculoskeletal disorders of the nervous system, resulting in movement disorders, poor posture and poor performance is one of the main indicators of this disorder (Robinson and Gribble, 2008).
2. Core stability: the chest as a cylindrical central region - the upper third of the shoulder girdle and pelvis of the plate as the lower third of the plate legs impressive performance, which reflects the state of the chest and belt shoulder.
3. Static balance: When the sum of all external forces acting on an object is zero, the body is in a state of static equilibrium in other words, static balance, the ability to keep the center of gravity of the body, inside the building with minimal.
4. Dynamic balance :When torque is the sum of all external forces acting on an object is zero, the body is in a state of dynamic equilibrium in other words, means the body's ability to maintain a state at the time of the move.
5. Proprioception: Related to deep tissues such as bone and pods of sensing pressure and deep sense of deep pain.

#### 2.6.2 Operational definitions:

1. Cerebral Palsy: by damage to the brain before birth, during birth or after they are born. This failure to appear for movement disorders usually spite of the damage to the brain and its lack of progress, the problems caused by the disease in the patient's life is changing.
2. Core stability: In this study, the order of core stabilization training exercises without a Swiss ball from the wing and the wing Swiss ball exercises is provided by Jeffrey in 2002.
3. The ability to maintain the center of gravity in the range of support that in this study the Earth's surface (with eyes open and eyes closed) done.
4. Dynamic balance: The ability to maintain the center of gravity in the range of support in the case of support is stable and in this research is moving up in three directions.

5. Proprioception: the ability to feel and understand the spatial location relative to each other without the use of eye organs (Lephart et al., 1997).

In this study, using quasi-experimental research design pretest - posttest control group.

### 3 Statistical Society

The population study of all spastic diplegia cerebral palsy rehabilitation centers in Karaj girls aged 10 to 15 years up.

#### 3.1 Sample and sampling method

In this study, 20 female patients with spastic diplegia cerebral palsy that have been criteria and the research was approved by the supervisory doctor and were randomly assigned to two experimental and control groups of 10 patients matched for age, height and weight are in a range of homogeneous groups.

Inclusion criteria for research:

1. The samples are spastic diplegia cerebral palsy research.
2. The ability to sit alone or with its support.
3. Perceived enough to understand simple verbal requests and instructions and practice the test is over.
4. Absence of orthopedic surgery in the year before the test.

Exclusion criteria from the research:

1. The lack of cooperation during the exercise.
2. Hearing loss, vision and illusion of being based on medical examinations observer.

### 3.2 variables

#### 3.2.1 Independent variables

Core stability exercises

#### 3.2.2 Dependent variable

1. Static balance
2. Dynamic Balance

### 3.3 Collection tool data

1. The consent form
2. Personal Information Form
3. Inventory PAR - Q medical advice to determine the activity
4. Balance for weighing
5. tape measure to measure the height
6. Romberg test to evaluate static balance
7. Y test to assess the dynamic balance
8. Stopwatch to perform the Romberg test
9. The core stabilization training protocol
10. Mattresses to implement the practice test
11. The wing Swiss ball exercises to implement

• Romberg test to evaluate static balance:

In this test, participants will be asked to open and close your eyes for 30 seconds with feet parallel to the stand. Fluctuations in person at the same time maintaining the balance and the situation is assessed, and excessive volatility, balance disorders or abnormal numerous steps. If your balance with your eyes open but with closed eyes cannot maintain, difficult to use sensory information - figure shows (Arian et al., 2010). The reliability of this test in healthy subjects with eyes closed eyes open 0.91 and 0.77 have been reported.

• Y test to measure dynamic balance:

To measure the dynamic balance of subjects, the test Y (Y BALANCE TEST) in three directions (anterior, posterior medial, posterior-external) are drawn with the angle of 135 degrees from each other, are used. Before starting the Y test, dominant leg will be determined subjects. If the right foot is superior fitness test conducted in counterclockwise and clockwise if left foot was superior in tests done.

Each subject performed three times in each direction, and the mean values were calculated and the length of the foot (in centimeters) from the anterior superior iliac spine to the inner ankle and lying supine on the ground to be measured divided and then multiplied by 100 to obtain the achievement gap as a percentage of leg length. Balance Test y valid 0.91 is.

### 3.4 Procedure

Data collection method:

After signing the consent to participate in research by parents and filling out forms and questionnaires of personal information PAR - Q and Targeted subjects randomly into two groups (10 patients in the experimental group and 10 in control group) were divided. Then the experimental group pre-test include: (Romberg test to evaluate static balance and dynamic balance test to evaluate Y), core stabilization exercise protocol consists of: (3 sessions per week for 8 weeks and each session was 45 minutes and include warm-up , stretching and strengthening exercises without the ball, Swiss ball, who first week include: 1. You're the abdomen in the supine position (3 rounds and each round of 20 repetitions), (2) your abdomen in the prone position, (3 rounds and each round of 20 repetitions), (3) your abdomen to the knee (3 rounds and each round 20 repetitions). The second week includes: 1. you the abdomen in the supine position (3 rounds and each round of 20 repetitions), (2) you have the stomach in the prone position (3 rounds and each round of 20 repetitions), 3. You're in the belly of the squat (3 rounds and each round of 20 repetitions). Third week: 1. You gather the

abdomen in the supine position with one leg (3 rounds and each round of 20 repetitions), (2) you roll up the stomach in the prone position with one leg (3 rounds and each round of 20 repetitions). 3. Paul unilateral (6 reps for each side of the body and 10-second pause). The fourth week include: 1. you hold the abdomen in the supine position with the upper limbs and hands and feet close together (3 rounds and each round of 20 repetitions), 2 squat with one leg bringing up the rear (20 repetitions for each leg three rounds and each round), 3. rotate the trunk from side to side holding weights (3 rounds and each round of 20 repetitions for each side of the body) and Swiss ball exercises with wings that fifth week include: 1. Sit on a Swiss ball and your practice to the belly (3 rounds and each round is 10 seconds), 2. Scott while Swiss ball between the wall and the shoulder (3 rounds, each round of 15 repetitions), 3-raising hands and feet simultaneously in the prone position (3 rounds, each round of 10 repetitions). Six weeks include: 1 launch route miles in a 45-degree angle to the left or right (3 rounds and each round 12 reps), 2. Paul (shoulder and one leg on the ground floor and raise the buttocks and legs (3 rounds and each round of 15 second pause), 3. thee in the belly lying on a Swiss ball so that the soles of your feet on the ground behind the ball and Switzerland (3 rounds and each round of 20 repetitions). week Seven: 1- and 15 repetitions of each round). 3. Paul a way to get a leg up with (6 reps for each side of the body and 10-second pause). Eight weeks include: eight weeks include: (1) lying supine on a Swiss ball and your practice with the belly up get a leg (3 rounds and each round of 20 repetitions), (2) raise the opposite arm and leg in a squat (3 rounds and each round of 20 repetitions), 3. Paul feet on a Swiss ball is so high get a leg (3 rounds and each round of 15 second pause) that during the break between rounds 1 minute and 5 minute cool-down was conducted between movements (Jeff Ray 2002). After doing core stabilization exercise from both the experimental and control groups post-test includes: (Romberg test to evaluate static balance and dynamic balance test to evaluate y) were performed.

### 3.5 statistical methods

To analyze the data, descriptive statistics to describe the data and determine the orientation of the center of each group (mean and standard deviation) of the Shapiro-one test to determine the normality of the data, covariance analysis to test the hypothesis, significance level 05 / 0 and SPSS software version 20 was used for calculations.

Table1 mean and standard deviation static balance with open eyes closed and dynamic balance training and control groups shows. Average rates static and dynamic balance shows that the average balance open eyes closed and dynamic balance in post-exercise control group further.

Table (1) describing the variables

Post-test		Pre-test		Group	Variable
standard deviation	Average	standard deviation	Average		
18.2	27.1	4.37	22.4	Practice	Static balance with open eyes (time in seconds)
3.6	26.2	3.1	23.4	Control	
4.14	23.1	4.36	18.2	Practice	Blindfolded in a state of static equilibrium (time in seconds)
4.5	22.9	3.1	18.9	Control	
13.1	75.81	10.6	62.71	Practice	Dynamic balance (are achieving cm)
9.50	57.59	9.50	57.5	Control	

Information provided in Table 1 shows that the average pre-test in static balance with open eyes, eyes closed in a state of static balance and dynamic balance training group, respectively, 22.4,

18.2, 62.71and in the control group, respectively, 23.4, 18.957.5 is (figures 1, 2 and 3).

Figure (1) Average static balance with open eyes before - the post-test in two groups: research

Figure (2) in a state of static equilibrium blindfolded average pre - and post-test in two groups: research

Figure (3) Average balance of static and dynamic pre - and post-test in two groups: research

#### 4 Analysis of the research findings

##### 4.1 Test assumptions of analysis of covariance (ANCOVA)

A) The nature of the data:

Vic Shapiro-test results Table 2 shows the data of static balance with open eyes in two independent variables were not normally distributed ( $0.05 > p$ ). Therefore, relevant data to static balance with open eyes using Mann-Whitney nonparametric test was tested.

On the other hand, static balance in a state of dynamic equilibrium eyes closed and normally distributed ( $p < 0.05$ ).

Thus, according to make two assumptions of homogeneity of the variety of line slope and linear relationship between variables and the dependent variable (see section below) to test hypotheses in a state of static balance and dynamic balance of covariance was used blindfolded.

Table (2) Shapiro-wilk test results

Post-test			Pre-test			group	Variable
Sig.	df	D	Sig.	df	D		
0.007	10	0.774	0.037	10	0.834	Practice	Static balance with open eyes (time in seconds)
0.003	10	0.738	0.292	10	0.914	Control	
0.063	10	0.853	0.687	10	0.952	Practice	
0.348	10	0.919	0.531	10	0.938	Control	Blindfolded in a state of static equilibrium (time in seconds)
0.357	10	0.920	0.477	10	0.933	Practice	
0.585	10	0.943	0.585	10	0.943	Control	Dynamic balance (are achieving cm)

Information presented in Table (2) shows that the average pre-test in static balance with open eyes, eyes closed in a state of static balance and dynamic balance training group, respectively, 0.037, 0.687, 0.477 and in the control group, respectively, 0.292, 0.531, 0.585is. The mean post-test static balance with open eyes, eyes closed in a state of static balance and dynamic balance training group, respectively, 0.007, 0.063, 0.357 and in the control group, respectively, 0.003, 0.348, is 0.585.

B) Assumption of homogeneity line slope:

F-test results in Table (3) show that the slope of the regression line in a state of static equilibrium data blindfolded and dynamic balance homogeneous study groups ( $P < 0.05$ ). Therefore, the assumption of homogeneity line slope is established.

Table (3) the results of assumption of homogeneity of slopes

Sig.	F	Variable
0.571	0.335	Static balance of closed eyes
0.792	0.072	Dynamic balance

C) The assumption of a linear relationship between the variables of the variety (pre-test) and the dependent variable (performance):

the dependent variable is the variety of covariance analysis to test the hypothesis static balance and dynamic balance used blindfolded.

Figures 4 and 5 shows the relationship between two variables and the dependent variable is linearly is the variety. Thus, according to assumptions contact data distribution, homogeneity line slope and the linear relationship between two variables and

Figure (4) variable distribution of the Curite (pre-test) and the dependent variable in a state of static equilibrium eyes closed (post-test)

Figure (5) variable distribution of the Curite (pre-test) and the dependent variable dynamic balance (post-test)

## 4.2 Testing hypotheses

The first hypothesis assumes the following:

First, the null hypothesis: core stability training on balance in a state of blind girls with cerebral palsy spastic diplegia effect.

The results of analysis of covariance (ANCOVA) in Tables 4, 5 show that between static balance in the pre-test and post-test mode blindfolded there is a significant relationship (F (1, 17)

=19.67,  $p=0.000$ ). Also, it was observed that core stabilization exercise significant effect on the balance of closed eyes is after controlling for pre-test. In other words, the average balance of closed eyes adjusted core stabilization training group (23.3) and control (22.63) there is no significant difference between (F(1, 17)=0.353,  $p=0.560$ ). Therefore, the null hypothesis is confirmed.

Table (4) analysis of covariance

ETA <sup>2</sup>	Sig.	F	MS	df	SS	Source
0.536	0.000	19.6	143.6	1	143.6	pre-exam
0.020	0.560	0.353	2.58	1	2.58	Group
			7.30	17	124.1	Error

The first hypothesis assumes the following:

The second null hypothesis: core stability training on balance in a state of open-eyed girls with cerebral palsy spastic diplegia effect.

Due to the lack of normal distribution of data, static balance with open eyes in order to test this hypothesis pre-test and post-test

scores were low, Mann-Whitney test was conducted on the data. Mann-Whitney test results showed that the mean change in Tables 4, 5, and 6 static balance with open eyes girls with cerebral palsy spastic diplegia training group (4.7) and control (2.8) There was no significant difference ( $p=0.143$ ,  $z=-1.55$ ). Therefore, the null hypothesis is confirmed.

Table (5) Mann-Whitney

Sig.	Z	W
0.143	-1.55	85

The third null hypothesis:

Of core stability training on dynamic balance that girls with cerebral palsy spastic diplegia not affect.

The results of analysis of covariance (ANCOVA) Table 4-5 shows the dynamic balance between pre-test and post-test there

is a significant relationship (F(1, 17)=78.74,  $p=0.000$ ). Also, it was observed that core stabilization exercise a significant effect on dynamic balance control after their pre-test. In other words, the dynamic balance between the average adjusted core stabilization training group (73.1) and control (60.24) there is a significant difference (F(1, 17)=32.17,  $p=0.000$ ). Therefore, the null hypothesis is rejected. That is, core stabilization exercises resulted in significantly improved dynamic balance was elected.

Table (6) the results of analysis of covariance

## 5 Discussion and conclusion

### 5.1 Discussion

Central nervous system combines the stability of the central nervous system and peripheral systems. The system of internal and external forces acting on the body's ability to process and system of the body active in the resistance against disturbing the balance right level of intensity control. Core stability can be divided into three sub-sections that include dynamic systems, static and nervous. In order to stabilize fit, the interaction of these systems is required. Defects in one or more than one system can have a delayed effect on core stability. Static balance can be made by bones, ligaments, tendons and connective tissues are organized. Active-balance system, refers to the muscle system is global and local. These textures can be actively shrunk and the forces of the ligaments and bones resist and more power to balance production and increases the stability of the central patio. Core stability exercises to reinforce the proprioceptive receptors. At the beginning of the proprioceptive receptors are highly stimulated and after a while earn a little consistency. But by the end of the message are sent to the CNS. Wireless joint body together to make a conscious understanding of the situation with the organs until change their status to be able to show the

necessary reaction. Information on posture from three sources collected and will be sent to the central nervous system. These include: Visual system, vestibular system and proprioceptive systems. Central nervous system receiving information from these three sources and integrating this information to maintain the balance of export orders. Wireless joint body together to make a conscious understanding of the situation with the organs to able to respond to reveal their status changes. Core stability and posture by maintaining the good condition during functional activities can prevent the occurrence of faulty movement patterns. Proper functioning of the body's center of maintenance of postural and dynamic postural balance during functional activities of destructive patterns that disrupt the balance will stop. When the body naturally works to keep the balance to control nerve and muscle function (such as static and dynamic balance) will give. People with nerve and muscle control and strength, core stability are good, with biomechanical chain will be the perfect move because it tends to affect the dynamic balance and posture is appropriate. Swiss ball exercises stimulates and strengthens the vestibular apparatus in the inner ear is responsible for balancing the public body. Receptors in the vestibular apparatus are sensitive to motion. Head movement stimulates and activates these receptors. As a result of impulses that are sent to the CNS are signs head. Vestibular apparatus to

control the movement of head and eyes when performing physical activity is responsible and the help maintain balance and body awareness through movement. Vestibular apparatus is sensitive to the location of the head in space And in order to achieve the goals of stability and postural orientation and sudden change of direction of the body to the CNS report. The role core stability exercises stimulate the nervous system - the cognitive, muscular - skeletal strengthen abdominal muscles, trunk muscles and pelvic floor muscles are. Swiss Ball Exercises to strengthen the role of the vestibular apparatus, visual and proprioceptive receptors in bone and pods is, is. Core stability is an important component in maximizing balance. Exercise improves balance.

## 5.2 Conclusion

The results of this study showed that a core stabilization exercise improves dynamic balance samples and the balance of girls with cerebral palsy spastic diplegia not affected, However, due to the fact that in the control group did not show any changes in static and dynamic balance can be improved dynamic balance in the experimental group attributed to the effect of core stabilization exercise. Limitations are as follows:

1. The mental attitude control subjects
2. Control hours of sleep the night before the test subjects
3. Individual differences subjects
4. Subjects for exercise motivation
5. The level of economic and social subjects
6. Fed subjects

According to the results of the above study that the positive effect core stability training on dynamic balance with cerebral palsy spastic diplegia, it is recommended that this training as a therapy to create and enhance their balance and occupational therapists are taken into consideration.

It is recommended that the:

1. Static and dynamic balance of people with cerebral palsy spastic plegias Mono.
2. Static and dynamic balance of people with cerebral palsy spastic hemiplegia.
3. Static and dynamic balance spastic quadriplegic cerebral palsy sufferers.
4. Static and dynamic balance of people with cerebral palsy spastic hemiplegia more.

**Abstract:** In the last few years, it has been very difficult to differentiate insurance products in competitive markets. The aim of this study was to investigate the factors affecting the formation of the Asia Insurance citizenship behavior. The population in this study is employees of Asia Insurance which the number of 140 Employees were used by available method. To test the research hypotheses, structural equation modeling and Lisrel 8.8 software were used. The findings suggest that the relationship between domestic brand management and employee commitment to the brand, employee commitment to the brand and brand citizenship behavior, did not exist. The relationship between job satisfaction and citizenship behavior of brand was approved. Finally, suggestions for managers is presented.

**Keywords:** brand citizenship behavior, employee commitment to the brand, domestic brand management, job satisfaction, Asia Insurance

### 1 Introduction

In the last few years, differentiating the insurance products in competitive markets have been very difficult (Ranjbarfard and Bakhtiari, 2011). This becomes more difficult when according to official statistics of the Central Insurance of Iran, more than 20 brands with more than 15 distinct types of services were working at the end year 2013 (Central Insurance of Iran, 2014). Brand is considered as a tool for differentiation and competitive advantage for products and services provider (Keller, 1993). Brand means a name, term, sign, design, symbol or any other feature that cause differentiation and provide products and services (Dibb et al., 1997). Imagine of customers and their experiences are often influenced by the behavior of employees and their doing tasks. Porricelli and colleagues (2014) believe that words like brand ambassador, Brand Champions, Living the Brand is influenced by spirit of employee behavior. This behavior is part of a larger concept under the Citizenship behavior of brand (Porricelli et al., 2014). According to official statistics of Central Insurance, Iran Insurance with more than 45% of the market share, is ranking first in Asia and the Asia Insurance company as the largest private insurance company, with over 10% share of the insurance market is in second place (Central Insurance of Iran, 2014). So in this research we seeks to answer the question that what are the factors affecting the formation of a brand citizenship behavior of employees in Asia Insurance?

### 2 The theoretical and background of research

#### 2.1 Brand Citizenship behavior

Citizenship behavior of brand is a brand-related concept which recently has become the research topic of interest among the marketing and management researchers. As mentioned in the introduction, recently the concept of organizational citizenship behavior has been applied to the Citizenship behavior of brand. Therefore it is necessary in this section that first examine organizational citizenship behavior. The difference between brand citizenship behavior and organizational citizenship behavior which was raised by Berman and Zeppelin (2005) was that organizational citizenship behavior is the concept which is concerned inside of the organization; while, Citizenship behavior of brand is a concept beyond Within the organization By considering actions outside of the organization (Berman and Zeppelin, 2005). Berman et al. (2009) describe the brand citizenship behaviors as keep alive the brand by staff (Berman et al., 2009). Organizational citizenship behaviors of brand pays attention by considering behaviors, to the behaviors of the

organization. Based on the fact that the behavior of their citizenship also involves behavior that is directed towards external target groups, from a perspective, citizenship behavior is wider than the organizational citizenship behavior. On the other hand, because citizenship behavior of brand instead of focus on the entire organization, it focuses only on the brand, and has a narrower range than the OCB (Berman and Zeppelin, 2005).

The first research to identify the citizenship behavior of brand was done by Berman and Zeppelin (2005) and identified seven dimensions for it. Then they began to reform their suggestion and reduced the number of dimensions to three dimensions (Berman et al, 2009). Although some other said that citizenship behavior of brand is one-dimensional so brand equity is based on staff (King & Grace, 2010).

In one-dimensional approach, View of Citizenship behavior of brand is limited to behaviors based on brand within the organization. But, multi-dimensional approach is more comprehensive, and in addition to considering one dimensional, is paying attention to convey brand concept to foreign costumers and stakeholders by the staff. Authors are believing that according to wide target groups which insurance companies are facing, citizenship behavior of brand seems to define the one dimension better due to its comprehensive approach. To convey the brand values of the organization to target population, first Staff should be familiar with organization brand. Thus, One-dimensional approach is considered as a prerequisite for a multi-dimensional approach (Porricelli et al., 2014). Thus, citizenship behavior of brand is measured by three dimensions brand acceptance, brand enthusiasm and brand development.

#### 2.2 Job Satisfaction

When someone says he has job satisfaction, this means that he really likes his job, has good feeling toward his job and considers great value to the job. Results show that staff with higher job satisfaction are in good manner mentally and physically. Job satisfaction is a kind of positive psychological feeling which one has towards his job and is generated by factors such working conditions, organization of job, relations governing workplace and cultural factors (Mura & Longo, 2012). A single factor will not lead to job satisfaction, rather a certain combination of various factors cause someone at a certain time feel satisfying toward his job and tell himself that he is satisfied with his job and enjoys it. By influences of various factors such as income, social value of job, working conditions and employment products at different times, someone can feel satisfied toward his job. Generally, human behavior is a complicated action and there is not much reason indicating that Important sustainable as job satisfaction should only be resulted from A category of factors (Rayton, 2006). Job satisfaction is a set of adaptive and maladaptive feelings which staff look to their work with those feelings (Dehghan, et al., 2011). Job satisfaction is one of the most common organizational behavior variables which indicates general view point of someone toward his job (Riley, 2006). A person who has high job satisfaction has positive attitudes towards his job, while a person who is not satisfied with his job, has negative attitudes towards his job (Xie, et al., 2014). From another perspective, Job satisfaction is considered as a full emotional response to the working conditions and environment. Somewhere else, Job dissatisfaction is discussed, it means the contrast between what one expects to receive from his work and what the person actually received.

#### 2.3 Domestic Brand Management

As Foreign branding by Advertising and strong brand Treaty, facilitates the customer's decision-making process, Companies have found that Promote the brand message through inside has the equal value. Internal branding within the organization to

promote brand means staff is mentioned (Ahmed & Rafiq, 2003). Since the internal branding creates a common understanding of the brand throughout the organization, Enables staff At the time of exposure problem, apply Brand Treaty.in this case, In short we can say that Internal branding cause employees understand the brand values and by combining them In creating brand reality affect Beneficially on The attitude of staff And forming their behavior to integrate to the brand (Drake et al., 2005). Branding services and products both on external orientation, including market segmentation and identify the market opportunities and positioning the same brand. However, services branding has internal orientations through employee participation in the branding process. In traditional marketing to brand marketing was only paid attention to foreign customers. Continued and qualified delivery of services based on the brand promise is where staff are entering branding process. Fulfilling the brand promise to customers when they experience is confirming a statement which organization has expressed about external branding efforts Such as advertising (Berman & Zeplin, 2005).

#### 2.4 Employees' commitment to the brand

Commitment to the organization represents the employees' degree of intervention and conflict with the goals of organization

and their interest to pursue working in the organization. Commitment to the organization can be known as "someone's sense of belonging to the organization and his sense of responsibility towards the goals of organization", also it is defined as people's willingness to provide energy and loyalty to social system (Ng & Feldman, 2011). In fact organizational commitment is a reflection of emotional attachment of the person to the organization and his identification with its objectives (Golparvar & AriziSamani, 2010). Components of commitment can be expressed in three cases: first the person should accept the values and objectives of the organization; second he should have the desire to attempt toward achieving organizational goals; and third he must have intense desire to be a member of the organization (Porter et.al, 1974). In this study the concept of employees' commitment towards brand of organization is of interest. Commitment to the brand and emotional and mental connection to the brand are defined. In fact commitment to the brand is the strong desire of employees to keep the brand. Being committed to the brand, the person knows the brand as his sign of personality and existence and does his best to keep it.

After reviewing literature review, figure 1 was selected as a theoretical model.

Figure 1. Theoretical model of the study

The hypotheses are as follows:

Hypothesis 1: internal brand management influences the employees' commitment to the brand.

Hypothesis 2: internal brand management influences citizenship behavior of the brand.

Hypothesis 3: internal brand management influences staffs' job satisfaction.

Hypothesis 4: staff' commitment to the brand influences the citizenship behavior of the brand.

Hypothesis 5: employees' job satisfaction influences the citizenship behavior of the brand.

Hypothesis 6: employees' job satisfaction influences their commitment towards the brand.

#### 3 Research method

This research from purpose view is practical. Also the method of data collection is descriptive or non-experimental, and since it has analyzed the nature, conditions, and relations between phenomena and variables, it is of survey and correlative kind. This study considering the criteria of time, it is cross-sectional. Also considering the degree of its depth, is of broaden studies (observational and low depth) and in comparison to deep studies. Statistical population of the present study consisted of the managers and employees of Asia insurance company in Tehran. Considering the limitations of accessing to all the staffs, 200 employees of Asia insurance company who had the possibility to answer the questionnaires were selected. According to Cochran 2 formula for limited population and at the P-value of 0.05 it is necessary that 132 employees who are accessible be selected. In this study data collection was through questionnaire. Table 1 represents the questionnaire of the present study. The value of Cronbach's alpha values for every component is also presented in this table.

Table 1- questionnaire

variable	component	question	Cronbach's alpha
Citizenship behavior of the brand	Brand acceptance	1-5	0.79
	Brand development	6-9	0.76
	Brand adherence	10-15	0.75
Internal brand management	Brand nature	16-18	0.82
	Brand leadership	19-22	0.81
	Brand connections	23-26	0.71
Commitment to the brand	-	27-32	0.76
Job satisfaction	-	33-38	0.77

#### 4 Findings

In this study, according to the results obtained by descriptive statistical analysis and demographic characteristics of respondents, the findings are presented in Table 2.

Table 2. Demographic characteristics of respondents

		Frequency	percentage
sex	Male	53	37.9
	Female	87	62.1
Marital status	single	35	25
	married	105	75
age	Under 25	52	37.1
	25-34	54	38.5
	35-44	20	14.2
	Over 45	14	10
Education level	Associate degree and under it	13	9.2
	Bachelor	70	50
	Master	48	34.2
	PhD	9	6.4
Job experience	Less than 5 years	23	16.4
	6-10 years	24	17.1
	11-15 years	47	33.5
	16-20 years	30	21.4
	21-25 years	11	7.8
	More than 25 years	5	3.5

#### 4.1 Analyzing research hypothesis

Hypothesis 1: internal brand management influences employees' commitment towards the brand.

According to table 3, the effect of internal brand management on employees' commitment does not have a significant influence;  $t=1.69$ .

Hypothesis 2: Internal brand management influences citizenship behavior of the brand.

According to table 3 the effect of internal brand management on citizenship behavior of the brand has standard variation of .65 which has the value of  $t=2.93$ .

Hypothesis 3: Internal brand management influences employee's job satisfaction.

According to table 3, the effect of internal brand management on employees' job satisfaction has standard variation of 0.69 which has the value of  $t=6.95$ .

Hypothesis 4: employees' commitment towards the brand influences the citizenship behavior of the brand.

According to table 3, the effect of employees' commitment toward the brand does not have a significant influence,  $t= - 0.23$ .

Hypothesis 5: employees' job satisfaction influences the citizenship behavior of the brand.

According to table 3, the effect of employees' job satisfaction on the citizenship behavior of the brand has standard variation of 0.28,  $t= 2.45$ .

Hypothesis 6: employees' job satisfaction influences their commitment towards the brand.

According to table 3, employees' job satisfaction does not have a significant influence on their commitment towards the brand,  $t= 0.39$ .

Table 3 summary of research hypotheses

hypothesis	path		Statistics t	Path coefficient	Hypothesis result
	from	to			
1	Internal brand management	Employees' commitment to the brand	1.69 ns	0.11	failed
2		Brand citizenship behavior	2.93	0.65	confirmed
3		Employees' job satisfaction	6.95	0.69	confirmed
4	Employees' commitment to the brand	Brand citizenship behavior	-0.23	-0.19	failed
5	Employees' job satisfaction	Brand citizenship behavior	2.45	0.28	confirmed
6		Employees' commitment to the brand	0.39	0.09	failed

Figure 2. Represents the final model of the study.

Figure 2- final model of research (numbers inside parenthesis are statistics t and numbers out of parenthesis are standard path coefficient)

## 5 Conclusion and discussion

In the one-dimensional approach of brand citizenship behavior, the view of citizenship behavior towards behaviors based on the brand are limited within the organization. But multi-dimensional approach of brand citizenship behavior is more comprehensive and in addition to covering the one-dimensional approach, it concerns the transference of brand concepts to customers and other stakeholders by employees. The authors of this study believe that considering the vast number of target groups that insurance companies are facing, citizenship behavior of the brand seems more comprehensive compared to one-dimensional approach. Since in order to transfer brand concepts and values of organization to the target society, first the employees of the organization should become familiar with the brand of the organization. As a result one dimensional approach is in some ways a prerequisite for multi-dimensional approach.

Real tribute to the employees, empathy and sympathy of the leader or senior managers of the organization, delegating to staff, loyal testament of the organization to employees and customers, community based behaviors, information sharing and activities like these builds trust in employees towards the brand. When senior managers are committed to employees, there is also the possibility to transfer this commitment from employees to customers. In fact there would be a cascading flow movement in the whole organization. This flow also causes the appearance of various kinds of brand based behaviors and return of external customers with more intensity towards the goals and visions of the organization.

To provide an environment of networked interactions, building trust in employees toward the brand and making them committed towards the brand it is necessary that activities which appease employees be undertaken. The human resources manager in addition to transferring brand concepts to employees at the time of employment and selection, must organizes training courses over the career path to ensure that they have gained sympathy with the brand. Organization members have diverse needs, that meeting their needs within the organization's mission statement and according to the interests of the parties is not far-fetched. Developing job path, promoting cooperation based on trust between employees, developing relationship between employer and employees, and activities like this, induces the impression to the employees that they are important to the organization and the organization is committed to them. This feeling results in employees' commitment towards the brand. Another aspect of brand management is related to activities out of organization such as advertisements, having communication with the customer, promotion activities, and like them creates loyalty in external customers to the organization or brand. Brand based behaviors from employees not only improves long-term relationships between external customers and organization, but also transfers the trust and commitment of employees to

customers. Customers' commitment towards the brand completes and strengthens the cycle of managers' commitment to the organization and employees, employees' commitment to the organization and customers.

**Abstract.** Instability and complexity may be too low and predictable environment on the impact of emerging leadership. In an unstable environment, a new style of management which enables the development of intangible assets and capabilities to enable dynamic activity, it is important. With this interpretation of the purpose of this study was to determine the relationship between servant leadership and commitment of staff satisfaction with the mediating role of psychological empowerment. The purpose of applied research and study of the nature and content of the survey is descriptive and correlational. In this study, random sampling method is available. The results showed that servant leadership theories with satisfaction and employee commitment had a significant relationship with the mediating role of psychological empowerment.

### 1. Introduction

Today, the Department of large organizations and advanced owes everything to competent manager, informed and competent with the knowledge and management techniques have been successful in carrying out this important task (LAN and Wei, 2015). One of the tasks of managers in process management, leadership and organization. In fact the essence of leadership, and is increasing its considerable influence exerted by leaders on subordinates and is an institutional priority (Ergeneli, et al., 2007). This led one of the prominent features and essential feature of any real manager. Conditions, the nature of their work and tasks and characteristics of selected employees. Leadership of an organization to adapt to change and to survive and thrive in new environments, specific features generally requires managers to respond to them are facing many problems (Lee et al., 2015). One of the most important characteristic that can help leaders and managers in response to these changes, is servant leadership. Among the important factors that could cause extensive research in the field of management, the appeal of the concept and style of management (Ambali et al., 2011). Because no matter when executives began to do "what" to do something, create a new way for teams or stimulate activity, however, is that their success depends on "how" to do this. Burns (2010) found that managers with the management style of his servants to challenge others to do exceptional things and trying urge. Larry Spears identified ten main properties which are central to the development of a servant-leader. These specifications are listening, empathy, healing, awareness, persuasion, conceptualization, foresight, stewardship, commitment to growth of people, and building community. Burns continued his argument stating that "the only style of servant managers that are able to draw the necessary routes for organizations because they are the source changes, the changes are fully dominant aristocracy and the winds of change are at" (Petrimulex, 2012).

In the meantime, employees of an organization to adapt to changes and trends in order to survive and thrive in new environments, specific features generally requires managers to respond to them are facing many problems. One of the most important characteristic that can help leaders and managers in response to these changes, leadership behaviors. Employees subject tendencies that try to explain and define the role of attitudes in human capabilities. Employees that have appropriate behaviors, effective resources that the targets with maximum productivity, satisfaction and commitment make researcher (Hafmann, 2012). Today, many organizations are subject to

change and any change requires employees and managers to be adaptable and adapt to changes. The social interaction in a proper way and fruitful for most managers and leaders has become increasingly important as a key element in the management of organizational changes. Studies have shown that overtaking will be future managers and effective so that they can effectively communicate with their human resources and their behavior and attitudes appropriate to take a position (DonPage and Paul, 2014). psychological empowerment of employees through the process of strengthening the feeling of self-identification and elimination of those organizational conditions that lead to powerlessness and inability to have them Managers using the mechanism of leadership and approaches to the elimination of powerlessness and inability to create the tendencies in human resources employees (Msbtrgray and real insight) in the direction of the organization. The main problem in this study is whether the satisfaction of servant leadership and staff commitment had a significant relationship with the mediating role of psychological empowerment? This study investigates the mediating role of job involvement in servant leadership and the mediating role of psychological empowerment in social security organization. The next section proposes the theoretical foundations and the literature and elaborates on the conceptual pattern and theories.

### 2. Research Method

The purpose of applied research and study of the nature and content of the survey is descriptive and correlational. The study also in terms of field data collection and questionnaire tool. The population of this research included all employees and managers of social security Ardebil province a total of 207 persons. Morgan will be used to select the sample studied sample of 130 people with 95% reliability is achieved. In this study, random sampling method is available. Collecting the required data, the field using a standard questionnaire. Referring to the workplace in Ardebil province will be the Social Security Organization. Three questionnaires were used to collect data, a questionnaire that will be used in the form of a single form. Scale questionnaire consisted of servant leadership (Lan and Wei, 2015) consists of 24 questions, a standard questionnaire Ergeneli, et al., (2007), consists of 15 questions in order to assess the psychological empowerment and ultimately standardized questionnaire Hoffman (2012) in order to measure the adherence of work (satisfaction and employee commitment) consists of 10 questions (5 questions about employee satisfaction and employee commitment 5 items), respectively.

Conceptual model is a model based on the theoretical relationship between the factors and variables affecting the subject of research. Figure 1 depicts the conceptual pattern of the present research.

The above model presents that servant leadership directly affects social security organization and indirectly when mediated by job involvement. In addition, job involvement, also, has direct effects on social security organization.

### 3. Finding

In this study, a questionnaire was used for data collection. Therefore, using confirmatory factor analysis research questionnaires about the overall structure of content is validated. For confirmatory factor analysis and structural equation modeling standard loadings and t-statistic is calculated. (Figures 1, 2, 3). Also, the results of the evaluation of the structural model are presented in table 1.

Figure 1. Conceptual model

Figure 2. The relationships between variables

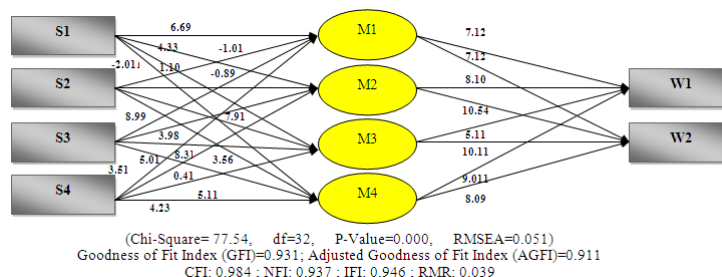

Figure 3. Significant numbers of variables

Table (1): The results of the evaluation of the structural model

Path to from	Data	t	Bias	Lower Bounded	Upper Bounded	sig
xyz	0.549	2.135	0.0007	0.00022	0.0894	0.034
xye	0.223	2.433	0.0006	0.00035	0.0824	0.015
x1yz	0.155	2.049	0.0005	0.00025	0.0885	0.041
X2yz	0.310	2.555	0.0060	0.00055	0.0748	0.011
X3yz	0.201	2.183	0.0055	0.00011	0.0807	0.030
X4yz	0.223	2.433	0.0088	0.00088	0.0801	0.015
x1ye	0.243	2.555	0.0054	0.00095	0.0777	0.009
X2ye	0.017	4.017	0.0007	0.00074	0.0811	0.000
X3ye	0.449	4.386	0.0006	0.00068	0.0963	0.000
X4ye	0.128	2.304	0.0099	0.00027	0.0325	0.022

Due to the amount of t-test statistics calculated for the difference between intervals +1.96 and 1.96 is not (critical region of 95%), on the one hand due to the significant level calculated that less than the level of accuracy (0.05), which was also due to lack of zero between lower and upper confidence interval for this route and thus confirming the hypothesis suggests a significant way related to it. (table1).

The findings of this research confirmed the positive effect of server leadership on job satisfaction. These findings are coordinated with the results of researches that has been carried out by Scuderi (2010). The findings of this research confirmed the positive effect of server leadership on organizational citizenship behavior (H4). These findings are coordinated with the results of other researches (Zehir et al., 2013). The server leaders provide peace, security and confidence in the work atmosphere, which increases the citizenship behaviors of the staff.

In addition, job involvement has positive correlation with commitment, organizational citizenship behavior, motivation, and positive performance and has negative correlation with absenteeism and turnover. Job involvement is also associated with the identification. The involved individual usually knows his job as introducer for himself (Kahn, 1999). Thus, with respect to the benefits of job involvement for organizations, and on the other hand, servant leadership which has a positive relationship with job involvement, top managers of most organizations are recommended to develop serving in order to take advantage of job involvement.

**4. Conclusion**

The design of this study is descriptive in nature. To examine the research question, one sample t-test and structural equations modeling were used. The obtained data from the instrument were

put into SPSS 20 for data analysis that proposed the following issues:

1. By creating an exchange of ideas between think tanks and human resources, exchange of knowledge between employees and managers, and integrate the context of a strong sense of commitment to the goals of the Bank provides
2. According to the kindness and love of their heads and make it operational.
3. In order to promote independence as a lever Trust staff also recommended that the deputies and executives from the principle of absolute authority.
4. By creating think tanks and holding brainstorming sessions, field staff and provide dynamic interaction between them and creating the atmosphere full of peace and humility provide.
5. By improving the work life and continued support for the staff, improve human capital at all levels provide banks.

The servant leadership topic is important for all organizations so it is suggested that leaders of organizations take this topic as a serious business and foster it as much as possible in order to improve organizational identification and job involvement. Without a shadow of doubt, job involvement has undeniable benefits and it is associated with organizational identity. It also has significant benefits for organizations. So the servant leadership can serve as a bridge to cross today's turbulent and changing environment. In conclusion, it should be highlighted that scientists should conduct more researches investigating different aspects of this field of research in various contexts.

**Abstract:** The main purpose of this research was to investigate the effect of applying information technology in increase administrative health. The statistical population of the research are the staffs of Social Security Offices of west Azerbaijan province that their number is 1600. The sample size using Morgan table was estimated 309 persons and they were selected by cluster sampling method. The validity of questionnaires was approved by the supervisor and a handful of management teachers and its reliability was confirmed by Cronbach's alpha that for information technology and administrative health questionnaires, were 0.85 and 0.88 respectively. The obtained results indicated that there is positive relationship between applying information technology and administrative health of the staffs of social security offices of west Azerbaijan province.

**Key words:** Information technology, health administrative, social dimension, political dimension.

### 1 Introduction

According to the domestic and international evidences Iran is one of the most corrupt countries in the world .according to science survey in the monthly research economic journal that has been done in 2002, it has been identified that about two-thirds of respondents were grappling with the problem of bribery and have been paid the bribery (Khezri, 2008) also the institute of international transparency in his 2014 report ranked Iran in 136 in terms of administrative and economic corruption index.

Corruption that is the contrast point of official health suffered both developed and developing societies and exploring about it suggests that corruption inhibit the growth of competition and neutralization of activities in order to reduce poverty and social discrimination and by negative effect on efficiency and effectiveness of the system of official health leads to waste national resources and thus reduce the effectiveness of the government in the conduct of affairs and people's confidence in government and non-state organizations. Corruption also weakens the incentives, social harms or weaken existing institutions, inequitable distribution of resources and the political losses and finally results in economic losses. United Nations Development Programme (UNDP) defines corruption as the abuse of public and administrative power for personal gain through bribery, extortion, nepotism, fraud and embezzlement. And equals it with "Increasing monopolization of power and personal discretion and reducing accountability, trust and integrity and transparency" (International Transparency Organization, 2004). The results show that corruption is caused by multiple and wide factors. In such a way that cultural, social, economic, political and administrative factors were diagnosed for this phenomenon. Also focusing on, preemptive actions instead of punishing of culprits, following regular and systematic anti-corruption programs, emphasis on corporate culture and strengthen it as part of general society and finally address the problems of organization, administrative structure and analysis on the basis of sociological approach in order to reducing official corruption have been proposed as basic solutions (Ghaderi, 2010). Another tool that is effective in reducing corruption and improving administrative health is advanced information and communication technologies (Khezri, 2008). Internal changes and evolution of disease-oriented approaches to holistic health and individualization to the community in recent years and significant progress in information technology in the world have followed

The idea of using information and communication technologies in improving the quality of services organizations (Matolx et al., 2007).

Innovation and change is a unique feature of the third millennium, referred to as the age of information, many countries have found that the age of the information is the arena of organizations that have served the capabilities of information technology to their services and they take actions with effective approaches in order to reproduce and rebuild the bureaucracy and generally in social system (Zahedi, 2005).

Experiences from various countries indicate that corruption is a complicated, hidden and varied affair. In fact, corruption in the administrative aspects and other aspects of society is such as an infection, if penetrate in the limbs and body of society, makes infectious its members one after another and destroy them and even may corrupt all the society. Since the social security administration deals with in a sense that people are concerned with the health and insurance and also in terms of the extent of the scope of its business is exposed to official corruption the problem of corruption and ways to combat it has always been a concern for officials and administrators. In the meantime, one of the tools that appear to be useful in the prevention of corruption and administrative health promotion is information systems. However there are some conflicts between researchers and experts on the health effects of information systems. Therefore with regard to the stated materials the aim of this study is to find an answer to this question that what effects the applying IT on increasing health administration in the Social Security offices in Western Azerbaijan province.

### 2 Methodology

The method of the study is survey-descriptive. The statistical population of the research are the staffs of Social Security Offices of west Azerbaijan province that their number is 1600 person. The sample size using Morgan table was estimated 309 persons and they were selected by cluster sampling method. The tool for data gathering were questionnaires, the standard questionnaire of information technology of Mostafae (2009) and standard questionnaire of administrative health of Mc Kasker (2006) .the validity of questionnaires was approved by the supervisor and a handful of management teachers and its reliability was confirmed by Cronbach's alpha that for information technology and administrative health questionnaires, were 0/85 and 0/88 respectively .the collected questionnaires were analyzed by (Kolmogorov Smirnov and Pearson tests. The tool for data gathering were questionnaires, the standard questionnaire of information technology of Mostafae (2009) and standard questionnaire of administrative health of Mc Kasker (2006) .

### 3 Findings

Statistical indicators (central and dispersion) research variables are show in Table 1 below.

Table 1. Statistical indicators (central and dispersion) research variables

variables	mean		Max	Min	range	Sample size	SD
	Standard error	statistics					
Administrative health	0.01201	2.852	4.65	1.50	2.80	309	0.31420
Administrative Agent	0.2213	3.625	5.02	2.75	2.17	309	0.41011
Political factor	0.03202	3.325	3.02	1.36	1.80	309	0.33111
Economic factors	0.01652	2.485	3.74	2.02	1.75	309	0.27296
Social factors	0.02419	2.845	5.06	2.02	3.00	309	0.12277
Information Technology	0.02451	3.751	4.18	1.84	2.40	309	0.42419

### 3.1 Kolmogorov-Smirnov test

As it can see in table 2, for all variables of the research the significance of the test is bigger than error level of 0/05 (P-value=sig> 0.05).it means that all variables of the research with 95 percent confidence are normal and the null hypothesis of the test is confirmed.

Table 2: Kolmogorov-Smirnov test to fitness of normal distribution

variable	number	Kolmogorov-Smirnov test	sig	result
Administrative health	309	063.1	068.0	normal
Administrative factor	309	093.1	054.0	normal
Political factor	309	935.1	124.0	normal
Economic factor	309	9830.	4320.	normal
Social factor	309	976.0	389.0	normal
IT	309	3211.	067.0	normal

### 3.2 Hypothesis testing

#### The main hypothesis test:

Applying IT is effective in applying health administration in Social Security offices in Western Azerbaijan province.

As it can see in table 3, the significance of the correlation test is smaller than error level of 0/05

(P-value=sig< 0.05).it means that the correlation between applying IT and health administration is significant with 95 percent confidence and an assumption of lack correlation between two variables is rejected. The positive correlation means that two variables have direct relationship with each other it means that by increasing applying IT the value of health administration in Social Security offices in Western Azerbaijan province increases.

Table 3: Pearson correlation test for the main hypothesis

variable	Staff's performance	
	Applying information technology	Number of observations
Pearson correlation coefficient		0.425
significance		0.000

Testing the first sub hypothesis; applying IT is effective in increasing administrative factor of official health Social Security offices in Western Azerbaijan province.

As it can be seen in table 4 the significance level of the correlation test is less than 0.05 (P-value=sig< 0.05).resulted that the correlation between applying IT and office factor of health is

significant with 95 percent confidence and the assumption of lack of correlation is rejected. The positive value means that two variables have direct relationship with each other.it means that by increasing applying IT the amount of administrative health system increases in Social Security offices in Western Azerbaijan province.

Table 4: results of Pearson correlation test for first subsidiary hypothesis

variable	Administrative factor	
	Applying information technology	Number of observations
Pearson correlation coefficient		0.412
significance		0.000

**The second sub hypothesis:** applying IT is effective in increasing political factor of official health Social Security offices in Western Azerbaijan province.

As it can be seen in table 5 the significance level of the correlation test is less than 0.05 (P-value=sig< 0.05).resulted that the correlation between applying IT and political factor of health

is significant with 95 percent confidence and the assumption of lack of correlation is rejected. The positive value means that two variables have direct relationship with each other.it means that by increasing applying IT the amount of political health system increases in Social Security offices in Western Azerbaijan province.

Table 5: results of Pearson correlation test for second subsidiary hypothesis

variable	political factor	
	Applying information technology	Number of observations
Pearson correlation coefficient		0.258
significance		0.004

**The third sub hypothesis:** applying IT is effective in increasing economic factor of official health Social Security offices in Western Azerbaijan province.

As it can be seen in table 6 the significance level of the correlation test is less than 0.05 (P-value=sig< 0.05).resulted that the correlation between applying IT and economic factor of

health is significant with 95 percent confidence and the assumption of lack of correlation is rejected. The positive value means that two variables have direct relationship with each other.it means that by increasing applying IT the amount of economic health system increases in Social Security offices in Western Azerbaijan province.

Table 6: results of Pearson correlation test for third subsidiary hypothesis

variable	economic factor	
	Applying information technology	Number of observations
Pearson correlation coefficient		0.312
significance		0.004

**The fourth sub hypothesis:** applying IT is effective in increasing social factor of official health Social Security offices in Western Azerbaijan province.

As it can be seen in table 7 the significance level of the correlation test is less than 0.05 (P-value=sig< 0.05).resulted that the correlation between applying IT and social factor of health is

significant with 95 percent confidence and the assumption of lack of correlation is rejected. The positive value means that two variables have direct relationship with each other.it means that by increasing applying IT the amount of social health system increases in Social Security offices in Western Azerbaijan province.

Table 7: results of Pearson correlation test for fourth subsidiary hypothesis

variable	social factor	
	Applying information technology	Number of observations
Pearson correlation coefficient		0.441
significance		0.004

#### 4 Discussion and Conclusion

The main purpose of this research was to investigate the effect of applying information technology in increase administrative health.

Results indicated that applying IT is effective in increasing official health of Social Security offices in Western Azerbaijan province and this is consistent with findings of other researchers (Ahmad Baladehi et al., 2014) and it is inconsistent with findings of Farhadi and Mottaghian (2014). Therefore managers and authorities in Social Security offices in Western Azerbaijan province should use the newest technologies and information and communication technologies and in this way increase the amount of official health.

Results indicated that applying IT is effective in increasing administrative factor health of Social Security offices in Western Azerbaijan province and this is consistent with findings of other researchers (Ahmad Baladehi et al, 2014) and it is inconsistent with findings of Farhadi and Mottaghian (2014).therefore managers and authorities in Social Security offices in Western Azerbaijan province should use the newest technologies and information and communication technologies and in this way increase the amount of official health.

Results indicated that applying IT is effective in increasing political factor health of Social Security offices in Western Azerbaijan province and this is consistent with findings of other researchers (Ahmad Baladehi et al, 2014) and it is inconsistent with findings of Farhadi and Mottaghian (2014). Therefore managers and authorities in Social Security offices in Western

Azerbaijan province should use the newest technologies and information and communication technologies and in this way increase the amount of political health of health administration.

Results indicated that applying IT is effective in increasing economic factor health of Social Security offices in Western Azerbaijan province and this is consistent with findings of other researchers (Ahmad Baladehi et al., 2014) and it is inconsistent with findings of Farhadi and Mottaghian (2014). Therefore managers and authorities in Social Security offices in Western Azerbaijan province should use the newest technologies and information and communication technologies and in this way increase the amount of economic health of health administration.

Results indicated that applying IT is effective in increasing social factor health of Social Security offices in Western Azerbaijan province and this is consistent with findings of other researchers (Ahmad Baladehi et al, 2014) and it is inconsistent with findings of Farhadi and Mottaghian (2014). So, managers and authorities in Social Security offices in Western Azerbaijan province should use the newest technologies and information and communication technologies and in this way increase the amount of social health of health administration.

**Abstract.** The purpose of the present research is to investigate factors effective on customers' active engagement. Therefore, the present study investigates the effect of customer engagement on purchase intention as well as how the mediating role of customer interaction, self-esteem and self-expressiveness is effective on customers' purchase intention. This research, from data collection viewpoint is descriptive and survey, including library study and 30 questionnaire that was distributed among the study population customers of Nike brand in Tehran, with a sample size of 400. Results obtained by using the Kolmogorov-Smirnov, Pearson correlation coefficient and structural equation modeling reflect: there is a positive and significant relationship between self-esteem and brand love; brand self-expressive and brand jealousy.

**Keywords:** Brand Love, Brand Jealousy, Self-Esteem, Brand Self-Expressiveness, Active Engagement, Customers' Purchase Intention

### 1 Introduction

In today's world, brand names have effective role as one of the intellectual properties in developing and earning more money in business units. The issues associated with brand names including brand-consumer relationship which deals with important concepts such as brand commitment, trust and loyalty and can bring many positive outcomes for companies and managers are highly regarded in marketing research. One of the dimensions of consumer-brand relationship is emotional aspect of this relation which is related to issues higher than mere loyalty or rather than being a supporter of certain brand name. This stage includes concepts such as brand attachment and brand emotional relationship and also feelings such as brand love and brand jealousy which are the main subjects in the present study. In recent years, the roles of customers and companies have been increasingly combined. Examples of this combination can be seen in customer participation activities in production or development of products (Jaakola & Alexander, 2014). The concept of customer engagement as one of these combined roles has been regarded in recent years by researchers and those who are active in industry (Van Doom et al., 2010). Customer engagement has become one of the recent activities of managers and often is applied by companies and organizations through websites and other social networks.

Brand love cannot merely predict the customer engagement; hence, it caused brand jealousy variable was regarded as a complement to brand love in order to make better prediction of customer engagement. Customer engagement is accompanied with many advantages and it is considered as a driving force to maintain a long-term relationship with customers (Sarkar & Sreejesh, 2014). Customer engagement is regarded as one of the strategic necessities to create a sustainable competitive advantage for companies and it can predict the future of business (Brodie et al., 2013); therefore, marketers pays certain attention to customer engagement.

Since, less research has been performed on customer engagement in Iran, the researcher made an attempt to conduct a research in this field and provide the way for future studies regarding customer engagement.

### 2 Theoretical framework of the research

Brand names are an integral part of consumers' lives and are present in all aspects. Recent research has been focused on understanding and explaining certain types of relations established between consumers and brand names. For example, concepts and measures such as brand sensitivity, brand

relationship, brand commitment, brand trust and brand loyalty are defined among the concepts related to consumer-brand relationships and consumers have been divided into groups based on the depth of such relations (Albert, et al., 2008). However, brand fascination is a new concept in the field of marketing science which has recently attracted the attention of many researchers and academics. Brand fascination has been uniquely investigated by researchers as one aspect or dimension of broader concepts such as relational value and brand emotional attachment. The results have shown that Brand fascination affects critical marketing variables.

Brand names make consumers' life meaningful and have an important role in shaping their behavior (Albert, et al., 2012). This belief that inanimate objects such as brand names can be mixed with human characteristics is considered important in terms of marketing and consumer psychology (Sung & Kim, 2012). In the area of interpersonal relationships, people are often interested in individuals with whom they share common features. The same belief is also true about consumer-brand relationships. This subject rooted in social psychology suggests that consumer experiences of brands create some brand images in his mind through a series of exchanges. Keller claims that brand images are acted similar to information nodes in individuals' memory and remind meanings of brand names to consumers (Hwang & Kandampully, 2012).

Recently, Riemann and Aaron claimed that these theories about human relationships can be also relevant to close relationship between consumers and brand names, because sometimes people have a similar relationship with favorite objects as they do with humans. Often, these objects are certain brands which consumers are in relation with and use them to build their identity. Like the sense of loving others, brand names can create warm feelings among consumers. Therefore, consumers experience a pleasant feeling of being important and finally, a close relationship is made between consumers and brand names. Brands can give a favorite image of themselves to consumers because self-definition by possessions allows individuals to introduce themselves more different than what they actually are.

#### 2.1 Review of the Related Literature

1. Sarkar & Sreejesh (2014) conducted a research titled "Examination of the Roles Played by Brand Love and Jealousy in Shaping Customer Engagement" among 170 persons who had automobile in metropolitan cities in India. The results of this research confirmed the effect of self-esteem on brand jealousy; self-expressiveness on brand love; brand love on brand jealousy; brand jealousy on purchase intention; and brand jealousy on customer active engagement. Brand jealousy played the role of mediating factor very well to show the effect of self-esteem and self-expressiveness on purchase intention.
2. Wallace, Buil and de Chematony (2014) conducted a research titled "Consumer Engagement with Self-Expressive Brands: Brand Love and WOM Outcomes" on 265 Facebook users who were following a brand name as their favorite brand during the past year. In this research, the effect of self-expressive brand (social self) on brand love; self-expressive brand (inner self) on brand love; self-expressive brand (inner self) on word-of-mouth advertising; self-expressive brand (social self) on brand acceptance; brand love on word-of-mouth advertising; and brand love on brand acceptance were confirmed. Also, the effect of self-expressive brand (social self) on word-of-mouth advertising and self-expressive brand (inner self) on brand acceptance which were expected to be approved were rejected.
3. Motaharnejad, et al., (2014) conducted a research titled "Investigating the Relation between Brand and Consumer (A Case Study of Home Appliances)" with the purpose of investigating the relation between brand and customer. Study population included all consumers of home appliances in Mashhad selected through simple random sampling. Proportional

Beliefs	0.807	0.821	0.771	1		
Opinions	0.805	0.814	0.825	0.813	1	
Satisfaction	0.774	0.772	0.737	0.788	0.749	1

Significant level = 0.01

4.1 Path analysis (hypotheses testing)

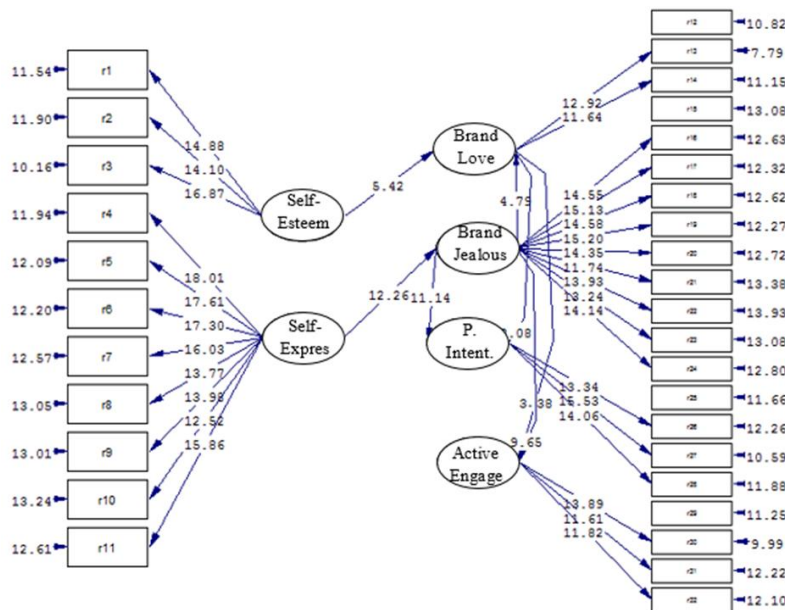

Lisrel software was used to test hypotheses and investigate the relation among factors of model. The results obtained from

model analysis in different cases of path and significant coefficients have been shown in figure 2 and 3.

Chi-Square=718.70, df=456, P-value=0.00000, RMSEA=0.048

Figure 2. Theoretical Model of the Study in cases of significant coefficients (t-statistic)

Chi-Square=718.70, df=456, P-value=0.00000, RMSEA=0.048

Figure 3. Theoretical Model of the Study in cases of standard path coefficients

Different types of tests are used in research to determine the fit of model (Houman, 2005). Generally, it suffices to use 3-5 indexes in order to validate a model (Tabatabaei, 2002). In the

present research, following values were calculated:  $\chi^2/d_f = 1.576$ , RMSEA = 0.04, NFI = 0.99, NNFI = 0.98, CFI = 0.99.

Therefore, the research data are sufficiently fit with factor structure and theoretical foundations and this represents that questions are consistent with theoretical structures.

#### 4.2 Research hypotheses testing

In hypothesis 1, the effect of self-esteem on brand love indicates a standard path coefficient with value of 0.42 and  $t = 5.42$ .  $t$ -value for this parameter (according to one percent error rule in rejecting null hypothesis for values out of the range from  $-2.58$  to  $2.58$ ) has been calculated more than  $2.58$ ; therefore, it can be concluded that the null hypothesis is rejected with 99% confidence and hypothesis 1 is accepted. In hypothesis 2, the effect of self-expressiveness on brand jealousy indicates a standard path coefficient with value of 0.74 and  $t = 12.26$ ;

therefore, this hypothesis is accepted. In hypothesis 3, the effect of brand jealousy on brand love indicates a standard path coefficient with value of 0.36 and  $t = 4.75$ ; therefore, this hypothesis is accepted. In hypothesis 4, the effect of brand jealousy on active engagement indicates a standard path coefficient with value of 0.76 and  $t = 9.65$ ; therefore, this hypothesis is accepted. In hypothesis 5, the effect of brand jealousy on customers' purchase intention indicates a standard path coefficient with value of 0.85 and  $t = 11.14$ ; therefore, this hypothesis is accepted. In hypothesis 6, the effect of brand love on active engagement indicates a standard path coefficient with value of 0.49 and  $t = 3.38$ ; therefore, this hypothesis is accepted. In hypothesis 7, the effect of brand love on customers' purchase intention indicates a standard path coefficient with value of 0.46 and  $t = 3.08$ ; therefore, this hypothesis is also accepted (table 3).

Table 3. Summary of research hypotheses

Hypothesis No.	Hypothesis		Standard path coefficient	t- statistic	result	Significant level (percent)
	from	to				
1	Self-esteem	Brand love	0.42	5.42	confirmed	99
2	Self-expressiveness	Brand jealousy	0.74	12.26	confirmed	99
3	Brand jealousy	Brand love	0.36	4.75	confirmed	99
4	Brand jealousy	Active engagement	0.76	9.65	confirmed	99
5		Purchase intention	0.85	11.14	confirmed	99
6	Brand love	Active engagement	0.49	3.38	confirmed	99
7	Brand love	Purchase intention	0.46	3.08	confirmed	99

#### 5 Suggestions

According to the results obtained from hypotheses testing, the following suggestions are recommended:

1. Suggestions based on hypothesis 1: In the early stages of a customer-brand relationship, when the customer is just starting to engage and purchase a brand, his interest can be very high. If the company has the ability to preserve customer's enthusiasm and strengthen it in the early stages, it can take advantage of benefits including brand commitment and positive word-of-mouth advertising for a long time. Fashion brands strategy should be in the way that brand personality and images are used to increase the emotional relationship between customers and brands.

2. Suggestions based on hypothesis 2: Companies encourage their customers through establishing emotional relationship with them to talk positively about their brand and develop more word-of-mouth advertising. If this goal achieved, it would increase the number of their customers and in this way company's profitability would be improved. Since, the brand personality could strengthen the customers' subjective perception; a deliberate effort can be made to create a powerful brand by a selection of distinct personality which is in accordance with desired sections on the market.

3. Suggestions based on hypothesis 3: Being well-known because of superior quality can bear the greatest impact on brand image; hence, branded apparel companies need to emphasize on maintaining and enhancing the quality of their products in order to improve their brand image over time and according to the sixth hypothesis to increase brand love. Manufacturing companies need to maintain and even improve the quality of products to create a positive word-of-mouth advertising and in this way encourage their customers to increase their purchase intention.

4. Suggestions based on hypothesis 4: Companies should prevent negative word-of-mouth advertising because such advertising has negative effect on purchase intention and

damages the company's brand. Manufacturing companies can create a positive word-of-mouth advertising by presenting an online platform to satisfy consumers and meet their needs simply. This will not only increase performance of product sales, but it will also decrease advertising costs. Brand managers must take advantage of means enhancing the credibility of the product quality to attract customers' attention and trust. Product quality reputation is achieved through getting certificates, offering insurance for goods, increasing popularity, etc.

5. Suggestions based on hypothesis 5: People who have personality traits interested in online purchase usually are optimistic. They have a positive impression on the product and an eagerness to own it and they make a decision to purchase it without hesitation. This indicates that consumers with vigorous features can be easily exited for purchase intention. Companies would be able to attract unplanned shopping behaviors through arousing customers' emotions and making them interested in brand.

6. Suggestions based on hypothesis 6: According to the research results, most customers of Nike products are between 18-38 years of age; as a result, advertising companies must make efforts to attract the attention of this age range. When a brand is well-known, it causes a better mental image and increases brand love in this group and in this way it is accompanied with word-of-mouth advertising for Nike brand. Most customers of Nike brand are athletes, young people and also educated ones. Although, they have common characteristics, distinct groups can be recognized among them and customized marketing activities must be done for each group as a specific target market. It requires extensive and detailed data collection from customers. In the way that in addition to overall demographic variables, some information about customers' interests, activities and lifestyle are achieved. Through categorizing homogeneous groups of customers, customized marketing activities can be focused on them. For example, related advertising messages and news are sent to individuals interested in public sports and walking and are always purchasing products related to such activities or young women including students are encouraged to

buy new models of bags and sport shoes through receiving related advertising and information or a certain page is considered for them on companies' website and social networks.

7. Suggestions based on hypothesis 7: Companies should produce and introduce products with high prestige to draw attention of people with high self-value and individuals who consider themselves as important ones and on the other hand try to build identity using well-known and luxury brands and put themselves in a high social status. Companies would be also able to encourage individuals and customers to purchase and use their products and services by improving value, service and quality of products. They should also consider different obstacles which prevent the purchase.

**Abstract.** With regard to the increasing expansion of internet and communicative services, producers and sellers pay more attention to the internet and its use in selling products. In this article, first, the literature review toward the cosmetic products was discussed from different points of view. Then, a regression testing was used as a statistical method in this article. 384 individuals were used as the statistical population of this study. In this study, these people were selected from the health customers who at least bought something from the internet one more time. Also, in this article, SPSS software was used as an instrument for analyzing data in descriptive and inferential statistics. The results show that there is a direct and significant relationship between the online marketing variables and exporting the products.

**Keywords:** Exports, Online Marketing, Relationship, Sales

### 1 Introduction

Active companies in different countries exported their products to other countries at the time of domestic market saturation. Companies used exporting as a simple, substantial, and important method in order to enter to the international markets. Companies expanded their exports in order to use their chances and obtain income, financial sources, and other privileges. In most of the developing countries such as Iran, export is considered as a trade strategy (BaBae, 1392).

From economical point of view, internet plays an important role in the success of companies in domestic and foreign markets. In most trades, businessmen use internet as a cheap and expanded media for making a relationship with present and future customers and simplifying the most marketing affairs. Nowadays, internet will lead to the decrease in the communication expenses with removing the time and place limitations in the economic, social, and cultural relationships of people. One of the most important economic processes which are obtained in the international trade directly and indirectly is the export of goods and services. Internet expanded the export of goods and services considerably as a modern electronic trade tool (Tayyebi, 2012).

Studying the efficiency of online marketing on the exporting of health producers can be one of the most regarded issues in managing the marketing in organizations. The aim of this study is to study different dimensions of online marketing and the effect of online marketing on exporting the health products (Iranian exporting companies). (Samiee, 1998).

### 2 Concepts, Points of View, and Theoretical Background

Marketing is a process of planning, pricing, advertising, and distributing the goods and services in order to reach to individual and organizational aims. Marketing ideas of the 1970s was recognized after two decades of economic boom in the west and at the time of recession caused by the oil shock and economic issues. If organizations wanted to become successful in their carrier, they would have to use marketing (Katler and Armestrang, 2000).

Product marketing can be done in internal or foreign markets. Exporting marketing is included of all activities that a company does at the time exporting goods to the foreign countries. Although product marketing in internal markets is of high importance, exporting marketing is included of choosing the markets and suitable countries through marketing searches, necessary changes in goods, and suitable channels. In exporting marketing, a company may use an internal marketing strategy

and export its things with less product changes (Esmaili Pour, 2008).

Nowadays, internet is an important commercial factor. Internet is developed faster than other communicative technologies and universal markets are progressed more than other media technologies.

Online marketing is one kind of electronic trade which is included of information management, public relations, services, and sales department.

Online marketing is included of using internet and dependent digital technologies for the purpose of accessing to marketing aims and supporting the marketing concept in a modern way. (Clarke, 2002).

In practice, online marketing is a use of a company website and its mixture with direct developed technologies such as Google, banner ads, electronic post, and its relation with other sites for the purpose of giving services to new customers in order to develop the relationship with customers. Also, this point should be regarded that online marketing would be a good way if there were a complete correlation between an online marketing and traditional media such as press and television.

Generally speaking, online marketing means using internet and other digital technologies with traditional media for the purpose of accessing to marketing aims (Chaffy et al., 1999).

#### 2.1 Internet as a Communication Tool in Marketing

Marketing communication is included of different elements such as sales promotion, general relation, direct marketing, and advertisement. Advertisement is an important element of marketing specially, online marketing. Marketers use advertising for giving information about the trade name and its advantages in relation to other trade names, and finally choosing a trade name by the customer. Electronic advertising is one kind of electronic communication. Therefore, companies and industries spend a lot of money on electronic advertising due to an important role of advertising in giving information to the customers and encouraging the customers to buy things (Strauss and Phroust, 2001).

#### 2.2 Internet as a Market Tool in Marketing

Internet is an efficient mediator for conducting the market studies in the worldwide. Due to the fast changes in the international markets and the increasing competitions among them, companies should access to related and timely information in order to expand their exports. Therefore, companies use internet for gathering initial data about online marketing, bulletin boards, web users, advertisement assessment, identifying systems of customers, and post electronic marketing lists (Quelch and Klein, 1996). Also, they use internet for gathering secondary data about online newspapers and journals, industrial companies, trade companies, representatives, distributors, state contacts, and legal details of a host country (Hemil, 1997). Companies use internet for gathering information about marketing in order to expand international markets (Quelch and Klein, 1996).

#### 2.3 Internet as a Sales Tool in Marketing

Internet is a very good sales tool because companies can access to the potential customers from all around the world and sell their products. In addition, internet will lead to a dramatic growth of online population. It means that internet is very good tool for exporting companies to sell their products to people from all around the world. Companies can accept online orders through a safe online payment in online trades. Therefore, internet is considered as an important index in increasing the

existent exporting activities of the companies and expanding the number of customers from all around the world (Hemil, 1997).

#### 2.4 Internet as an Improving Tool in Marketing

Companies use online advertising to introduce their commercial name to the people from all around the world. Therefore, they should make people familiar with their commercial name and answer to the questions toward their commercial name. Also, this kind of advertising should make customers familiar with the values and advantages of a commercial name and encourage them to buy things. If people remember the commercial name of the advertised company, this kind of advertising would be successful. Also, the commercial names which are remembered by customers easier than other commercial names are of high competing advantages (Dubov, 1994).

Remembering the commercial names of the companies and advertisements is related to the customers' point of view toward an advertisement. Generally, studies show that consumers who have a positive attitude toward an advertisement can remember the advertisements and the commercial names of the companies better than the consumers who do not have a positive attitude toward an advertisement (Ston et al., 2000). Researchers such as Chen and Velz (1999), and Beraner and Komar (2000) show the differences between the customers' point of view toward an electronic trade and sites in a model.

The results show that the people's point of view toward a site has a direct relationship with the people's point of view toward advertisement, commercial name, and the purchasing aims of the consumers (Ivanef, 2012).

#### 2.5 Internet as an Expense Reduction Tool in Marketing

Since internet has a less expense, it will make companies to reach to the potential worldwide customers. While companies think that internet is one kind of expensive marketing, this affair will lead to the expense reduction of transactions such as sales expenses, preparation expenses, and expenses of producing and delivering the products which lead to the increase in profits (Dunt and Harpher, 2002). Many companies, industries, and storekeepers can make a complete coordination among worth wide activities through internet. Therefore, companies can perform their international trade activities with less expense through internet.

### 3 Literature Review

Mr. Hosseini and his coworkers studied the effect of electronic marketing on the exporting performance of industrial exporters from 2000 to 2005 and stated that advancements in information and communication technology would affect trade processes a lot and internet as the most important electronic marketing tool would make companies to reach to the international markets. Most companies do not have a lot of information about different ways of electronic marketing and their effects on exporting markets. The aim of the present study is to study the effect of electronic marketing ways on the exporting performance of producing and exporting companies. In this study, this question can be posed that there is a relationship between the usage of the internet in the marketing activities and the exporting performance? The statistical population of this study is the exporters of the industrial department from 2000 to 2005. One major hypothesis and six sub-hypotheses were defined for the purpose of answering to this question. Also, the relationship between the electronic marketing and exporting performance in the mentioned companies was tested with one conceptual MODEL. These hypotheses were studied with Pearson correlation test. Also, these hypotheses were analyzed more with the variance and regression analysis. Results show that there is a positive and significant relationship between the use of internet in marketing activities and exporting performance of studied companies. This relationship was confirmed with three dimensions of the electronic marketing. These three dimensions of the electronic marketing were the use of internet in the

activities relating to the customers, distributing channels, and marketing studies about the exporting performance. Marketing studies toward exporting performance are included of export growth and profit, the arrival of customers to the new markets, the improvement of market conditions, people's positive point of view toward products, services, and the commercial names of the companies (Marketing News, 2003).

Researchers such as Manian (2010), studied the role of the electronic trade in the expansion of the exporting goods and services in order to attain to the competitive benefits. They stated that the advancements in information and communication technology specially, internet increased a commercial competition among the organizations in attracting, keeping, and preserving the customers. Therefore, internet was considered as a main source of the competitive benefit for the organizations. One of the main strategies of the organizations was electronic trade to be survived in the competitive and dynamic markets. Generally, buying and selling things through electronic tools such as internet is called electronic trade. On the other hand, in the competitive world, we will observe the fundamental developments in the business and changes in the arrangement of economic authorities. Most of these developments are related to the familiarization of forerunner countries with a competitive benefit. In this study, an electronic trade and its importance in developing the non-oil exports such as exporting the goods and services are examined. In this article, first, the studies toward the electronic trade and the exports of goods and services were discussed. Then, a final model toward an electronic trade was suggested for the purpose of expanding goods and services. Finally, the findings of the study and its applied recommendations were given (Mohammadi, 2014).

Hashemi (2010) studied the effect of electronic trade on the amount of petroleum, gas, and petrochemical. They stated that the effect of an electronic trade on the amount of petroleum, gas, and petrochemical was studied and the results and the necessary suggestions were given. In this study, the methodology was explained. In this study, a field method which was supported by the library studies was used. The statistical samples of this study are the exporting companies of petroleum, gas, and petrochemical products. After studying the literature review and analyzing the indexes of the electronic trade, 24 major indexes were identified in the frame of three variables which were the improvement in the exporting process, income increase, and the decrease in the exporting expenses. Data were collected through a questionnaire. Also, quantitative and qualitative techniques were used in this study for analyzing the data. The results of this study showed that an electronic trade had a positive and significant effect on the amount of exporting and the three variables. With regard to the results of the study, it was recommended to the active statesmen and managers in the domain export to pay more attention to an electronic trade at the time of codifying the exporting policies.

Babae (2013) studied the effect of an electronic marketing like an internet on the marketing performance of rug exporters of Tehran. He stated that an electronic marketing is one of the new tools and methods of marketing. Therefore, information and communication technology and internet developed the trade in all around the world. Although internet is the most effective tool in the marketing and makes companies to reach to the world markets, most of the companies do not know to use electronic marketing or not. The purpose of this study is to examine the effect of online marketing on the marketing performance of rug exporters in Tehran. Therefore, the data of this study was gathered from the Iranian rug exporters which their office was in Tehran most of the time and used internet for exporting their rugs. The statistical community of the present study was 642 rug exporters. After a lot of studies, it was identified that only 81 exporters used internet for exporting their rugs. Therefore, in practice, the statistical community of this study was 81 individuals. In this study, 53 companies were selected with a simple sampling. In this study, one major hypothesis and 11 sub-hypotheses were formed. These hypotheses were confirmed or rejected with a regression, multivariable variance analysis, and

Fredman test. In this study, all of these tests were analyzed. The results of this study showed that internet was effective on exporting the rugs. Also, the effect of the three dimensions of online marketing such as the usage of internet in activities relating to the customers, distribution channels, and marketing studies was confirmed with the online marketing dimensions. Finally, the most important factors among online marketing (independent variable) and marketing performance (dependent variable) was identified with Fredman test.

Some researchers such as Kolah Kaj and Azizi (2013) studied the effect of online marketing on the exports of Khuzestan companies. They stated that online marketing was considered as a new industrial revolution in the 21 century and developed with the market universalizing. Nowadays, internet is an important commercial factor and is developed faster than other communicative technology. Also, universalized markets were developed more through the internet rather than other media technologies. Therefore, the effect of online marketing on the exports of the companies is regarded as a considerable issue in the marketing management of corporations. In this study, different dimensions of the internet usage in the marketing (Communications, market studies, sales, image improvement, and expense reduction) were examined on the Khuzestan exporting companies who export their products to other countries and used internet in their business. In this study, a questionnaire was used as a tool for testing the five hypotheses. This questionnaire was distributed among 90 exporting companies in Khuzestan. Kay Eskouer tests and Espearman or Pearson tests were used as a statistical method for analyzing the data. In this article, data were analyzed with the use of SPSS software. The results showed that there is a significant relationship among communications, market studies, sales, image improvement, and expense reduction. Phazyani et al., (2014) studied the role of internet in removing the marketing barriers and problems of exporting companies. They stated that active companies in all around the world would sell some of their things through international marketing at the time of the saturation of internal markets. Exporting goods is a way that companies can attain to the foreign markets. Since there are a lot of problems in this domain, the role of internet in removing the exporting problems was studied. Internet has an effective role on the success of exporting marketing. In this study, Researchers studied the barriers of using information technology by production and exporting companies and the ninth roles of internet in removing the marketing barriers. The researchers reached to a conclusion after studying the benefits of internet, gathering data, analyzing data, and identifying the problems of using an internet.

Manian (2010), who studied the effect of electronic banking on the marketing in Saderat bank stated that marketing was important in the business strategy and formed from the basic concepts. The purpose of marketers is to satisfy customers' needs. Customers' satisfaction will influence on their purchases. Therefore, this affair will influence on the profit of companies. In this study, the effect of electronic banking was studied on the marketing of Saderat bank. Finally, some solutions were given

for developing an electronic banking and the performance improvement of bank marketing. The results of this study show that bank can attain to its aims sooner. The present study was a descriptive study which was done in a survey way. Since the statistical population of the present study were from the clerks of Saderat bank in district 13 and the number of its clerks were 248 individuals, the statistical population of the present study was not a lot. Therefore, Korjesi and Morgan table was used for identifying the sample size of the study.

The samples of this study were 150 individuals which were selected randomly from the statistical population of the study. Some questionnaires were given to the samples of the study to fill the questionnaires. Also, the hypotheses of the present study were analyzed with the multiple regression method. Finally, the researchers reach to this conclusion that electronic banking variables such as automated teller machine, point of sale, telephone banking, mobile banking, internet banking, and factors such as advertisements, human relations, service qualities, and rivals have a positive effect on the marketing and confirm the hypotheses of the study.

Ivanef (2012) who studied the effect of internet on the unified marketing communications stated that the main purpose of this article was to merge systemic activities with the internet in a way that there would be a suitable balance. In recent years, changes has an important effect on the economic and social life of people. Internet will make these changes and provide many chances for the consumers to interact with companies and buy products from them. We should not disregard this point that there are a lot of information sources for consumers.

## 4 Research Hypotheses

### 4.1 Main Hypotheses

Online marketing has an effect on the export of health products.

#### Sub-hypotheses

Internet has an effect on the marketing and exports of the health products as a communication tool.

Internet has an effect on the marketing and the exports of the health products as a tool of the study.

Internet has an effect on the marketing and the exports of the health products as a sales tool.

Internet has an effect on the marketing and the exports of the health products as an image improvement tool.

Internet has an effect on the marketing and exports of health products as an expense reduction tool.

### 4.2 Conceptual Model of the Study

Researchers need scientific and theoretical framework for conducting scientific and unified studies which is called a conceptual model.

Since the suggested model is included of all variables of the study, it is used in this study and was shown in Figure 1.

Figure 1. Conceptual Model of a Study

## 5. Methodology

In general, the methods of the study in behavioral sciences are categorized based on two criteria of research aim and the way of gathering data (Sarmad and his coworkers, 2008). The present study is correlation based on the aim of the study and the way of gathering data.

The statistical population of this study is included of the health production companies' clerks in Iran. The number of these people is 10000. The sampling size of this study which was calculated with Cochran formula is 384 individuals. These people were selected randomly.

### 5.1. Questionnaire Validity and Reliability

The reliability and the validity identify the correctness of measuring tools (Sakaran, 2002). The questionnaire of this study was extracted from Lou and Julian research (2007). In this study, Cronbach's alpha coefficient was used for measuring the reliability of the questionnaire. If Cronbach's alpha coefficient were more than 0.7, a questionnaire would have reliability. The validity of this questionnaire was confirmed by online marketing professors and elites.

Table 1. Cronbach's Alpha Coefficient (N= 30)

Number	Variables	Cronbach's Alpha Coefficient
1	Communications	0.71
2	Market Research	0.71
3	Sales	0.82
4	Image Improvement	0.82
5	Expense Reduction	0.79
6	The Total of Variables	0.92

## 6. Data Analysis

In this study, first, descriptive statistics (Some of the research results were stated in the following part.) was used for the purpose of studying the properties of the statistical population. Then, the hypotheses of the study were tested with SPSS software.

### 6.1. Descriptive Statistics

Descriptive statistics of companies' clerks were shown in Table 2.

Table 2. Descriptive Statistics

Sex	Number of People	Percent of People	Educational Level	Number of People	Percent of People	Age	Number of People	Percent of People
<b>Male</b>	213	55.47	<b>Diploma and Lower</b>	41	10.67	<b>20 to 30</b>	94	44.28
<b>Female</b>	171	44.53	<b>Associate Degree</b>	72	18.75	<b>30 to 40</b>	177	23.43
<b>Total</b>	384	100						
<b>Experiences</b>			<b>Bachelor of Art</b>	197	51.30	<b>40 to 50</b>		81 18.28
<b>Below than Five Years Old</b>	72	41.14	<b>Master of Art and Higher</b>	74	19.27	<b>50 and More</b>		32 16.00
<b>Between 5 to 0 Years old</b>	44	25.14						
<b>Between 10 to 20</b>	27	15.43						
<b>20 and More</b>	32	18.28						
<b>Total</b>	384	100	<b>Total</b>	384	100	<b>Total</b>	384	100

### 6.2. The Study of Data Normalization with the Use of Kolmogorov-Smirnov test

First, it should be identified that the gathered data are of normal distribution or not. If the distribution of the gathered data were normal, the hypotheses of the study could be tested with parametric t tests, and if the distribution of gathered data were

not normal, the hypotheses of the study could be tested with nonparametric tests. In this part, the results of the Kolmogorov-Smirnov test was studied for all of the dependent and independent variables of this study. Therefore, based on the obtained results, appropriate tests were selected for approving or rejecting the research assumptions.

Table 3. The Test Results of Variable Normalization

Number	Factors	Significance Level	The Amount of Error	Hypothesis Approval	Results
1	Communication	0.657	0.05	H0	Normal
2	Market Research	0.749	0.05	H0	Normal
3	Sales	0.847	0.05	H0	Normal
4	Image Improvement	0.538	0.05	H0	Normal
5	Expense Reduction	0.674	0.05	H0	Normal
6	Export Performance	0.632	0.05	H0	Normal

With regard to the results of the table3, these variables have a normal distribution because their significance levels are more than their error amounts (0.05).

### 6.3. Hypothesis Analysis

Table 4. The Results of Regression Test

Number	Variables	R2	ANOVA (Sig.)	Hypothesis Approval or Rejection
1	Communication	0.712	0.000	Approved
2	Market Research	0.726	0.000	Approved
3	Sales	0.743	0.000	Approved
4	Image Improvement	0.623	0.000	Approved
5	Expense Reduction	0.684	0.000	Approved

Research hypotheses show that online marketing has an effect on the exporting of health products. The amount of ANOVA in the table 4 is less than 0.05. This amount of ANOVA shows that there is a liner relationship between online marketing variables and production exports. The results of regression test in Table 4 show that sales and market research have the most effect on the product export, and image production has the least effect on the exports of products.

### 7. Conclusion

The main purpose of this study was to study the effect of online marketing on the export performance. With regard to the significance level between the use of internet as a communication tool in marketing and export performance, the obtained results by a regression test show that there is a liner relationship between communications in marketing and export performance of health products. Amount of R2 is equal to 0.712 and shows that %71.2 of variations in product exports are related to the marketing.

The results of this study show that the managers of the health product exporting companies believe that using internet as a communication tool is effective and can improve the export performance as a communication tool in marketing. Findings of this hypothesis is not in accordance with the research results of Lou and Julian (2007). In other words, communication was rejected in the study of Lou and Julian.

With regard to the fact that there is a significant relationship between the use of internet as a research tool in marketing and export performance, the obtained results with a regression test show that there is a linear relationship between a market research in marketing and export performance of health products. The amount of R2 is 0.726 and shows that %72.6 of product export variations is related to a market research. Since a market research will influence an export performance, managers of these companies should make an opportunity that the companies become aware of systems relating to information technology and use them easily. Although this hypothesis was approved in exporting companies of Iran, Lou and Julian (2007) study had different results. The results of Lou and Julian study rejected this hypothesis.

With regard to the fact that there is a significant relationship between the use of internet as a sales tool in marketing and export performance, the obtained results with a regression test show that there is a linear relationship between sales in marketing and export performance of health products. The amount of R2 is 0.743 and shows that %74.3 of product export variations is related to sales in marketing.

Therefore, it is suggested to the managers of health product exporting companies to pay more attention to the sales through internet because selling through internet can influence the export performance. (Hosseini et al., 2005)

The findings of this study are not in accordance with the findings of Lou and Julian, (2007) research. In other words, selling through internet was rejected in Lou and Julian's research.

With regard to the fact that there is a significant relationship between the use of internet as an image improvement tool in marketing and export performance, the obtained results with a regression test show that there is a linear relationship between image improvement in marketing and export performance of health products. The amount of R2 is 0.623 and shows that %62.3 of product export variations is related to the image improvement in marketing.

Therefore, it is suggested to the managers of health product exporting companies to make an opportunity for companies to become aware of systems relating to information technology and use these systems easily. Findings relating to this hypothesis is not in accordance with the results of Lou and Julian, (2007) study. In other words, image improvement was rejected in Lou and Julian's research. With regard to the fact that there is a significant relationship between the use of internet as an expense reduction tool in marketing and export performance, the obtained results with a regression test show that there is a linear relationship between expense reduction in marketing and export performance of health products. The amount of R2 is 0.684 and shows that %68.4 of product export variations is related to the expense reduction in marketing.

Therefore, the managers of these companies should make an opportunity for companies to become aware of systems relating to information technology and use these systems easily.

In a similar study, Lou and Julian (2007) made a tough relationship between an expense reduction and export performance in Austrian country.

**Abstract.** Nowadays in workplace the reduction of stress is a necessity. The existing project aims to detect the factors of qualities of work life, has started to consider the effect quality of work life on performance of staff in North Cement Company. The existing project has considered the effect seven factors of quality of work life on staff function. In confirm of validity, questionnaire has been justified according to Walton and ACHIEVE's theoretical models. Alfa's factor of questionnaire about quality of work life is 0.835 and, function 0.870 and the whole of questionnaire 0.912. The information was collected by use of questionnaires of 195 people of company's staff. The results showed the positive effect of the quality of work life on the function of the staff of North Cement Company.

**Keywords:** North Cement Company, reduction of stress, quality of work life, function of the staff

### 1 Introduction

Expand progress of science and technology has caused broad changes in whole dimensions and basics of human life. Organs are not exceptional of this matter and in order to sustain in a such changing environment, inevitably forced to review of politics, strategies, aims, programs, etc. (Pardakhtchi, Mohammad Hassan and et al., 2009).

A number of open-minded people believe that a part of income slump and the reduction of product quality (service) in some countries been caused to lack of work life quality and some changes that have been created in staff's interests and betterment. Staff believe that they should have more authority and movement on their own works. To some extent that human resources have been considered in company, consequently they play a crucial and important role according to coming true of company's aims (Dolan and Schuler, 2013).

One of the important weak points of management is being indifference to quality of staff work life that has caused to reduce the efficiency of companies and to the reason of lack of knowledge understanding of managers of this issue, its own real fitness and measurement is lost.

When managers treat respectfully with their staff, and gives them this opportunity to express their ideas, the staff is more encouraged to work and this companionship is caused to increase of efficiency even more than expected results and this matter in itself caused to more engagement for better work and consequently a better quality on their work life (Dolan and Schuler, 2002).

According to a research done among a thousand successful company and organ in America cleared that these company's staff exceptionally to this reason that their companies had given them more authority from their rivals, has caused to increase of better function.

In these researches 3000 staff of these companies has been asked this question that (has the increase of efficiency and amount of your function had in life and in fact in quality of your work life or not?) more than 93 percent of the respondents has responded positively and have treated increase of their own work life quality resulting from quality of their function in company and company's success (Eghbali, 2013).

### 2 Conceptual foundation of research

#### 2.1 The definition of work life quality

Sangeeta Jain has expressed his ideas about the quality of work life: all expressions, and views concerning to concept of work life quality: industrial effect, human resource expanse, organic effect, work structure expression, job wealth social laws and specialized and technical systems, group work concept, the management of work staff, cooperation and parallel with each other, staff joining and their interference in company affairs, jobs structure. In another definition, work life quality according to Hunt definition and colleagues are: the general quality of people activities in work place (Alwani and et al., 2014). Edgard and Budin (2003) they consider the quality of work life of complex of general work quality of working life situation in company and believe that the quality of work life shows the views and feelings of staff from their own work and includes a wide range of work environment that affects staff learning and health (Esmali Lahmali, 2013). The quality of work life includes a complex of real situation and work environment in a company like: the amount of wage and reward, welfare facilities, hygiene and security, cooperation in decision-making, educational periods, devolution (Mehdizadeh, 2010).

#### 2.2 Legalism in the organization

Order to provide freedom of expression and the rule of law without fear of retaliation of higher authorities and penetrating than the domination of man in the organization. The variable presented in the hope of fairness and formulation in job promotion, freedom of speech (the right to express opposition to the attitude of the head of the organization without any fear from him) reserved the right to respond to all issues, including the allocation of wages, bonuses and job security and the assurance of the absence of discrimination on gender, ethnicity and religion and beliefs. (Mehdizadeh, 2010)

#### 2.3 Continued growth opportunities

Improving the personal ability, providing opportunities for advancement and opportunities to apply acquired skills (Mehdizadeh, 2010).

#### 2.4 Social dependence of work life

How to harvesting or perception about the organization's social responsibility. Thus, the role of social utility and social damage effects and its activities are increasingly the main issues of the staff. Accordingly, that it makes sense that organizations do not feel their social responsibility leads to despise the value of work and the basis for the need for self-esteem and professional staff provide them (Mehdizadeh, 2010).

#### 2.5 Social integrity and cohesiveness

Social integration means the primacy of the interests of the organization in teams and social groups. Lack of prejudice of race and gender and create a sense of community in the organization and freedom of individuals to express ideas and feelings in the form of associations and to promote the participation of workers in the regulation of the intellectual and practical cases which helps to create organizational integrity (Mehdizadeh, 2010).

#### 2.6 Development of human capabilities

Availability of opportunities to develop human capabilities such as independence and self-regulation of the work, the bringing benefit from the different skills, access to appropriate information and planning work for the staff there. The purpose

of this factor is that the opportunity to acquire skills and training are created and at the same time coordinating personnel to the mission, goals, programs and strategies in order to meet the needs of individuals and organizations to take action (Mehdizadeh, 2010).

### 2.7 Safe and healthy working environment

Must work environment pollution effects that can adversely impact the physical and mental state employees leave the workplace to reduce. In other words health and safety contact, reasonable working hours and physical conditions of work, including physical and safe working conditions with minimal risk and age restrictions apply for employment (Mehdizadeh, 2010: 3).

### 2.8 The overall atmosphere of life

To establish a balance between work life and other parts of life that includes free time, staff and family life education is to be relevant. It also determines the job description and competency good effect on staff morale and job promotion will be routed (Mehdizadeh, 2010: 4).

### 2.9 Operation

Performance is to accomplish the tasks that the organization has been responsible for human resources (Bagheri, 2014). The goals have been achieved (Khaki, 2007).

### 2.10 Ability

Power to accomplish a task successful (Khaki, 2007).

### 2.11 Clarity

Admission clear understanding how, where and how they do it (Khaki, 2007: 54).

### 2.12 Help

Help support the organization that is the support that employees need to complete the effectiveness of the work (Khaki, 2007).

### 2.13 Incentive

Enthusiasm and desire to do homework (khaki, 2007)

### 2.14 Evaluation

The mechanism of judgment in relation to how the work (khaki, 2007)

### 2.15 Validity

Occasion, legality and legitimacy of the decision of the director (khaki, 2007)

### 2.16 Environment

Set external factors (khaki, 2007)

## 3 Background research

A study entitled "The effect on the quality of work life employee performance Rudaki Foundation for Culture and Art" by Mr. Ahmad Pasandideh Fallah Dana in 2014, master's degree in Public Administration at the Azad University of Tehran has been done. The researchers found that the components of employee performance affects the quality of working life.

The researchers found that the components of employee performance affects the quality of working life.

Another study entitled "The impact on the performance quality of working life of staff General Administration of Customs international airport of Imam Khomeini" in 2013 has been done by Azam Babaei the great expedition master's degree in Public Administration at the Azad University of Tehran. The researchers found that the components of employee performance affects the quality of working life.

Another study entitled "The impact quality of working life on the performance of staff General Administration of Customs international airport of Imam Khomeini" in 2013 has been done by Sorye Monasebi the great expedition master degree in Public Administration at the Azad University of Tehran. The researchers found that the components of employee performance affects the quality of working life.

Another study entitled "Effects on the Quality of Work Life Legal Department employee performance and claims of Bank Melli Iran" in 2013 has been done in master by Monica Singh Honjen. The researchers found that the components of employee performance affects the quality of working life and this means that by increasing or decreasing satisfaction with the quality of working life, the performance will be affected employees.

In another study to investigate to develop indicators of quality of working life to help define working in developed economies that has been done in Australia. The study was conducted by Gillian Geonsidin and Ron Callus in 2003. In this study, the pattern Walton and developed 15 indicators to check the status of Australia's quality of work life.

They responded to two basic questions based on the research findings, these two questions were: What is the most important issue affecting the quality of working life? Second, what changes are needed to improve the quality of work life? The results showed that overall more than 70% of employees have a positive attitude to the five indicators of fifteen QWL index. That have evaluated (Ahmadi, 2009). Koonemee and et al., (2010) study the relationship between the institutionalization of ethics, quality of working life and output of paid staff. The study questionnaire via e-mail was distributed among 514 human resource manager in Thailand. The results of this study showed a significant positive relationship between these three components. Results also tacitly implies on goodness of both ethics and quality of working life, employees have a positive impact on three major aspects that these three aspects are: job satisfaction, organizational commitment and team spirit (Eslami, 2012).

## 4 Theoretical framework

The theoretical framework suggests that research depends on which theory and research. In conjunction with the independent variable quality of working life, Walton model is used. Walton model includes seven factors (workplace health and safety, law, social dependence of work life, developing human capabilities, opportunities for continued growth, the overall atmosphere of life, social integration).

In conjunction with the dependent variable, employee performance, the ACHIEVE model (Hersey and Goldsmith) is used. ACHIEVE models consist factors of ability, obviously, help, motivation, evaluation, reliability and the environment. Despite the quality of working life, while boasting greedily staff to work all their efforts in order to achieve the organizational goals.

## 5 Hypotheses

The main hypothesis: the quality of working life is a positive and significant impact on employee performance.

Subsidiary hypothesis:

1) Safe and healthy working environment has a significant positive impact on employee performance.

- 2) Legalism in the organization positive and significant impact on employee performance.
- 3) Social dependence of work life is a positive and significant impact on employee performance.
- 4) Developing human capabilities and a significant positive impact on employee performance.
- 5) Continued growth opportunities and significant positive impact on employee performance.
- 6) Overall living space and has a significant positive impact on employee performance.
- 7) Integration and social cohesion is a positive and significant impact on employee performance.

## 6 Research Methodology

Table 1. Descriptive statistics

	AVERAGE	STANDARD DEVIATION
Quality of working life	62.85	10.58
Safe and healthy working environment.	9.16	2.8
Legalism in the organization	9.39	2.74
Social dependence of work life	9.45	2.94
Developing human capabilities	9.91	2.64
Continued growth opportunities	6.6	1.76
The overall atmosphere of life	8.81	2.88
Social integration	9.51	2.92
Operation	90.78	12.9

The correlation coefficient between quality of working life and employee performance is provided.

Table 2. Correlation coefficient

Factors	Employee Performance	
	The correlation coefficient	significant
Quality of working life	0.696	0
Safe and healthy working environment.	0.477	0
Legalism in the organization	0.393	0
Social dependence of work life	0.559	0
Developing human capabilities	0.277	0
Continued growth opportunities	0.229	0.001
The overall atmosphere of life	0.333	0
Social integration	0.377	0

As can be seen in Table 2, the quality of working life ( $r = 0.696$ ), safe and healthy working environment ( $r = 0.477$ ), Legalism in the organization ( $r = 0.393$ ), social dependence of work life ( $r = 0.559$ ), developing human capabilities ( $r = 0.277$ ), continued growth opportunities ( $r = 0.229$ ), overall living space ( $r = 0.333$ )

and social integration ( $r = 0.377$ ) and there is a significant positive relationship.

Results of regression analysis, quality of work life and performance of employees in the table.

Table 3. Regression Analysis

Statistical indicators	correlation coefficient	multiple correlation squared	adjusted multiple correlation coefficient	estimated standard error
Social dependence of work life	0.559	0.312	0.308	0.413
Safe and healthy working environment.	0.629	0.396	0.390	0.388
Social integration	0.673	0.453	0.444	0.370
The overall atmosphere of life	0.696	0.484	0.473	0.360
Legalism in the organization	0.712	0.506	0.493	0.353

As seen in Table 3, the stepwise regression analysis in total over the five-step, five social dependence of work life, workplace safety and health, social integration, overall living space, Legalism in the organization staff performance have multiple correlation. Stepwise regression analysis based on the variables in order of importance, the first social dependence of work life

with the performance of multiple correlation coefficient was 0.559. In the second step with the addition of safe and healthy working environment variable multiple correlation coefficient was 0.629. The multiple correlation coefficient of 0.07 was added for safe and healthy working environment. In the third step with the addition of variable social integration of multiple

correlation coefficient was 0.673. Added multiple correlation coefficient was 0.044. In the fourth step, with added living space variable overall multiple correlation coefficient was 0.696. Added multiple correlation coefficient was 0.023. In the fifth step with the addition of variable Legalism of the multiple

correlation coefficient was 0.712. Added multiple correlation coefficient was 0.016.

Employee performance regression variance analysis table is as follows:

Table 4. Regression analysis of employee performance

Source changes	Sum of squares	Degrees of freedom	Mean Square	ratio F	meaningful
regression	14.913	1	14.913	87.526	0 <sup>1</sup>
Remaining	32.884	193	0.170		
Total	47.796	194			
regression	18.939	2	9.469	63.003	0 <sup>2</sup>
Remaining	28.858	192	0.150		
Total	47.796	194			
regression	21.644	3	7.215	52.691	0 <sup>3</sup>
Remaining	26.152	191	0.137		
Total	47.796	194			
regression	23.150	4	5.788	44.617	0 <sup>4</sup>
Remaining	24.646	190	0.130		
Total	47.796	194			
regression	24.197	5	4.839	38.758	0 <sup>5</sup>
Remaining	23.599	189	0.125		
Total	47.796	194			

<sup>1</sup> Social dependence of work life

<sup>2</sup> Social dependence of work life · Safe and healthy working environment

<sup>3</sup> Social dependence of work life · Safe and healthy working environment · Social integrity and cohesiveness

<sup>4</sup> Social dependence of work life · Safe and healthy working environment · Social integrity and cohesiveness · The overall atmosphere of life

<sup>5</sup> Social dependence of work life · Safe and healthy working environment · Social integrity and cohesiveness · The overall atmosphere of life · Legalism in the organization

As can be seen in Table 4, analysis of variance, credit stepwise regression analysis to predict the performance of employees. (Significance level zero and the ratio F = 38.758).

Table regression coefficients, standard and non-standard employee performance is as follows:

Table 5. standard and non-standard regression coefficient employee performance

Indicators of data	Custom beta coefficients	standard error	Standard factor beta	The amount of t	meaningful
1 constant	2.602	0.100		26.127	0
Social dependence of work life	0.282	0.030	0.559	9.356	0
2 fixed amount	2.280	0.112		20.304	0
Social dependence of work life	0.224	0.031	0.443	7.330	0
Safe and healthy working environment.	0.166	0.032			
			0.313	5.176	0
3 constant	1.994	0.125		15.946	0
Social dependence of work life	0.204	0.029	0.404	6.932	0
Safe and healthy working environment.	0.150	0.031	0.283	4.880	0
Social integration	0.125	0.028		4.445	0
			0.245		
4 fixed amount	1.819	0.132		13.771	0
Social dependence of work life	0.198	0.029	0.393	6.909	0
Safe and healthy working environment.	0.132	0.030	0.248	4.328	0
Social integration	0.115	0.027	0.227	4.210	0
The overall atmosphere of life	0.095	0.028	0.184	3.408	0.001
5 constant	1.698	0.136		12.469	0
Social dependence of work life	0.191	0.028	0.378	6.755	0
Safe and healthy working environment.	0.114	0.031	0.214	3.722	0
Social integration	0.102	0.027	0.200	3.728	0
The overall atmosphere of life	0.085	0.028	0.164	3.068	0.002
Legalism in the organization	0.087	0.030	0.161	2.896	0.004

As can be seen in Table 5, in the final step of a stepwise regression analysis of five social dependence of work life, workplace safety and health, social integration, the overall atmosphere in the organization to predict employee performance into the life and rule of law have been regression. To the social dependence of work life and standard beta coefficient 0.378,

0.214 a safe and healthy work environment, social integration 0.200, overall living space of 0.164, 0.161 legalism in the organization can have significant predictor of employee performance.

Verified prioritize research hypotheses based on Friedman test:

Table 6. Prioritize the secondary hypotheses based on Friedman test

Theories	Average rating	priorities
Safe and healthy working environment has a significant positive impact on employee performance	3.81	4
Legalism in the organization and significant positive impact on employee performance	3.97	3
Social dependence of work life is a positive and significant impact on employee performance	4.01	2
The overall atmosphere of life and significant positive impact on employee performance	3.43	5
Social integration and a significant positive impact on employee performance	4.10	1

## 8 Conclusion

The aim of this study was to determine the impact on quality of work life employee performance Cement north. As the results showed, in terms of quality of working life of employees with a positive and significant impact on employee performance.

According to the results the most points related to the ongoing growth opportunity and it would be an opportunity for organizations to be considered. Pointing to provide continued growth opportunities, improving the personal ability, opportunities for advancement and opportunities to use acquired

skills. Action greater incentive to earn more skills and better performance are created.

The study results show that the level of overall living space and safe and healthy working environment at the lowest levels are among the factors and the senior management attention to these factors, including the weakness of the organization. As safe a working environment as helmets and safety shoes for workers, or earplugs to have the lowest risk of hearing damage is prevented. As well as the working environment should be safe and healthy working environment that could adversely impact the physical effects of pollution. Among the factors consist models based on

correlation of social dependence of work life, workplace health and safety and legality of the highest correlation coefficient can be said that the most important factors in the performance of employees.

Among the factors consist models based on correlation coefficient continued growth opportunities, developing human capabilities correlation coefficient is the least that can be said is the least important factors in the performance of employees.

Among the factors consist greatest impact social dependence of work life, workplace safety and health, social integration possess. Therefore it is recommended to look and work as a strong point for improving employees' performance improving these efforts.

The impact of the factors consist factor is the organizational legality on their own.

## 9 Suggestions

Providing health resorts in places of pilgrimage - tourism for Northern Cement Company staff

The forced leave to those who do not use their vacation.

Use of the equipment is worn risk and should be avoided.

Equality in law enforcement for all employees.

Continuous monitoring, protection against pollution, clean air standards and the use of international standards such as ISO 14000.

**Abstract-** the main aim of this research is comparison of trade off theory and packing order theory in describing finance structure of accepted steel firms in Tehran's securities exchange by using data panel method. To this, using sampling, 22 active steel firms in Tehran's securities exchange during 2009- 2014 have selected as samples. To this work, relation between variables, by using econometrics software of sign data is evaluated and tested. The results showed that deficit variable in packing order model has a negative and meaningful effect on pure debit also deficit variable in trade off model has a positive and meaningful effect on pure debit. Due to different effectiveness of deficit variable on net debit signally and based on amount in both theories, packing order and trade off, none of both theories with complete decisiveness, cannot describe firms' structure.

**Keywords:** securities exchange, trade off theory, packing order theory, capital structure.

### 1 Introduction

Capital structure issue is a significant and controversial issues in firms' finance area. Offering different theories, researchers try to offer the best pattern and theory to determine optimum capital structure and minimize firm's capital cost to maximize market's value of firm's stock. There are many theories, each of them prescribes a version to support finance for the firms, some prescribe finance support by offering debit securities, some by equity securities, and some by both of available sources. But note that none of available theories and patterns solely cannot theorize firm's capital structure without considering firm's conditions and characters such as profitability, firm's size, current firm dominance level in the firm and so on (Ahmadinia, et al., 2012).

One of the basic financial managers' decisions in public stock firms is determining debit and stock composition that these decisions must be taken to maximize stockholders' wealthy. Traditional view in capital structure based on this theory that one can increase firm's value by using lever. But start of modern theories of capital structure can be primary article of Modigliani and Miller who assert that under special conditions (presence of complete competitive market, lack of tax on income, lack of presence of bankruptcy and agency costs, presence of informational symmetry among capital market actors), firm value doesn't depend on capital structure. Later in 1963, these two thinkers by adding debit tax exempts for firms using debit, know making financial lever as increase firm value. So, Miller in 1977, by adding tax on personal incomes to model, finds that tax interests are deleted by personal incomes. Yet, testimonies of empirical studies showed that real behavior of financial support of the firms doesn't fit with literature of capital structure. Therefore, later, publishing theories of Modigliani and Miller and 1963 and paradoxical behavior of firms, new theories such as trade off and prefer are offered. In trade off theory, it supposed that the firm determines a proper debit rate and moves toward it. In prefer theory, firms prefer internal financial supply rather than external financial supply and there is no proper and certain debit rate for firms. In capital market more sophisticated than Iran's capital market, many theories and hypotheses in field of capital structure and determining related factors are offered (Alinejad Saroklaei and Taghizadeh Khaneghah, 2012).

The steel is one significant and effective good in growth and development of the countries. This good after oil and gas is second volume good of global trade and many basic industries such as transportation, building, making machinery, mine and other industries related to producing and transferring energy, depend on steel. So improvement and development of steel industry is important in economic development of countries. So in this research plot, we tried to by doing trade off theory and packing order theory in description of financial structure of accepted steel firms in Tehran's securities exchange by using data panel method, evaluate weakness and strengths of this industry for capital structure (Etemadi and Montazeri, 2013).

### 2 Review on research literature

In checking structure of firms' capital, we try to theorize various sources composite used in financial supply of actions and required investments. Additionally, one can say that the aim of determining capital structure is specifying composite of financial sources of any firm, to maximize its stockholders' wealthy, because cost of firm's capital is subject to its capital structure. Selecting proper capital structure decreases cost of firm's capital and increases market value (Jolahzadeh, 2010).

This matter that how firms select and adjust own strategic financial sources, has attracted many financial economists and yet result in many discussions. Of course, sometime one believes that nature of such problems so complicated that no one can address editing reasonable theory. Since half century before that Weston offers possibility of editing such theories, Modigliani and Miller deliver own theory. Studies show that since publishing their article, various theories and patterns about structure of firms' capital and way of selecting them has been edited.

Researches show that no one of current theories and patterns solely cannot theorize effective factors in determining structure of firms' capital and provide certain answer to below questions:

Why in various conditions, some firms to supply finance of own actions, releasing stock select option, some select utilizing internal and some select borrowing way. Therefore, it seems that the greatest available problem is lack of comprehensive theory that can describes and predicts treatment of financial supply and structure of firms' capital completely.

According to studies, tax, costs of financial distress (bankruptcy), transaction costs, adverse selection and agency conflicts are main factors that firms introduce to financial supply through making debit and forming structure of their capital structure. To determine above factors, already various theories and patterns are offered that most important of them are trade off theory and packing order theory.

In various countries, due to composite of market and various economic conditions, trade off theory and packing order in various periods are checked and compared, and place of such research in Iranian firms id blank. This research wants to compare these two models while check power of description of these two theories about Iranian firms by implementing these two theories on data panel of accepted steel firms in Tehran's securities exchange (Khalifeh Soltani et al., 2014).

#### 2.1 History of research

Ahmadinia, et al., (2012) in own study under title of determining difference of strategic and non-strategic industries of Tehran's securities exchange by highlighting on structure of capital and cash value added by data panel approach, address financial structure category and its effect on firm value due to kind of firm. The results represent that both groups of strategic and non-

strategic industries and also all industries, there is meaningful relation between financial structure and cash value added. Also, adjusted coefficients and independent variables coefficients in regression models shows that relations between financial structure and cash value added in strategic and non-strategic industries are different.

Alinejad Saroklaei and Taghizadeh Khaneghah, (2012) in his research by title of "determining pattern of structure of accepted firms in Tehran's securities exchange" checked capital structure of 158 production firms during 1998 to 2002. The results of this research show that there is a direct relation among profitability, visible constant asset and size of firm. Findings of this research confirm trade off theory by rejecting packing order theory.

Shojaei et al., (2015) in a research by title of "over analysis of determining factors of capital structure in firm level" by checking 127 studies during 1900 to 2013 conclude that size, asset structure, growth opportunities, profitability, cash flow and oscillation play major role in deciding about capital structure. Checked factors in this research in the countries with various development degrees, have different impact on capital structure and effect of these factors has been different during various times.

Khalifeh Soltani et al., (2014), in a research to compare power of description of two models, trade off and packing order in treatment of Japanese firms conclude that based on outputs, packing order theory is better than trade off theory. This researcher showed that if quarter regression model is used, packing order model has better prediction power.

### 3 Statistical population

Due to great number of steel firms and their wideness throughout state and lack of access to audited financial forms, all of them are statistical population firms to test hypotheses, available firms in Tehran's securities exchange. Sampling done by systematic delete method, so that firms have been selected among statistical population according to below conditions:

- 1) Are production firms. 2) Since 2009 to 2014 are in exchange.
- 3) During 2009 to 2014, offer required information to doing this research completely. 4) Their financial year end is February. 5) During research, has no change in financial period. 6) Firm has no operation pause in 2009 to 2014.

Finally, considering above conditions, 22 firms are selected as sample studied in this research.

### 4 Research hypotheses

Among two models, packing order and trade off, packing order model has predicting power more about capital structure of accepted steel firms in securities exchange.

Packing order (preferred theory) about capital structure of accepted steel firms in securities exchange is predictor.

Trade off model about capital structure of accepted steel firms in securities exchange is predictor.

### 5 Research pattern and variables

Variables in packing order model:

1. Cash flow after payable interest and tax ( $C_{it}$ )
2. Gain ( $DIV_{it}$ )
3. Investment ( $X_{it}$ )
4. Net increasing capital in flow ( $\Delta W_{it}$ )
5. Net debit ( $\Delta D_{it}$ )
6. Deficit: deficit in investment and internal financial sources stated by below relation:

$$DFF_{it} = DIV_{it} + X_{it} + \Delta W_{it} - C_{it} \quad (1)$$

In this condition, packing order model is:

$$\Delta D_{it} = a + b_{FO} DFF_{it} + \varepsilon_{it} \quad (2)$$

Variables in trade off model:

Addition to effective variables in packing order model,  $DIF_{it}$  is defined as:

$$D_{it}^a = \text{optimum borrowing level}$$

And in this condition, trade off model is calculated as:

$$\Delta D_{it} = a + b_{TO} DIF_{it} + \varepsilon_{it} \quad (3)$$

## 6 Findings of research

### 6.1 Assessing first pattern of research

#### 6.1.1 Non-covariance

In statistics, as standard variances of a variable in considered certain number of below observations, always are not constant. Non-covariance issue occur as various periods of error lack equal variances, so that diagonal elements of covariance matrices are not equal. In fact, non-covariance occurs as various observations have various error variance (Gajarati, 2006). Probable presence of non-variance one important concern and problem in using regression analysis includes variance analysis, because presence of non-covariance can delete validity of meaningful statistic tests.

There are two option related to non-covariance and first solution that is very usual is using efficient evaluator OLS. But at same time, they use constant standard errors that make presence of non-covariance possible. Better and second solution occur when we know pattern, the pattern which we usually don't know using weight limit square to calculate effective and efficient evaluators about non-covariance pattern, if we have correct knowledge.

#### 6.1.2 Self-correlation

Serial (sequence) correlation of disorder in time periods is defined under title of self-revolve. With supposing that all other suppositions of OLS are true, under conditions of self-correlation, OLS evaluator also always lacks diagonal. In result, OLS is not BLUE no longer, and usual standard errors OLS and other test statistics have no validity and credit.

#### 6.1.2.1 Solving non-covariance and self-correlation problems

There are two methods to considering non-covariance and self-correlation problems that are:

- a) Constant standard errors
- b) GLS (generalized minimum squares)

#### 6.1.3 F Limer test and research first pattern Hausman test

To assess and hypotheses test, first F Limer test done to specify integrated data or sign data and also Hausman test to determine constant effects or accidental effects. F Limer test is used to determine using composite data model or sign model. If (prob 0.05); (sign data method) and otherwise, integrated data model is confirmed. Hausman test is done to determine using constant effect model against accidental effect model. Hausman test is formed based on exist or non-exist of relation between assessed regression error and independent model variables. If there is such relation, accidental effect model is used and if there is no relation, constant effect model is used.  $H_0$  hypothesis shows lack of relation of independent variables and assessment error and  $H_1$

hypothesis shows presence of relation (table 1). H0: random effect, H1: fixed effect

Table 1: research first pattern variance non-equality test (packing order model)

model	F Limer test			Hausman test		
	Statistics	Possibility (0.005)	Result of test	Statistics	Possibility (0.005)	Result of test
	2.01	0.0000	sign	23.52	0.0004	Constant effect

Due to above table, since F Limer statistics is less than 5 percent, data is used in form of panel. Here, to determine proper model, Hausman test is used because achieved possibility is less than 5 percent. Zero hypothesis is rejected and constant effects model is used (table 2).

#### 6.1.4 Assessment of research first pattern

$$\Delta D_{it} = a + b_{it} DFF_{it} + a_{it} \quad (4)$$

Table 2: results of assessment of research first pattern (packing order model)

variables	Assessment coefficients	T statistics	Standard deviation	Meaningfulness level
Constant coefficient (y-intercept)	-4.29	-7.07	6.36	0.0000***
Deficient (DIFF)	-0.26	-2.28	0.78	0.0231**
Determination coefficient	Adjusted determination coefficient	Durbin-Watson statistic	F statistic possibility	F statistics
R-squared	Adjusted squared	Durbin-Watson statistic	Prob (F-statistic)	F-statistic
0.72	0.68	2.06	0.000000	7.29

\* In 10 percent level, \*\* In 5 percent level, \*\*\* In 1 percent level

Due to F statistic (7.29) and achieved error level (0.000000) is less than 0.05 error level, in result, in 95% assurance level, one can say that in research model, it is fits well and has high meaningfulness.

$R^2 = 0.65$  represents adjusted determination coefficient represents description of independent variables. It means that dependent variable is justified by independent and control variables, while Durbin-Watson statistic amount is 2.06.

( $1.5 < DW < 2.5$ ). due to Durbin-Watson statistic, one can say that there is no serial correlation model among residual statements and acclaim lack of existence of self-correlation.

Due to result of first pattern assessment, it is clear that deficient variable in packing order has negative and meaningful effect on net debit, so that one unit increase in deficient makes 0.26 decrease in net debit (table 3).

#### 6.2 assessing second research pattern

##### 6.2.1 F Limer test and research second pattern Hausman test

Table 3: variance non-equality of research second pattern test (trade off model)

Model	F Limer test			Hausman test		
	statistic	Possibility (0.05)	Result of test	statistic	Possibility (0.05)	Result of test
1	2.27	0.0000	sign	19.76	0.0008	Constant effects

Due to above table, since F Limer statistic possibility is less than 5 percent, data is used in form of panel. Here, to determine proper model, Hausman test is used because achieved possibility

is less than 5 percent. Zero hypothesis is rejected and constant effects model is used (table 4).

##### 6.2.2 Assessment of research first pattern

Table 4: results of assessment of research second pattern (trade off model)

variables	Assessment coefficients	T statistics	Standard deviation	Meaningfulness level
Constant coefficient (y-intercept)	0.58	1.24	11.47	0.2849
Deficient (DIFF)	0.59	3.56	0.29	0.0000***
Determination coefficient	Adjusted determination coefficient	Durbin-Watson statistic	F statistic possibility	F statistics
R-squared	Adjusted squared	Durbin-Watson statistic	Prob (F-statistic)	F-statistic
0.65	0.60	1.81	0.000000	3.83

\* In 10 percent level, \*\* In 5 percent level, \*\*\* In 1 percent level

Due to F statistic (3.83) and achieved error level (0.000000) is less than 0.05 error level, in result, in 95% assurance level, one can say that in research model, it is fits well and has high meaningfulness.

$R^2 = 0.65$  represents adjusted determination coefficient represents description of independent variables. It means that more than 65 percent of dependent variable changes is justified by independent and control variables, while Durbin-Watson statistic amount is 1.81.

( $1.5 < DW < 2.5$ ). due to Durbin-Watson statistic, one can say that there is no serial correlation model among residual statements and acclaim lack of existence of self-correlation.

#### 7 Conclusion

Main aim of doing this research is comparison of trade off theory and packing order theory in describing financial structure of accepted firms in Tehran's securities exchange by using data panel.

Due to results of research patterns assessment, these results are achieved:

Due to result of first pattern assessment, it is clear that:

Deficient variable in packing order model has negative and meaningful effect on net debit, so that one unit increase in deficient make 0.26 decrease in net debit.

Due to result of second pattern, it is clear that:

Deficient variable in trade off model has positive and meaningful effect on net debit, so that one unit increase in deficient makes 0.59 increase in net debit. Results suggest positive relation between longtime debit changes of studied firms and necessary adjustment to gain optimum debit level. In other words, steel industry firms tried to average usage amount of long time debit (optimum debit amount) that these results support trade off theory. Result related to trade off theory is different from Sandra and Mirez (1998) research that already confirmed by packing order theory. But it fits with result of Flannery and Ranjan (2006) research in U.S and also with general result of Bagherzadeh (2002) research in Iran that already confirmed by trade off theory.

## 8 Suggestions

It suggested that due to trade off theory, the firms in steel industry with decrease deficient, try to decrease own net debit.

It suggested that research subject is checked in various industries.

It suggested that detailed research about this subject separately is done by considering various definitions of capital structure.

**Abstract.** The purpose of this study was the short-term effect of antioxidant and carbohydrate supplementation on aerobic and anaerobic power of young female volleyball players in Qazvin Province. In this study 36 people were selected from a members of a volleyball team called. They were randomly divided into three groups. Each group consisted of 12 people: carbohydrate, antioxidant and placebo. Pre-test was done and variables related to aerobic and anaerobic power were tested by Mc Ardle test and RAST test. After 14 days, athletes received 120 ml of 5% monosaccharide and 100 ml of vitamin E and 200 mg vitamin C as antioxidant and 60 cc of maltodextrins. The result showed that there is no significant difference between short-term consumption of carbohydrates, antioxidants and placebo on aerobic capacity of girl volleyball players.

**Keywords:** carbohydrate, antioxidant, aerobic capacity, anaerobic power

### 1 Introduction

In today's world, physical education and sports is not limited to a specific field of expertise, art or skill and is regarded as a science with various aspects of theoretical and practical. Sports nutrition is considered as a branch of science including exercise that deals with the scientific study of the nutritional status of athletes in training and competitions and offers guidelines for nutrition. Research conducted in different countries in relation to nutrition and its impact on sporting performance is very widespread which provide the athletes with the new findings. Increasing achievement of sports as well as high expectations of athletes in different fields have caused the athletes to have a considerable attention to nutrition and dietary supplements from childhood and adolescence hood. Most experts believe that supplement nutrition have a key role in the success of athletes both in training and in recovery and as well as in tournaments. Although at this age the more attention should be toward technique and tactics. But, children's participation in heavy competition, such as national, continental and global championships have increased the importance of supplements and vitamins usages. It is because food alone cannot provide micronutrients in the body and leads micronutrients deficiencies. Sports injuries in soft and hard tissue is among the other issues that elite professional athletes and especially teens are facing wherein the proper usage of nutrients will play an important role in its improvement. Therefore, research has shown that protein carbohydrate supplementation will be effective in speeding up the recovery of athletes (Zoppi et al., 2006). The health of the young athletes in future is also very important in addition to the championships. Thus, the related research in this field implies that consumption of vitamin E have an important role in preventing cardiovascular disease. It is also to be noted that consumption of supplements postpones fatigue in the athletes (Bloomer, et al., 2007). Carbohydrates is considered as the main source of energy and the excessive usage of them lead to incensement of the energy of the body while the effects of E and C vitamins is not increased with the excessive usage and cause some problem in the body. Technical problems at different levels of sports is almost equal and it is the non-technical matters that transcends individual or team against another person. Issues such as nutrition, psychology, etc., in the past has lead the countries such as former Soviet Union (tables of Olympic medal before the collapse of the Soviet Union) and China to be among the top countries in the world (medal table 2008 Olympics). Scientific research suggests that nutritional and dietary supplements and antioxidants is to

improve the performance of the athletes (Mendel and Ehofheins, 2007). The effects that antioxidants and supplements on the rate of contraction of muscle in different forms is among the issues that have preoccupied the minds of researchers. Since previous studies have shown that supplementation has not a significant effects on the performance. However, the use of some of them effects on body composition and aerobic power. And the use of some supplements had no effect on some elements of fitness such as flexibility. On the other hand it has been found that athletes who eats food as the only supplier of energy have energy deficiencies. This energy deficit in men and in women in such a case is 4.7% and 2.7% respectively that should be covered using dietary supplements. In determining the appropriate nutritional advice in any sport, the assessment of the essential needs and determination of the prerequisite materials that limits the performance is crucial. In team sports, the players perform different exercises that the exercise intensity can change at any time and varies from the steady state to the extreme activities. Because of the nature intermediary of team sports the performance of the athlete at the end of the race after a period of intense activity is disrupted. Therefore, consumption of nutrients and supplements in team sports will be offered according to interval training. The found results shows that increasing the amount of muscle glycogen before competition can increase the performance in a team sport competitions. In agreement with this view, there is a finding that has been observed that the use of glycogen in the first half was more than its use in the second half of the competition. In addition, players with lower initial glycogen, covered a shorter distance, and had a lower activity especially in the second half, with respect to the players with the usual amount of muscle glycogen before the competition. Usually drinking liquids that contain carbohydrates provides few calories but is enough to delay fatigue during the tournament. And since the team sports use all of three means of energy during exercise and aerobic exercise is also one of the major systems involved in these types of activities, It should be noted that carbohydrates are the primary fuel source are aerobic system and only the macronutrients can be metabolized to produce energy. Therefore, in the absence of carbohydrates in team sports, athletic performance is in jeopardy. So, with a suitable food strategy in the days and hours prior to the match, the athletes of the team sports have a rare muscle carbohydrate stores at the end of a game seems desperate. However, this does not mean that the ability of the athlete at the end of a game will not be affected. In addition, the antioxidant activity of some vitamins such as vitamin E and C and their positive effects against the harmful effects of free radicals, preventing arteriosclerosis, the heart attacks and ... cannot be ignored. In this study, researchers sought to answer this theory that:

Does carbohydrate supplementation and antioxidants can affect aerobic and anaerobic power of young volleyball players?

Is there a difference between the short term usage of carbohydrates and antioxidants complement on the aerobic and anaerobic power?

The results of this research can provide the coaches of volleyball team in different age level with the required knowledge on the usage of the carbohydrates and antioxidants supplements in the tournament. Also the effect of this drug on aerobic and anaerobic power, will be effective in improving the level of preparedness.

### 2 Methodology of the Research

This research is a quasi-experimental study and application. The study population consists of players selected from youth volleyball player of Bouin Zahra club in Qazvin Province. The number of athletes at this age category who were 85 people are between the ages of 18 and 25 years old and all the individual from the statistical society who participated in the study completed consent form. 36 athletes of the volleyball player who

had regular exercise were selected and then randomly divided into three groups of 12 subjects and before the start of training complementary carbohydrate solution and vitamins E and C were feed to two different group, and the third group received placebo (maltodextrins). All the participant in the study were team members of Bouin Zahra youth volleyball team who

participated as volunteers. Statistical society were consisted of Bouin Zahra youth volleyball players who were selected purposively all with the physical health who participated as volunteer. All these athletes has a previous athletic records with a suitable performance in volleyball.

Table1. weight, height and age of the participants

<i>variable</i>	<i>Minimum</i>	<i>Maximum</i>	<i>Average</i>	<i>Standard Deviation</i>
<i>Weight</i>	40	70	58.8	5.8
<i>Height</i>	154	169	161.8	3.7
<i>Age</i>	18	25	25.8	6.7

In this study, the independent variables include carbohydrate supplements and vitamins E, C consumption and dependent variables are aerobic and anaerobic power. In order to measure the relevant factors, anaerobic and anaerobic power, the stair test of Mac Ardel and speed running test of RAST were used. In this study a 40 cm stair and a metronome with the brand of Wittner Junior made by Germany for measuring VO<sub>2</sub>max in the stairs test of Mac Ardel was used. Data were collected through field trials. Considering that the aim of this study was to evaluate the long term effect of carbohydrate supplement and antioxidant on the aerobic and anaerobic power, when this material was used by the athletes that the effect of exercise on aerobic and anaerobic had it impact were almost constant and only the effect of carbohydrate supplements and vitamins were assessed. The time of the pre-test and post-test and carbohydrate supplementation and antioxidants consumption were between 2 successive competitions. And thus one day before and one day after the 14-day consumption of carbohydrates and vitamin supplements the aerobic and anaerobic power tests were taken. Before the beginning of the exercise carbohydrate supplement in the form of water-soluble and vitamins E and C were given to two different groups. And maltodextrins as placebo was given to the third group a group (it is to be noted that all the three groups were is the same condition and individuals participated as volunteer). Mac Ardel stair test was used to measure aerobic power with a 16-inch (40 cm) stair with a four-step beat (top - up - down - down) and Compound of steps per minute for women. The duration of the test is three minutes.

$$VO_{2Max_{woman}}=111.33-0.42(\text{recovery beat rate in one minute})$$

In order to measure anaerobic power of youth volleyball players the test of RAST was used in which the player had to run a distance of 35 meters 6 times with 10 seconds of rest between each repetitions and then according to the time from every 35 meters, the required power of each repetition was is obtained.

$$Power (w) = \text{body mass (kg)} * \text{displacemet}^2 / \text{tim}^3$$

The peak power - the highest amount

The minimum power - the lowest amount

Mean power - mean power of 6 stages

Fatigue index =the total time of 6 stages / minimum power - peak power

The Monosaccharide were used as additives in this study. The first group of athletes used 120 CC a 5% solution of it, half an hour before exercise and the second group consumed 100 mg of vitamin E and 200 milligrams of vitamin C of Vigel type as well as chewing ascorbic acid daily (Zoopi 2006, Mokhlesi 1999, Ali Karami, 2009), and the third group used 60 CC of placebo (maltodextrins) respectively. In this study the obtained data were described and analyzes in two parts. In the first part, research variables were described using statistics such as mean, standard deviation, and tables and related charts and in the second part, to test the hypotheses, analysis of covariance (ANCOVA) and to compare the two groups Bonferroni post hoc test at the level of 0.05 with version 20 of the SPSS software was used.

### 3 Research findings

The results showed that there is no significant difference between the average effect of short term usage of carbohydrate supplement, antioxidant and placebo on aerobic capacity of young female volleyball players but there is no significant difference between the average short-term usage of carbohydrate supplementation, antioxidant and placebo on anaerobic power, the anaerobic maximum power and fatigue index;

In the other words, short-term usage of carbohydrate supplementation resulted in a significant increase in anaerobic power, maximum anaerobic power and fatigue index compared to the use of short-term antioxidant and placebo groups and there is no significant difference between the antioxidant intake and placebo on the maximum anaerobic power and anaerobic power and fatigue index.

### 4 Founding in three groups

#### 4.1 Investigation of the effect of carbohydrate supplement on the anaerobic power:

There is no significant difference between the short-term usage of carbohydrate supplementation on aerobic capacity of young female volleyball players. By the analysis of variance (ANCOVA);  $p= 452.0$  the null hypothesis is confirmed. In fact, there was no significant difference on the average of adjusted aerobic power of volleyball players of carbohydrate (M = 41.0) and placebo groups (M = 40.8).

Figure 1. Average and standard deviation of aerobic power of research groups in pretest and post test

Table 1. Results of variance analysis (ANKOA) of aerobic power

Source	SS	df	MS	F	Sig
Pre-test	108.2	1	108.2	45.9	0.0
Carbohydrate	3.83	2	1.91	814.0	452.0
Error	75.4	32	2.35		

**4.2 Investigation of the effect of carbohydrate supplement on anaerobic power**

There is no significant effect between the short-term usages of carbohydrate supplementation on anaerobic power of youthful female volleyball players. Bonferroni test results; (P=5.0)

therefore the null hypothesis is rejected. Short-term usage of carbohydrate supplementation resulted in a significant increase in anaerobic power of young female volleyball players and there is also a significant difference between the adjusted average of anaerobic power of the consumer of carbohydrate supplementation (M=6.263) and placebo (M=7.210)

Figure 2. Average and standard deviation of anaerobic power of research groups in pretest and post test

Table 2. Variance analysis test (ANKOVA) of anaerobic power

Source	SS	df	MS	F	Sig
Pre-test	11569.0	1	115690.9	77.8	0.0
Carbohydrate	18791.4	2	9395.7	6.3	5.0
Error	47537.7	32	1485.5		

**4.3 The effect of antioxidants on aerobic power**

There is no significant effect between the short-term usages of antioxidants on aerobic capacity of young female volleyball players. Analysis of variance (ANCOVA). Hence, the null hypothesis is confirmed. There is no significant difference between the adjusted average of aerobic power of youthful

female volleyball players the of the antioxidants consumer (M=6.41) and placebo groups (M=8.4).

**4.4 The effect of antioxidants on anaerobic power**

There is no significant difference between the effects of short-term usage of antioxidants by young female volleyball athletes

on the anaerobic power. Bonferroni post hoc test; ( $P=0.1$ ). Therefore, the null hypothesis is confirmed. There was no significant difference between the anaerobic power of the Young girl volleyball player consumer of antioxidant and placebo groups.

#### 4.5 Reviewing the impact of carbohydrates and antioxidants supplementation on aerobic and anaerobic power

There is no significant difference between the impact of short-term usage of antioxidant and carbohydrate supplementation on aerobic and anaerobic power of young female volleyball players. Bonferroni post hoc test, so the null hypothesis is rejected. There is a significant difference between the adjusted average young girl volleyball player of carbohydrates, antioxidants and placebo groups in aerobic and anaerobic power. In the other words the results of Bonferroni test showed that the usage of the carbohydrate supplementation of results in a significant increase in aerobic power of female young volleyball players with respect to antioxidants usage.

### 5 Discussion and conclusion

#### 5.1 Discussion

Ramezanpoor (2003) performed a study entitled ergogenic effect of 8 weeks supplementing usage of vitamins C and E in adult football players and the results showed that in both groups speed, maximum strength, aerobic capacity, and the fatigue time is improved and the variation of blood lactate concentration after maximal exercise is decreased. Comparison of the two groups in the pretest and post test showed that there is no significant difference in any stage. This research is consistent with the present study. Hoffman et al., (2008) conducted a study as testing an energetic supplement before the exercise on the performance of the exercise. The study was conducted on 12 strength athlete males in which one groups was feed 120 ml of energetic beverage while another group was given a same amount of placebo which was done after 2 minutes at the end of each agility practice and after 10 minutes of aerobic test the obtained results showed there is no significant difference in performance between groups using the ineffective drug and the group using the supplement. This research is consistent with the present study.

Mahrooghi, (1998) performed a study aimed to comparison of the effects of creatine supplementation with mixture of creatine-Carbohydrates on the anaerobic power and cellular damage indices (CK, LDH) in boys aged 18-15 years of Koohrang city. The results showed that in the second experimental group the usage of creatine supplementation improved anaerobic power ( $P < 0.05$ ). Also the usage of creatine significantly increased the levels of creatine kinase and lactate dehydrogenase ( $P < 0.05$ ) in this group. But in the group which has used creatine along with carbohydrates, anaerobic power increased significantly ( $P < 0.001$ ), whereas CK and LDH enzyme did not increase significantly. No significant differences observed in CK and LDH enzymes and anaerobic power of the carbohydrates group. The above research is not consistent with the present study. It may be because the subject were not athletes and the usage period of the supplement was short and they were with different age and gender.

Rahimi, (2003) performed a study entitled the effects of a supplementation on the levels of ATP, muscle strength, power and endurance. The results showed that there is no difference in the vertical jump (anaerobic power) but the level of ATP is increased. This study is not in line with the results of the present study it may be because of the difference between the type of carbohydrates in two research and the period of its consumption or because of the difference in gender and age of the subjects.

Rahim (2009) performed a study as the effect of ascorbic acid supplementation on aerobic and anaerobic power of handball players and there was no significant changes in aerobic and

anaerobic performance of the groups with respect to placebo group. This research comply with the present research study given that antioxidants combination of vitamins E and C, and with a much more time was used in the present study there was no significant difference on the aerobic and anaerobic power.

Gaeini and Rajabi (2003) performed a study entitled six-week effect of usage of Q10 coenzyme supplementation on aerobic endurance, maximum power, minimum power, average power, and fatigue index of football players. The results showed there is significant differences ( $P < 0.05$ ) in the amount of aerobic capacity. While in contrast no significant change observed in the amount of anaerobic performance parameters including maximum power ( $p=0.933$ ), minimum power ( $P=258$ ), average power ( $P=625$ ) fatigue index ( $P=0.569$ ). This research is consistent with the present study.

DeNysschen et al., (1999) in their research investigated effect of two regimes of vitamin c (100 and 200 mg) on the aerobic (vo2max) and anaerobic power. The results showed that daily doses of 100 and 200 mg of vitamin C for a week of have no significant effect on the aerobic and anaerobic power of physical education students of Gilan. This research is consistent with the present study. Given that antioxidants combination of vitamins E and C, with a more period of time is used in this research but as the above study, no significant difference was observed on the aerobic and anaerobic power.

Kreider et al., (2007) performed a study entitled fallacy effect of usage of the dietary supplements used by young athletes of Great Britain. The research was on girls and boys 12 to 21 years old ( $403 = N$ ) was performed. The research showed that the consumer of the supplements believe that there is a direct link between the use of their favorite supplements and their performances. Now young athletes are moving away from health and only focus on their performances. This research study do not match. It seems that the carbohydrates and antioxidants supplements usage have a positive effect on several factor of the present study including anaerobic power, maximum aerobic power and fatigue index which may be because of the difference between the types of the carbohydrate or antioxidants or because of the difference between the time and period of usage of these supplements.

Clark et al., (2000) conducted a study entitled the effects of vitamins E, C and combination of both on bioenergetical index of sports man. The results of this study showed that a daily intake of 400 mg of vitamin E, 1000 mg of vitamin C and 400 mg of vitamin E along with 1000 mg of vitamin C for three weeks has a significant effect on the aerobic and anaerobic power of the students. This research study do not match with the present study.

### 6 Conclusion

According to the results we can say that the daily usage of carbohydrate supplementation at a rate of 120 cc for 14 days may be effective on the anaerobic power, maximum aerobic power and fatigue index of young girls, but the daily consumption of 100 and 200 mg of vitamin E and C for 14 days have no significant effect on aerobic power and anaerobic power (maximum anaerobic power and fatigue index). So the usage of the carbohydrate can be suggested to the athletes and coaches this sport in this age group with the he determined amount of intake.

**Abstract.** With increasing changes in society, organizations need to adopt themselves with environmental conditions and for this purpose they should beside revise their organizational structure, improve their relationship patterns with other organizations. The research method used is descriptive to survey and in terms of purpose is applied one, which preparing and distributing a questionnaire among 148 managers with the organizational position was performed. Based on the results of the test, it was determined there is a direct positive relationship between organizational intelligence and knowledge management as well as according to secondary hypotheses. Therefore, according to the research findings can be accepted by 95% confidence there is a direct relationship between organizational intelligence and knowledge management.

**Keywords:** Organizational Intelligence, Knowledge Management, the desire to change, performance pressure, common fate, spirit, application of knowledge, unity and agreement

### 1. Introduction

Today we can claim with absolute certainty that identifying and using organizational intelligence can increase the competitiveness of an organization and differentiate it from other organizations. The necessity of organization intelligence application increases the efficacy of existing structures in order to their objectives and information from restricted and operational mode will be developed to the use in executive levels for managers. Given that managers are working in organizations that are affected by their indoor and outdoor environment, so the organizational intelligence can help managers and enable them to meet the needs and timely response to the environmental changes, therefore, relying on it improve their performance.

On the other hand, despite it seems knowledge as a resource is essential to the survival of organizations, but in many organizations the knowledge management has been considered seriously. The importance of people knowledge in organizations and participation in organization people knowledge is one of the key and effective in increasing organizational efficiency.

Finally, knowledge management is one of the most important factors of the company's success in a competitive situation. The importance of this issue is to the extent that today a number of organizations measure their knowledge and reflect this

knowledge as intellectual capital as well as an index for rating agencies and companies in their report.

### 1.1. Statement of the problem

Organizational intelligence and knowledge management has a considerable impact on productivity, performance improvement of organization and increase a company's competitiveness, so that addressing both issues resulted in synergistic property and is an important step to enhance the organization, so there this issue how much the organization value these two issue? And whether the organization concerns them? For this purpose to clarify the matter we decided to examine the relationship between organizational intelligence and knowledge management and determine whether there is a relationship between these two matters?

Thus, the main research question is to investigate the relationship between organizational intelligence and knowledge management in Lavan Oil Refining Company.

### 1.2. Necessity of research

Investigation of the relationship between organizational intelligence and knowledge management can be resulted in more understanding of concept and its related dimensions and this leads to more flexibility in organization members in relation to environmental changes organization and increases the competitiveness power of organization and finally leads to preservation, survival and promotion of organization.

### 2. Literature (research background)

The intelligence in Thorndike's point of view, in fact, is a partial theory of mental ability. Thorndike insisted that many of the elements in a given mental activity, are share, therefore, they can be used in various classes, for example, they can be divided in verbal meanings groups, mathematical reasoning, comprehension, subjective understanding and so forth (Thorndike,1937).

Mehara et al., (2012) believe that people with higher IQs are more successful and efficient.

In the management literature several definitions have been provided for organizational intelligence. Since 1967 that the concept of organizational intelligence was raised by Wilensky, a lot of research has been done about organizational intelligence, but still there is no single definition of organizational intelligence (Xuezhony & Zhaohan, 2008).

Figure .1: Dimensions of Organizational Intelligence according to Chenari (2015)

Beheshtifar and Pourafghan they in 2015 in a study concluded that there was a significant relationship between organizational intelligence and organizational success and organizational intelligence is a basic approach to improve performance and achieve success in the long term (Beheshtifar and pourafghan, 2015).

### 2.1. Organizational knowledge

Today in competitive environment of the business, the most important determining factor for the development and survival of each organization is the existence of knowledge. Taking advantage of this knowledge that the organization is run and process of production is circulated. Without an important tool such as knowledge, the running of an organization and doing its tasks virtually will not be possible. By knowledge, the organizations provide services and products and the organization is kept in the competitive market and its survival is assured. But how that knowledge is gained and how is managed in a satisfactory way is very important.

The most important issue in this regard is used today, is the organizational knowledge management that with effective knowledge management process, such as: Knowledge creation, knowledge transfer or knowledge sharing, and ultimately knowledge utilization conduct the organization in productivity path and organization sublimity.

### 2.2. The definition of knowledge management

To achieve information and data that can be effective and usable in different ways, different times and in different conditions. The knowledge includes perception and understanding obtained through reasoning, intuition and learning.

Ellen Knapp states: Knowledge Management is the art of transforming information and intellectual assets into sustainable value for its clients of company and its individuals (Seifollahi and Davari, 2008).

Chenari (2015), in his opinion, knowledge management in organizations should be considered from three perspectives or horizons and different goals (Figure1):

1-The business perspective 2-The management perspective 3-The operational support perspective

The business perspective: focusing on why, where and to what extent the organizations should invest on the productivity of knowledge. Strategies, products, services, alliances, acquisitions, or a lack of investment must be considered in a knowledge-based view. The managerial perspective: focusing on organizing determination, directing, facilitating and monitoring the knowledge-based activities and measures required to achieve the desired objectives and enterprise (organizational) business.

The operational support perspective: recognizes this point that knowledge managers should pay attention to knowledge processing (Seifollahi and Davari, 2008).

### 2.3. The relationship between knowledge management and organizational intelligence

Future competitive advantages will be revealed to the organization's ability to manage knowledge and information and physical and financial capitals are replaced by intellectual and mental capitals and the power of the mind would be dominant power in the arenas of global competition. Drucker, using terms such as knowledge work, knowledge workers and knowledge organization, suggests a new type of organizations that in such an environment depends on the abilities of knowledge. Therefore, improving and promoting organizational intelligence

on the implementation of knowledge management can be very efficient in smart organizations design and exploiting opportunities and cope with environmental threats (Taheri Larry, 2010).

The importance of organizational intelligence integrating and knowledge management have been reviewed by Richard and Noori and the aim of this study is to present an analysis of the difference between knowledge management and organizational intelligence and establishing a base (framework) for its relationship with other fields in work environment. Findings from this study demonstrated the effectiveness of organizational intelligence based on knowledge building and development and improvement of mental models cause the increased understanding of integrity in decision-makers (Richard and Noori, 2005).

Azami and Yaghobi (2016) in their study investigated the relationship between organizational intelligence and conflict management and came to the conclusion that there is a significant positive relationship between all aspects of organizational intelligence and conflict management and they believe that successful organizations have a higher IQ and are desirable in terms of management and can obtain the highest efficiency of human resources.

Josef Haddad in 2006 has addressed the issue of knowledge management and in that research has considered the components of knowledge management include knowledge creation, knowledge establishment, knowledge registration and knowledge sharing and has defined them.

Richard and Noori based on research carried out in 2005 concluded that the effectiveness of organizational intelligence based on development and promotion of knowledge and improvement of mental models will increase the understanding in decision-makers about their integration.

Metora and Varla in 2004 examined the intelligence and knowledge management and concluded that the knowledge and intelligence can be improved through practice and they will be destroyed in lack of practice.

## 3. Research Methodology

This study is a survey-descriptive and in terms of purpose is an applied one. The type of research is applied.

### 3.1. Statistical population

The statistical population of this research is Lavan Oil Refining Company employees that have organizational position and totally are 557 people.

### 3.2. Sampling

In the present study simple random sampling method is used. In the random sampling, after determining the sample using Morgan table, with allocation proportional with population size, the sample size for this method to be determined.

To determine the sample size in this mode Morgan table (see Appendix 1) has been used in which the sample size is 148.

### 3.3. Data collection tools

In this study, questionnaire has been used as the main instrument to collect field data, because data collection with this volume (size) and limited time with other tools wasn't possible.

### 3.4. Methods of data analysis and hypotheses test

Analysis of the collected data in this research is conducted using appropriate statistical tests including Pearson correlation coefficient and regression analysis and since the default of many statistical tests including Pearson correlation and coefficient regression analysis is the normality of observations, Kolmogorov-Smirnov test is used for normality of observations.

### 3.5. The examination of research hypotheses

In this section, the research hypotheses, in other words, the relationship between the variables, are examined. Based on the results in the previous section to investigate the relationship between organizational intelligence and knowledge management, as well as between the components of organizational intelligence and knowledge management Spearman correlation coefficient is used.

### 3.6. The main hypothesis

To investigate the claim of correlation between two variables, we use the Spearman correlation coefficient.

Table 1: The correlation test of main hypothesis variables based on Spearman correlation test

	Knowledge Management	Organizational Intelligence
Knowledge Management - correlation coefficient	1.00	0.450
The significance level		0.00
Number	148	148
Organizational Intelligence - correlation coefficient	0.450	
The significance level	0.00	1.00
Number	148	148

Based on the output of correlation test table 1, since the sig is less than 0.05, the null hypothesis is rejected and there is a correlation between these two variables. The correlation coefficient for 148 data is 0.45.

### 3.7. First sub-hypothesis

Table 2: The correlation test of sub-hypothesis (1) variables based on Spearman correlation test

	Knowledge Management	Strategic vision
Strategic vision - correlation coefficient	1.00	0.129
The significance level		0.119
Number	148	148
Knowledge application - correlation coefficient	0.129	
The significance level	0.119	1.00
Number	148	148

Based on the output of correlation test table, since the sig is more than 0.05, there are no sufficient reasons to reject the null hypothesis and there is no correlation between these two variables. (Table 2)

### 3.8. Second sub-hypothesis

Table 3: The correlation test of sub-hypothesis (2) variables based on Spearman correlation test

	Knowledge Management	Common fate
Performance pressure - correlation coefficient	1.00	0.341
The significance level		0.046
Number	148	148
Knowledge application - correlation coefficient	0.341	
The significance level	0.046	1.00
Number	148	148

Based on the output of correlation test table, since the sig is less than 0.05, the null hypothesis is rejected and there is a correlation between these two variables. The correlation coefficient for 148 data is 0.341. (Table 3)

### 3.9. Third sub-hypothesis

To investigate claim of correlation between two variables, we use the Spearman correlation coefficient.

Table 4: The correlation test of sub-hypothesis (3) variables based on Spearman correlation test

	Knowledge Management	Desire to change
Desire to change - correlation coefficient	1.00	0.439
The significance level		0.034
Number	148	148
Organizational Intelligence - correlation coefficient	0.439	
The significance level	0.034	1.00
Number	148	148

Based on the output of correlation test table, since the sig is less than 0.05, the null hypothesis is rejected and there is a correlation between these two variables. The correlation coefficient for 148 data is 0.439.(Table 4)

### 3.10. Fourth sub-hypothesis

To investigate claim of correlation between two variables, we use the Spearman correlation coefficient.

Table 5: The correlation test of sub-hypothesis (4) variables based on Spearman correlation test

	Knowledge Management	Spirit
Knowledge Management- correlation coefficient	1.00	0.091
The significance level	148	0.088
Number	148	148
Spirit - correlation coefficient	0.091	1.00
The significance level	0.088	148
Number	148	148

Based on the output of correlation test table, since the sig is more than 0.05, there are no sufficient reasons to reject the null hypothesis and there is no correlation between these two variables.(Table 5)

### 3.11. Fifth sub-hypothesis

To investigate claim of correlation between two variables, we use the Spearman correlation coefficient.

Table 6: The correlation test of sub-hypothesis (5) variables based on Spearman correlation test

	Knowledge Management	Unity and agreement
Knowledge Management- correlation coefficient	1.00	0.192
The significance level	148	0.019
Number	148	148
Organizational Intelligence - correlation coefficient	0.192	1.00
The significance level	0.019	148
Number	148	148

Based on the output of correlation test table, since the sig is less than 0.05, the null hypothesis is rejected and there is a correlation between these two variables. The correlation coefficient for 148 data is 0.192. (Table6)

### 3.12. Sixth sub-hypothesis

To investigate claim of correlation between two variables, we use the Spearman correlation coefficient.

Table 7: The correlation test of sub-hypothesis (6) variables based on Spearman correlation test

	Knowledge Management	Knowledge application
Knowledge Management- correlation coefficient	1.00	0.405
The significance level	148	0.00
Number	148	148
Knowledge application - correlation coefficient	0.405	1.00
The significance level	0.00	148
Number	148	148

Based on the output of correlation test table, since the sig is less than 0.05, the null hypothesis is rejected and there is a correlation between these two variables. The correlation coefficient for 148 data is 0.405. (Table7)

### 3.13. Seventh sub-hypothesis

To investigate claim of correlation between two variables, we use the Spearman correlation coefficient.

Table 8: The correlation test of sub-hypothesis (7) variables based on Spearman correlation test

	Knowledge Management	Performance pressure
Performance pressure - correlation coefficient	1.00	0.492
The significance level	148	0.00
Number	148	148
Knowledge application - correlation coefficient	0.492	1.00
The significance level	0.00	148
Number	148	148

Based on the output of correlation test table, since the sig is less than 0.05, the null hypothesis is rejected and there is a correlation between these two variables. The correlation coefficient for 148 data is 0.492. (Table8)

## 4. Results

### 4.1. The results of the main hypothesis

According to the analysis done through correlation it can be said that in the main hypothesis there is relationship between knowledge management and organizational intelligence in Lavan Oil Refining Company. Since the correlation coefficient is 0.450, with 95% confidence can be accepted the relationship is direct and positive.

### 4.2. The results of first sub-hypothesis

According to the analysis done through correlation it can be said that there is no relationship between knowledge management and strategic vision (first sub-hypothesis) in Lavan Oil Refining Company.

### 4.3. The results of second sub-hypothesis

According to the analysis done through correlation it can be concluded that there is relationship between knowledge management and common fate in Lavan Oil Refining Company. Since the correlation coefficient is 0.34, with 95% confidence can be accepted the relationship is direct and positive.

### 4.4. The results of third sub-hypothesis

According to the analysis done through correlation it can be concluded that there is relationship between knowledge management and desire to change in Lavan Oil Refining Company. Since the correlation coefficient is 0.439, with 95% confidence can be accepted the relationship is direct and positive.

### 4.5. The results of fourth sub-hypothesis

According to the analysis done through correlation it can be said that there is no relationship between knowledge management and spirit (fourth sub-hypothesis) in Lavan Oil Refining Company.

### 4.6. The results of fifth sub-hypothesis

According to the analysis done through correlation it can be concluded that there is relationship between knowledge management and unity and agreement in Lavan Oil Refining Company. Since the correlation coefficient is 0.192, with 95% confidence can be accepted the relationship is direct and positive.

### 4.7. The results of sixth sub-hypothesis

According to the analysis done through correlation it can be concluded that there is relationship between knowledge management and knowledge application in Lavan Oil Refining Company. Since the correlation coefficient is 0.405, with 95% confidence can be accepted the relationship is direct and positive.

### 4.8. The results of seventh sub-hypothesis

According to the analysis done through correlation it can be concluded that there is relationship between knowledge management and performance pressure in Lavan Oil Refining Company. Since the correlation coefficient is 0.439, with 95% confidence can be accepted the relationship is direct and positive.

## 5. Recommendation and conclusion

### 5.1. Recommendation based on literature

Considering the literature and the studies that have been done to develop this research, the following proposals (recommendation) for improving organizational intelligence and knowledge management are offered.

1. Training the employees to identify and strengthen the awareness regarding variables and components of organizational intelligence and knowledge management
2. Encourage the employees to use the latest achievements of organizational intelligence and knowledge management technology systems
3. Develop and promote the process of innovation and learning and transforming organizational environment to a flexible initiative environment in exposure to the new success toward strengthen organizational intelligence and knowledge management
4. Putting in the access to knowledge and employees easy access to it at all levels of the organization in order to support the growth of knowledge
5. Create mechanisms to share knowledge among employees and promote a culture of knowledge system
6. Advice to managers to plan for the continuation and development of knowledge in organization in such a way that it remains sustainable at the corporate level
7. To build the capacity in organizations to achieve new knowledge and training managers to offer different ways of creating knowledge
8. Create focal points for knowledge sharing to connect and dissemination of employees knowledge with the aim of strengthening their potential capacities
9. Scientific - applied conferences about knowledge management and organizational intelligence in order to improve these two key issues among staff
10. The research support of organization of people who are active in the field of knowledge management and organizational intelligence
11. Create a feedback mechanism to organizational intelligence and knowledge management influence and providing feedback on the performance of these two components and promoting it in order to strengthen productivity and improve organizational performance

### 5.2. Recommendation based on results

1. According to the results of the main research hypothesis, given that totally there is a direct and positive relationship between organizational intelligence and knowledge management, the organization must creating measure mechanisms determine the level of organizational intelligence and applying knowledge management in the organization individuals and using training, seminars and conferences, both in internal and external levels, compensate the existent weaknesses and shortcomings and strengthening these two components in the company, in order to using this potential and optimizing achieve high efficiency in all areas. The organization should consider this strengthening of each of the components boost another and synergies and additional modes in the recovery of the two components are achieved.
2. According to the first sub-hypothesis, to promote knowledge management it is recommended the organization in the first step identify and describe its own purpose and therefore choose a good perspective for itself.
3. According to the second sub-hypothesis in the research, the organization must properly define and specify its mission and involve all employees through training and consultation employment until retirement.
4. According to the third sub-hypothesis, organizations need to review business models to provide a favorable opportunity for managers' success and these patterns that promotes the desire for change (promotion) must be consistent with the necessary changes to achieve the strategic vision.

5. According to the results of fourth sub-hypothesis in research, the organization should enhance employees' quality of life and pay attention to employees' feelings about work and management to interest, commitment and optimism of employees towards work and organization to be enhanced, because such a program as the spirit could have a positive effect enterprise (organizational) intelligence.

6. According to the fifth sub-hypothesis, the organization should arrange its organizational structure be based on a clear strategy in such a way resolve the bottlenecks and constraints causing lack of transparency and understanding of the duties and responsibilities.

7. According to the sixth sub-hypothesis, the organization must provide the background the implementation of knowledge management in organization and using the tools of information technology to take advantage of valuable staff (employees) resources, ideas and information.

8. According to the seventh sub-hypothesis, organization must make available job descriptions to managers in a way that specifically all of them recognize their responsibility (duties) well and organization must arrange a performance assessment team in order to the managers get feedback on their performance.

#### 6. Suggestions for future research

1. In the context of the development of organizational intelligence components in organization some studies are done.
2. The next suggestion is that the organizational intelligence programs are compared with knowledge management in some organization or subsets of an organization the quality of these programs separately to be determined.
3. The subject of investigation of the relationship between intelligence and management in other population such as pupils, students or another organization to be investigated.
4. The researchers study on the individual components of the intelligence organization with knowledge management separately.
5. In the context of creation and development of culture, establishment and sharing knowledge in the organization as a whole or individually be investigated.
6. Given that yet in our country, many organizations do not consider these two important issues or practically do not use and considering the vertical hierarchy organizational structure it is recommended training- briefing courses are held for all executives of organizations.
7. Some research on the causes of lack of consideration of senior managers of Iranian companies to organizational intelligence and knowledge management is conducted.

#### 7. Limitations and problems of research

- Among the limitations of this study, that researcher was faced with a shortage of research findings on the relationship between organizational intelligence and knowledge management. Since the organizational intelligence in the context of public management is a relatively new concept, the study was lower in this case than in other cases.
- Lack of cooperation by some people due to lack of interest to participate in non-work activities and prolong distributing and collecting questionnaires among agencies (organizations).

**Abstract.** The aim of this study was to measure the effects of risk management on the financial performance of companies listed on the Stock Exchange of Tehran. Research in terms of empiricist epistemology, it argued systems, inductive and from the study, is the archival field. The population of this research in terms of geographical scope is limited to firms listed in the Tehran stock exchange in terms of time, including a six-year period from the beginning of fiscal year 2011 up to the end of the fiscal year 2015. That statistical sample size of 95 firms among firms accepted in Tehran Stock Exchange were selected by systematic elimination. The results showed that the hypotheses of risk management reporting and management of risks of non-compliance with laws and regulations on the financial performance of companies listed in has a significant effect.

**Keywords:** Risk Management, Strategic Risk Management, Operational Risk Management, Financial Reporting Risk Management, Financial Performance

### 1. Introduction

Due to extensive changes and technological progress in various fields, the stock market as a factor in development of a society is faced with enormous changes (Hoyt and Liebenberg, 2009). With the growing competition between the threats and opportunities facing today's organizations and all organizations at national and international levels, the concept of risk has greatly increased. So threats can be mentioned that the organization fails. The managers for the growth and survival of the organization should think of ways to reduce the risks of undesirable (Lv and Dongping, 2015).

In the meantime, enterprise risk management with a systematic approach, the risks in an industry and commercial enterprise creates maximum opportunity. In the business environment, especially Stock Exchange, companies and industries with more risk and higher impact factor, face, therefore, the importance of risk management techniques in this firm is very essential and important (Boone and Kurtz, 2012).

Risk management system that the organization identify and analyze the risks and to adopt a set of techniques and strategies to deal with them. The definition of risk management is made up of three components; identifying and risk analysis, techniques, and strategies for coping with risk and feedback. These components make up the basic principles of risk management and risk management are more or less in all views (Gordon et al. 2009).

On the other hand, in recent years there has been a change of paradigm in the way of approach to risk management, so that instead of studying risk management from an island perspective, holistic approach to risk management is adopted. ERM interests of all stakeholders, including shareholders, creditors, senior managers, employees, customers and provides member associations (Bruce, 2014).

However, the results of many studies about the role and importance of risk management, emphasized that the company be considered when successful, the continuous development of its financial performance due to effective management of risk is comprehensive. The main problem is whether research, risk management and financial performance of companies listed on the stock exchange has a significant effect? To answer this question in the present study was to assess the financial

performance of companies listed in Tehran Stock Exchange rate of return on equity (ROE) is used. Since the main objective of management is to benefit the shareholders, with a ROE accounting approach can now be considered the ultimate measure of financial performance. As well as risks that are studied in this research as risk management, includes four categories: strategic risk management, operational risk management, risk management reporting and management of risks of non-compliance with laws and regulations (Gordon et al. 2009).

Strategic risk management, strategic risk management and systemic risks in the industry (external risks) is formed, which includes the company's ability to reduce systematic risks. Management of operational risks; risk management techniques to increase staff efficiency as well. The output data rate is an accurate measure of the operational risk management of sales divided by the number of staff has been achieved.

Risk management reporting; accurate reporting is crucial to success in all aspects. A benchmark for low reliability of financial reporting, the combination of the three factors is important weaknesses in internal controls, qualified audit reports and the restated financial statements. Weaknesses in internal control auditing standard for quantification of variables that Tvsrt performance audit consultants and internal auditors is done, is used, which is calculated mandatory stock companies. As well as on weighted average standard variable qualified audit reports provided reports on company activities over the years is used. Variable restated financial statements as well as variable expressed qualified audit reports.

Manage the risks of non-compliance with laws and regulations, with the arrival of the company to the stock exchange, the company would have to observe the laws and regulations governing the relationship is not with the environment. That is why the risk of non-compliance with laws and regulations is a wide range of risks. One of the most efficient tools in the field of auditing standards is accepted. The measure of non-compliance with laws and regulations manage the risks involved in this research is audit fees to total assets.

### 2. Methodology

The variables in this study include variable risk management (including strategic risk management, operational risk management, risk management reporting and management of risks of non-compliance with laws and regulations) as independent variables and the rate of return on equity (ROE) as an indicator of financial performance as the dependent variable based on the research base Olamide et al (2015) based on the extraction and conceptual model that has been drawn. To assess the financial performance of companies listed in Tehran Stock Exchange rate of return on equity (ROE) is used.

As well as risks that are studied in this research as risk management, includes four categories: strategic risk management, operational risk management, risk management reporting and management of risks of non-compliance with laws and regulations.

Strategic risk management, strategic risk management and systemic risks in the industry (external risks) is formed, which includes the company's ability to reduce systematic risks. Management of operational risks; risk management techniques to increase staff efficiency as well. The output data rate is an accurate measure of the operational risk management of sales divided by the number of staff has been achieved.

Risk management reporting; accurate reporting is crucial to success in all aspects. A benchmark for low reliability of financial reporting, the combination of the three factors is

important weaknesses in internal controls, qualified audit reports and the restated financial statements. Weaknesses in internal control auditing standard for quantification of variables that Tvsrt performance audit consultants and internal auditors is done, is used, which is calculated mandatory stock companies. As well as on weighted average standard variable qualified audit reports provided reports on company activities over the years is used. Variable restated financial statements as well as variable expressed qualified audit reports.

Manage the risks of non-compliance with laws and regulations, with the arrival of the company to the stock exchange, the company would have to observe the laws and regulations governing the relationship is not with the environment. That is why the risk of non-compliance with laws and regulations is a wide range of risks. One of the most efficient tools in the field of auditing standards is accepted. The measure of non-compliance with laws and regulations manage the risks involved in this research is audit fees to total assets.

The research hypothesis test models;

$$ROE = \beta_0 + \beta_1 (SRM) + \beta_2 (ORM) + \beta_3 (RRM) + \beta_4 (NLRM) + \epsilon_{it} \quad (1)$$

The research in the field of research funding is positive. According to the historic data is used to test the hypothesis, the research team used a quasi-experimental and post-event. Research in terms of empiricist epistemology, it argued systems, inductive and from the study, is the archival field. The study population includes firms listed in the Tehran Stock Exchange between the years 1389 to 1393 in which a financial faces in the years-have provided to the Stock Exchange. This is because access to reliable information and audited financial faces respectively. The number of active firms in Tehran Stock Exchange at the beginning of 1388, about 342 companies respectively. Sampling in this study is the systematic elimination.

1. Between 2011 and 2015 the number of companies that have participated in exchange and investment companies and banks are not.
  2. Investment companies and banks and insurance companies that are not.
  3. Companies that have their fiscal year ending on 29 March.
  4. Companies with fiscal year not change during the study.
  5. The companies whose financial information is available in the time period studied.
- The number of firms for which data were collected (final sample of 122 companies).

### 3. Finding

The main hypothesis of this study: risk management on financial performance of companies listed in Tehran Stock Exchange has a significant effect.

H0: risk management on financial performance of companies listed in Tehran Stock Exchange had no significant effect.

H1: risk management on financial performance of companies listed in Tehran Stock Exchange has a significant effect.

Table 1: The results of researcher model

Variable	Coefficient	Std. Error	t-Statistic	Prob.
SRM	0.58425	0.111229	5.254110	0.0000
ORM	0.17017	0.03082	5.521425	0.0000
RRM	0.14811	0.035668	4.152410	0.0000
NLRM	0.13421	0.047509	2.824951	0.03944
C	0.0851	0.046638	1.824725	0.3348
Effects Specification				
Weighted Statistics				
R-squared	0.167448	Mean dependent var.		0.308503
Adjusted R-squared	0.164122	S.D. dependent var.		0.518174
S.E. of regression	0.449824	Sum squared resid.		76.68731
F-statistic	41.00459	Durbin-Watson stat		2.167485
Prob (F-statistic)	0.000000			

To test this hypothesis, the results of the model are presented in Table 1 have been used. The likelihood or significance level for each variable is less than 0.05, the null hypothesis is rejected at the 95% confidence level. The Durbin-Watson statistic is the amount 2.167, shows his lack of solidarity. Also, according to the t-statistic for the variables are significantly different (due to exposure to the centroid +1.96 and -1.96, or critical values at 95%), according to the above main hypothesis can be confirmed. as closed. This means that risk management on financial performance of companies listed in Tehran Stock Exchange has a significant effect. Given the significant level of 0.000 F test results (such as the amount is less than 0.05) showed that the scattering data of the regression line distribution is reasonable. The coefficient of determination risk management model shows the financial performance of companies listed in Tehran Stock Exchange 16.7 percent implications.

#### 4. Conclusion

According to findings, following outcomes are proposed:

- Reform of corporate annual accounts
- Reform of the regulations and guidelines required
- Internal control system systematically up
- Reform of accounts between Groups
- Disclosure of related party transactions in accordance with Accounting Standard No. 12.
- The inclusion of binding rules and regulations for the statute
- The use of consultants and legal experts versed in company
- Executed auditor and legal inspector comments and criticisms point by point
- Trying to obtain quality assurance certificates and safety.

# PRINCIPLES OF CRIMINALIZATION OF SEXUAL BEHAVIOR IN IRAN AND ENGLAND CRIMINAL LAW WITH AN EMPHASIS ON PREVENTION STRATEGIES

<sup>a</sup>AINAZ DERAY, <sup>b</sup>ARSALAN GHORBANI

<sup>a</sup>Department of law, Bandar Anzali Branch, Islamic Azad University, Bandar Anzali, Iran

<sup>b</sup>P.h.D Professor, Department of International Relations, Faculty of law and Political Sciences University of Kharazmi, Tehran, Iran

Email:<sup>a</sup>ainazderay@yahoo.com,

<sup>b</sup>arsalan.seng.ghorbani@gmail.com

**Abstract:** Criminalization of a sexual behavior can prevent its occurrence in society. But sometimes In addition, behaviors that are the introduction of an abnormal behavior occurrence are also considered as crimes and the bigger crime can be prevented. But this may lead to indulge in criminal or penal inflation. Given the definition of the crime, criminalization can be called the selection process in which legislators with regard to social norms or other necessities and based on the theoretical foundations of acceptable behavior prohibits or binds a behavior, and ultimately to support it, provides criminal sanctions. Criminal law is a relative concept in terms of misdemeanor and felony society and is subject to change at different times and places.

**Key words:** Criminalization Principles, sex crime, preventive strategies

## 1 Introduction

The current paper is designed in several sections. First of all, we will provide the reader with a brief introduction to sex criminalization concept. Then, the paper investigated the United Kingdom approach towards criminalization of sexual behavior and the causes and motives in their criminal law in addition to concept and principles of sex criminalization in Iran. Later, we will discuss the issue of prevention. In fact, the current paper tries to answer the following questions: "Is it possible to provide Iran and the United Kingdom with the same preventive measure despite the differences in the principles of criminalization?"; "are the sex crimes are the same for both Iran and the United Kingdom? And is the knowledge of foundations of sexual behavior from the perspective of criminology preventive strategies effective to treat such deviations? What is certain is that it cannot be expected to achieve accurate and efficient preventive measures without the identification of the root causes of crime. Factors affecting sexual abuse must be recognized in order to adopt appropriate measures in reducing the violence. No doubt that sexual desire satisfaction motivation may vary depending on the characteristics of the offender and the victim and even the type of society.

## 2 First discussion: introduction

### 2.1 Criminalization

The criminalization is the process of prohibition and or permission of an act by the legislator based on main social norms and beliefs, relying on acceptable theoretical foundations with stipulated criminal sanctions. Accordingly, Criminalization is a second order science based on other disciplines including law philosophy, political philosophy and social sciences. Criminalization is classified into three categories:

- a) Legislative criminalization, which is the main and most logical type and proceeded by the universal principles of criminal law and punishment of crimes.
- b) Judicial criminalization, which is recognized both overt and covert. Its overt form is that of the votes by the General Board of the Supreme Court's precedents; and the covert form is the personal criminal justice by judges that is conducted in the face of uncertainty and brevity of law and to avoid rigid frameworks and rules sometimes considered to the service of the community.
- c) Criminalization accredited by fatwas and jurisprudence resources, which is based on Article 167 of the Constitution emphasized by article 214 of the Criminal Procedure Code (Tohidí and Fazli, 2014).

### 2.2 Sex crimes rules

Sex crimes in Iran rules are derived from the Shia jurisprudence and are discussible in two categories of "hodod" and "tazirat". In other words, the criminalization of sexual crimes in Iran should be traced in jurisprudence law. In the crime sections the crimes against chastity under the titles of adultery in Article 63 of the Penal Code, sodomy in Article 108 of the Penal Code, panderism in Article 135 of the Penal Code and false accusation of adultery or sodomy in Article 139 of the Penal Code have discussed the category with the specified sanctions or punishment based on the quantity and quality crime based on the Sharia law.

The legislator should criminalize sexual offenses to prevent crime in the community. Iran and the United Kingdom legislators and theorists are trying to take necessary actions for the prevention of sexual offenses.

Europe criminal law on sexual offenses has faced major changes of vision in the recent decades. For example, the new Labour government, a few years ago, provided a bill entitled Justice for All proposing that that the victims must be at the center of the criminal justice system. Sexual crimes include a wide range of decriminalization in terms of legislative changes, as well as crime and sexual deviancy as "sexual assault" (or even incest and adultery with minors) have been reduced and by expanding the decriminalization of these issues, prevention is limited to the fight against sexual violence in the form of legal. Provisions relating to the criminalization of sexual behavior in the United Kingdom mainly amended by the Sexual Offences Act, passed in 2003. Sexual assault is the sex crime that has attracted public attention much more than other sexual crimes in the penal system in the United Kingdom with the maximum penalty of life imprisonment.

## 3 Causes of sexual crimes

### 3.1 Personal factors (direct)

The personal factors include factors related to the criminal and considered an expression of personality traits and character with direct impact on their tendency towards the crime. These factors can include two sets of psychiatric factors and sexual dysfunction.

#### 3.1.1 Psychiatric disorders

Quest for sex with violence and without regard to the needs and the rejection by the partner is affected by aggressive and unbalanced personality. All those who have a brief overview on the perpetrators of rape confirmed the presence of some rare abnormal behaviors and personality traits. Even a glimpse into the ways of the invaders and their degrading behavior or injuries inflicted and killings after the rape sometimes we hear in the media, it concludes that they are people with personality problems and mental disorders (Razmsaz, 2013; Ahmadi, 2005).

#### 3.1.2 Sexual dysfunction

Human sexual behavior and tendencies so complicated and interwoven with characters that is with a major impact on psychological characteristics and relationships with others. These issues have occupied the minds of many thinkers, especially psychiatrists and psychologists to find the hidden aspects of human sexual desires and behaviors and have been pioneered by Freud. There is no precise definition of sexual dysfunction and researchers classify and describe some dysfunctions directly. For example sexual dysfunction is classified into three categories: Trans sexualism disorder, diffuse sexual dysfunction and sexual dysfunction (Owhadi, 2001).

According to psychiatrists transsexual people experience a gender identity that is inconsistent with, or not culturally

associated with, their assigned sex, and desire to permanently transition to the gender with which they identify.

### 3.2 Social and cultural factors

Today, no one denies the effective and highlighted role of the social environment and communication on the crimes. Durkheim finds the causes of all abnormal behaviors in the social environment, and some as Lakasani because went to extreme in this regard so that they say "All people of the world are guilty with the exception of criminals" (Gozón, 1995). Cohen and Ahlin believe that crime is a certain form of collective solutions adopted by the lower class that arises from frustration. According to these two sociologists there are specific types of offenders entitled sociologist contentious group that commit rape as a tool for establishing their social status.

### 4 Prevention

The term prevention literally means to prevent, deter them, and take precautions to prevent bad and unwanted events (Sadeghi, 2013). Although there are ample definition and classification of prevention by experts in criminology, but in a nutshell it can be said that crime prevention is to avoid going to crime and disorder commitment (Gozón 1995).

### 5 The second discussion: Foundations and the reasons behind criminalization of sexual behavior in Iranian and the UK criminal law

According to Iranian criminal law, satisfaction or dissatisfaction do not have a role in the criminal nature of these deviations, while reviewing the fundamentals of criminalization of sexual behavior in other countries, especially the United Kingdom in the pages ahead show that there is a big difference in this regard between Iran and the United Kingdom. In fact, criminalization of sexual behavior in the majority of countries with different traditions and beliefs is of the founding principles of the criminal policy of the government. The legislator always criminalize a number of behaviors keeping in mind the principles and reasons. However, the legislator usually not be stipulate the principles and reasons, and the legislated rule does not explicitly points to the criminalization foundations. In other words, criminal law experts are constantly investigating the fact that what behaviors should be considered criminal and what behaviors should be excluded. Accordingly, in the criminalization of acts incompatible with chastity, all penal systems, including Iran and the UK do not act in uniform manners, for example ,in many countries sodomy and adultery, which is done by mutual consent, is decriminalized; however, the vast majority of these countries, have criminalized rape in their laws, and respond strongly with various foundations, including the preservation of generations, human dignity, the principle of patriarchal rule, and finally, the principle of legal ethicist.

It seems that all western legal systems are making efforts to modify abnormal behaviors as one of its main objectives in the criminalization of these behaviors.

Iran and The UK criminal law have discussed specific punishment measures. So officials have to adopt policies and practices to prevent the occurrence of these crimes and prevent corruption in the society. Agencies and other institutions of society should cooperate with the government for crime prevention. All members of the community are responsible in the prevention with more effective measures to prevent sexual offense unlike the criminal measures stipulated by the legislator. If social communities fail to adopt appropriate measures then the legislator should criminalize sexual offenses and act to prevent crime in the community.

The UK criminal law in relation to sexual offenses focuses on the accused unaccepted behavior, not the physical damage that may be caused. In addition, although many sex crimes can cause psychological harm to the victim (and this may be the main reason) but is not required to prove the damage. The charged is responsible in case of committing a forbidden action (material

element), with the capabilities necessary to blame (mental element. Moreover, the regulations prior to Sexual Offences Act 2003, was somewhat naive and incoherent. Mainly there was only two crime of sexual assault against adults, which included sexual assault (with a maximum punishment of life imprisonment) and a gross invasion (with a maximum penalty of ten years' imprisonment).

The survey of the basis of sexual behavior criminalizing in the UK criminal law implies that contrary to penal policy based on jurisprudence and Sharia law to criminalize sexual behavior by the Iranian government, the UK government has adopted a different solution or alternative basis for the criminalization based on liberal politics (Mosavati Azar, 1995).

In the UK criminal law, the first priority for the criminalization of sexual behavior is primarily that the sexual relationship must be without consent or occurred on a child under 12. Proof of this is very difficult, because defendants often claim that she was satisfied, and the discovery of the issue in court, negatively or positively, can be very difficult.

### 6 The third discussion: Strategies to prevent the sexual crimes

Prevention of crime in the world today is as an activity must comply with series of laws and regulations that is a factor in achieving the desired goals and to do that in good faith or devotion is not sufficient. Prevention is in fact part of the responsibilities of all local and state institutions and especially the councils of citizens in the neighborhoods can play an important role in the regulation of the prevention of crime in their individual and collective levels. The following crime prevention strategies can be used:

- 1) Inform public about crime and criminal practices and techniques that are used through the mass media (How to steal a car in remote places or roam criminals and thieves in the neighborhood in order to monitor vacant homes for burglary)
- 2) Forecast projects and group projects
- 3) Provide specific age groups with training at schools, universities and the neighborhood mosques (for example training youth about the effects of drugs and psychedelic effects on the mind and body).
- 4) Changes the lives of people living in those neighborhoods (widening the streets and increasing the amount of light in the environment)
- 5) Encourage and assist private companies for the manufacture and supply of safety equipment at more affordable prices
- 6) Anticipate ways to expose the hidden activities that provide context for offense;

So far, we got familiar with the principles of criminalization of sex crimes in Iran and the UK and figured out that the principle or rule of losses is the issue in Iran criminal law and consent of any sex offender's acquittal would be ineffectual in Iran penal system and sexual relationship outside the marriage bond itself bears the title of crime. Unlike the criminal policy of the UK, that only action in the absence of the victim consent is a crime. But despite these differences, both countries adopted measures in the criminalization of sexual behavior somewhat with different reasons and motives.

### 7 Conclusion

We, given research conducted in the prevention of sexual offenses in the criminal policy of Iran and the UK, realized that although the root causes and the criminalization of sexual behavior in the two criminal systems looks somewhat different, always the same solutions can be provided to prevent this crime. Sexual behavior defined in Iranian law is somewhat different from sexual crime in the penal system of the UK, but the preventive measures , including situational prevention where it is believed the offense was predictable and regardless of who

committed and what was affected, the crime can be controlled by reducing opportunities is the same in both penal system. I think, the criminalization of sexual behavior in Iran is more severe with strict sanction enforcement compared to that of the UK only because of the root cause of religious jurisprudence in Iranian law and a ban on having sex without parity interest.

**Abstract.** The study aimed to explaining the relationship between LMX leadership styles on the quality of crisis management in the Iran Khodro Industrial Services Engineering company. The study population consisted of employees of Iran Khodro Industrial Services Engineering company and data collection tools to assess leader-member relationship was Maslyn questionnaire, which consists of 4 dimensions of loyalty, influence, professional respect and participation. The results of this study showed that conceptual model of relationship between leaders-member and its four dimensions on the quality of crisis management with the fit data and 50% of the variance crisis management by leadership style is explained. A relationship based on loyalty, respect, influence and empathic participation can improve the quality of crisis management, particularly in the preparation stage.

**Keywords:** Leadership style, leader -member relationship, crisis management

### 1 Introduction

Crises are part of the business climate and remove all the crises that threaten the organization is impossible.

On the other hand, adapting to the situation, take advantage of the competitive environment and economic mechanisms, need more tools to take advantage of the opportunities created and this is what is referred to as strategic management. When faced with crisis, organizations spend much time and money and many people acquire different experiences. Crisis management to adapt to change and transition from problems to fix the damage caused by certain new environment requires specific features generally managers to respond to them are facing many problems (Darwish Zadeh and Akhavan, 2011). One of the most important attributes that can help leaders and managers in response to these changes the relations between managers and employees. Leader-Member exchange or LMX is system of elements and their relationships including the relationship of two members and consists of dependent behavioral patterns that two-way and interactional outcome sharing, environmental concepts, values, and directions created.

Leader-follower exchange approach that is relatively nature of contingency, relationship with any of his subordinates unique leader regarded and the exchanges and interactions between a leader and a subordinate that are called couples, is established. In the approach, managers with each of your employees behave based on different levels of social exchanges; they are not treated equally by all his subordinates (Rasuli and Shahae, 2009).

Leaders- member exchange theory is the presentation of a theoretical approach to understanding leadership in working condition. This theory can be due to focus on a dynamic relationship between leaders and subordinates distinguished from other theories of management (Hosseini et al., 2010). This leadership theory as a process, conceptualization, and its focus on the relationship between leaders with the member emphasizes on two-member communication process. This theory believes that leadership is an exchange process between the leader and his

members. The impact of sub follower on the leaders and their behavior, as much is leader's impact on the behavior of sub follower. According to this theory, leaders and followers develop couple's relationships that leaders behave differently people, it leading to the formation of two groups of followers - intimate and non-intimate group. The group is desirable for leader called intimate group, members of this group were considered leaders and a greater share of resources they received. In contrast to this advantage, the leaders expect the members of this group perform the functions beyond the scope of their official job descriptions (Leiden and Maslyn, 1998). According to the above cases, crisis management and leadership integrity is a member of both the scope of the research and the aim of this study understand "Does explanation of the relationship between leader-member (vertical relation model) effect on quality of crisis management of Iran Khodro Industrial Services Engineering Company?"

### 2 Theoretical foundation

According to the needs of mental, emotional individual or in general word, given the issues that emerges in relation to the others to arrive, including the principles and practices of human relations school of followers. This attitude has emphasized the importance of the human dimension members for other people and organizations considers necessary for an organization toward a common goal (Shojaee et al., 2004).

One of the factors influencing employee's satisfaction is their relationship with their direct manager. LMX approach emphasize on unique exchange relationship between director and employee and the case against the use of a specific style for all employees. Exchange relationship between director and employee can be good and poor quality or low quality (Rasuli and Shahae, 2009). Dimension of this approach includes loyalty, influence, professional respect and participation.

Crisis management is the process prevention of crisis or minimize its effects should the worst occur for the process planning and then look for ways to manage and resolve it (AMA, 2003). If you define crisis management as plan to control the crisis, four-step for planning crisis management should be conducted. First, we must predict tragic events, then the contingency plan should be set, so it should be formed and trained crisis management team and organization and finally have to complete applications, they will be implemented on a pilot basis and with practical exercises (Kritner, 2004). According to the literature, leader-member relations and crisis management in Iran are very low and the search was performed.

In Iran, there is not research on examining the relationship between leader-member on the quality of crisis management. Therefore, crisis management and consolidation of leader-member were two scope of the study, was to investigate the relationship between leader-member, four dimensions of loyalty, influence, professional respect and partnership and check the quality of crisis management of the four phases, including identifying the symptoms of the crisis, preparedness, response and recovery and learning was studied.

Based on this conceptual model was developed and is presented in Figure 1.

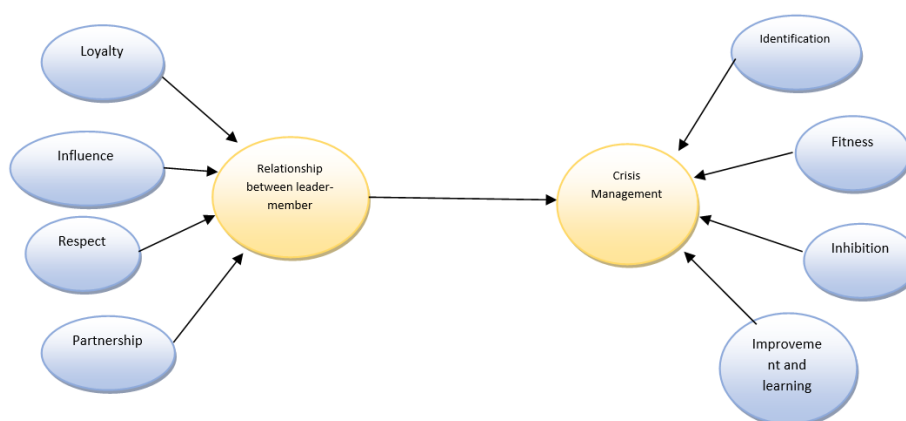

Figure 1 Conceptual Model Research

Based on the conceptual model, the study was designed to evaluate the following hypotheses:

- There is a relationship between leader-member and quality of crisis management in Iran Khodro Industrial services engineering company.
- There is a relationship between loyalty of leader-member and quality of crisis management in Iran Khodro Industrial services engineering company.
- There is a relationship between influence of leader-member and quality of crisis management in Iran Khodro Industrial services engineering company.
- There is a relationship between respect leader-member and quality of crisis management in Iran Khodro Industrial services engineering company.
- There is a relationship between partnership of leader-member and quality of crisis management in Iran Khodro Industrial services engineering company.

### 3 Research methodology

This study is descriptive and relational and in term of purpose is applied research. The population of this research managers and

employees in Iran Khodro Industrial Services Engineering Company. That number was 600. Cochran formula was used to determine the sample size of the research sample consisted of 280 people. In this study, to measure the relationship between the leaders – members, Maslyn questionnaire with 12 questions was used that has four components loyalty, influence, participation and professional respect. In order to measure the quality of crisis management using interviews with experts and professors of a questionnaire containing 26 questions in four dimensions detect the signs of crisis, preparedness, response and recovery and learning was designed and during the various stages of its reliability and validity were examined and approved. Cronbach's alpha coefficient for both scale and all its dimensions higher than 0.7 were obtained. Overall, 82.9% of the sample were male and 17.1% were women; 43.6% of the studied sample has an associate degree and lower, 43.6% Bachelor and 12.8% MA and PhD.

The average age of respondents in the sample is about 35 years, the average work experience of employees in the sample is 9.63; to analyze the data, SPSS-20, and AMOS-20 software was used.

### 4 Findings

To investigate the hypothesis, first correlation coefficient between leaders and members and different aspects as well as crisis management was examined and then the fitness of conceptual model was discussed.

Table 1. Pearson correlation coefficients between the variables

Pearson correlation coefficients					
Leadership relationship-member	Partnership	Respect	Effectiveness	Loyalty	
**0.53	**0.38	**0.44	**0.39	**0.46	Identification
**0.59	**0.48	**0.58	**0.32	**0.48	Fitness
**0.57	**0.44	**0.60	**0.30	**0.44	Inhibition
**0.52	**0.45	**0.52	**0.27	**0.40	Learning
**0.60	**0.48	**0.59	**0.35	**0.49	Crisis management

As Table 1 shows results, there is a significant relationship between loyalty of leader members with four dimension of the crisis management and with overall score of crisis management so that 24% of the variance of crisis management by the loyalty is explained ( $r=0.49$ ;  $0.05 > P$ ). Thus, the first hypothesis is confirmed.

Based on the results obtained in relation to the second hypothesis, influence of leader-member has a significant

relationship with the four dimensions of crisis management and with overall score of crisis management; so that 12% of the variance of crisis management by influence is explained ( $r=0.35$ ;  $0.05 > P$ ).

The results of third hypothesis showed that there are significant correlations between the total score of crisis management and respect as well as all its aspects and 35% of the variance of crisis management by respect is explained ( $r=0.59$ ;  $0.05 > P$ ).

Finally, the results of forth hypothesis showed that participation leader-member with four dimensions of crisis management and total scores of crisis management were significantly correlated and 23% of the variance of crisis management by the participation is explained ( $r=0.48$ ;  $0.05 > P$ ).

After examining the correlation between different aspects of the relationship between the leaders-member and crisis management, in order to investigate the simultaneous role of variables of structural equation modeling was used. Figure 2 shows the results of the relationships in the conceptual model.

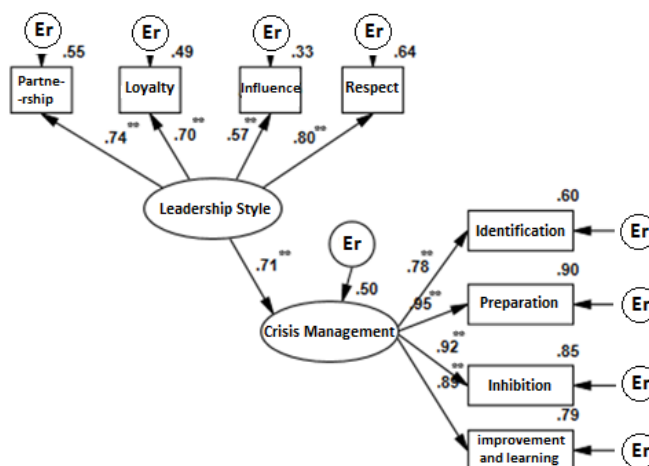

Figure 2 The relationship between leadership style and crisis management \* Coefficients that are significant at alpha level of between 0.01 to 0.05; \*\* coefficients that are significant at the alpha level less than 0.01

As has been shown in Figure 2, 50% of the variance of latent crisis management variable through leadership style is explained ( $r=0.71$ ;  $0.01 > P$ ). Also, based on the results of Figure 3, among the components of crisis management, leadership styles has

highest indirect relation level with readiness ( $0.95 \times 0.71=0.67$ ) and the lowest level of correlation had with the identification ( $0.78 \times 0.71=0.55$ ). Table 2 shows result of the calculation of fitness model index in Figure 2.

Table 2 Abstract indicators fitted to the model presented in Figure 2

	absolute fit index					Comparative fit indices					parsimony fit index	
	Chi-square/df	sig	SRMR	GFI	AGFI	NFI	RFI	IFI	TLI	CFI	RMSEA	PCLOSE
Allowed	<5	$0.05 \geq$	$0.08 \leq$	$0.90 \geq$	$0.90 \geq$	$0.90 \geq$	$0.90 \geq$	$0.90 \geq$	$0.90 \geq$	$0.90 \geq$	$0.08 \leq$	$0.05 <$
Model 2	2.61	0.001	0.05	0.91	0.84	0.94	0.91	0.96	0.94	0.96	0.11	0.001
Model 3	1.41	0.12	0.03	0.96	0.91	0.97	0.95	0.99	0.99	0.99	0.05	0.40

The results in table 2 show there have been significant levels of difference between the conceptual model with the relationship model based on the data collected ( $0.05 > P$ ).

The RMSEA value outside the limit ( $0.08 < RMSEA$ ) and indicate the amount PCLOSE that the amount has a significant difference with allowance limit in operation ( $0.05 > P$ ).

However, other indicators have generally are indicative of the fitted model:  $0.08 > SRMR$ ;  $0.90 < CFI$ ;  $0.90 < NFI$ ;  $0.90 < TLI$ ;  $0.90 < RFI$ . To improve the fit model, the proposed measures of

AMOS software to improve conceptual model calculated and the index based on the possibility theory of relationships, were included in the model. Table 2 shows the results of this calculation. According to proposed indicators, among components of leadership style and effectiveness of two components loyalty there is a significant area of overlap with together. In addition, a latent variable factor beyond the influence of leadership style, the only meaningful relationship with one of the aspects of crisis management by name has been identified. Figure 3 show the results of the modified model based on these proposals. As Table 3 show results of modified model of better fitness than Model 2.

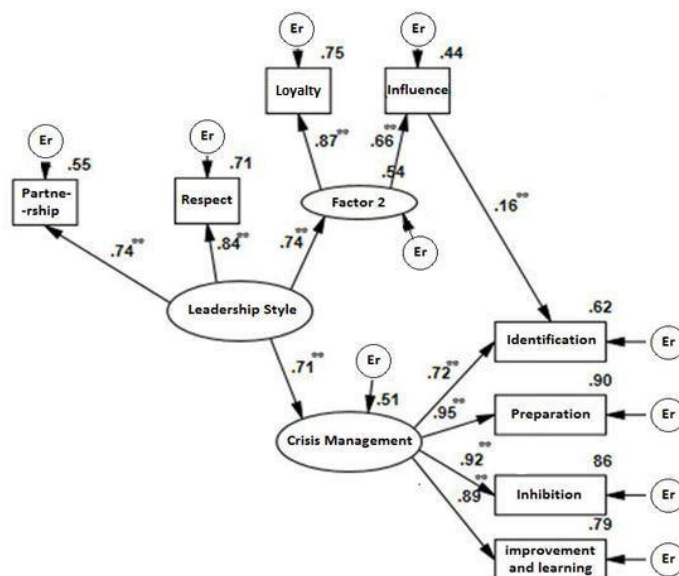

Figure 3 Modification of the relationship between leadership style and crisis management. \* Coefficients are significant at the alpha level of between 0.01 to 0.05; \*\*:

Coefficients that is significant at the alpha level less than 0.01.

As Figure 3 shows, a second level of influence in connection with the two components and loyalty have an impact of 44% of the variance ( $r=0.66$ ) and 75% of the variance loyalty ( $r=0.87$ ). Latent variable leadership style could explain 54 percent of the variance in latent crisis management ( $r=0.74$ ). On the other hand, also could influence the measured variable latent factors beyond identifying leadership styles could predict 3% of the variance ( $r=0.16$ ). Because of this relationship beyond the relationship between leadership and management style latent crisis and with regard to the least role that effective leadership styles among other components latent factor has played at least role in leadership styles. It seems the relationship between effectiveness and identify the association between leadership style is not unique.

## 5 Discussion and conclusion

This study aimed to investigate the role of leader-member relationship style and quality of crisis management in the Iran Khodro Industrial Services Engineering Company was done. The results of the research showed that among the four components of crisis management, adherence to the highest correlation with the level of readiness ( $r=0.48$ ), then identified ( $r=0.46$ ), inhibition ( $r=0.44$ ), and the lowest level of relationship by learning ( $r=0.40$ ) showed. As a result, loyalty 24 percent increase in improving latent variable of crisis management explained ( $r=0.49$ ). The results show loyalty with all four components of crisis management showed a significant correlation ( $0.40 < r, 0.05 > p$ ). This suggests that the role of leader-follower interactions can establish a pattern of loyalty in crisis management purposes is carried out. Factors influencing the highest correlation with the level of detection ( $r=0.39$ ), then readiness ( $r=0.32$ ), inhibition ( $r=0.30$ ), and the lowest level of relationship by learning ( $r=0.27$ ).

As a result, 12% increase in improving latent variable of crisis management explained ( $r=0.34$ ). The results of this study indicate that the most positively influential crisis management and leader-member influential role in predicting been identified. This means the effect of gravity and leader-member influencing factors and barriers crisis. Due to the relatively high correlation between the components of crisis management seems the communication path- to identify the most impact on the relationship between leadership effectiveness have complied with the other components of crisis management.

Dimension of respect of the aspects of leader-member relationship, the highest correlation with the level of inhibition ( $r=0.60$ ), then readiness ( $r=0.58$ ), learning ( $r=0.52$ ), and the lowest level of correlation with the identification ( $r=0.44$ ) showed. As a result, 38 percent increase in improving latent variable of crisis management explained ( $r=0.62$ ). The results of study show a positive relationship respect and leader - member with crisis management.

So leaders who treat their employees with respect to the critical path to self-actualization potential and create positive changes in their employees created and developed.

Finally, the last component of crisis management, partnership has highest correlation level with readiness ( $r=0.48$ ), then learning ( $r=0.45$ ), inhibition ( $r=0.44$ ), and the lowest level of correlation with the identification ( $r=0.38$ ) showed. As a result, participation 25 percent increase in improving latent variable of crisis management explained ( $r=0.50$ ).

The results of this study also showed a positive relationship participation of the leader-member and crisis management and leaders who have employees who are currently beyond the commitments in advance organizational objectives with managers and leaders participate, who is more responsible than to deal with crises and preparation for crisis management will be more efficient and more. The overall score for the leadership style between the components of crisis management had highest level of correlation with readiness ( $r=0.59$ ), inhibition ( $r=0.57$ ), identification ( $r=0.53$ ), and learning ( $r=0.52$ ) showed. The result of this relationship led to the leadership style 50 percent increase in improving latent variable of crisis management explained ( $r=0.71$ ). Among the components of leadership styles in position with respect to the sequence 0.62 ( $R^2=0.38$ ), in partnership with 0.50 ( $R^2=0.25$ ), loyalty to 0.49 ( $R^2=0.25$ ), and influential 0.34 ( $R^2=0.12$ ), the highest to the lowest level of crisis management showed correlation with latent variables.

The results of study show a positive relationship between total score of efficient style of leader-member and crisis management. Leadership style is the most important determinants of strategic management in the sense that improve leadership competencies through improving the quality and quantity planners and strategic management challenges that lie ahead, can be important for the success of the organization in dealing effectively with the crisis. On the other hand, as the results of this study showed that the most effective leadership style of crisis management,

predominantly through their influence on improving employees' perceptions of readiness and inhibition of organization than predicted and unpredicted crises. This can mean that when the recovery fails to gain leadership style and organizational readiness does not end in disaster management and it cannot expect favorable changes in other components of the organization.

Finally, based on the results of this study, it is recommended to use in devising educational programs based interventions to improve management style and leadership style special emphasis in the curriculum done. Based on the results of this research, interventions based on leadership style, to change the perceptions of respect and loyalty cannot expect much improvement in the indicators of crisis management.

Abstract. The necessities derived from modern era require ICJ to harmonize its law of evidence proving claims with the last scientific gains concerning the fact-finding process. Such a legal harmonization can play a major role in development of international law boundaries and subsequently can evolve the mechanisms of evidence proving before the international tribunals. Through the descriptive method, this article examines some emerging aspects of abovementioned process and presents some new results which are necessarily in association with tenets of rules governing on law of evidence. Finally, this paper argues that development in jurisprudential processes of judicial tribunals generally and ICJ specifically is inevitable, but the centrality of State sovereignty still remains and underlies this development.

Keywords: Development of International Law, Jurisprudence, International Court of Justice, Law of Evidence

### 1 Introduction

Due to various reasons, addressing issues related to the Jurisprudence of International Court of Justice has increasingly become important. In recent years, because of growing number of international disputes -specifically *Matter of Fact*- on one hand and posing disputes related to the highly technical issues on the other, the importance of issues concerning the Court's jurisprudence has been doubled. With regard to the unique peculiarities of international adjudication, the policy of international tribunals is usually based on the investing on non-controversial evidence, instead of addressing parties' controversial facts and evidence. Similar to Permanent Court of International Justice (Manely, 1992), ICJ has always tried to build his judgements based on the facts which are agreed by litigants (Valencia-Ospina, 1999). However in adjudications within national courts, the judicial authorities usually action more actively concerning facts discovery. However, this policy of Court has not been always practical and in some cases that litigants have had a remarkable disagreements concerning the facts and evidence, Court has encountered serious challenges. In Court history, ICJ has faced some cases in which the determination of dispute's fact and evidence was primarily needed or basically the fact discovery has been posed. In this respect, both cases can be referred, including cases concerning "*Military and Paramilitary activities in and against Nicaragua*" (1986) and "*Corfu Channel*" (1949). Increasing wave of States tendencies in resorting to ICJ contentious jurisdiction for settlement of disputes- especially among the developing countries- in recent years, it is explicitly observed that, the number of international disputes in which decision making concerning *matter of fact* is considered prior to application of governing rule on *matter of law* have been remarkably increased. Such a transformation necessarily led to growing rate of attention paying to law of evidence before the Court. In this respect some cases can be referred, including Oil Platforms (Islamic Republic of Iran v. United States of America), 2003; Armed Activities on the Territory of the Congo (Democratic Republic of the Congo v. Uganda), 2005 and Application of the Convention on the Prevention and Punishment of the Crime of Genocide (Bosnia and Herzegovina v. Serbia and Montenegro), 2007. In this regard, cases concerning territorial issues like the case concerning (2007) Maritime Delimitation and Territorial Questions between Qatar and Bahrain can be added to the abovementioned cases as well, in which the role of evidence as the basis of possession proving is notably significant, so that in proceeding process great deal of evidence is provided.

This article tries to indicate some developing dimensions of judicial jurisprudence through the study of ICJ proceeding

procedures. To achieve this purpose, addressing the collection of methods and tools governing on fact-finding process has been put on the agenda. The current article attempts to respond this question that how Court has applied the rules governing on law of evidence in its proceedings towards States disputes. Since only States are capable to litigate before the Court, a large extent of attention has been dedicated to the element of States sovereignty. On the other words, that part of developing mechanisms are investigated that are in association with States behavior. To this end, referring to some primary foundations as the starting points of discussion will be inevitable. There should be a distinction between two concepts of legislation and the development of international law. Article 24 of the Statute of the International Law Commission refers to the role of government policy in the development of international law as well as other factors and variables such as international courts decisions, especially the International Court of Justice opinion, as positive reasons or evidences of the existence of a rule of customary international law. In other words, International Court attempts to extract and identify international law through its decisions. Controversies exist among the international legal experts in this regard. Broadly speaking, there have been two approaches in relation to this issue.

#### 1.1 Traditional Approach

According to this approach, Article 38 of the Statute of the International Court of Justice includes the most recognized sources of international law. It refers to acts and not the creation of law. Article 38 of the Statute is faced some restrictions regarding the judicial decisions as a subsidiary source of international law. First, judicial decisions along with the "teachings of prominent writers of different nations" enjoy the subdominant feature. Accordingly, judicial decisions' duty is a tool which enables International Court to identify and apply the rules of customary international law. Secondly, it seems that this article allusion to Article 59 of the Statute, which is at the end of the 1 (d) of Article 38, eliminated the possibility of resorting to the doctrine of jurisprudence in international law. Therefore, judicial decisions have no value genuinely. However, as will be shown, there is no such restriction in practice.

#### 1.2 Realistic Approach

According to this approach, one cannot deny that jurisprudence of the International Court of Justice is recognized as one of the sources of international law in practice. Side views of the Court on the interpretation of the rules are accepted as the best available understanding base of international law. They are also used as certain reasons. This issue has been accepted not only by writers, but also by governments and international courts. One of the trends in international investigations is that governments refer to previous judgments of the Court in order to prove their claims. In fact, they do not have any doubt about the validity. Governments may object to the issue in terms of lack of applicability of past decisions and not the lack of credibility. Articles 38 and 59 have never been cited. The other side claim has not been rejected. Fitzmaurice (2005) stated that, over time, court decisions gain value and credit which separate opinions of dissenting judges do not have it. Lauterpacht (1966) also cites several reasons for the court referring to his previous decisions. He states that previous decisions of the Court are the factor of stability which affects future decisions in terms of legal and practical experience. These decisions are regarded to be the reason for what the court considers as law. It will be a reliable statistics for the future position of the Court. Therefore, for practical reasons, these decisions show what international law is. In fact, they are largely similar to legal resources which have been mentioned in the first three paragraph of Article 38. In terms of form, they may only be considered as a subordinated instrument to determine the sources of law. However, the effect is the same (Ibid). The Court is also aware of the effects of its

decisions beyond the parties. In the case of the Aegean Sea (1978) continental shelf, the Court stated that, however, under Article 59 of the Statute, court decisions have no binding effect beyond the parties and they are considered only in that specific case. Obviously, any comment of the Court in the case of 1928 law will also have consequences with respect to relations with other governments, with the exception of Greece and Turkey.

In the case of "Anglo-Iranian Oil Company", Alvarez also pointed to the Court's role in the development of international law. According to him, if the statute of the Court wants to limit his authority to the resolution of conflicts, the states will state it clearly. In that case, Court was considered merely the Court of International Arbitration, but the current Court is a Court of Justice. Given the dynamicity of international life, it has a dual role of rule declaration and development of rights. The first task is to settle disputes between states, as well as protecting the rights of the states in accordance with the Law of Nations. With regard to the second task of rights development, these tasks include deciding on existing rights, adjusting them, creating new concepts if needed. The second special task is justified by the dynamic character of international life. Moreover, one cannot deny that the main sources of international law and judicial decisions branches are completely separated. They are very complex and affect each other. In many cases, judicial decisions establish the compilation basis of treaties. For example, Court decision of 1951 in the case of fishing (explaining the fact that drawing straight lines is the criteria to determine the width of the territorial sea) and the North Sea Continental Shelf decision of 1969 affected the formulation of Law of the Sea. Basic concepts such as armed attack and legitimate defense have crystallized in court procedures (for example, the case of Nicaragua) (Ruda, 1991). Therefore, it can be stated that court decisions have a very important role in the development of international rights. In some cases, they determine and interpret other sources of international law as well. This is done in two ways. First, one of the tasks of the International Court of Justice is the identification of rules of customary international and their application toward the mentioned specific case. This task makes the court to identify a customary rule in the first step and introduce it. With this action, it can take part in the development of general international law. Secondly, in addition to international treaties and conventions, court may decide on the basis of general principles of international law.

In this case, to impose a general principle of law in a particular case, the Court will have to describe different aspects of the general legal principle. As a result, the scope of legal interpretation of that principle will be developed. This issue is more important especially when the Court is faced with the silence of the international treaties and customs.

## 2 Sources of Law of evidence Proving Claim in International Court of Justice

In this article, those sources of international law which are used by International Court of Justice in the course of judicial duties in connection with fact-finding and proving the claims will be investigated. In the domestic (Iranian) legal system, there are usually compiled codes which are employed by judicial institutions to play their roles. For example, Articles 194 to 294 of the Civil Procedure Code of the Islamic Republic of Iran specify the rules governing the proof of claim. In international law, there are no compiled codes which can be used by the International Court. Moreover, international investigations are not equal in terms of procedure code. This means that each investigation is subject to its own conditions and requirements. For example, international arbitrations are different from international judicial investigations. Each international investigation depends largely on litigants. Dispute parties also affect investigation issues. However, over time, it was seen that rules and regulations have been gradually formed in jurisprudence and international arbitration in connection with matters of procedure generally and in connection with fact-finding and proving the case specifically. Procedures of the

Permanent Court and the International Court are parts of these procedures. Generally, sources of evidence proving the disputes in the international investigation can be divided into two main groups of written sources and unwritten sources. The main written source is founding documents and, in other words, the Statute of the International Courts and their investigation rules. The provisions contained in this resource usually express the general principles. They assign the details determination to the International Court. In addition to these resources, International Court must consider other unwritten sources. The most important unwritten sources are general principles of law and international jurisprudence.

### 2.1 Written Sources:

The main written regulations related to rules of evidence proving the claim can be found in Statutes and investigation rules of the International Court of Justice. However, the court has created written sources in other forms. Civil judicial procedures and administrative guidelines of the Court are among them. All these sources will be introduced in the following.

#### 2.1.1 Principle Sources:

##### A. Statute of the International Court of Justice

The Statute of the International Court of Justice is the most important and most original document for duties of the Court. This Statute determines organizational issues, procedure and court powers. Broadly speaking, in the Statute, there are not many regulations related to the rules of evidence proving the claim. It contains Court general issues and power. However, the Statute is most important resource for decision-making on matters. It is a mother document. Therefore, other resources should be interpreted with respect to the provisions of the Statute. The provisions of the Statute are broad and flexible (Hygt, 1987). With the division of the investigation procedure into two written and oral stages, the Statute regards the issues related to the Procedure Code such as rules of evidence proving the claim in two ways. Paragraph 5 of Article 43 has predicted the witnesses and experts hearings. In Article 44, the Court is allowed to visit the place to gain the reason. In a general prescription, Article 48 of the Statute has allowed the Court to issue some arrangements in order to handle the case. The court can decide on form and time of presentation of the arguments of each party. Moreover, this article authorizes the Court to make all the necessary arrangements related to finding the reason. Article 49 allows the Court to ask any document and explanation before court hearing of representatives. This Article specifies that, in case of failure, Court can formally consider the issue. Article 50 has made it possible to appoint an expert or expert group by the Court. Article 53 also specifies the conditions of the investigation in which one of the parties is absent. As it can be seen, Statute of the Court did not express significant provisions about rules of evidence proving the claim. This legislative gap regarding the proving issues such as standard proof of the claim and general issues can be seen more in the court.

#### 2.1.2 Secondary Sources:

##### A. International Judicial Practice:

Article 19 of the Rules of proceedings allows the Court to determine its "internal judicial practice" by notices. Under this Article, the court civil judicial procedures should be determined according to the Statute through declaration that will be adopted by the Court. Accordingly, the court has approved its civil judicial procedures on 5<sup>th</sup> of July 1968. On April 12, 1976, in another statement, it has modified its civil judicial procedures. The declaration has 10 articles. Prior to these two announcements, the court has regulated its civil judicial procedures in accordance to resolution of 20 February 1931 and amendment of 17 March 1936 of the Permanent Court. In the introduction of the Declaration of 1976, the Court states that if

the Court finds the circumstances so required, it is free under certain conditions to deviate the resolution.

In the rules approved, the way of handling the issue is not mentioned. There are just the regulations addressing the issues raised by a case. According to Article 1 of this Declaration, Court judges can hold meeting on the sidelines of hearings. They can exchange their information and inform each other about their possible questions in order to apply paragraph 3 of Article 61 of the Rules of Court proceedings.

#### *B. Practice Directions:*

With regard to the increase of cases in the agenda of the International Criminal Court, the court has attempted to approve a set of rules known as "Practice Direction" in 2001 to solve practical problems in the course of investigations. Gradually, the Court has attempted to complete this set. Court added other rules to this set for the last time on December 13, 2006. These rules have been developed with the aim to accelerate and facilitate the investigations of the Court. In connection with the legal basis for issuing these instructions, there is no clear conclusion. These rules can be justified according to the Court authority in Article 30 of the Statute. They can be considered as part of the Court's inherent powers. Accordingly, it can be noted that the governments of both sides are required to follow these rules. Among 12 practice directions issued by the Court, in some cases, there are some of the issues related to evidence and proof of the claim. In practice direction 1, it was stated that special agreement has no effect on the proof of claim. The practice direction number 2 asks the litigants to bring a summary of their arguments. The practice direction number 3 asks the litigants to bring a limited number of documents. In practice direction 6, recalling the paragraph 1 of Article 60 of the rules of proceedings, it was stated that the oral hearing will be limited only to complain. The reason for this is that the competence and capability of lawsuit is the issue which should be investigated by the court itself. There is no need to hear the arguments of both sides. Practice direction number 9 implies the issue related to the documents registration with delay. This issue exists in paragraphs 1 and 2 of Article 56 of the Court proceeding rules as well. In connection with the registration of these documents, the Court has stated some restrictions. Practice direction No. 9 has determined the method of Implementation of paragraph 4 of Article 56 of the proceeding rules on the basis of oral hearings and documents which were not provided according to Article 43 of the Statute. Practice direction number 11 implies the limitations of telling the issue related to the issuance of temporary safeguarding in hearings. It can be stated that the Court has sought further restrictions to provide evidence and documents by governments. As it can be seen, in International Court written sources, there are not many minor issues related to rules of evidence proving the claim. Only the general issues were highlighted. The main topics covered by these written sources are the evidence issues and the method to provide it. Basically, a lot of issues were not considered. For example, in these regulations, there is no article about proving, standard of proving or judicial value of any of the evidence. As will be shown in other parts of the research, the court has investigated such issues relying on other unwritten sources.

## **2.2 Unwritten Sources:**

In addition to written sources, International Court of Justice uses other sources in investigation of issues related to rules of evidence proving the crime. The general principles of international law and international judicial procedure are among these sources.

### **2.2.1 General Principles of International law:**

Paragraph (c) of Article 38 of the Statute of the Court implies "the general principles of law recognized by civilized nations". During the investigation of claims, the Court uses this resource. However, topics have been proposed concerning the scope and

meaning (Bin Cheng, 1953, p. 536). Placing the general principles of law as a source of international law in Article 38 of the Statute of the Court has been done to "complete the international legal system". International law is more uncertain compared to domestic law. Most international lawyers agree that the purpose of insertion of the general principles of law is to prevent the legal gap. In practice, Court pays no attention to the "civilized nations". It can be stated that, in the view of the Court, all countries are civilized nations. These principles do not belong to any specific legal system. They are common in all systems. Bin Chang, in one of the most famous written works related to the general principles of law, considers three special tasks for this legal source. First, the general principles of law are the source of many legal rules which express these principles. Second, the general principles of law are considered to be the guidance of legal orders which inspire the interpretation and implementation of legal rules. Third, in the absence of law, the facts of the case are applied. In legal systems, such as international law in which the written rules are limited, the third special task of the general legal principles is very important. It plays an important part in defining the legal relations between states (Ibid., P. 390). Permanent Court and International court of Justice pay attention to the general legal principles contained in Article 38 of the Statute of the Court. Permanent Court never mentioned this Article. It always spoke about it in a vague and ambiguous form. In some cases, Permanent Court Citations can be classified in the principles of customary international law and the general principles of law of the paragraph (c) of Article 38 of the Statute. International Court pays attention to this resource in several cases explicitly, but it pays attention to this resource in a lot of cases without any citations. Although there was no hierarchy between sources of international law and the issues of contractual rights and customary law are paid much attention, international rights (international treaties and conventions) have a secondary character. However, in connection with the rules of evidence proving the claim, the general principles of law must be considered one of the main sources. In the case of "some German interests in Upper Church" when dealing with a matter of procedure, the Permanent Court put the general principles of law near the provisions of the Statute and Rules of Court proceedings.

### **2.2.2 International Jurisprudence:**

Observing Article 59, paragraph 1 (d) of Article 38 of the Statute, has introduced judicial decisions as incidental tools for setting the rules. In the past, justifying the use of previous judicial decisions (including the decisions of the Court) was very difficult. Today, their important position has been identified by the Court and writers. This regulation does not show the Court commitment to the doctrine of judicial procedures as it is in the common-law legal system. In the Statute of the Permanent Court, there is exactly the same regulation. However, this regulation does not prevent the court to use its previous findings in reaching its decisions. In any case, the existence of convincing reason of the Permanent Court can deviate from its previous practice. Accordingly, in many cases, the Permanent Court cited the principles of jurisdiction, procedure and substantive in its previous opinions. Hereby, the Permanent Court created the organized approaches in connection with many legal fields. In this regard, judicial decisions considered by the Court can be divided into three categories; the Permanent Court judicial procedure, Court procedure and procedures of other international courts. Among these cases, Court usually pays much attention to its judicial decisions and Permanent Court judicial procedure. It rarely refers to the decisions of other international courts.

#### *A. Jurisprudence of Other International Tribunals:*

In practice, the Court has no tendency to rely on judicial procedure of other international courts. A former employee of the Court claims that, in the Court, there are unwritten rules according to which Court should only refer to its judicial procedure. However, in some cases, the Court also refers to procedures of other courts. In addition to cases in which another

court decision forms the topic, Court on various occasions has referred to other international opinions. In some cases, in general, Court refers to them using some terms such as "procedures," "arbitration court decisions", "international decisions" or "international judicial procedures". In some cases, Court specifically referred to these ideas. 56. In the case of "land, sea and border's dispute", the Court Branch considered decision of 1917 of the Central American Court of Justice as a supplementary tool. On several occasions, the Court cited ALamaba's arbitration vote of 1872 and Britain and France arbitration of 1977. Moreover, recently, in the case of the Convention on Genocide, the Court finds no shame in reference to the International Criminal Court of Yugoslavia. In the case, reference to Yugoslavia court decisions was conducted as the reason, not as a substantive judicial procedure. In one case, Yugoslavia court procedure was criticized.

#### *B. Jurisprudence of Permanent Court of International Justice:*

In connection with court reference to past decisions of the Permanent Court, there is no obstacle. The Court has repeatedly endorsed the Permanent Court judicial procedure. The court position is different from the Permanent Court's from an organizational perspective, but their judicial procedures are considered to be the same. The Court had considered the past decisions of the Permanent Court. In order to prevent confusion in appealing to the Permanent Court judicial procedure in San Francisco conference, it was tried to reinstate the numbering of the Statute of the Permanent Court. In this regard, in 1984, in the case of Nicaragua, the Court stated that "the primary concern of the Statute draft producers to maintain the integrity between the Court and the former Court as much as possible". Therefore, the Court made no distinction between its decisions and the Permanent Court's. In this regard, Winiarski (judge) has stated that "since starting to work, the Court had considered the continuity of tradition, judicial procedure and practices". Guerrero, the last chairman of the former Court, was the first chairman of the Court. With limited and insignificant reforms, the court has adopted the investigation rules of the former Court. Most importantly, without commitment to the Stare Decisis as a principle or rule, the court usually uses the former Court decisions. The result has been the remarkable unity of procedure which is an important factor in the development of international law. Accordingly, the Court repeatedly referred to the Permanent Court judicial procedure in its decisions. The main reason for this is the official successor of the Permanent Court.

#### *C. Jurisprudence of International Court of Justice:*

In reference to its previous decisions, the Court does not hesitate. These decisions have gradually become one of the main documents of the Court. In other words, in addition to various factors, the court paid attention to "Case-Law of the Court ". It has repeatedly cited this procedure. These decisions include pleading votes and advices. The results of an investigation show that the International Court of Justice referred to its previous decisions in 26 percent of cases between 1948 and 2002. For example, the court referred to its previous decisions more than 28 times only in 3 pages of advisory theory of 2004.

### **3 Principles Governing the Production, Admissibility and Evaluation of the Evidence in the International Court of Justice:**

In the knowledge of law, speaking about the reason is possible when an event leads the mind to reality. In other words, when the mind becomes able to reach the unknown through its findings, that sign is called reason whether an external event or a provision of law. Therefore, reason is sometimes used synonymously with cause and analogy. It was said that whatever persuade the spirit for the existence of truth is reason. In this way, the legal and judicial mean of proof is not taken away. Reason is the signs of the existence of truth which is disputed. In international investigations, dealing with reason is slightly different from internal law. In internal systems, there are certain

rules and regulations in connection with reason according to which the accepted formats of a document are defined as reason. In international investigations, there is no specific and precise definition for reason. "The flexibility of international investigations, the tendency for resistance against the special rules of applicable evidence in domestic legal systems makes the concept of reason much wider in international investigation (Kazzazi, 1996). The International Court, generally, reason is "the documents which are presented by one of the parties in accordance with his initiative or the Court request to prove a claimed fact or a claimed legal right". Another point is that the detailed categories in the domestic legal systems have no important role in International proceedings especially in claims of International Court of Justice. The term reason is referred to as all the tools and templates to prove a fact.

### **3.1 Principles Governing the Process of Fact-finding in International Court of Justice:**

Generally, two basic principles can be introduced in relation with offering, accepting and evaluating the evidence in International Court of Justice. They are also applicable in other international courts. First, unlike national courts, the government can provide any evidence or reason. In other words, there is no acceptable evidence and unacceptable evidence in particular sense (Principle of freedom of the parties in presenting the reason). Secondly, in acceptance and evaluation of the evidence presented, the Court enjoys an extensive freedom (Principle of Court freedom in reception and assessment of the reason). Gradually, in practice, it can be seen that all these principles have accepted restrictions as follows.

#### **3.1.1 The Parties Freedom to Produce Evidence:**

In all provisions of the Statute and rules of Court proceedings, the kind of evidence confirmed by the Court is not specified. The entire form of the evidence is assigned to the governments. Evidence may include the governments' official documents, national legislation, map, report of international organizations, the United Nations resolution, media and newspapers content and government officials and individuals' comments. International Court of Justice has interpreted the lake of the rules defined in the Statute in relation to the type and form of evidence in a way that a litigant can present any suitable reason within the time specified by the Court. In practice, the Court considers few restrictions for litigants, but, in some cases, it uses its power to reject the proposed reason (Duward V, 1999, p. 184).

#### **3.1.2 Court Freedom to Accept and Evaluate Evidence:**

The freedom of parties to provide evidence has the analogy of the freedom of court to accept and evaluate the evidence presented by parties. Court is not limited to any specific evidence system. It is considered to be the final authority to accept and evaluate the evidence. It has an extensive power. This does not mean that the Court can act arbitrarily. The Court has developed a set of rules which needs to be developed based on the mentioned issues and problems of evidence in some cases. When assessing the evidence, Court even acts freer compared to Admission stage. This is largely similar to the internal regulations of countries. This means that, to determine the burden of proof, it didn't determine any rule and criteria. It makes decision according to the conditions of each reason.

### **4 Statements by Officials or Governmental Institutions:**

In the last decades, we have witnessed a revolution in the field of international trade tools. This has led to facilitate the access to high-ranking representatives of the government (Watts, 2004). These groups of data such as press conference, joint statement, Radio and TV interviews and lecture at the national, regional and international institutions are used to confirm the interpretations and claims. .70 Referring to these statements is based on the fact that no one can benefit from his contradictory behavior toward others. In other words, a litigant cannot deny the truth after

confessing it (Estoppel Rule). Confession is a truth or a possible right. It is performed by an international document such as treaty, specific agreements and exchange of notes. It can be understood by representatives' behavior and speech. However, the only time to consider an issue as a confession is, first, when it is expressed explicitly. Secondly, confession should be voluntarily and unconditionally. Finally, referring to the confession must be made in accordance with the principle of good faith. The statements which don't have all or some of these elements cannot be referred according to the Estoppel rule. There are no definitive binding. They can have a degree of proving value (Bowett, 1957). Officials' statements are presented before the International Court of Justice in two ways. Statements made by government officials were referred before the dispute. This statement is used as a supporting reason for a fact. For example, an official involved in the conclusion of an international treaty states his understanding of the regulation of the treaty. In fact, he explains the inherent obligations of his country according to that treaty. In the International Court of Justice, appealing to government officials' statements is done with two goals. With referring to officials of other governments, governments are seeking to prove the facts which have been disputed. 73 In some cases, officials' statements are referred to as the reason of a commitment or an International right in terms of the sea area or territory. In this section, the Court Procedure will be investigated in relation to both groups.

#### 4.1 Political Officials' Statements as Proving Evidence of Fact or International Responsibility of States:

As stated, in some cases, the litigants refer to other side government. There are always these documents in Court. In fact, one of the common ways in Court is referring to such statements. However, the method of dealing with these evidences is not always the same. It depends on the conditions and circumstances of each case. The existence of such statements does not indicate a fact. It can be stated that there is a kind of direct relationship between the level of official and the degree of transparency of statements. In other words, the higher level of official causes clearer expression. The relationship between the expressed issue and administrative tasks of official is important. In the case of Minco, in order to prove its sovereignty over Minco, England referred to the French ambassador's note of June 12, 1820. At one of the tables, the letter of Maritime Minister is presented as English. France claimed that Britain cannot rely on this letter. First, it was presented during the negotiations between the parties. Secondly, negotiations did not lead to any agreement. However, the Court rejected the France argument. According to Court, this document is not an offer or a compromise during negotiations. This is the facts presented by the ambassador of France. Therefore, this statement should be considered as reason of official views. In the case of "military and paramilitary activities in and against Nicaragua", the value of officials' statements was presented. The Court stated that the contents of the Court include the statements of governments' representatives and high ranking officials. Some of the statements are presented at the formal institutions of government or a regional or international organization. Other comments were presented during press conferences or interviews which are reported by local and international press. The Court opinion is that such statements by senior political figures have special value if they are confirmed by the highest authority.

However, it is natural that such statements shall be treated with caution. Article 53 and other basis cannot justify the selective approach which ruins the conformance of court procedure and primary task of equality between the parties. The court should consider the situation according to which the statements have been express publicly. The Court cannot value them equally without considering the way of their presentation. The statements in a national or international official publication are not the same. It should be considered that whether the text of the official statements is in the native language of the speaker or it is based on the presented translation. It should be considered that whether these statements are presented through recorded official

correspondence or not. In some cases, the court should interpret these statements to ensure the confirmation of a fact. The Court also stated that "the court considers the statements to be very important". The Court should scrutinize the declaration. In this case, two witnesses were Nicaraguan officials.

The United States registered the testimony of the foreign minister. Court classified these evidences in "special groups" (ibid). In connection with the legal effects of such declarations, the Court stated some points. First, according to Court, such statements can be considered as the reason of the accuracy of the facts. Secondly, such statements indicate that these reasons are related to the government which its officials stated them. Thirdly, they can be considered as the reason for description of the facts. The Court considers the statements which are contrary to the views of the government very important (ibid). The important point stated by the court in this case is that the Court is not limited to contents that mentioned by litigants. In its path, in search of truth, the Court may consider the statements by representatives of the claim in international organizations and resolutions adopted or discussed in these organizations in the case of thematic relationship (ibid).

It is not clear that this conclusion of the Court has the general feature. In fact, In order to perform its task, the court acted upon the Article 53 of the Statute to ensure the reasonableness of the subject.

#### 5 Conclusions

Accepting the major role of Court in international community has increased the necessity of investigations on law of evidence, since equipping and resorting to the meticulous legal tools of fact-finding has provided better grounds for more active participation of ICJ in international community. Since ICJ is the only judicial arm of UN, has to comply with UN Charter and provisions. However, Court did not find itself independent of developing in some legal approaches that are directly in connection with justice realization. As a well-established principle, it can be stated that ICJ enjoys the remarkable level of authority in acceptance and assessing the provided evidence by litigants. However, realizing the Court authority must not be applied in a way that breach the fundamental principle of impartiality. Various parameters are effective in utilization of ICJ flexible policies in connection with methods and tools determination concerning fact-finding process. Surely, the principle of State sovereignty must be considered as the first cause of these policies acknowledgement. Furthermore, in recent years, Court has considered the issued instruments by international organization as confirming evidence of fact. Generally one of obvious instance of development in this ground is recognition of issued documents of UN organs as definitive evidence. Accordingly, it seems that some variations in Court approach concerning law of evidence are evident-especially compared to 70<sup>th</sup> decade-. The best way for promoting the Court Status is development of its fact-finding mechanisms. Consequently, the expansion of fact-finding mechanisms will face less objection compared to increasing the domain of Court compulsory jurisdiction or widen the statutory authorities.

**Abstract.** By means of the descriptive approach, this article tries to present a meticulous definition from the legal limits of *Opinio Juris*, assess its practical functions and analyze its nature as well. Clearly, about "legal belief" and its necessity in formation of a customary international law rule, there are extensive theoretical debates in scene of doctrines. However, this research firstly addresses the primaries of current theories concerning *opinio juris* and secondly presents some new dimensions in the realm of the judicial practice of International tribunals including ICJ, legal mechanisms indicating *opinio juris* and UN General Assembly acts as well as the other similar texts as the proving evidence of *opinio juris* to specify a legally acceptable framework for Genesis of international law.

**Keywords:** *Opinio Juris, Legal belief, Voluntarism, Legal Mechanisms, Customary International Law*

### 1 Introduction

One of the component elements of custom is the immaterial element which reflects the legal belief of the States in following a practice. Now the discovery of this legal belief can be obtained through different ways which are discussed here.

#### 1.1 Concept and Necessity

As the International Court of Justice states in the issues related to the continental shelf of the North Sea, in the formation of the customary rules, merely the existence of a "great" and "much unified" practice is not enough. Also the mentioned practice should be made in a way that it implies the recognition of legal rules or obligations. In this regard The Court explains that "two conditions should be met": first the existence of "an established practice" which contain the mentioned conditions and the other" belief in the fact that such practice is obligatory because of the existence of a legal law". So the objective element of custom- practice- as was mentioned in the previous part, should accompany with a " Subjective Element" which lies in the concept of the "legal belief derived from necessities" .the Latin equivalent which is usually used as an abbreviation:"*Opinio Juris*", "the legal belief of the states" or in others point of view "legal firm vote of the states". Such a concept dissociates the Wheat from the practice or Chaff. Thus the aforementioned practice should be drawn in the form of the following equation.

The general practice of the states + their legal belief = custom = International law; thus the existence of both objective and subjective elements of custom- meaning the general practice and legal belief- is necessary and unavoidable in the process-making of the legal rules. The first element defines what has occurred in the world and the second element prescribes the entering of the existing practice to the legal relations era (right and duty). Also it should be noted that in a way that practice which leads to the formation of the customary rule should be general, the legal belief needed in this process should also have the necessary generality. In other words, the legal belief should also be the product of belief or shared attitude of the states of the world or the international community as a whole. And this is different from the individual legal belief of the states.

Basically the states behavior lie in their relation to each other in different forms. Some of the behaviors may accompany a legal necessity and some others do not. If it is supposed that some behaviors become the custom, the condition is that what is legally necessary (what is necessary in accompany with the legal belief) should be divided from what is not necessary. Also there are some cases in which the behavior or in other words the practice which should be considered in the process- making of

customary rules, is ambiguous. (Idem). Also in these cases the legal belief of states have gained attention as a decisive concept especially from the international Court of Justice in order to explain the issue that why the practices of the mentioned states were not regarded in the process of custom-making. A behavior that does not clearly have the ability to refer to an existing or potential legal treaty or in other words does not fit in the framework of international legal relations, should not be paid attention in making or defining the existence of a general customary rule. One of these cases is the ambiguous refusal.

As mentioned previously, the actions which are based on the refusal have the capability that in a state of the necessary conditions, participate like the positive actions in the process of rule-making. One of these conditions is the necessary clearance for recognition of the action. One of these conditions is crystallization for the recognition of the act. But even if this comes true, theoretically and practically in most of the cases the refusals are ambiguous. And what can make clear these ambiguities are the legal beliefs of the States.

### 1.2 Nature

Especially the content of the discussion here is based on the question that in the formation process of custom, on which basis and why should the States continue doing that? By States. I mean the States which act in a systematic way and in a specific framework. In this regard, interpreters and the followers of different schools of thought, offer different explanations which can be divided into two groups: 1) The theory of the implied consent of the voluntarist, 2) Legal belief derived from the necessities.

#### 1.2.1 The Consent Theory of the Voluntarist

It has been considered by them from the Grotius time that what explicitly is in consent of the States is treaty and what is done implicitly is customary law. And this is rooted in Positivism. The advocates of the voluntarist theory of custom generally put their establishment on the basis that; since the states have government in the international relations area, they are not required to the obligations without their consent. In their idea, custom is regarded as a kind of implied treaty which the states have to follow if they have created that. Tunkin –one of the advocates of this theory- believes that "the basis of the customary rules, is the consistency of voluntarism of the countries or other subjects of the international law. The countries have the same right in the process of making international law rules and so the majority of them cannot make the rules which is necessary for the small numbers of countries to follow." (Arechaga, 1978) He considers accepting a point of view other than this, contradictory with the principal rules of international law. In law-although not in the world- the states have the same value. It is right that in reality this tendency of the powerful states to determine the actual influence on the process of the formation of international law, legally, the majority of the states cannot create rules for the others and consider them obligatory for them to follow.

Tonkin continues this is of great importance that the situation is different especially in the current international law system whose duty is to adjust the relations between the states belonging to different social system. Only a rule has the capability to convert into general international law rule which has been recognized in all of the legal systems by the States (Walden, 1977). But this theory has a wide range of objections. In this regard Kelsen (1970) believed that "the customary law is necessary to obey for the countries who have not participated in the customary law and the idea that this is just necessary to obey for the countries that have recognized the laws, is on the basis of an international norm." In fact, if this theory will become in to practice in a flexible and permanent way, its practical consequences will be out of mind.

Among the implied consent theorists, professor Strupp maintains interesting view. At first he believes that “agreement” is the only possible source in the international law, Provided that the states are equal to each other, and if there is not a great organization and no top authority to impose a rule on the states, accordingly we can conclude that the international law cannot exist without consent and consistent voluntarists of the states (Strupp, 1934). Strupp considers custom as implied consent that implied satisfaction and this is the interesting point of his view, and a state is necessary to obey the other states who have admitted the claim rule.

### 1.2.2 Legal Beliefs (opinio Juris) Derived from the Necessities

Literally this expression means a belief or legal belief derived from the necessities; The Latin equivalent of this shows that it has no roots in the Roman law and in the classical writings (idem, p262). It appears that the first person who has used this expression completely, is the 2011 *Genny* contract (D’amato, 1971). And this is in the domestic law framework although in Guggenheim idea, some parts of this idea or other ideas similar to that are found in the written history of Germany in the late eighteenth century (Mendelson, 2000). In the current discussion, generally the expression *Opinio Juris Sive neessitates* is interpreted as “belief in the legal nature and necessary related act (practice), or belief in its necessity”. In other words, a state who makes a practice or procedure, believes that it does a kind of legal obligatory or it accepts a legal right that this obligation and right is also the manifestation of an objective rule and is based on the social life requirements and international life necessities.

Then, Kelsen (1967) believed that the customary law is necessary for the states that have not participated in the creation of customary rule-including new and also the active states- and this idea that the international law is just necessary for the countries that have recognized its law-as was stated by the voluntarists view- on the basis of a norm of international law.

## 2 The Recognition of a Customary Law with Relying on the Central Role of Legal Belief

As mentioned, the principal approach of the judicial practice in the recognition process of customary international law was based upon considering the practice and then recognize and discover its legal belief. In other words, the judicial practice has searched for the legal beliefs of the states by relying on the states’ practices. But it is necessary to mention that taking such procedures could not be effective in all cases. The developments of the international communities under the influence of the humanistic concepts development and human rights suggest that in the recognition process of related necessary legal rules, another procedure should be taken. In such field, the mentioned process can never be established, because in most of the cases, at first, or there is no practice or what is available is contradictory and inconsistent. As a result and on this basis, International Court of Justice takes another trend in order to recognize the customary rules related to the humanistic considerations especially the humanitarian law i.e. takes another trend into consideration which is usually referred to as practice or modern attitude in the procedure of customary rules recognition.

### 2.1 Recognition of the Concept and Review of Some Theoretical Concepts

Although the process of the concept and the origin of its formation and recognition of the rule is a pre-determined process and is based upon a twofold system, is never done in a consistent and exact way. The judicial international practice shows that the judicial institutions have followed the mentioned practice when recognizing the rule without considering the pre-defined general system and because of taking into consideration the situation and also the judicial policy which is affected by variables such as shared regulation, justice and benefit and is different from situation to situation. And it is certainly due to the positive and great attribute of custom as a source of fluid with the high

adjustability capability which can continuously adjust itself to the transition of the international community. It appears that the source of such adjustment in judicial practice should be searched through the reaction of The International Court of Justice in recognition of Article 3 common to the four Geneva Conventions in the case of Nicaragua. Way of identifying the shared 3 article in the court’s vote show that this judicial institution has excluded consideration of the states’ practices at first and has considered a central and dominant role for the legal beliefs of the states in the recognition process and this procedure of the court became a pattern for other international judicial institutions who recognized in this way their customary rules in their own competence.

We should also mention that in the new procedure framework, the legal beliefs of the states are derived from Principles of Humanity and Dictates of the public Conscience and not from their practice. In other words, a belief which is not in the framework of the States voluntary and their national benefits but is influenced by most of the principles and natural valuable laws and ideas. In this field, the recognition of the legal belief (in relation to the necessity of a rule) is imagines upon those Principles of Humanity and Dictates of the public Conscience which undoubtedly are acceptable by all members of the international community and then its following is investigated in the state’s practice. In this framework “The Court should convince that the existence of the rule in the legal beliefs of the states, is emphasized in their practice.” The contradiction and conflict in the state’s practice can undermine the laws based upon the practice, however, in the case of the laws dependent upon the humanistic and moral values-here modern customary law- the situation is different and the contradictory practices do not question its validity (Robert, 2003). And this can be a positive attribute for the new procedure in which the natures of the formed and recognized rules have the eternal stability and consistency.

Also sometimes the modern procedure has been compared with the interpretation of Hardt and Koskenniemi. The prescriptive interpretation of Hardt about law and the Utopian interpretation of Koskenniemi about law, on the basis of the first interpretation, laws are not resulted from considering the events and their descriptive because these facts imply what exists (the current practice). But in the light of this interpretation, the legal rules are always prescriptive and are wholly based upon what they should be (the practice which should exist). In the form of the second interpretation also law is based upon the principles which are not related to the states’ benefits or their will; completely moral principles and different from their current reality which is imposed on the world.

### 2.2 Theoretical Primaries

In order to define the issue and explain it completely, it is needed in the following discussion, first the arguments about the basis of the international law should be submitted that the natural law doctrine is of great importance from the view point of the theoretical bases. Nature, wisdom, justice, morality and divine rights are all the concepts which are evolved from the natural law concepts. From the view point of the advocates of natural law doctrine, it is understood that the basis of the law generally and international law specifically are put in the metaphysics and it is emphasized that there are general principles and rules which govern the individuals and States and States have to obey them.

In other words, principles and rules beyond the will. Tomas Habz philosopher and the British jurist only considers natural law as the basis of international law. But from his point of view, the most important principle of the natural law is the right of self-preservation. In the framework of natural law we face with a collective of primordial, eternal and immutable rights which do not need the elapse of the time and it includes all the humans from every race and sex. Therefore, no statutory and contractual rule can deprive them of a human. From the view point of those who believe in the common humanistic nature, the inspired rules

from the nature of human are so basic that the final aim of a regulation are the rights which are based upon the general awareness and pursuit of human values rules which are the proper finale for the human.

On this basis, the legal regulation which is contained of natural law principles is beyond the desire of the individuals. This point must be mentioned that, the teachings of natural law doctrine especially at the beginning of nineteenth century weakened, however this fact must not be considered as complete disappearance of principle and beliefs of natural law. In this regard, some has used the expression hibernation. Although the natural law lost its position as an inclusive basis of international law for a while, from the late nineteenth century it's observed the reviving of the natural law ideas and thoughts in the basis of international law field. Generally the basic principles of the law are as old as the state. In the framework of this school-unlike natural laws which imagined the legal rules as fixed and eternal and know the state as the positive law of these rules, its advocates know the international law rules as the product of the states will. In this regard, the system which is meant by lawyers is a logically consistent system which creates beyond a deductive pure process, all the rules required for making decisions about the existing and possible issues in the system.

Similarly, unlike the natural law attitude in which belief in metaphysical basis was of great validity and merely by induction, the nature of them can be achieved, the positive law can be achieved by induction and without resorting to the principals of metaphysical concepts. Thus "real law", "ideal law", "law at the same level with reality", "law at the same level of value" are distinct from each other. Such an attitude does not necessarily contradict with the idea which considers "law" as a result of divine will the nature of the objects or human. However, based on the definition, the laws which are not made of will, are not "law" on their own and it means that they should enter into the positive law to become accessible. In other words, Laws have to be made. Often "positive law" and "natural law" are put against each other. Although the positive law doctrine has more consistency with the international system because of the consideration of consent and the states' will as the formation basis of rules, it could not and also it cannot be responsible of the issues and requirements of the current international community.

The development of the human rights and other humanistic considerations especially from the early twentieth century showed the reviving of the principles and natural law ideas in the international law realm. Specifically ratification and formulation of the he Hague Conventions of 1899 and 1907, the adoption of the UN Charter in 1945, that its introduction begins with "we the people of the United States" and the human dignity and fundamental human rights are among the aims and desires of the United Nations. Issuing of the Universal Declaration of Human Rights in 1948, ratification of the Civil and Political Rights in 1996, ratification of the four Geneva Conventions in 1949, ratification of the adjoined Protocols in 1977, the real manifestation of the humanistic values in the form of valuing individual in the international law by predicting individual complaints in international juridical institutions. Special attention of the international court of justice to the humanistic aims and desires, Drafting and ratification of the binding Genocide convention in 1948 and the ratification of several human rights' documents..., and also the dimensions of the permanent and temporary inter states criminal courts in order to act against the serious and systematic violations of the humanistic values. In this framework we can name the establishment of the Nuremberg and Tokyo Criminal tribunals, Criminal Court for the former Yugoslavia and Rwanda and the International Criminal Court in 2002, and it should be noted that not paying attention to the power and the role of the accused official during the prosecution and punishment is another great traits of the above courts), the establishment of several judicial and quasi-judicial institutions especially in the area, all shows the importance of the principles and basis of the natural laws in

the international level. Nowadays, human right is another saying of the natural law.

### 2.3 The Procedure of the International "Judicial Practice"

From the conceptual and general point of view, it previously mentioned in detail about the modern custom and the process of its recognition in the international judicial practice. Undoubtedly, nowadays, the dominant procedure in the process of the recognition of the customary rules related to the humanistic considerations is affected by the transitions which result from the development of the related concepts. It is transitioned from the initial recognition to the central discovery of "legal belief". If we put apart the theoretical basis of this transition, it should be noted that it is necessary to investigate the procedures of some valid international judicial organizations. It is obvious that just a collection of the judicial ideas in order to introduce the procedure, is enough.

#### 2.3.1 International Court of Justice

As mentioned, the recognition of the article 3 common to the Four Geneva conventions in 1949 by the international court of justice in the case of Nicaragua was a turning point in the new international judicial practice in the process of recognition of the customary international law. In the case of armed conflict not of an international character occurring in the territory of one of the High Contracting Parties, each Party to the conflict shall be bound to apply, as a minimum, the following provisions:

(1) Persons taking no active part in the hostilities, including members of armed forces who have laid down their arms and those placed 'hors de combat' by sickness, wounds, detention, or any other cause, shall in all circumstances be treated humanely, without any adverse distinction founded on race, color, religion or faith, sex, birth or wealth, or any other similar criteria.

To this end, the following acts are and shall remain prohibited at any time and in any place whatsoever with respect to the above-mentioned persons: (a) violence to life and person, in particular murder of all kinds, mutilation, cruel treatment and torture; (b) taking of hostages; (c) outrages upon personal dignity, in particular humiliating and degrading treatment (d) the passing of sentences and the carrying out of executions without previous judgment pronounced by a regularly constituted court, affording all the judicial guarantees which are recognized as indispensable by civilized peoples. (2) The wounded and sick shall be collected and cared for. An impartial humanitarian body, such as the International Committee of the Red Cross, may offer its services to the Parties to the conflict. The Parties to the conflict should further endeavor to bring into force, by means of special agreements, all or part of the other provisions of the present Convention. The application of the preceding provisions shall not affect the legal status of the Parties to the conflict.

### 3 Legal Mechanisms indicating Opinio Juris

As internationally legal frameworks, treaties have always played a major role in manifestation of States' legal belief. The content of a treaty as an internationally authentic act, perfectly can reflect States tendencies in connection with global issues. Even according to some scholars, a treaty, specially a law-making one, is the strongest manifestation of States legal belief. Tangibly the recent Statement seems to be exaggerated, because States conclude treaties for diverse purposes and mostly they know that they don't include the international customary law. Accordingly, the consent to be bound by a treaty doesn't inherently reveal the State belief containing the text accordance with custom. However, such statement can be acceptable just about the declarative treaties, because these kind of treaties reflect the remarkably extent of States' general legal belief stating their content have already entered the international customary law realm and its customary content still continues. As the linchpin of opinio Juris, generally treaties including bilateral and

multilateral have a significant role in formation of customary rules.

In terms of reflecting all viewpoints of State including legislator and executive arms, treaties enjoy the legal content and potentially transmit the legal belief of party State. In order to prove and estimate the states tendencies concerning the accessed treaty, the text and primary actions relating the treaty codification, must clearly indicate the commitment of party states to the binding legal belief and potentially can be binding for all states including non-party states. ICJ that has always considered the primary actions concerning treaty conclusion as the auxiliary means in recognition of States belief toward customary law, in the case concerning *North Continental Shelf* declared that the accomplished negotiations in Commission indicates that the principle of “median line” as has been stipulated in article six of Commission, had been notably encountered some remarkable hesitations when it was proposed, in a way that they considered it more *Lege ferenda* rather than *Lege lata* or as an emerging rule of customary international law.

Consequently, ICJ though considering the primary actions of 1958 Geneva treaty concluded that there was not any legal belief toward considering the median line method as a general legal rule among those States. Based on the States declared believes, their consent to the treaty text also can indicate the stating reasons of States legal belief (Lepard, 2010). Signature, ratification or accession to a treaty, indicates the consent process of a State to a treaty. In this process, ratification is absolutely more significant than the others. It must be noted that the accession of States to a treaty can include various intentions and only acceptance process of a treaty cannot reveal ipso facto the legal belief of States. In this regard, The States intention must explicitly symbolize the legal belief of them on its legal and binding content, regardless of their accession to treaty or not. As it mentioned, there will be limited problems in declarative treaties, because in these cases either in treaty text (introduction) or articles it is explicitly stipulated or by any other way including the prohibition of reservation right, it is clarified. However, in other kind of treaties, the recognition of “legal belief” will be partially difficult. In these cases also, for example, evaluation of States viewpoints within signature and ratification, the tone of treaty, and States speed in ratification of treaty after signature, even their following approach before the entering into force and some other cases can be appropriate tools in extracting the legal belief toward the accessed treaty.

Furthermore, the number of States accessing to treaty, temporal domain which is needed to entering into force and the frequency usage of “termination” and “withdrawal” clauses in the treaty text, must be taken into account as well. Therefore, treaties totally can contribute particularly in recognition of States legal belief and even objection and non-accession of States to these instruments can indicate the viewpoint and negative propensity of States toward an issue which is covered by treaty.

#### 4 The Role of UN General Assembly and other Similar Texts as the Proving Evidence of *Opinio Juris*

One of the most significant tools extracting States legal belief is the UNGA resolutions. Likewise treaties, resolutions can reflect States viewpoints addressed by GA as well. As an institution enjoying the general jurisdiction, GA can investigate the diverse domain of international issues and subsequently is an important reason indicating States legal belief. In this regard the tenth article of UN charter declares: “*the general assembly may consider the general principles of cooperation in the maintenance of International Peace and security, including the principles governing disarmament and the regulation of armaments, and may make recommendations with regard to such principles to the members of the Security Council or both.*” Moreover, in article 13 it is explicitly emphasized that GA “*shall initiate studies and make recommendations for the purpose of: a. promoting International cooperation in the political field and encouraging the progressive development of international law*

*and its codification; b. promoting International cooperation in the economic, social, cultural, educational and health fields and assisting the realization of Human Rights and fundamental freedoms for all without distinction as to race sex language for religion*” It must be noted that GA resolutions do not directly participate in custom-making process, rather is considered only as a ground for explanation of States tendencies in a general level.

There is no any reason for States not to be able to declare their legal belief though GA resolutions concerning a specific norm as an internationally legal norm. States votes in relation to resolutions and their statements that have been framed in this form (resolution), easily will reflect their approach. On this basis, such resolutions either can codify customary international law or be effective in genesis of modern customary law. Regarding the declarative resolutions, it must be stated that, since the purpose of these resolutions are manifesting the general principles of international law, consequently have this potential to reveal States legal belief concerning their customary and continuous nature. This fact that GA resolutions can indicate the existing customary law or be considered as the indicator of States legal belief, has been noted under the international judiciary practice. In case concerning Nicaragua, in order to recognize the existence of the customary rule relating non-use of force among the States, ICJ found “legal belief” extractable by resorting to some GA resolutions indicating propensities of States. The consent to the text of such resolutions can be considered as acceptance of regulation validity or the rules creating the legal framework of those resolutions.

In case concerning legality of the threat or use of nuclear weapons ICJ expressed the same statement: “*they can, in certain circumstances, provide evidence important for establishing the existence of a rule or the emergence of an opinio juris.*” Referring to some resolutions in Nicaragua case and adherence to “*certain circumstances*” in legality case is not accidental. Such considerations of ICJ indicating all resolutions of GA aren’t evidence for emerging a general legal belief. Under the certain circumstances, resolution can indicate customary international law. In the latest case, ICJ asserted- concerning discussed issue- in spite of high rate of States nay and abstaining votes, many resolutions have been adopted that none of them proving an “*opinio juris*”. In this respect, even a consensual resolution may not reflect States legal belief, when the primary situation symbolizes the affirmative votes have been gained only under some political considerations rather legal will of States. Thus, in general legal belief obtaining process of States, only cannot be relied on superficial form of resolutions. Wordings, adoption process and general framework of resolution must be deeply scrutinized. The general consensus and unanimity do not necessarily prove the aforesaid intention; conversely, the price of achieving consensus or any kind of objection absence may be either absence of a binding legal rule or a kind of ambiguity in which the several legal perceptions are possible.

Consequently, the recent Status can invalidate a rule legally as well. For example in connection with adoption by consensus of some resolutions concerning Outer Space, after a meticulous analysis, Pro Cheng (1986) has concluded that there is no any comprehensive agreement on recognition of these resolution content as “Instant” customary international law. Similar to declarative treaties, some resolutions also enjoy such peculiarity that can be obtained by legal stipulation in several stages including; related ingredients listed in text, primary actions concerning its codification, viewpoints of States within drafting and adoption, resolution tone and some other factors. For example, the famous 2625 GA resolution concerning “*principles of international law*” which is legally general manifestation sample of State belief and indicator of customary international law principles. The framework of this resolution- both in text and title- explicitly contain some international law principles governing on States relations and ICJ has confirmed it in case concerning Nicaragua as well and recognized the resolution content as general explanation of States legal belief. The third

article of defining international aggression resolution and (1)95 resolution- reflecting principles listed in Nuremberg charter-are some other manifestation samples of States general legal belief.

A point seems to be reemphasized; except with organizational and internal issues, UNGA resolutions are only a recommendatory and not binding for state-members. Recommendation means a non-binding advice. In framework of general international practice, advice is explanation of a legal act containing a tendency, however is not binding for its addressees. General Assembly resolutions as a series of recommendation document even though does not contain the authoritative content, according to ICJ at least enjoy a persuasive validity. ICJ in 1966 and in *South West Africa* case explicitly emphasized on the recommendatory nature of GA resolutions. However, their persuasive power can be considerable and at the same time their authoritative dimension does not make them binding. Now some points concerning the situation of resolutions explaining general legal belief of States. As it mentioned, the primary actions relating to resolution codification and the text wordings play an important role in extracting States legal belief. In connection with resolution wordings and used tone, Pro Viralli believes resolutions always contain some signs concerning its creators' will, however, for comprehending such signs, getting familiar with special language of diplomacy is necessary. An example is usage of "shall" and "should" interchangeably. In this respect, ICJ believes the way of UNGA resolution wordings is the significant factor in determining their validity as evidence of States legal belief. In case concerning Nicaragua ICJ declares: "the resolution demonstrates that the States represented in the General Assembly regard the exception to the prohibition of force constituted by the right of individual or collective self-defense as already a matter of customary international law". In Court ruling relating to legality of the threat or use of nuclear weapons, the content of resolution and its ratified circumstances for obtaining the legal belief was considered as well.

In this framework, not only it is necessary the agreed States opinions to be examined, but also the explanation concerning those opinions separately and States statement concerning every paragraph must be scrutinized as well. In case concerning Texaco against Libya, the arbitrator asserted, even though the resolution 3201 relating to creation of new world economic order has been adopted without voting, issued statements by representatives of exporting States symbolize these States had not agreed with change and reforming the rules relating to expropriation compensation which had been previously declared in resolution 1803 concerning permanent sovereignty over natural resources. According to McDougal, for decision making about whether a resolution or UN statement is exact expression of nations expectation from law, various facts need to be clarified, including: how many States do vote in favor or against the resolution or statement? To what extent is the relative power of voters? To what extent the listed policies in resolution is consistent with previous expectation? What has happened after the resolution adoption? What expectations can be created from the other sources? Title of resolution, in some cases may reflect the agreed States will as well. For its very important decisions, GA sometimes determines a specific title like "Declaration", including: Universal Declaration of Human Rights, Declaration on the Granting of Independence to Colonial Countries and Peoples and Declaration on Friendly Relations. However, the title of a resolution is not considered as a miracle.

There may not be a sufficient acceptance concerning specific part of a resolution or declaration- as *lege lata*- on one hand, and there may be a resolution does not enjoy the title of declaration or any similar title on the other. However, as *lege lata* it can be the manifestation of international community unanimity relating to rules listed in resolution. Regardless of declarative resolutions explaining the existing customary international law, about the other resolutions; the more affirmative vote of States within voting, the more effectivity in obtaining the general legal belief of States and consequently formation of customary rule. It must be repeatedly considered that, if a resolution does not contain the

general legal belief of States, at least can express the viewpoints of States concerning an issue that can contribute in genesis process of customary international law. The more number of affirmative votes to resolutions containing a specific rule, the more validity as explaining evidence of States legal belief they will enjoy. According to one noted researcher, repetition of the same norms in the consecutive instruments expressing soft law can lead to the creation of international community legal belief. In his dissenting opinion, Judge Tanaka has expressed the same perception in case concerning South West Africa in 1966. According to Tanaka, even though GA resolutions don't enjoy the binding power, what for customary international law necessary is, include the repetition of similar approaches that usually are observable in these kind of resolutions and declarations. The mentioned considerations concerning GA resolutions role as the reflecting evidence of States legal belief, undoubtedly is applicable about the other similar texts. For example, ICJ in Nicaragua ruling, referring to Helsinki final act ratified in conference on security and co-operation in Europe, recognized it as the States will evidence on prohibition of force use rule. However, since GA is only international public authority guaranteeing all States attendance, as a result enjoys a major role in explanation of States viewpoints and general tendencies concerning various issues. Security Council, Human Rights Council, International Organizations, European Union, Regional and Trans-regional Organization, public conferences and some other institutions, according to their authority, can reflect the States belief and propensities concerning specific issues.

## 5 Conclusions

Even though obtaining the general, widespread and uniform practice is considered necessary in genesis of customary international law, judicial practice indicates that in relative absence of these conditions, dominant appearance of *opinio juris* can be compensatory. On the other words, the judicial policy of Court has mostly lain on amending the defect of practice through paying more attention to *opinio juris* and obtaining the States firm legal belief. The prohibition on use of force and interference of States in their domestic affairs (Nicaragua case, 1986), is a noted example of applying such policies. Consideration of States silence and non-objection can be stated as the other evidence obtaining the *opinio juris*. International law Association in Statement of principles applicable to the formation of general customary international law in 2000, in spite of its general view recognizing the proving of *opinio juris* unnecessary in process making of customary rules, explicitly expresses that the conduct of States and international courts and tribunals, a substantial manifestation of acceptance (consent or belief) by States that a customary rule exists may compensate for a relative lack of practice. Moreover, some scholars like Cheng believe that *opinio juris* is only principle element of custom-making. Regardless of central role of *opinio juris* in genesis of customary rule, the twofold system governing on formation of customary rule must not be ignored. Even though based on some conditions it may play a major role in crystallization of custom, similar to *opinio juris*, existence of practice is necessary for formation of customary rule as well. Finally, treaties and resolutions provided that not to be derived from political considerations most probably indicate the States legal belief. Treaties are the output of threefold powers (legislation, judiciary, executive) and accordingly symbolize the State's *opinio juris* in various legal affairs. Resolutions of UNGA also are created to reflect the viewpoint of States member concern with several issues. Thus, every full powered mission member is authorized to manifest his State's specific *opinio juris* either by voting in favor of resolution or against it, even by putting the silence policy on the agenda.

PH.D.C of international law & Corresponding Author  
Email: "sayvania@gmail.com"

Abstract. International customary rule is composed of the two elements, material that is called practice and immaterial factor which is called *opinio juris*. Through the descriptive method, this article is promised to investigate the limits and various dimensions concerning the practice factor. According to the results, material element at the first step implies states practice and there are no any written and specific rules about what qualifications the practice should have. Issues including the length that the practice should be obtained, repetition of the practice, degree of the practice coherency and integrity, generality of the practice, essence of the practice, practices that are criteria in this framework and finally the other practice makers other than States, are a part of the most significant issues that should be considered in determination.

Key Words: Practice, Customary Law, Refusal, Omission, Beneficiary States

### 1 Introduction

(general practice ) that is accepted as law, inserted in 38 (1) (B) Article of international court of Justice Statute, basically indicates state practices and this issue is inferred from Court views well. States do not have physical entity. They are a collection of connected governing institutions (organs) that have a complete legal personality. Sovereignty is considered as constitution and the main emblem of government due to international law and is explanatory of its place in international relations. In Max Huber's view in judgement related to Palmas island (1928); (sovereignty indicates the independence in relations between States.) And independence also as has been put by Anzilotti at his personal theory in advisory view of international Permanent Court of justice in 1931 regarding tariff regimes between Austria and Germany, means that the state which according to international law has sovereignty, receives its entity and authority from that same international law. State practices through qualified organs appear that form the main movement of rulemaking at international level. Determination of state qualified organs according to international law has been allotted to its own inside legal system. According to article 4 of International law commission plan draft regarding international responsibility of states 2001, behavior of each governmental organ -according to international law- is considered as the practice of that State regardless of that organ has a legislative, judicial ,executive function or another function and whether what position the mentioned organ has in governmental organization and this organ is an element of central government or an element of local governmental unit (paragraph 1).

The way of separation of power and competency domain among government's different organs also has been allotted to their inner system that of course following considerations should be considered: 1)although the determination of competency domain of formal organs is the responsibility of governments inner system, international law regarding some senior governmental authorities (e.g. the head of the state) considers them among government Ostensible representative who even have competency behind what is defined in inner system framework for them. Concerning making agreement, such a situation has been affirmed by international Court of justice in the case related to maritime and territorial boundary between *Cameroon and Nigeria in 2002*. And Court about this case has based its own verdict on Article 7 (2) of Wien convention on law of treaty 1969. There is no reason to conceive that substantial difference exists in the relation between treaty-making and the process of custom-making (Danilenko, 1995). Nevertheless, we emphasize that the form of exerting such a verdict will include just some of state senior formal authorities.

2) When a government formal ordinary organ acts over its authorities, their behavior will not be contributed in the process of custom-making, albeit by doing a violating act, this issue ascribed to the state and consequently will followed by its international responsibility. In other words, behavior outside authority domain of state formal organs – other than about a few number of senior authorities that already was mentioned – cannot be noticed as making element in rule making process, although it is possible - if being violating- to lead to the responsibility of states at international level(Danilenko, 1998). Concerning this issue, it needs to be stated that the executive power measures must be considered and not only foreign ministry. Leading of international negotiations and occasions in nowadays modern method is not always the responsibility of foreign ministry. This task can be done by economy, transportation ministry and etc. Other than the cases that an executive organ take measures outside its authority domain and its action is rejected by senior authority, apparently there are no appropriate reasons regarding that why state capacity of practice-creating be confined to foreign ministry. ICJ in the case of the *NotteBohmm 1955* states that a governmental rule (whether constitution that is possible, for example, to include claim of competency on maritime areas) can be considered as the manifestation of that state practice. Court in *Lutos verdict* also emphasizes on this issue in the same manner that inner courts are part of government organs and their decisions must considered as a part of state practice. Legislation of territorial rules and reflex ion of them in judicial verdicts during legal procedure can be viewed as notable indicatives of government behavior; particularly, basic and main rules of each country regarding limitation or desigment of government competencies, separation and resignation of authorities and promotion of human rights.

Also, verdicts issued from inner courts particularly can be suitable delineation of executive condition of legal processes, realization of justice immunities and extradition. In many case we see the state practice-making through association of the triple powers with each other. For example, the request of extradition is made. In this case, approving or disapproving national rule, inner court decision and accomplishment or not doing extradition by executive government can be a manifestation of government real practice regarding the mentioned issue (Gilbert, 1998).Also about the governments that have confederation or federal position like US and Switzerland, it primarily must be told that practices of each of their inner territorial units – that also do not have international independent personality- cannot be viewed as state practice, unless their practices are on behalf of central government and or approve and pass by them. Thus, state practice, as it was described, has a determining role in creating rules of customary international law. Indeed, states as main subjects of international system and their behavior and approach as the basic element of rule-making in this domain, has the most important and dominant role in the area of (practice makers).

### 1.1 International Organizations

Even though "general practice" as the material element of custom-making basically indicate state practice, international organizations that are created to organize disorder in international relations in generating systemic order has increasingly developed these days and actually is considered as an inseparable part of international life and plays roles in different areas. This increasingly development has been the outcome of extension of international relations particularly in twentieth century. international organizations that first has just took step in international domains in limited areas and the framework of technical issues, presently has generalized own activities domain to most important international issues including legal, political and security issues. Thus, international organizations due to having subjective legal personality are considered one of the active subjects of international law and

therein can be both producer of right and obligation, and its subject. Although organizations firstly take this own personality form the State will, they with continuance in their activities act as an independent legal personality. Nevertheless, international organizations practice also can be effective in practice-making process and codifying legal rules because the practice of all subjects of international system contributed in generating and creating legal rules. Generally, as international organizations have capacity of treaty-making in international legal area to implement their missions and achieve aims that has been made for their realization – that its borders has been defined in Wien convention on law of treaty among countries and international organizations and or international organization with each other on March 21, 1986- as they also can participate in the formation process of general customary international law through the practice of their organs.

Such association is actually of main impacts and consequences of having independent international legal personality. Of course, we should note that acceptance of legal personality for international organizations should not lead to this conclusion that state members of an organization do not have any independent practice in involved organization framework anymore, and what is efficient in deduction of customary rules is only the practice of the organization itself. International organizations privilege of independent legal personality of constitutive members will not have any conflict with obtaining independent practice of state members of the organization, because one state do not lose own entity and identity due to enrolling in an international organization, rather it assigns some of own competencies and authorities to the related organization to achieve a specific aim. As we will see in the following, international organization resolutions, particularly, *United Nations* General Assembly resolutions are a very appropriate place to assess state practices in discussed issues and a manifestation and reflective of their legal belief. International Court of Justice in advisory verdict related to the reservation on genocide Convention 1951, in explanation of customary law related to reservation, noted the practice of United Nations Secretary General as trustee of many of multilateral treaties alongside the state practice of national authorities. Regardless of the above case as an example of organization behavior, many of other practices of international organizations through their decisions appear in the form of responsible authorities' resolution, statement, and declarations. Therefore, presentation of such documents can be considered as a clear sample of organization practice. Concerning this, even some authors view organization approach as a custom constitutive material element as concrete only in this form and do not accept crystallization of the organization tangible function in the way described above (Higgins, 1987) Oppositely, some others of commentators seek organization practice manifestation just in the framework of tangible behavior of it (and not verbal in the form of resolution and statement) (Mandelson, 2000, p.201). These last group believed that the passage of any resolutions and statements by international organization is more explanatory of governments function which are member of that organization rather than the organization itself, when electing about pros and cons of one resolution that poses some issues regarding international law, states are forming their own practice about the discussed issue or try to display own legal belief related to the matter. Therefore, it is better to know such a function more as a manifestation of state behavior and inclination than assessing organization practice (Ibid, p.202) Hence, international organizations as main subjects of international law system can participate in practice-making process and forming of rules of law, whether in the framework of inner organs and or in relation to other governments at international relations level.

### 1.2 International Judicial Authorities

International court and tribunals are not legislation authorities. The point that is needed to be noted here is that whether international judicial authorities themselves can make practice in the process of international customary law formation? In other words, whether decisions of these authorities can be considered

as “general practice” that constitutes the material element of custom? This issue can be represented from 3 perspectives. One is considering international court and tribunals as constitutions that take their competency and authorities from governments. Thus, their verdicts are viewed as a form of state practice and another that consideration of this authorities as inner organs of an international organization and thus viewing their decisions as the approach of that organization and finally the judicial practice of judicial authorities that can find the presence of customary rules in different areas. In each 3 ways, the issue is that whether international courts and tribunals can be material element of custom-making practice? Regarding this issue, some authors has considered these authorities decisions as a form of state delegation practice. Professor Wolfke believes; this fact that states accept verdicts and ideas of judicial organs means that such decisions per se can be viewed as a form of state practice (Wolfke, 1993). In his viewpoint, such an idea also has been already affirmed by *Guggenheim*. Then Wolfke clearly has point out the international Court of justice practice and accordingly analyses planned references of Court to own prior decisions and also references of other international constitutions including states themselves, international organizations, non-governmental organizations, international law commission and doctrine to such decisions in this framework (Ibid, p.74)

Form his view; it is completely natural that we assess judicial history in the framework of the international practice leading to formation of customary law. It has been explicitly accepted by states. Wolfke even in opposite of persons who believes in kind of made and polished law should be viewed (Ibid, p.75). Also, then some judgments of court are adduced by this lawyer to prove the claim. For example, Court in the case of boundaries limitation of continental shelf between Canada/ Us in 1984 has specified that ( ...Court verdict ...in the cases of North sea continental shelf has been considered as the greatest participation of this authority in application of governing customary law in the discussed area.) part D of paragraph 1 of Article 38 international Court of justice Statute that due to it(... judicial decisions ... as accessory tools to determine rules of law) is considered, also is another reason that has been posed by Wolfke regarding the practice-making role of international judicial authorities verdicts. He believes that this part of Article 38 indirectly guarantees the acceptance of some degree of rulemaking by judicial authorities (Wolfke, 1993).

### 1.3 Non-governmental International Organizations

Primarily does not accept governing doctrine, direct participation of non-governmental international organizations in the making process of international customary law. Although the situation related to treaties is also the same. Non-governmental international organizations are not active subjects of international law and cannot cause right or obligation. They can merely be the subject of right of obligation. Unlike non-governmental international organizations that directly participate in the practice-making process leading to the formation of customary material element, role of non-governmental organizations is only limited to some secret lobbies in backstage and influence on state agents in diplomatic conferences and international assemblies. Therefore, non-governmental organizations can play important roles in all steps related to the formation of customary law, from the beginning of the negotiations and reasons gathering to identifying and final ratification of rule, but they do not have direct participation in the process. Also, - clearly about treaties- non-governmental organizations is possible to enter extensive strains on international society members to put a specific treaty draft in the agenda of future negotiations and or even, in some cases, it's possible to represent a specific draft text of own to be combined with the text that is developed by states (Hobe, 2005). But ultimately, it is these states – and not non-governmental organizations- that participate in the conclusion of treaties. The situation regarding customary international law norms that the above-mentioned organizations, with respect to them, can

indirectly influence on governments function and their approach development (Ibid, p.214).

## 2 Nature of Practice

### 2.1 Verbal and Material Acts

Generally counting practices and behavior that guarantee international practice leading to the formation of customary rule is not a simple task. Primarily, material elements or practice can include both physical and material act of states and verbal act of them. Nevertheless, lawyers' view regarding this issue is not the same because some of the related specialists accept only physical acts as practice, while it seems that dominant view about this issue regarding international judicial practice indicate any kind of behavior as the material element custom-formation. Then, we will continue this discussion in detail. As it mentioned, there is a disagreement concerning the nature of state practice – like other posed issues in the present writing. Some lawyers like Damato and Wolfke view only state material and physical acts as a manifestation of the practice and representing a strict concept regarding this issue, limit the source range of custom's material element. They believe that any claims or general statements per se cannot be explanatory of state practice. In this regard professor Damato asserts; a claim is not an act. Although the claims may articulate a legal norm, they can't constitute the material component of custom. (Damato, 1971, p88) According to him, sending missiles, nuclear procedures, receiving ambassadors, making levies on customs duties, expelling an alien, capturing a pirate vessel, setting up a drilling rig in the continental shelf, visiting and searching a neutral ship and ...are among the most important state's practices. For a state has not done anything when it makes a claim; until it takes enforcement action, the claim has little value as a prediction of what the state will actually do(idem). The situation is the same in the cases that a state decides to support or oppose the development or changing of an act. Damato provides an example in this regard; sending the first Sputnik to the globe and at the same time the development of the customary law related to passing the satellite over other countries' territories. He believes that if a state's decision was to oppose the development of this law, it was necessary for the states to show this either by providing a constraint for passing the aforementioned satellite, or in the case of lack of ability to do this by any way to act against the Soviet Union (idem, p89). Also Damato pays attention to the possibility of difference between the actions and words of states. If our understanding of practice component implies both physical and verbal behavior, we might occasionally face with the issue that there is a difference between what the state says and acts. Basically, this difference will not exist if we consider practices as physical acts. The state can say many things with different voices at the one time but a state can act in only one way at one time (idem, p 51). In addition to Damato, Professor Wei provides nearly the same analysis about the practice component. In his opinion, providing a great commentary of what would be the material component of custom including the placing of different verbal acts such as unilateral intimations, declarations, statements, resolutions, and treaties and... in this framework, only leads to the increase of ambiguities. Specially, in regard of Wolfke's point of view and other similar views; there is no reason for not paying attention to the verbal acts or general declarations of the states. In this regard, hinting to the professor Mullerson's ideas would be logical. Although he will not show clearly the component of the actions that comprise the states practice, he puts the acceptance of the wide concept of the evidences that formulate material component of the custom against the same challenge, as was put by Damato. At first he acknowledges that there is a distinction between what the states claim and what the states act. For example, "the claim" of having the right of innocent passage in waters of a territory and it's "enforcement". But he asserts that in the case of acceptance of the wide definition of practice, what would be the way to distinguish it from the legal believes of the states? (Mullerson, 1998) In this regard also Red considers the distinction between act and legal belief where verbal acts are paid attention as the

reason for creating practices. Nevertheless, Mullerson does not clearly assert that he agrees with the acceptance of verbal acts as the state's practices or not. Finally, he states his analysis this way, that the state's practice can contain both subjective component [verbal acts] and the objective component [physical acts] but the subjective component is not always defined as legal belief (idem). Mullerson believes that subjective attitudes of the states about their act may be implied in their actions (idem).

Diplomatic statements(such as complaints), political statements, press releases, official instructions(such as military law) , armed forces' circular, states' interpretations about the drafts of the treaties , domestic legislation, votes of the national courts and executive authorities, the views of the governments before international courts, international organizations' statements and resolutions are all examples of the verbal acts. Thus, international law association besides Akehurst and Mendelson discusses the quality of participation of verbal acts similar to the physical acts in the process of practice-making which lead to the formation of the material component of custom. Finally it acknowledges despite of the content above, we can consider some of the declarations more usefully as just stating the beliefs than the official acts of the state's practice. Professor Dinstein believes a view which only considers physical acts as the component of custom, is a highly exaggerated view (Dinstein, 2006). This jurist believes this is right that in a wide level a physical act is of a greater importance in comparison to a verbal announcement, warning, or censures (totally verbal acts) however, there is no difference between them in terms of their validity. Actually Dinstein considers a higher value for some actions such as laws authorized by parliaments and the votes issued by the courts than other verbal acts.

In his opinion, undoubtedly, laws authorized by legislative institutions and domestic courts' decisions have a higher value like physical acts –or even more value – in the process of practice-making, however, in other cases the general declarations of the states including statements, announcements and notices, only have a side role (idem) and they cannot make an practice which leads to the formation of the material component of custom without the states' physical acts (idem, p 276). Thus although at first, he considers physical and verbal acts of the states in the same way, finally , he makes some distinctions between them in relation to their role quality in the process of practice-making which lead to the creation of customary rules. Yet this dissociation is not at all comparable to the Twirl Wee point of views who considered totally verbal acts as the evidences for making practices. Dinstein believes in this framework, when the preconditions are available, the general statements of the states can put their actions in a special situation, especially by making clarification of that action or by making explanation of that as an exception to the rule. In other words, there would be a kind of impact on the delimitation of the discussed rule. But this cannot contribute to the process of making the quantitative component of custom on its own (idem, p 277). Besides the judicial practices, international law association in the year 1950 clearly mentions treaties, domestic courts' decisions, national rules, diplomatic correspondences and national legal advisors' beliefs as examples of the possible different forms of the state practice, as well. Also the states' considerations especially big states imply the acceptance of verbal acts as a kind of the state practice. Declarations of the rights of foreign relations of the United States (section 102) states; actions and diplomatic instructions and other governmental acts and official statements whether they have been taken unilaterally or in a form of collaboration with other states ,for example in the framework of international organizations, they can establish different forms of the states' practice. Relying on the verbal acts of the states in order to search for the customary law is the current reality of the international system and is of great importance, especially, for those states which do not have the material facilities for taking actions in a special field.

For example, for the states which do not have the weapons for mass destruction or the states which do not have the facilities for sending satellites to the space or landlocked states, verbal act is the only way of practice for them. As was mentioned above, The International Court of Justice has consistently cited official correspondences, diplomatic declarations and other similar cases and the states have not objected to them.

## 2.2 Verbal Element; Emergence in the Practice or Legal Belief?

As was stated before, the majority attitude toward the defining of the nature of material component of custom contains both physical and verbal acts. Here the problem is that when verbal acts are considered as both the practice evidences and legal belief evidences, what would be the way to authenticate and dissociate them? Verbal acts are being considered as the most important evidence for proving the existence of legal belief. The result which is achieved in this case, according to some lawyers, will be an epistemological way which causes one of the components of the creator of the customary International law rule look redundant. Viewing more meticulously, the solving of problem does not seem to be difficult. Although apparently and at first, considering verbal acts as evidences for both creating practice and evidences for creating legal belief of the states, can lead to the fomenting of some ambiguities, these problems can appear where the states do not have any verbal act about an issue. In the recent case- besides the material component-also the mental component is extracted on the basis of the wide and convincing practice of the states and not through understanding of the preconceived notions. This has been expressly confirmed in the votes of the Court Branch in the year 1984 (Gulf of Maine case). Thus necessarily, insisting on the dissociation between the sources of the evidences of components of custom is not logical. As the verbal acts can show the states practices and also the legal beliefs, physical acts can also contain such situations but in the case of the former we face a different situation. In this regard some of the lawyers, in addition to acknowledging that verbal acts of the states can be cited as a form of practice, they believe that the contents of such actions will also show the mental elements or their legal beliefs. (Mendelson, 2000).

## 2.3 Refusal or Omission

Although the material element or practice implies the states' actions( both physical and verbal), it is possible that under especial situations, refusing to take action( refusal) will be paid attention as a kind of the state's practice in the process of the formation of legal international customary rules. For example, refusal to prosecute an accused or suspect foreigner diplomat for committing the crime in order to create the customary rules related to the diplomatic immunities. The majority of the authors and commentators have more or less accepted the role of refusal in the process of making practices, professor Wolfke believes that "There is no basis for excluding refusal as a kind of process which lead to the formation of the international custom. Everything depends on the situation and occasion." (Wolfke, 1993) Professor Akehurst also stated "The state's practice can contain refusal and silence." (Akehurst, 1994, p11) The point of views of other jurists such as Sorensen, Tunkin, Bernhardt, Danilenko and Kunz, in relation to the role of refusal are the same. In this way professor Mendelson also believes that; refusal can be paid attention as the material component of custom or practice but we should consider the situation and a degree of caution (Mendelson, 2006). Like other jurists such as Wolfke and Akehurst, he poses popular Lutos vote as the basis of his analysis. 168 It appears that the best understanding of the role and place of the refusal in the process of making practices which lead to the formation of customary rules, have been done in the framework of this idea. In this case, The Permanent Court of International Justice did not accept the refusal of the states (except the flag State) from the prosecuting of the accidents on high seas as an evidence for existing a customary legal international rule which ban the states from such actions(idem). But this policy of The Court was for the reason that the refusals

of the states were ambiguous and this can mean that there is no problem in situations that refusals of the states as a government practice contain no ambiguity. In this case, by citing to the lack of prosecution from the non-flag states about the claims related to the collision on the high seas, The French government was a pretender of a kind of duty for such states. The Permanent Court of Justice denies this reasoning of the French government not because of the fact that refusals of the states naturally do not have the characteristic to consider this as a "practice", but because this refusal seemed ambiguous in such situation and it was unlikely that this was as a result of aware commitment.

## 2.4 Characteristics of the Practice

Which characteristics should the practice or material component of custom have? Under which quality are the states' actions recognized as the international practice? Article 38 (1) (b) of the Statute of the International Court of Justice only considers the generality of the practice. Nevertheless, investigating of the jurists ideas about the international juridical practice implies other traits and qualities which the practice that lead to the formation of a customary rule should also contain them. We will discuss this issue in detail in this section.

### 2.4.1 The Generality of Practice and the Limits of This Generality

As was mentioned before especially in citing of the paragraph1 (b) of the article 38 of the Statute of the International Court of Justice, the international practice which lead to the formation of the customary law should be "general". But this generality does not mean the participation of the all of the states in the world in the process of making practices, because this way we should wait for years for creation of a customary law to come true that is so exceptional and far away from expectation. With the generality of the practice, it means that it implies "wideness" and "similarity" which are the basis for the formation of the rule and all of the states are required to comply with them, unless it be in the framework of "Persistent Objector". The general practices of the states contain both the sequential and parallel actions which are as a result of the practices of cognizable organizations in a period. In most of the cases these actions can be accomplished independently, however, the consistency between the states should not be disregarded. Now we should discuss about the issue that how many states should participate in this practice? There is no specific criterion in this regard and naturally like the other issues about the custom, it is difficult to exactly pose a rule about the number of the states which should participate in the practice which leads to the formation of the customary law. This participation not only contains the states actions but also it contains the reactions of other states whose interests are affected. (Akehurst, 1974). The majority of the customary rules which have been done by the international juridical authorities were based on the wide participation of the states. But it is also possible that the general practices of the states be the result of the actions of a few numbers of the countries. And it is also possible that the other states have the "once in each direction" participation. (Dinestein, 2006, p283) But it has been said that if a state or a group of states do not protest against the action of another group in the case that they are objector to that, their silence mean that they have accepted such actions. (Idem) From the standpoint of international Law association committee statement about the principles governing the formation of the international customary law, the States practices should be wide in order to create a general rule of the international customary law, so as was stated in the court's practice, and not necessarily universal, also it is not necessary for the specific governmental requirements to an international customary law, it will be proven that the mentioned state has participated in the practice actively or deliberately has agreed about that (idem).And the international judicial authorities has never denied this state from the commitment for the reason that the state has not participated actively in the practice which lead to the formation of General rule of customary international law claims.(idem).

### 2.4.2 The Time Element

Custom is formed in the floor of time (Dinstein, 2006). How much time is necessary for a customary law to come into emergence? About this we should state that there is no specific criterion. Maybe in this frame work; the time needed for the time passing for creating a customary law; the wording of the International Court of Justice in North Sea Continental Shelf Cases will be the best criterion for analyzer. Although passing a short time does not necessarily or in itself prevent the formation of the customary rule of international law, on the basis of what was basically a convention rule, but the necessary condition in this short period is that the practices of the states especially those states whose interest will have been affected especially, regarding the citation of the regulation, be wide and really consistent. In addition to this, the practice should be made so that it makes possible the recognition of the fact that a legal rule or a legal necessity has been regarded. The needed scale of time continuity in order to creation of an international customary rule depends on various related factors. For example, if an issue was stated which no other rule was accepted about that, establishing the rules concerning the issue will take shorter time than the issue which exist a customary law for it and it should be adjusted for the establishment of the new rule. Nowadays, in parallel of the development of the international relations, the importance of time is reduced. In assessing the behavior of a state, time is of low importance and its situation in each case depends on the other factors related to that activity. In the past and in the Roman law, basically custom was considered as a product of a long practice, also in the common law in order to convert the practice to law, that practice should have a long history so that nobody can remember its root time. (Mendelson, 2006). In the international level, most of the legal rules have a long history. but this does not mean that the formation of the new rules also need such history. At the present, the creations of the customary rules are provided in a short time and faster than the past (idem, p210). For example the rules governing the law of sea were first announced by President Truman in the year 1945. In the year of 1951, in the judgement of the Abu Dhabi Lord Asquith the dispute case of Petroleum Company of Dolapment and Sheikh Abu Dhabi, he ruled that the mentioned doctrine with specific line yet do not appear in the international stature of a rule of law. But over the next years and until the 958 Geneva Conference, more states claimed jurisdiction over the continental shelf. at the time of the conference had been accepted that the coastal states should have especial rules over their continental shelf. And thus 1958 convention recognized such rights for the coastal states.

### 2.4.3 Integrity and Uniformity of Practices

The practice should be Virtually Uniform in order to participate in the process of making the principles of international law. It means that the different samples of the practice, should necessarily be similar and consistent both internally and in general. That the practice should be internally consistent means that the behavior of a participated state in the process of custom-making about a special issue should be consistent in different levels.

By consistency in general, it means that different states should not have different practices about a special issue (idem). In the Nicaragua case, the court did not find an opportunity to consider come points in relation to the present issue. According to The Court when considering customary international law related to the principle of banning on the resort to the force and also the principle of prevention from intervening of the states in each other's internal affairs, this international juridical institution do not expect that the states' practice in obeying the mentioned principles be in a high rate so that they should prevent from intervention in each other's affairs by resorting to force in a consistent way. The Court believes that for the formation of a customary law, it is not necessary that the related practice be consistent with that rule. In order to establish the existence of such a rule, it will be enough that the states' behaviors be generally consistent with that and the examples of the practice

which are inconsistent and incompatible with the rule, should be treated as a violation of that rule and not the signs indicating the recognition of a new rule.

### 2.4.4 The Practice of the Beneficiary States

The wide and consistent practice of the states in order to form a customary law, should be represented. International Court of Justice in the issues related to the continental shelf of The North Sea has emphasized on the "the practices of the states whose benefits are affected in a special way" in the process of practice-making. This suggests that the number of the states in comparison to the situation and the states which are related to the issue is of lower importance because their benefits are in relation to the mentioned rule. For a claim rule to legitimate, a proper reaction from the states and the beneficiary states is needed. Thus for example we can hint to the Britain's contribution in the formation of the law of the sea in the nineteenth century and the role of the United States and the former Soviet Union in the development of the law beyond the atmosphere. Before a claim rule can find its way in the area of the customary international law, it is possible that the participation of some states be more necessary.

## 3 Conclusions

Through qualified organs, State practices appear and form the principle movement of rulemaking at international level. According to international law, the determination of State qualified organs has been allotted to its own internal legal system. In this respect ILC considers every organ behavior as State behavior, regardless of its function, including legislature, judiciary or executive. In the other level, international organizations enjoying subjective legal personality, actively act as practice makers especially that their activities realm has remarkably developed nowadays. These organizations behavior largely shows themselves in the form of declaration and resolution. International judicial authorities also can contribute as practice makers. This contribution may be realized in two forms, first as institutions that received their authority from States and their behavior is seen as States will and second, consideration of these authorities as the internal organs of an international organization and regarding their decisions as organizational practice. Similarly, Non-governmental organizations contribute just in the primary proceedings of practice making as well. ICRC is a NGO that has widely participated in formation of international humanitarian law. Concerning the nature of practice, both physical behavior of State like nuclear test and verbal act like authorities statements are regarded as practice element. However, sometimes verbal acts of States may indicate the legal belief of their doers parallel to consideration as a practice. Similar to Physical and verbal act, omission and silence also may be recognized as practice. Sometimes States manifest their will by omission or silence, like refusal to prosecution and silence on States nuclear test or bombardment. The aforementioned approach of States is regarded as their practice. The generality of practice widely relates to its uniformity and integrity. Even only two States can constitute the necessary quantity to form a regional custom. Because generality is determining not universality. The length of time is not inherently significant for realization of States practice. One practice may be consolidated just over one decade and the other may be recognized over decades. Finally, as the practice makers, the penetration coefficient of beneficiary States acts is noticeably more determining than the others as well.

**Abstract.** Financial and economic issues, especially capital markets is one area that is important in today's forecast. Various techniques exist to predict future stock prices. Fundamental analysis is one method that considers several variables. In this paper, neural network model (RBF) and econometric panel data are used to increase efficiency, reduce costs and time in fundamental analysis. For this purpose, a sample of 35 year - company of listed companies in Tehran Stock Exchange are selected in the petroleum products industry. The results indicate good accuracy in modeling to predict the stock price on the Stock Exchange and subset of industries. Also, comparing the accuracy of econometric panel data pattern with neural networks in forecasting stock price represents the neural network has higher precision.

**Key words:** fundamental analysis, prices stock prediction, RBF, panel data, petroleum products industry

### 1 Introduction

Short-term planning in various fields for survival and persistence of activity of economic entities and effective investment and financing decisions is necessary for managers, investors, users and creditors. We can have a good reaction by planning before encountering the adverse economic events. It is necessary to improve the ability to predict accurately and consistently to increase the effectiveness of programs. Because the prediction is a key element in decisions of users within the organization and outside the organization. Therefore, efficient and effective decision would be made on the basis of correct predictions (Haghighat, Bakhtiari, Beheshtipoor, 2011). In general it can be said that the predictions is estimating future forecasts and the goal of predicting is reducing risk in decision-making. Predictions are not usually correct and have some errors, and this amount is reduced by having more information about the system. The predictive value means to the use of this information in the process of predicting. In finance the information such as stock prices, profits, returns on equity, bankruptcy and risk can be predicted. Among these, forecasting of stock price is important, because they are the factors that effect on activists decision on NYSE stock prices. The existence of related information forms basic transactions in the capital market and therefore information is the most valuable assets in capital market (Economic World Press, 2007). The main goal in these markets is to predict the future trend of prices to adopt appropriate strategies for buying or selling. However, the stock market is not affected only by the macro parameters, but another important factor effect on it (Torabi and Homan, 2010). Various techniques exist to predict future stock prices. One method that considers several variables, is fundamental analysis (Yaldiz and Yazgol, 2010).

In fundamental analysis it is believed that changes in stock market are unpredictable and the behavior of stock prices is formed in accordance with the theory of random walk (Exact date not repeatable). Several factors affect the stock price. Some of these factors are economic variables and some of the variables include: financial ratios, industry conditions, and more. Analyze economic, industry and company should to be combined to predict future stock prices using fundamental analysis. In fundamental analysis the forecasts are based on the facts and real events. Trader analyze real-world events and news based on knowledge and strategies to deal with market forecasts (Murphy, 2008). The basis of fundamental analysts is that all changes in prices has probably a financial- fundamental reason and believe that the actual intrinsic value of securities can be obtained. investors can use the potential to invest in petroleum products industry to improve efficiency, and by predicting stock prices, the companies in this industry, decided to invest more appropriate to take stock. Achieving economic growth and improving

investment incentives requires an active and reliable capital markets in developing countries. This is possible through the absorption and distribution of capital and financial resources in the sector of industry (Namazi and Kyamehr, 2007).

In the past decade the financial forecasts in accounting and finance has been the subject of much research. For instance, forecasted earnings per share, stock price, earnings management, financial ruin, etc. (Peter, Vladimir and Renata, 2013). Much research have been taken in this area using statistical approaches and artificial intelligence approaches. Among the methods used, the traditional statistical methods highly dependent on assumptions such as linearity, normality, independence of predictor variables and etc (Russell and Noroyg, 2012). Previous research shows that the neural networks have predictability more than the statistical model (Olson and Masman, 2003, Arabmazar Yazdi, Ahmadi and Abdul, 2006, Kordloyi and Haideri Zare, 2010, Fahimi fard, Salarpoor and Sabouhi, 2011, Makiyan and Mousavi, 2012, 7 Chung et al, 2012). Also, if two or more models are then combined, the likelihood of achieving the best prediction increases (Nazarian et al, 2013). In addition to neural networks, econometric models are used to estimate and prediction. Time series data, cross-sectional data, panel data are these methods. Among these panel data is one of econometrics methods that that each day the desire to do it in the scientific studies expanded (Ashrafzadeh and Mehregan, 2008). Given that stock prices are one of the variables influencing investment decisions, managers and creditors, it is expected this group use advanced techniques such as artificial neural network and use panel data to predict stock prices. In this study, the panel data and artificial neural network RBF (econometric model) are used to increase effectiveness, reduce costs and fundamental analysis.

### 2 Theoretical Issues

With the development of financial markets and an increasing amount of information, participants in financial markets are looking for tools which can make precise predictions of the future state of market with them. With a review of previous research on forecasting in capital markets, predict models can be classified into four groups:

1. Technical Analysis
2. Fundamental Analysis
3. Econometrics
4. Intelligent Techniques

In this research the combination of fundamental analysis, intelligent forecasting and econometric (panel data) will be examined.

Fundamental analysis is based on the assumption that stock prices does not reflect all information with respect to time and is in search of information that do not reflected in the current stock price and, therefore, predict a future price adjustment. Because market prices in the future move to the basic values (Abarbanel and Boucher, 1997, 1998).

#### 2.1 Panel data

The panel data consist of the time series data and cross-sectional data. It means the information regarding cross sectional data can be observed over time. Such data have two dimensions, which one dimension is related to a variety of units at any given time and another is related to the time. In time series data the values of one or more variables are observed over a period of time (for example GDP over the past few years). In cross sectional data the value of one or more variable are collected at the same time for a single data or a sample (for example the stock price for the 50 companies listed in a given year). But in panel data, the same cross sectional units (for example, a specific industry) are measured at the time (Gajarati, 2010).

## 2.2 RBF Neural Network

Research and interest in artificial neural networks began when the brain as a dynamic system with a parallel processing architecture is completely inconsistent with the known conventional processors. In 19th century, William James proposed stacks change attitudes about the physiological and brain structure. Among them may be noted in brain neurons and mechanisms for parallel processing. Function Networks are Radial Basis from the family of forward neural networks. These networks introduced for the first time by Bromhid & Low in 1998. RBF network with a variety of applications is one of the most popular neural networks and is main competitors for multilayered Persopron network. This method is different from other method due to forms of training, the function of neurons and hidden layers (Haykyn, 1998).

## 3 Research background

In the literature, fundamental analysis and econometric model for panel data are not presented.

### 3.1 Internal research

Botshekan (2000) used an artificial intelligence technique called neural networks - Fuzzy (ANFIS) for predicting stock price in Bahman company and assessed the ability this model in comparison to linear models (ARIMA).also box - Jenkins method is used to determine ARIMA model. Input variables are the price index, latest stock prices, trading volume and the price of oil. The results show superiority of Network - Neuro-Fuzzy (ANFIS) in predicting the stock price relative to the linear model (ARIMA).

According to Nazarian et al (2013) research and regards to the development of financial markets and the importance of these markets and the close relationship with macroeconomic variables the use of advanced mathematical models with complex structures to predicting the market is quite acceptable. In addition, the neural network model in comparison to other advanced models due to its high accuracy have special place, so predict volatility of stock index in Tehran stock Exchange using the daily data of stock price index between 03.25.2009 to 22.10.2011 and the reducing model with the potential long-term memory, forward neural network model and also the combination of two model. The results reflect base on the evaluation criteria of prediction error, although, the feed forward neural network model has a smaller error than the reducing model with the potential long-term memory. But the accuracy of combined model is higher than either of these two models alone.

### 3.2 External research

Schumann and Lohrbach (1993) predict the next day stock price in Frankfurt market by Arima and artificial neural network models. They have used the 13 given daily data for 9 years. The data is the type of technical data, also they have used an artificial neural network with two hidden layers. As a result we can't prefer these two methods together.

Feransesko & Rakesh (2012) provided a model for the predicting volatility in stock market belonging to the five founding members of the Association of Southeast Asian Nations as ASEAN-5, using the model of asymmetric APARCH with the two different distribution T-Student and GED, the aim was identify the symmetry or asymmetry in the relationship between stock returns and market volatility in ASEAN-5 market. The used data in the model were from indigenous companies of the stock market on January 2, 2002 to January 30, 2012 and are included financial turnover and the value of traded stock. The results represent superiority APARCH model and the t distribution using the prediction measurement error.

Peter, Vladimir and Renata (2013) predict the stock price with considering the quantitative data and hidden feelings (lack of assurance in reports and related terms) in the annual report and using nervous network and regression method. The used data include profitability ratios and technical analysis variables is

collected from companies listed in the United States in 2010. The results showed that nervous networks provide better results especially when we consider hidden feelings in annual reports.

## 4 Research methodology

### 4.1 Research goal

In this study, the econometric model for panel data and neural network RBF are used to increase efficiency, reduce costs and fundamental analysis. So the main aim of the study is examining the accuracy of econometric model and neural network (RBF) to predict the stock price and the main question is:

Do forecast accuracy of stock prices using fundamental analysis and neural network (RBF) in the Petroleum products industry is higher than the econometric model?

### 4.2 Research hypothesis

The forecast accuracy of stock prices using fundamental analysis and neural network (RBF) in the Petroleum products industry is higher than the econometric model?

### 4.3 Population

The population is listed companies in the Tehran Stock Exchange for the Petroleum products industry during the years 2006 to 2012 that data for this study are available.

### 4.4 Sampling method

The sampling method are in this form that the companies that have not the following conditions are removed:

1 – The firms are accepted in the Tehran Stock Exchange before 2006.

2 - In the period of the study, the fiscal year have not changed.

3 - The sample companies have the basic financial statements for the years 2006 to 2012.

### 4.5 Collecting data methods and tools

The required information and data for this study has been collected using the information in the database from the Tehran Stock Exchange (Tadbirpardaz & Rahavardeh novin). The necessary information to analyze the economic situation collected from the Central Bank database. TOPSIS method is used to check the status of the industry.

### 4.6 Data analysis method

In this study, the econometric model for the panel data and RBF neural network are used to predict the stock price. Thus, in this section to the variables and used data, the analysis of implementation algorithm methods and evaluation criteria of models.

## 5 Research variables

As previously noted, in the fundamental analysis, first investors analysis and the market and economy as a whole to realize the best time for investing. Then they analysis some of the industries or economy whose future prospects are good. Finally, if the analyst conclude that the investment is appropriate and appropriate industries with high efficiency work in the economy cycle, they focus on firm analysis. The impact of the economic indicators on the industry has been studied through inflation based on the consumer index, exchange rate in open market, oil earning, volume of money and coin rate. Industries are ranked each year using TOPSIS methods and variables used for analysis of company include: Current ratio, quick ratio, current debt to equity ratio, debt to equity, debt to assets ratio, interest coverage ratio, quick asset turnover ratio, current assets turnover ratio, tangible fixed asset turnover ratio, gross profit margin, operating

profit margin, net profit margin, return on equity, return on assets, the ratio of price to earnings, ratio of book value to market value ratio, price to book value ratio, price to sales, book value of equity, return on equity, total current assets, total liabilities, earnings per share. Factor analysis was used to determine the most influential variables. In the factor analysis, the variables that have a correlation above 0.5 were in the one group and based on the eigenvalues calculated for each group combining variables were obtained (Jelif, 2002). After determining the variables that have a correlation above 0.5 in a group, eigenvalues must be calculated to obtain combining variable. The matrix of eigenvalues which is obtained using EVIEWS7 software. The matrix of eigenvalues is multiplied by in the matrix variables that have high correlation and combining variables (PC s) is obtained.

**5.1 TOPSIS algorithm used in industry rankings**

Step One - normalizing decision matrix:

$$n_{ij} = \frac{r_{ij}}{\sqrt{\sum_{i=1}^m r_{ij}^2}} \tag{1}$$

The second step - the weighting to normalized matrix:

$$W = \{w_1, w_2, \dots, w_n\}$$

$$V = N_D \cdot W_{n \times n} = \begin{vmatrix} v_{11} & v_{12} & v_{1j} & v_{1n} \\ v_{21} & v_{22} & v_{2j} & v_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ v_{m1} & v_{m2} & v_{mj} & v_{mn} \end{vmatrix} \tag{2}$$

Step Three - Determine the ideal solution and negative ideal solution: Two virtual item A\* and -A are defined as follows:

$$A^* = \{( \max v_{ij} | j \in J), ( \min v_{ij} | j \in J') | i = 1, 2, \dots, m\}$$

$$= \{v_1^+, v_2^+, \dots, v_j^+, \dots, v_n^+\}$$

$$A^- = \{( \min v_{ij} | j \in J), ( \max v_{ij} | j \in J') | i = 1, 2, \dots, m\}$$

$$= \{v_1^-, v_2^-, \dots, v_j^-, \dots, v_n^-\}$$

$$J = \{j = 1, 2, \dots, n | j \in \text{benefit}\}$$

$$J' = \{j = 1, 2, \dots, n | j \in \text{Cost}\}$$

$$\tag{3}$$

Two virtually created options are the worst and the best solution.

Fourth step - obtaining measurements of distances:

$$d_{i+} = \{ \sum_{i=1}^m (v_{ij} - v_i^+)^2 \}^{0.5}; i = 1, 2, \dots, m \tag{4}$$

$$d_{i-} = \{ \sum_{i=1}^m (v_{ij} - v_i^-)^2 \}^{0.5}; i = 1, 2, \dots, m$$

Step Five - calculating the relative closeness to the ideal solution: This criteria is obtained by the formula:

$$c1_{i+} = \frac{d_{i-}}{(d_{i+} + d_{i-})}; 0 \leq c1_{i+} \leq 1; i = 1, 2, \dots, m \tag{5}$$

Step Six - Rating Options: finally, options are ranked according to the descending order.

In order to classify industries using TOPSIS, the variables such as return on equity, return on assets, EPS, P . E, stock return, current ratio, debt-equity ratio, operating profit margin and net profit margin are used. After using this method, Petroleum products, among the 10 industries classified on the Stock Exchange during the years 2006 to 2012 were ranked as follows in Table 1.

Table 1: Ranking the industry using TOPSIS method

Year	2006	2007	2008	2009	2010	2011	2012
ranking	7	9	10	3	2	2	10

**5.2 Algorithm using panel data:**

Panel data model can be demonstrated as follows:

$$y_{it} = \alpha_{i0} + \alpha_1 x_{1it} + \alpha_2 x_{2it} + \dots + \alpha_k x_{kit} + \epsilon_{it} \tag{6}$$

$$\epsilon_{it} = \mu_i + \lambda_t + v_{it} \tag{7}$$

$$c1_{i+} = \frac{d_{i-}}{(d_{i+} + d_{i-})}; 0 \leq c1_{i+} \leq 1; i = 1, 2, \dots, m \tag{8}$$

And here  $\mu_i$  and  $\lambda_t$  are imperceptible effects of individual and time respectively and  $v_{it}$  is residual for error component and in the matrix will be as follows:

$$y = \alpha_{NT} + X\beta + \epsilon \quad i = 1, \dots, N \quad t = 1, \dots, T \tag{9}$$

$$\epsilon = Z_\mu \mu + Z_\lambda \lambda + v \tag{10}$$

To implement for econometric model of panel data EVIEWS7 software is used.

**5.3 Neural Network Algorithm**

The used RBF neural network consist of an input layer (3 neurons), the middle layer (1 to 20 neurons) and output layer (1 neuron).

In Figure 1 the method used to complete the process is shown.

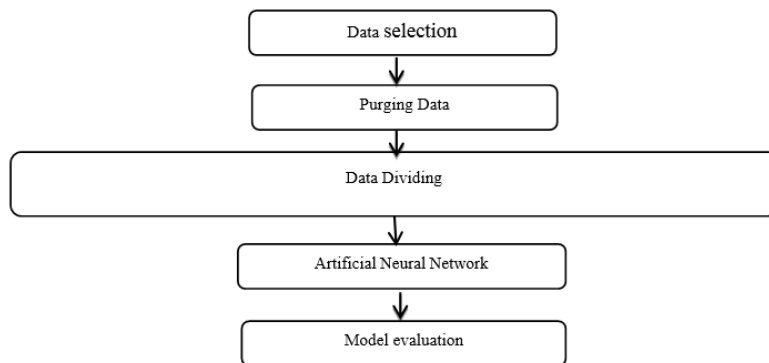

Figure 1: The process of Neural Network

After factor analysis and making appropriate and meaningful patterns the combining variable PC6 (Gross profit margin, Operating profit margin, EPS) were significant as accounting

variables in fundamental analysis using panel data econometric model are not Significant economic variables of hypothesis model.

Table 2: Descriptive statistics

Model	PC6	PS
number	35	35
Mean	1.7607	4896.2857
Median	1.6061	3927
Mode	0.46	1312
S.D	1.01728	3336.8675
variance	1.035	1113468.99

Table 2 shows the descriptive statistics of the variables in the model hypothesis, including: PS (stock price), and PC6 (Gross profit margin, Operating profit margin, EPS). Stock price is dependent variable and other variables are as independent variables. In this table, number represents the observations for each variable, the mean represents the mean of observations for each variable, median reflects the moderate of observations, mode represents the highest frequency of observations for each

variable, the standard deviation represent the deviation of the observation from the mean and variance is squared deviations from the mean of observations. To test for normality, standard error of skewness coefficient and Standard Error of Kurtosis are used. If the values of the indices are smaller than 2 - or greater than 2 +, the normality is rejected (Momeni & Faal Ghaiyoomi, 2012, 33). The results in Table 3 indicate that the variables are normally distributed.

Table 3: Standard error test

Model	PC6	PS
Number	35	35
standard error of skewness coefficient	0.398	0.398
Standard Error of Kurtosis	0.778	0.778

#### 5.4 Linearity

A situation that indicates an independent variables is a linear function of other independent variables. To detect linearity two factors of variance inflation factor and tolerance were used. The minimum amount that can be a get variance inflation is one and this is in the situation that there is no linearity between the independent variables, whatever the value of this factor is greater than one, indicate better linearity between the independent variables. Also, linearity is serious when the amount of variance inflation factor is greater than 10. Regarding the variance

inflation factor values in Table 4, the linearity between the independent variables is very few and the tolerance level is greater than 0.4, which is good (Momeni & Faal Ghaiyoomi, 2012).

Table 4: The linearity between independent variables

Model	tolerance	Variance inflation factor
Independent variable	0.954	1.048

Table 5 represents the mean residual is zero, which is underpinned by assumptions of regression.

Table 5: Statistical indexes in relation to the anticipated residual values

	Number of observation	S.D	mean	Max	min
Predicted Value	35	5814.5500	5603.6286	26762.8613	873.7574
Residual	35	2616.1055	0.00000	4748.56934	-8309.8623
The Predicted standardized value	35	1.000	0.000	3.639	-1.114
Standardized residual	35	0.955	0.000	1.733	-3.033

After considering the assumptions on the regression and preparing variables to build a model for selecting between integrated model and fixed effects model, the Chow test and for selecting fixed effects or random in panel data model Hausman test is used. This test has an asymptotic chi-square distribution

and degrees of freedom is equal to the number of explanatory variables (regression). According to the probability column in Table 6, the results of Chow test indicates panel data model is used. Hausman test is provided for selecting between random and fixed effects.

Table 6: Test F Chow

Hypothesis	Distribution	statistic	Degree of freedom	the probability
	F	16.1505	(4.30)	0.0024
	Chi-square	13.4579	4	0.0002

Table 7: Hausman test

Hypothesis	Statistic	Degree of freedom	the probability	the result
	0.000	3	1.000	Random effects

According to the column of Table 7, the probability is more than 0.5, so random effects model is accepted. According to results,

the stock price modeling by considering panel data model with fixed effects is summarized in Table 8.

Table 8: stock price modeling

Variable	The estimated coefficient	statistic t	probability
C	2535.794	4.2810	0.0002
PC6	222.3338	11.3963	0.0000
$R^2 = 0.730455$			
$\bar{R}^2 = 0.722287$			
$F = 0.000$			

As you see in above table, Note that the column probability is less than 5% for all variables, so all variables are significant and the model is suitable. The coefficient of determination represents the number of 0.7304, which represents the power produced to justify the model, it means the dependent variable is explained

by the independent variables by 73%; 73% change in the stock price depends on selected variables in the model. Also the calculated probability of F-statistic is less than 5%, so the model is valid. so the selected model for predicting is valid.

Price Stock=2535.794+222.3338\*PC6+ε

Table 9: Comparison of the models accuracy

model	Neural Network RBF	The type of error		
		RMSE	MAE	MAPE
	Neural Network RBF	1096.954	555.987	13.739
	econometric model of Panel data	1748.319	1327.093	52.436

After construction the appropriate model to predict stock prices, according to the prediction error criteria the research hypothesis were examined. As can be observed in Table 9, the criteria of RBF neural network is less than the econometric model. Therefore, the research hypothesis (higher RBF neural network accuracy in comparison to econometric model in forecast stock price in the Petroleum products industry) is confirmed.

## 6 Conclusion

Prices stock prediction in the exchanges can be considered one of the most important issues that facing by stakeholders. In this paper the stock price of Petroleum products industry were predicted using fundamental analysis and econometric model for panel data and artificial neural network RBF. Considering that fundamental analysis requires large volumes of information and time to learn all the basic elements, and often is costly and time consuming for split investors, thus, the econometric model for panel data and artificial neural network RBF were used to increase effectiveness, reduce costs in fundamental analysis methods. In the literature related to fundamental analysis the use of econometric models for panel data have been neglected to predict stock prices. The variables in selected models include, PC6 (gross profit margin, operating profit margin, EPS) were significant and determination of coefficient in model represents the power of a good justification of the model; also, the results of prediction in both models indicate a higher accuracy of (RBF) neural network into econometric model which is consistent with previous studies in the field of neural networks. Finally according to results, the selected model is proposed to help investment decisions.

**Abstract.** Investors and financial analysts, regarded profit as one of the main criteria evaluating companies and tend to measure their company's future profitability to hold or sell their shares to make decisions; therefore profits expected, to judge the condition of a company. Considering that accurate predictions and timely, improve decision making by users of accounting reports. The aim of this study was to investigate the relationship between qualities predicts management of earnings and quality of earnings in the company has listed on the Tehran Stock Exchange. 164 companies over the 2010-2014, including the companies listed on the Tehran Stock Exchange have been tested. The findings suggest that there is a significant correlation between the management of earnings prediction accuracy and quality of earnings.

**Keywords:** accuracy profit forecast, profit forecast accuracy, earnings quality

## 1 Introduction

In today's world, accounting information systems play very effective role in the turnover of business activity. The majority of accounting information has reflected in financial reports. On the other hand, it has known as the center of the financial reports, essential financial statements. Financial Statements are of all the activities and events relating to a financial period (Harasani, 2010). Among the basic financial statements, profit and loss statements for containing index measure of economic activity, means profit, the focus of the whole range of such portfolios analysts, corporate executives and investors in the world. It is clear that profit status and importance are as an important item in the financial statements. However, focusing on the benefits and features it provides an incentive to manipulate and make a profit. Despite the phenomenon of profit management, which spread over the years but the protests were less and less confront, the concept of "quality of earnings" appeared. Since then it used in the spotlight users of financial information to have better understand the situation of the company and financial decisions. It is also important prediction is that the fundamental element and key decision makers within the organization and outside the organization. Accordingly, the efficiency and effectiveness of each decision depends on the results of events. Thus, effective and efficient decision made based on predictions that its basis is correct. One of these predictions is Prediction profit that should provide logical information, reliable, and should be understandable, and relevant. Time and accurate predictions improved decision making by users of accounting reports.

### 1.1 Statement of the problem

Assessment of opportunities and risks in business activity and task management supervision involves understanding the nature of business activity, including the potential profitability of profit. Overall, the appeal of studying the current state of a company, the company depends on its potential to generate future income. Now the company is profitable and profitability will continue in the future, it is more attractive than to the company soon reduced the potential profits. In general, it argued that the most important criterion for selecting companies for investment decision making of investors, current and future profitability of the companies; So that investors in different investment strategies, mainly due to elect corporate profits (Naderi, 2006). Investors and financial analysts, profit considered as one of the main criteria and evaluating companies tend to measure future profitability of the company to hold or sell their shares decisions; thus, the profits expected, to judge the condition of a company. Forecasts

earnings per share in investments are of great importance (Mashayekh, 2007). Such information is important as the accounting income and its components when the people take decisions. Calculate the firm's net income affected by the practices and accounting estimates, therefore, there is a possibility of earnings manipulation by management. Accounting profit calculated and organized based on accrual numbers. According to the accrual approaches, the revenue and costs can report the profit. Since the accrual basis necessarily identifying income and costs are not base on receiving and paying money forecasts and estimates used in calculating profit. Therefore, it should note that number when deciding how much could be trusted. Managers are interested in maintaining Profit Increase. Because the rewards are often dependent on the firm's profit. The most important group of shareholders who are users of financial statements, their interests are in search profit information. We are investigating to study the relationship between accuracy and predictability of profit management and quality of earnings. The most important focus of this research is on quality management earnings and quality of earnings.

### 1.2 Importance and necessity of research

Investment Development on the one hand attracted people investment and lead them to productive sectors of the economy. On the other hand, according to investors, the investments will directed towards industries that profit is more or less risk that ultimately leads to optimal allocation of resources. Directors' authority to act on the application of the principles and compliance and the use of estimates and forecasts are among the factors that affect earnings quality. On the other hand, for reasons such as may be retained in the company, rewards and other factors, the director intentionally or unintentionally portray the situation of the company desired. So corporate profits are reporting under the principles of quality and competent managers, so in this respect the importance of evaluating earnings quality and will provide. It is very important that visitors can also use the survey results to assess the impact of the predict directors and predict on earnings quality (of the money).

### 1.3 Research purposes

The main objective of this study was to investigate the relationship between the quality of management forecasts of earnings and profits is quality.

Secondary objectives are as follows:

1. The relationship between management earnings forecast validity and quality of earnings.
2. The relationship between management earnings forecast accuracy and quality of earnings.
3. The relationship between management earnings forecast horizon and earnings quality.

### 1.4 Hypotheses

The main hypothesis:

There is a significant relationship between the quality management forecasts of earnings and quality of earnings.

Hypotheses:

1. Is there a significant relationship between the prediction validity of earnings management and earnings quality?
2. Is there a significant relationship between the management earnings forecast accuracy and earnings quality?
3. Is there a significant relationship between the forecast horizon management earnings and earnings quality?

## 2 Literature of review

Damghani (2013) in their study entitled Strategic earnings announcement, the anticipated timing of management with respect to the results of hypotheses testing viewed that in the first

hypothesis, there is a significant inverse relation with the positive news since the announcement of earnings forecasts. Results related to control variables showed a significant correlation between predictions at the time fixed in holidays, and a significant inverse correlation between predictive validity predictions years ago with the announcement of this year's holidays. In relation to the second hypothesis, direct relation between positive news since the announcement of earnings forecasts and stock market existed in working days.

Basiri and Khanmohammadi (2013) in their study to evaluate the sustained growth of profits on stock price reaction to the feature's predictions earnings per share. Their results suggest that the sustained growth of profits on stock price reaction to the predictive characteristics affect earnings per share. In particular, the results showed that the capital market reaction to bad news and forecast earnings per share prediction horizon is different from other companies in companies with sustainable earnings growth.

Darabi and EmamJome (2014) in the study investigate the relationship of ownership structure on the accuracy of their earnings forecasts. The results of tests showed that the first hypothesis (there is a relation between ownership concentration and earnings forecast accuracy) and this hypothesis was confirmed. The second hypothesis (if the ownership of large shareholders are more the greater the accuracy of analyst earnings forecast by) and the third hypothesis (if the ownership of small shareholders' are more, the greater the accuracy of predictions profit-analysis) the second and third hypothesis were rejected.

Choi et al., (2008) showed that while short-term forecasts help investors had better predict short-term profits, these forecasts may help them better predict their future long-term profits. As a result, when the company predicts long-term (whether annual or quarterly), Future earnings response coefficient is higher. In addition, companies offering short-term forecasts predict higher future earnings responsible coefficient than companies without emissions.

Kim and Guiv (2010) assess the quality of their profits and stock returns with macroeconomic variables. They were accruals quality and earnings quality criteria and concluded that the quality of accruals addressing macroeconomic variables change. In fact, firms with low accruals quality, to the shock and macroeconomic developments are particularly vulnerable.

Dhu (2010) investigate the utilization of accruals to predict future earnings paid by management. The results of this study showed that managers generally stable in predicting benefit accruals overestimation addressing. In this study a negative relationship between forecasting errors and accruals managers of companies that profit forecast to a range (i.e., bases his prediction is between two numbers) would presented to; But this overestimation does not exist for companies that provide forecasts in the form of a certain sum.

Lee et al., (2011) showed that earnings management in stressed bankrupt companies with the lowest earnings quality was more

opportunistically, While non-stressed non-bankrupt companies with the highest quality profit and stressed non-bankrupt companies with low earnings quality, earnings management more efficient and tend (more work for non-stressed non-bankrupt companies). The results also showed that in predicting future profitability profit is better than the quality of earnings management.

Tattoo (2012), the study examines the relationship between the quality of financial reporting and payment information asymmetry. The results indicate that the increase in earnings quality and financial reporting quality leads to high clarity information environment and reduce information asymmetry associated with the company's shares in the market.

#### The population, sample and sampling

The study population included 670 companies listed in Tehran Stock Exchange during the years 1389 to 1393 the following sampling, screening and impose restrictions have been selected. First, we started with the first restrictions so that companies were examples of companies that should accept prior to 1388 in exchange; then, these firms should not be financial institutions and banks. So companies other than financial institutions excluded from these companies; then the companies should not loss money.

### 3 Method of research

The method used in this research is correlation method. Because there is a relationship between the variable of interest and then we also used two methods of descriptive and inferential statistics. Descriptive statistics with reference to the financial data collected and summarized information is then used inferential statistics for hypothesis research.

#### The method of collecting and analyzing data

The required data collected in the following ways:

Library method: This method employed for data gathering in the field of literature. Therefore, by studying books, articles, thesis and search the Internet sites, the required information was collected.

The collection of required data to test the hypothesis using the new software and websites outcomes of research has done.

Enter data arranged in Excel in the Eviews software, and then descriptive and inferential statistics related to research variables obtained. If our data is not normal, normalization methods used to normalize the data. Inferential statistics can include the mean, variance, standard deviation, coefficient of skewness, kurtosis coefficient, the number of observations, etc. and inferential statistics including significant tests of the model, the significance of individual regression coefficients, correlation and test research hypotheses.

Table (1): how to calculate the variables related to quality management earnings predictions

Variable names	How to calculate variables
The validity of management forecasts	Differences between actual EPS forecast
Accurately predict Management	$y_p$ :The first year earnings forecast x $y = \frac{y_p - y_o}{y_p} \times 100$ $y_o$ :The real benefits of X according to financial statements
Management forecast horizon	The time interval for predicted earnings per share offered by companies to the financial statements defined in days.

**4 Results of testing hypotheses**

**4.1 Main hypothesis testing and results**

The main hypothesis:

Regression models used to prove the original hypothesis would be as follows:

$$ACCR_{it} = \beta_0 + \beta_1 MFQ_{it} + \beta_3 Size + \beta_4 Lev + \beta_5 IO + \beta_6 PRO + \epsilon (1)$$

There is a significant relationship between the quality management forecasts of earnings and quality of earnings.

Table (2) main hypothesis test results

Variable name	Symbol	Coefficient factor	standard deviation	T-statistic	Prob.
Profitability	PRO	0.01	0.00	7.96	0.00
Quality management earnings forecast	MFQ	0.00	0.00	2.03	0.04
Financial Leverage	LEV	0.53	0.07	7.98	0.00
investment opportunities	IO	0.00	0.00	-2.89	0.00
size of the company	FIRM_SIZE	0.00	0.02	0.14	0.89
Fixed amount	C	0.34	0.10	3.54	0.00
F statistic					19.9296
Significance level					0
Durbin-Watson statistic					2.116116
Hausman test					46.28877
Significance level					0
The coefficient of determination					0.79
Adjusted coefficient of determination					0.74
Statistic F (Chow)					7.814187
Significance level					0

F statistic is less than the accepted level of error (5%) and total regression model is significant. To select the type of execution model (fixed effects and random effects) used the Hausman test, since less than 5%, significance level for this test so fixed effects model will be used for regression analysis. Durbin-Watson statistic ranges from 5.1 to 5.2, which indicates there is no correlation between the model errors. Due to the low level of probability (Prob.) and T-statistic of the level of acceptable error for the variable quality of management earnings forecast. So, the test results show that the variable quality of management

forecasts of earnings and quality of earnings was a significant correlation. The results of that study, among other control variables such as variables, Profitability, financial leverage, investment opportunities are significant relationship with the dependent variable earnings quality. The coefficient of determination and adjusted coefficient of determination shows the model variables explained 74 percent of dependent variable.

The main hypothesis remains regression

Figure (1) histogram distribution

**4.2 The first sub-hypothesis test and its results**

$$ACCR_{it} = \beta_0 + \beta_1 MFA_{it} + \beta_3 Size + \beta_4 Lev + \beta_5 IO + \beta_6 PRO + \epsilon (2)$$

Hypothesis 1)

There is a significant relationship between the earnings quality and the accuracy of management earnings forecasts.

Regression models used to prove the first hypothesis would be as follows:

Table (3) first sub-hypothesis test result

Variable name	Symbol	Coefficient factor	standard deviation	T-statistic	Prob.
Fixed amount	C	-1.10	0.28	-3.86	0.00
Profitability	PRO	0.01	0.00	5.47	0.00
Financial Leverage	LEV	0.21	0.10	2.17	0.03
investment opportunities	IO	0.00	0.00	0.95	0.34
size of the company	FIRM-SIZE	0.28	0.05	5.77	0.00
The accuracy of management forecasts	MFA	0.00	0.00	1.22	0.22
F statistic					9.025228
Significance level					0
Durbin-Watson statistic					2.119974
Hausman test					49.478157
Significance level					0
The coefficient of determination					0.699618
Adjusted coefficient of determination					0.6221
Statistic F (Chow)					19.679775
Significance level					0

F Limer statistical significance (Chow) is less than acceptable error, panel for panel data regressions model selected.F statistic is less than the accepted level of error (5%) and total regression model is significant.To select the type of execution model (fixed effects and random effects) used the Hausman test, since less than 5%, significance level for this test so fixed effects model will used for regression analysis.Durbin-Watson statistic ranges from 5/1 to 5/2, which indicates there is no correlation between the model errors.Due to the high level of probability, (Prob.) T-

statistic of the level of acceptable error for the variable prediction accuracy of the test results show that, there is not profit between the prediction accuracy of management and quality management. The results of that study, the control variables, firm size, financial leverage and profitability are correlated with the dependent variable.

Figure (2) remains the distribution histogram of regression hypothesis

4.3 The second sub-hypothesis test and its results

Hypothesis 2)

There is a significant relationship between earnings quality and management earnings forecast accuracy.

Regression models used to prove the original hypothesis would be as follows:

$$ACCR_{it} = \beta_0 + \beta_1 MFE_{it} + \beta_3 Size + \beta_4 Lev + \beta_5 IO + \beta_6 PRO + \epsilon \quad (3)$$

Table (4) second sub-hypothesis test results

Variable name	Symbol	Coefficient factor	standard deviation	T-statistic	Prob.
profitability	PRO	0.01	0.00	8.46	0.00
Financial leverage	LEV	0.54	0.07	8.14	0.00

existence Research	The effect of quality management earnings forecast on earnings quality	There is a significant positive relationship between the quality management forecasts of earnings and quality of earnings.

**4.6 The first sub-hypothesis test results and similar Research results**

First hypothesis: there is a significant relationship between the earnings quality and the validity of management earnings forecasts.

Table (7): results of the first sub-hypothesis and similar studies

Researcher name, year	research title	Research results
Akbari (2008)	The variables affecting the reliability of earnings forecast by management	The results show the relationship between forecast accuracy benefit in the prior period and the size of the company's profit forecast reliability by management approved.
Kato and others (2009)	Study of optional profit forecast by management of companies listed on the exchange in Japan	The results showed that, often the first prediction was actually more profit but forecast earnings during the year, adjusted and reduced. In addition, the average time and information to predicted, But companies with weak earnings forecast and managers with optimistic and weak forecasts have low information load and have low reliability.
Resent research	The effect on earnings quality management earnings forecast accuracy	The accuracy of management earnings forecast and there is no significant relationship between earnings quality.

**4.7 The second sub-hypothesis test results and similar Research results**

The second sub-hypothesis: there is a significant relationship between earnings quality and management earnings forecast accuracy.

Table (8): results of the second hypothesis and similar studies

Researcher name, year	research title	Research results
Namazi (2007)	To investigate the factors affecting the accuracy of management earnings forecast Companies listed on Tehran Stock Exchange	It Showed that there is a relationship between earnings growth, sales growth, asset growth, profit forecasts in the past, financial leverage, stock prices and profit forecast accuracy; But there is no relationship between the dividends paid and the size of company profit forecast accuracy. The results of multiple regression model showed that there is a relationship between financial leverage to accurately predict revenue growth and profit.
Mknvmy (2009)	Biased investigation and the accuracy of forecasting earnings forecast based on the provisions dealing with the Canadian Co-management	The results show that the forecast handled significantly positive bias (well realistic) than other surveyed had forecast. But about the accuracy of prediction, were not significant
Resent research	The effect on earnings quality management earnings forecast accuracy	There is a significant positive relationship between earnings quality and management earnings forecast accuracy.

#### 4.8 The third sub-hypothesis test results and similar Research results

The third sub-hypothesis: there is a significant relationship between management earnings forecast horizon and earnings quality.

Table (9): results of the third sub-hypothesis and similar studies

Researcher name, year	research title	Research results
Ravi Lonkani, Firth Michael (2005)	Factors Affecting the earnings forecast error on a company-by newcomer Thailand Stock Exchange	They variables are size, age, income dispersion coefficient and the time horizon is earnings forecast. The results showed that there is a positive relationship among variables such as firm size and time horizon predictions error of prediction profit profitable.
Resent research	Horizon predict effect on earnings quality management earnings	There is no significant relationship between management earnings forecast horizon and earnings quality.

## 5 Conclusion

The results of the original research hypothesis suggest that there is a direct relationship between the quality management forecasts of earnings and quality of earnings. Therefore, investors in investment companies invest the quality of management forecasts and profits that are higher; this indicates that the share of cash these companies are higher. so, the more accurately predict higher management earnings, higher earnings quality themselves. Therefore, in calculating the predictive accuracy of management earnings expected to and actual earnings for-money has agreed. So companies that accurately predict of profits are high, Profit expected to is not much different from actually happened profit. Therefore, these companies the right place for investment and risk-free.

<sup>b</sup>EshaghRasouli12@gmail.com

**Abstract.** The current research seeks to examine the effect of career path anchors and career plateau on employee's performance in technical and vocational training centers of Ardabil Province. The research is applied in terms of objective, and it is a descriptive-correlative one in terms of methodology. The research population is comprised of all employees in the technical and vocational training centers in Ardabil city, which the size of population is equal to 330. Morgan table was used to determine the sample size, and based on the table; the sample size was calculated to be 177. Results suggest that the dimensions of career plateau (structural and content plateau) has a significant negative impact on employee's performance and dimensions of the career path anchors have significant direct impacts on employee performance.

**Keywords:** Career Path Anchors, Career Plateau, Performance, Technical and Vocational training centers

### 1 Introduction

Various perspectives have been presented on the performance. Employee's performance is a set of behaviors shown by individuals associated with the job, or it is the product or efficiency which by virtue of employment in the profession (including services, education, and manufacturing) can be obtained. Job performance is individual efficiency in terms of the duties prescribed by law, and it is the impact of human activities on the task that is assigned to him, and it expresses the amount of effort and success shown by an employee in carrying out job duties and behavioral assignments. In addition, job performance is the nature and method of carrying out the duties and responsibilities assigned by the expert (Rahnavard, 2008).

Performance means state or quality, function, and the process to explain effectiveness and efficiency of past actions. According to this definition, performance can be divided into two components: 1- The efficiency that describes organization's method to use the resources in the production of products or services, i.e. the relationship between real and ideal combination of inputs for producing specified outputs; 2-Effectiveness that describes the extent of achievement of organizational goals (Memarzade et al., 2008).

Employee's performance is affected by many variables that can reduce or increase performance. One of these factors is career plateau. Career plateau is a trap ahead of organization employees, and 99% of employee may suffer from this problem in their working history. According to Bardvik (1986), most of people become skilled within three years, and then the work becomes steady and monotonous, and there is not anything new to learn. In this case, the person feels helpless and knows its work valueless and unpleasant than the past.

The individual may face the attitudes and behaviors that could not work and his physical and mental health also falters. A career plateau is a point in one's career where the likelihood of progression is reduced. You may feel you have hit a plateau for a wide variety of reasons, such as reaching the highest possible level in your company; feeling restricted in your role; or no longer feeling challenged or engaged by your work. According to Gines and Germier, limited opportunities for promotion and the presence of strict rules and regulations cause a person to feel that he is caught in an unfair system, then the person feels negative thoughts about its job. Reinforce negative chronic conditions, sense of lack of progress in the life and career,

ensorious behaviors, frustration, indifference and negligence are among the signs of job burnout (Saatchi, 2007).

Today's staff more than ever people think and worry about their careers, and they demand secure, long-term and satisfying job, and want to grow in their jobs. On the other hand, employees often start their careers with hope and specific expectations to reach the highest level in the organization, and most of them attach significance to progress, power, highest responsibilities and rewards, but unfortunately the staff before achieving their goals suffer from career plateau (Michael and Wills, 2004).

The concept of career path as the link between the organizations and the people who work for them is examined from both interior and exterior aspects. Exterior career path includes positions and situations by which one can progress, and it defined in the form of organizational criteria of career path. However, interior career path is workers' tendency toward career orientation or career anchor (Arizi Samani et al., 2009). Career anchor was first coined by Edgar Schein. This term means employees' self-conception and is comprised of three main categories: 1) The talents and abilities to perceive ourselves 2) fundamental and important values, and 3) the evolved feeling about the motives and demands that are relevant to career path. According to the logic underlying career anchors, the consistency between job tendencies and working environment leads to job satisfaction, further commitment, and increased performance, otherwise, the result would be dissatisfaction and change of job. Career anchors are conscious attempts made by an individual to be informed of its skills, tendencies, values, opportunities, limitations, choices, and achievements, and also it is capability to recognize the objectives relevant to career and assign a program to achieve such objectives (Bermlı, 2004). The researcher's aim to perform this research was to assist managers in technical and vocational training centers to use the results obtained from the current research to improve organizational goals and ways to assist organizations to enhance employee performance to be able to specify the fact whether is there any consistency between career tendency and suitable work environment. The overall goal underlying the current research is to find an answer to the question that: what would be the impact of career path anchors and career plateau on the performance of the staff in the technical and vocational training centers in Ardabil Province?

### 2 Research Methodology

**A- Methodology:** the research statistical is comprised of all employees in technical and vocational training centers in Ardabil, which their number amounts to 330.

**B- Statistical population:** the research statistical population is comprised of all employees in technical and vocational training centers in Ardabil, which their number amounts to 330.

**C- Sample size and sampling:** the sampling method was a simple random one. Morgan table was used to determine the sample size, and based on the table, the sample size was calculated to be 177.

**D) Data collection and measurement tools:** data collection was done based a field-based procedure and a questionnaire.

**Career path anchors:** this concept is defined in the form of the following dimensions and indicators (Shine, 2006).

**Career plateau:** it has two basic dimensions including structural plateau and content plateau, which are measured using Taleghani Plateau Questionnaire (2010), and is comprised of 20 items.

**Performance:** employee’s performance can be analyzed in three parts including 1-Anti-role performance (counterproductive), 2- role performance (task-based), 3-Eextra-role performance (organizational civic behavior) as follows.

1- Anti-role performance (counterproductive) is a score related to Bent and Robinson counterproductive Checklist, quoted from Bukhari et al. (2009), and has one dimension to evaluate behaviors, and 11 items and is measured based on a distance-oriented scale.

2- Role performance (task-based) is a score related to Williams & Anderson’s Questionnaire (2004), and has one dimension, and is measured based on Likert scale.

3-Eextra-role performance (organizational civic behavior) based on Netemeyer at al.’s Questionnaire (1997) is measured in terms of the four dimensions including sportsmanship, civic behavior, conscienceless, and altruism.

**E) Validity and reliability:** validity is ability to measure the relevant characteristics and attributes using measurement. To determine content validity, the questionnaire was distributed among the professors and experts practicing in the area of management and behavioral sciences, and they were asked to present their opinions on the questionnaire’s validity. In the current research, the questionnaire’s reliability for the dependent variable and each of the independent variables was calculated using Cronbach’a alpha, and alpha for all of them was higher than 0.77.

**F) Data analysis method:** in this research, to extract information and their analysis, the SPSS was used.

**3 Findings**

Table 1: A summary of the correlation regression model between career path anchors and employee’s performance

Correlation Coefficient	Coefficient of Determination	Adjusted Coefficient of Determination
0.683 <sup>a</sup>	0.557	0.631

Based on the results obtained from Table 1, the correlation coefficient between career path anchors and employee’s performance is 0.68, and the coefficient of determination is 0.55

Table 2: The results obtained from regression analysis model between career path anchors and employee’s performance

Components	Non-Standard Coefficients		Beta Standard Coefficient	t	Sig.
	B	Standard Deviation			
Constant Value	2.645	0.309		8.558	0.000
Career Path Anchors	0.208	0.189	0.683	11.098	0.000

To determine the impact of the variable namely career path anchors as the predictor variable and the variable namely employee’s performance as standard variable, these variables were analyzed using multi-variable regression analysis in an

inclusion manner. As it can be seen in Table 2, the value of observed p is significant, and the results indicate that its beta is 0.68.

Table 3: A summary of the correlation regression model between career plateau and employee’s performance

Correlation Coefficient	Coefficient of Determination	Adjusted Coefficient of Determination
-0.793 <sup>a</sup>	0.629	0.627

Based on the results obtained from Table 3, the correlation coefficient between career plateau and employee’s performance is -0.79, and the coefficient of determination is 0.62.

Table 4: A summary of the results obtained from regression analysis model between career plateau and employee’s performance

Components	Non-Standard Coefficients		Beta Standard Coefficient	t	Sig.
	B	Standard Deviation			
Constant Value	-0.247	0.150		-11.647	0.001
Career plateau	-0.885	0.051	-0.793	-17.240	0.000

To determine the impact of the variable namely career plateau as the predictor variable and the variable namely employee’s performance as standard variable, these variables were analyzed

using multi-variable regression analysis. As it can be seen in Table 4, the value of observed p is significant, and the results indicate that its beta is -0.79.

Table 5: A summary of the correlation regression model between career path anchors and career plateau

Correlation Coefficient	Coefficient of Determination	Adjusted Coefficient of Determination
-0.593 <sup>a</sup>	0.559	0.633

Based on the results obtained from Table 5, the correlation coefficient between career path anchors and employee's

performance is -0.59, and the coefficient of determination is 0.55.

Table 6: A summary of the results obtained from the regression analysis between career path anchors and career plateau

Components	Non-Standard Coefficients		Beta Standard Coefficient	t	Sig.
	B	Standard Deviation			
Constant Value	3.226	0.277		11.656	0.000
Career path anchors	-0.509	0.869	-0.593	-11.233	0.000

To determine the impact of the variable namely career path anchors as the predictor variable and the variable namely career plateau as standard variable, these variables were analyzed using

multi-variable regression analysis. As it can be seen in Table 6, the value of observed p is significant, and the results indicate that its beta is -0.59.

Table 7: The results obtained from Pearson Correlation Coefficient to determine the relationship between career path anchors and employee's performance

Dimension of Career Path Anchors	Statistics	Staff Performance
Technical-Functional Merit	r	0.546**
	sig	0.000
Management Competency	r	0.258**
	sig	0.000
Security and Stability	r	0.291**
	sig	0.000
Entrepreneurial Creativity	r	0.111
	sig	0.142
Independence and Autonomy	r	0.405**
	sig	0.000
Dedication and sacrifice	r	0.129
	sig	0.088
Mere Challenges	r	0.273**
	sig	0.000
Lifestyle	r	0.304**
	sig	0.000
Career Path Anchors	r	0.383**
	sig	0.000

\*The test's significance at the level 0.05, \*\* The test's significance at the level 0.01

Based on the results obtained from Table 7, the significance level of the test error for confidence level is less than 0.99, and less than 0.01. Thus, it can be said that, other than the variables namely entrepreneurial creativity and sacrifice and dedication, other hypotheses are confirmed, and the correlation coefficient

between employee's performance and technical-functional competency is 0.54, management competency is 0.25, security and stability is 0.29, independence and autonomy is 0.40, mere challenges is 0.27, lifestyle is 0.30, and career path anchors is 0.38.

Table 8: The results obtained from Pearson Correlation Coefficient to determine the correlation between career path anchors and employee's performance

Variables	Statistics	Employee's performance
Structural Plateau	r	-0.713**
	sig	0.000
Content Plateau	r	-0.734**
	sig	0.000
Career Plateau	r	-0.793**
	sig	0.000

\*The test's significance at the level 0.05  
 \*\* The test's significance at the level 0.01

Based on the results obtained from Table 8, as the significance level of the test error for confidence level 0.99 is less than 0.01, thus, it can be said that, the ninth and tenth hypotheses and also the second hypotheses are confirmed, and there is a direct and

significant correlation between the dimensions of career plateau and staff performance. The correlation coefficient between employee's performance and structural plateau is -0.71, content plateau is -0.73, and career plateau is -0.79.

Table 9: A summary of the regression model of career path anchors in staff performance

Correlation Coefficient	Coefficient of Determination	Adjusted Coefficient of Determination
0.665 <sup>a</sup>	0.443	0.416

Based on the results obtained from Table 9, the correlation coefficient between career path anchors and employee's

performance is 0.66, and the coefficient of determination is 0.44.

Table 10: The results obtained from the regression analysis between the dimensions of career path anchors and employee's performance

Components	Non-Standard Coefficients		Beta Standard Coefficient	t	Sig
	B	SD			
Constant Value	3.340	0.359		9.293	0.000
Technical-Functional Merit	0.076	0.131	0.060	0.578	0.564
Management Competency	0.210	0.102	0.197	2.067	0.040
Security and Stability	0.323	0.104	0.229	3.111	0.002
Entrepreneurial Creativity	0.132	0.096	0.143	1.368	0.173
Independence and Autonomy	0.145	0.143	0.100	1.013	0.312
Dedication and sacrifice	0.158	0.085	0.248	1.860	0.005
Mere Challenges	0.498	0.161	0.366	3.088	0.002
Lifestyle	0.547	0.081	0.484	6.716	0.000

To determine the impact of the variables including technical-functional competency, management competency, security and stability, entrepreneurial creativity, independence and autonomy, dedication and sacrifice, mere challenges and lifestyle as predictor variables and the variable namely staff performance, multi-variable regression analysis was applied. As can be seen in Table 10, the value of p observed in all variables other than

technical-functional competency, entrepreneurial creativity, and independence and autonomy is significant, and the results indicate that the variables management competency (BETA=0.19), security and stability (BETA=0.22) dedication and sacrifice (BETA=0.24), mere challenges (BETA=0.36), and lifestyle (BETA=0.48) can predict the variable namely staff performance.

Table 11: A summary of the regression model between career plateau and staff performance

Correlation Coefficient	Coefficient of Determination	Adjusted Coefficient of Determination
-0.794 <sup>a</sup>	0.631	0.626

Based on the results obtained from Table 11, the correlation coefficient between career path anchors and employee's

performance is -0.79, and the coefficient of determination is 0.63.

Table 12: The results obtained from the regression analysis between career plateau and staff performance

Components	Non-Standard Coefficients		Beta Standard Coefficient	t	Sig.
	B	Standard Deviation			
Constant Value	-0.260	0.151		-1.716	0.088
Structural Plateau	-0.401	0.061	-0.404	-6.558	0.000
Content Plateau	-0.487	0.064	-0.466	-7.575	0.000

To determine the impact of the variables including structural and content plateau as predictor variables, and the variable namely employee's performance as standard variable, multi-variable regression analysis was applied. As can be seen in Table 12, the value of p observed at both variable is significant, and the results indicate that the variables structural plateau (BETA=-0.40), content plateau (BETA=-0.46), can predict staff performance, and content plateau (BETA=-0.46) can predict staff performance, and structural plateau with the BETA -0.40 is at its minimum level.

#### 4 Discussion and conclusion

One of the organizational challenges in the area of careers is the lack of appropriate insight in relation to capabilities and incentives that can actualize potential professional success. In fact, people do not have a good understanding of their career anchors. Lack of attention to career anchors by managers leads to forced labor in the organization, i.e. managers recruit manpower without considering their skill, interests and motivations, and this creates a gap between individual and organizational goals, and the employees may show reluctance to their jobs. Under this condition, employees may have not proper performance in their job, and they may be indifference to success in their career and this can lead to career plateau. As we know, human resources are one of the most valuable assets of any organization, because other factors such as technology, capital, etc. are related to human resources. Despite modern

technological advances, there is no factor that can replace human power, and human is still a key factor within the framework of organizations, and management should identify this capital and nurture its hidden potential and utilize it to progress the organization for the effective achievement of goals. However, if such asset suffers from career plateau, it loses its performance and efficacy, and organization may encounter unexpected negative results in the future. Based on the results obtained, career path anchors including functional-technical merit, management competency, security and stability, entrepreneurial creativity, independence and autonomy, dedication and sacrifice, mere challenges, and lifestyle and the dimensions of career plateau (including structural plateau and content plateau) can significantly influence the performance of the staff in the technical and vocational training centers in Ardabil city. Based on these results, the following recommendations are presented:

1- Managers of the technical and vocational training centers in Ardabil are recommended to elect the managers who benefit from management anchor, are more willful and enthusiastic to accept the liabilities assigned for accomplishing relevant tasks, behave the issues in an effective and analytic manner and seek to find an opportunity to use their management capabilities.

2- Managers of the technical and vocational training centers in Ardabil city are suggested to provide a fertile context in which the employees can have more freedom, thus to nurture their creativity.

3- Another recommendation is to hold cultural seminars and development of ethical components such as truth, honesty, trustworthiness, and respect.

**Abstract.** This research aims to investigate influence of Emotional Quotient (EQ) on decision-makings of individual investors active in Tehran Stock Exchange. In this study, according to nature of subject of the research, the survey method was used. Statistical population of the study includes individual investors of Tehran Stock Exchange and sample was chosen 360 people active in the Exchange. In this study, Bar-On Emotional Quotient Questionnaire and Tony Brid's Questionnaire of Investors' Decision-making Indexes were used. Results indicated that emotional quotient has a positive influence on decision-making of individual investors.

**Keywords:** emotional quotient, decision-making of investors, Tehran Stock Exchange

### 1 Introduction

Perhaps all of dealers in Tehran Exchange have observed sentimental behaviors and mental excitements of stock market over and over and even they have made many mistakes in investment by following mental environment. The interesting point is that investors mostly repeat these mistakes and seek their reasons while they neglect that praxeology or in other words psychology of stock market is considered as an expertise for which now in valid universities all over the world district subjects and schedules are considered in financial majors. In fact, all over the world and of course in two recent years in Iran, in stock market psychology has been overarched as an auxiliary tool along with scientific (substantial and technical) analysis for decision-making of investors so that many investors and active persons in Iranian Stock Market tend to learn psychology along with learning techniques such as substantial and technical analyses (Baghbani, 2011).

According to modern investors theory, dealers and generally active people in stock markets take their decisions based on rationality and this assumption leads that all information related to innate value of securities reflects in their price through 'invisible hand of market' (Roshangar and Ahmadi, 2011).

In other words, according to this perspective, prices of stock reflect all information related to future cash flows of each share. This perspective is called 'market efficiency' which based on it attempt to earn efficiency is useless through technical and substantial analyses (Shahbazi et al, 2013).

On the contrary of rationality assumption, financial praxeology believes that men are influenced by a wide range of emotions and mental forces while making a decision which can effect on their rationality. Therefore, influenced by these factors, price of properties can take some distance from their innate value. Researchers have tried to identify and analyze common behavioral patterns among active people in financial markets (Baghbani, 2011).

Behavioral financial decisions are for considering cognitive and sentimental components which influence on the process of an individual's decision-making and expand over the assumption of rational thoughts while considering different conditions or decisions. In the discussion related to behavioral financial decisions, as mentioned emotional effects play role in investing decisions.

After investing previous researches, to present evidences from this natural relation, Cemdoll and Montgomery (1997) stated that sentiments act as an integral component through all the process of decision-making. These include factors before decision-

making and also factors after it. Therefore, mistake in decision-making may be resulted from cognitive mistake and or emotional effects or both of them. This indicates that goodness of emotions of an investor can influence on his/her decision-making.

Slovick (2010) stated that most of aspects of analysis of investment are naturally mental. It is clear that assessing men's abilities to incorporate information in judgment or decision-making is one of such aspects. Ecrloof about importance of psychological elements in economy believes that feeling and supposition of an individual from himself affects on consequences of economy (Ecrloof and Conton, 2000).

One of the most important cognitive factors influencing on a person's decision-making is emotional quotient (EQ) (Cemdoll and Montgomery, 1997).

Emotional Quotient refers to some abilities, for example, a person can keep his stimulus and tolerate against diversities, control his impulses and postpone success, align his mental states and does not allow disturbance blemish his thought (Mirdrikvandi, 2011).

Therefore, related to investing hypothesis based on value in stock market, those who have learned their psychological lessons well and activate based on this principle, know negative and unflavored positions of market as golden opportunities and not scary threads for themselves and use them best. Therefore, this study aims to investigate influence of emotional quotient on decision-making of individual investors active in Tehran Stock Exchange in order to identify and investigate existing scientific and practical vacuums.

### 2 Practical background of the research

#### 2.1 Domestic background

In a research by Ahadi and his colleagues (2009) investigated the relationship between emotional quotient, document style and self-efficiency with satisfaction from life of employed women and concluded that there is a medianingful positive relationship between emotional quotient and self-efficiency with satisfaction from life. Also, they indicated that self-efficiency has the ability to predicate satisfaction from life.

- According to Keramati et al. (2009), in the investigation to find the relationship between emotional quotient and strategies of managers' conflict management, there is a positive and significant correlation between emotional quotient and resolvism strategy. Among experienced managers there was a negative and medianingful relationship between emotional quotient and strategy of control and lack of opposition. In addition, there is a medianingful difference between emotional quotient and kind of the strategies used by male and female managers.

Khusrasgani (2005) in this research has investigated dominant styles of investors in Tehran Stock Market. Results show that decisions of investing are not only influenced by economic and rationality indexes, but also by components such as investing horizon and amount of risk tolerance and such components have significant effects on behavior of decisions of investors.

Shahrabadi (2007) has introduced behavioral and financial domain and has posed its use in Stock Exchange. Results indicate that behavioral financial and what is discussed in psychology introduce men's behavior better and says men are influenced by behavioral biases although he is very reasonable. These biases cause limit cognition or biased cognition of fact and as a result leads to unreasonable reactions.

Nikumaram and Saeedi (2008) investigated possibility of predicting efficiency through this index based on index of emotions of stock market. Results indicated that possibility of predicting efficiency is verified via this index. In this study, using regression, the relationship between cash efficiency index and price of Tehran Stock Exchange and index of investigating behavior of investors was tested. Also, in this study, using Grenger's causality test, this result was verified that sentimental index is cause of changes in total efficiency of Tehran Stock Exchange and in other words, ability of explanatory of efficiency changes by emotions index (index of behavioral reaction of stock market) was verified.

## 2.2 Foreign background

According to Lahm and Cerby (2002), emotional quotient, modification of feelings and emotional understanding influence on functional effectiveness of an individual even more than what one can obtain only by 'General Quotient'. The authors have described general quotient as an individual's ability to obtain initial knowledge and use it in new positions. In relation to emotional quotient, Lahm and Cerby considered three adjective of sentimental argument based on Maier and Saloy's explanation about emotional quotient. The first investigated adjective which was focus on understanding feelings and the second emotional adjective was an individual's ability to understand conditions and emotional events and the final adjective proceeds to the way persons modify their feelings while it was verified that general quotient is important in mental activities. Also, it was revealed that emotional quotient has positive influence on individual's mental function.

Troy Betards (2010) indicated that there is no meaningfulness relationship between indicator biases, mental accounting and risk aversion about general loss with emotional quotient or its components. Also, several verifications were found for indicating biases and mental accounting in item level. In this research, 148 undergraduate students and faculty members participated from two private universities in Central United States. In attempt to identify the relationship between different investment biases and different components of emotional quotient, parametric and non-parametric analyses were used. Also, findings showed that generally women more than men are challenging with indicating bias and in item level. In addition, results indicated that the youngest participants significantly have lower points than their professional counterparts in general emotional quotient and intra-personal components and its adaptability.

Benartsi and Tallor (1991) indicated that many risk-averted people were more possible to take risk if their properties instead of return of annual property would come back to more than a long-term time framework such as 30 years on the average. This kind of judgments of investigator was not static and did not lead to favored results. Mental accounting causes the investigators operate in conservative manners with avoiding every position so that assessing separate position was more than assessing property.

Shefrin (2000) stated that behavior of a person can be different because there is dependency to the fact that how information is presented or interpreted in many cases. This behavior can affect decision-making of investors. Two ambiguous framework

worries which are considered are mental accounting and risk-taking.

Researches performed by Scot Scotplomalov (2000-2001) provided more verification to use emotional quotient in doing cognitive affairs. Investigated persons in researchers' study were identified in three groups of problems to be proceeded to. Problem groups 1 and 3 have three average levels of complexity related to them while the second group was identified as problem group. This study indicates that those who were successful in Group 1 in dealing with average problem issues are those who are higher emotional quotient. Even after dealing with the second group of hard problems, those who have higher emotional quotient have been more effective in facing with final problem group.

## 3 Methodology

Methods to collect data were in library (gathering texts and contents using books, articles, publications, etc.) and field (as interview, observation and questionnaire) manners. To collect information, two main methods are used, first to explain theoretical literature of a research it is tried to collect theoretical bases using library method, and then to study theoretically, data was gathered using data questionnaires required to analyze hypotheses of the research.

Statistical population includes individual investors of Tehran Stock Exchange. Because number of individual investors in Tehran Stock Exchange is not available, it is taken into account as an unlimited society. To determine sample volume, tables of Morgan and Cerjsi were used. Based on these tables, number of samples for an unlimited society was considered 384.

Of course, in practice and due to have more confidence and increase of accuracy, volume of sample was considered 360 people. Data used to this research was collected by two questionnaires: (1) Standard Bar-On Emotional Quotient Questionnaire including 51 questions which has been standardized in Iran by Samui (2006) and its reliability was reported 87%; and (2) Tony Brid's (2010) Questionnaire of investors' Decision-making Indexes.

Validity and reliability of this questionnaire were verified by Jalili and his colleagues (2014) in Iran. It reliability was reported 75%. Analysis method was used in two kinds of descriptive and inferential. In descriptive part, diagram, percentages, median, mean, standard deviation etc. were used and also in inferential part to analyze hypothesis of research, simple linear regression was utilized by spss software.

## 4 Findings

### 4.1 Descriptive statistics

#### 1- Major of investigated people

According to Table (1), from 360 investigated people, 336 persons (93.3%) have answered to this question. Among these 336 people, 72 persons' (21.4%) major was management, 87 persons (25.9%) accounting, 47 persons (14%) economy, 11 persons (33%) technical and 19% persons (5.7%) medicine.

Table 1- Frequency percentage of major of the investigated people

Major	Frequency	Percentage	Correct percentage	Cumulative Percentage
management	72	20	21.4	21.4
accounting	87	24.2	25.9	47.3
economy	47	13.1	14	61.3
technical	111	30.8	33	94.3
medicine	19	5.3	5.7	100
total	336	93.3	100	

Without answer	24	6.7		
Sum total	360	100		

2- Degrees of the investigated people

were undergraduates, 152 persons (42.2%) graduate and 14 persons (3.9%) Ph.d.

According to Table (2), 360 people answered to the questions. From 360 people who were investigated 194 persons (53.9%)

Table 2- Frequency percentage of degrees of the investigated people

Degree	Frequency	Percentage	Correct percentage	Cumulative percentage
undergraduate	194	53.9	53.9	53.9
graduate	152	42.2	42.2	96.1
Ph.d	14	3.9	3.9	100
Total	360	100	100	

3-Experience level of the investigated people

least investment experience, 79 persons (22.4%) had average investment experience and 19 persons (5.4%) had significant investment experience.

According to Table (3), from 360 people 352 persons answered to this question. Among 352 people, 131 persons (37.2%) were without investment experience, 123 persons (34.9%) had the

Table 3- Experience level of the investigated people

Experience level	Frequency	Percentage	Correct percentage	Cumulative percentage
Without investment experience	131	36.4	37.2	37.2
Minimum investment experience	121	34.2	34.9	72.2
Average investment experience	79	21.9	22.4	94.6
Significant investment experience	19	5.3	5.4	100
Total	352	97.8	100	
Without answer	8	2.2		
Sum total	360	100		

4- Descriptive statistics of independent and dependent variables

standard deviation is 25.64. Also, mean of individual decision-making was calculated 26.06, its mean was 26, its index was 28 and its standard deviation was 4.23.

According to Table (4), mean of emotional quotient was calculated 158.98, its median was 163, its index is 156 and its

Table 4- Descriptive statistics of independent and dependent variables

Variables	Mean	Median	Index	Standard deviation	Skewness	The least	The most
emotional quotient	158.9806	163.0000	156	25.64852	-2.077	34	203
Individual decision-making	26.0250	26.0000	28	4.23106	-0.825	11	35

#### 4.2 Inferential statistics of the research:

Investigation of hypothesis of the research:

- Emotional quotient influences on decision-making of individual investors active in Tehran Stock Exchange.

dependent variables. To consider linearity of data and flatness of the model, variability diagram and analysis of regression variance were used. According to Table (5), because meaningfulness level of E test is less than 0.05 and diagram is linear, therefore this condition held true.

To investigate this question of the research, linear regression was used. But using this method has its own conditions. One of its most important conditions is linearity of independent and

Table 5- Analysis of regression variance to investigate flatness and linearity of data about emotional quotient and decision-making of individual investigators

Model	Sum of squares	Degree of freedom	Mean of squares	F	Meaningfulness level
Regression	780.433	1	780.433	49.483	0.000
remained	5646.342	358	15.772		
total	6426.775	359			

Also, based on the results obtained from Table (6), one can predict decision-making of individual investors based on emotional quotient on level 0.000. That is, emotional quotient has positive effect on decision-making of individual

investigators and shows that the higher is the mark of a person in emotional quotient test, the more is the decision-making of individual investors (figure 1).

Table 6 – Results from analyzing regression coefficients to investigate power of prediction of decision-makings of individual investors based on emotional quotient

Model	Non-standard coefficient		Standardized coefficient		
	B	Standard error	$\beta$	T amount	Meaningfulness level
Static coefficient	16.886	1.316		12.832	0.000
Emotional quotient	0.057	0.008	0.348	7.034	0.000

Figure 1- Investigation of linearity of the relationship between decision-makings of individual investors and emotional quotient

## 5 Discussion and conclusion

Results indicated that emotional quotient effects on decision-makings of individual investors positively. Conclusion of this research corresponds with conclusion of Bontmpo's researches (2010) which indicated that there is a meaningful relationship between emotional quotient and bias. Discovering representativeness occurs when an individual decides to abbreviate some information which knows from an especial item. For example, when an investor makes relationship between different cases of investment and existing information, if the relationship is incorrect, decision-maker will be faced with tendentious reactions resulting from a weak relationship and will judge wrongly.

Shefrin (2000) believes that when individuals' judgment is based on stereotype, a kind of discovering representativeness will occur. According to the result of this research, one can say personal and internal characteristics of people such as shyness, bashfulness and emotionality have no effect on discovering representativeness of Exchange's people and in this case it was concluded that those who are shy and bashful cannot be among investors. Conclusion of this research corresponds with conclusion of Troy Betard's research (2010).

The present study investigated that whether there is a relationship between emotional quotient and investor's decision-making or not. While further survey of the hypotheses presented at this study is required, a natural progress in this research can be to determine this issue that whether performance of investor is influenced by emotional quotient and decision-making or not. Therefore, future researches should investigate that whether there is such a relationship or not. Future studies should especially consider effect of experience of investor and his age on his ability to overcome bias of investment. The present

research found verifying evidences that indicate they affect on a person's ability to overcome bias of investment but it is not possible to determine that whether age, experience of investment and or both of these factors are related to these differences or not.

In an attempt to identify this important factor, future researches should investigate influence of age and experience of investment. Therefore, other studies are required to identify the methods which can help people to overcome biases of investment,

Investigating emotional quotient toward investment biases has been based on such approach. Other researches are necessary to correctly identify the factors which by using it investors can effectively minimize influence of behavioral biases.

## 6 Recommendations for future researches

- Investing effect of variables of emotional quotient on decision-making of managers of organizations;
- Investing effect of other variables effective on investment decision-making;
- Assessing validity of investment decision-making questionnaire and domesticating it consistent with Iran

**Abstract:** The aim of this study was to investigate the relationship between recommendations and comprehensive quality management system with the mediating role of organizational citizenship behavior (studied at the Organization of Ardabil province) is. Morgan is also used to determine the sample size sample size of 274 is under the table. Finally, 270 questionnaires were returned and analyzed. Data collected from standard questionnaires OCB MOGHIMI (2005) standard questionnaire recommendation system Sohrabi (2013) and total quality management standard questionnaire MOGHIMI (2009) to analyze the data using SPSS software to analyze assumptions of correlation and regression coefficient is used. The results show that the recommendation system and total quality management Agriculture Organization There is a significant positive relationship.

**Keywords:** suggestion system, total quality management, organizational citizenship behavior, the role of mediator

### 1 Introduction

The system offers one of the most important tools is continuous improvement.

The system offers grounds for participative management and organizational citizenship behavior which unfortunately, for various reasons cooperative system and offers not find their place in our country. Today, organizations in a dynamic environment, ambiguous and changing work and one of the salient features of the modern era, profound and persistent changes in the social and cultural conditions (such as changes in mentality, ideology, social values), political, economic, technological and transnational occur (Hodavand M. et al., 2012).

The results of various studies indicate a very positive effect on individual performance and organizational citizenship behavior. Many organizations try to improve their organizational performance to have comprehensive quality management principles. TQM is a management approach that helps organizations improve performance by strengthening problem-based organization achieves quality. TQM is a system based on human resources, which tries to increase customer satisfaction and reduce the cost of operations to help the survival of the organization. One of the fundamental principles of total quality management and continuous improvement in all processes, improve the quality of customer service, production of lesions (lesions recyclability), focus on improving the process rather than criticizing people and making decisions based on data.

Come. But due to some inconsistencies and policies, systems and methods are inefficient, overlapping functions, duplication and the incidence of natural disasters (droughts and floods) agricultural sector has faced difficulties in recent years with the inhibit the growth of this sector is desirable. In fact, total quality management Agriculture Organization, is intended to improve organizational performance. But the relationship between total quality management and organizational citizenship behavior and their impact on the proper execution of the military system and the need to study the proposals is thinkable.

This study attempts to question the relationship between the research proposals and a comprehensive quality management and organizational citizenship behavior that is considered as intermediate variable appropriate solutions to the challenges of

the existing participative management system and barriers to reduce costs and achieve perfect efficiency, the impact of organizational citizenship behavior in organizations to identify and review.

### 2 Methodology

#### Research Methodology

This study, the purpose of the application, in terms of descriptive and correlation research method and the method of data collection is to field.

#### Statistical Society

The population of the original population from which the sample or reagent can be obtained or view. The population consists of all employees Agriculture Organization of Ardabil province, which employs 951 people.

#### Sample size and sampling

The method used for sampling is simple random sampling. Morgan is also used to determine the sample size sample size of 274 is under the table. Finally, 270 questionnaires were returned and analyzed.

#### The data collection tool

The following questionnaire was used for data collection:

MOGHIMI organizational citizenship behavior questionnaire (2005), which has 21 questions. A standard questionnaire recommendation system Sohrabi (2013), which has 44 questions. Total quality management standard questionnaire MOGHIMI (2009), which has 15 questions.

#### Validity and reliability

The validity of the questionnaire validity have been used, the survey questionnaires were approved with teachers.

To assess the reliability of the questionnaire, Cronbach's alpha coefficient was used. The results of Cronbach's alpha coefficient was calculated as follows:

Table 1: Table reliability of questions related to each variable

Variable	Cronbach's alpha coefficients
Suggestion System	0.74
Total Quality Management	0.79
Citizenship Behavior	0.88

#### Method of analysis:

To analyze the data, SPSS software was used. To assess the relationship between total quality management and suggestion system from Pearson and to determine the role of behavior in mediating the relationship between two variables recommendation system and total quality management regression coefficient with frequent entry method is used.

### 3 Findings

According to research results are 84.1% of the male respondents and 15.9% are women. In addition, 7% of respondents under 30

years of age and 40 percent with the lowest frequency to the highest frequency of 30 to 40 years old.

In the case of education, the results show that 5.6% of respondents are least frequent school or high school diploma and 50 % are the most frequent expert.

The Relationship between quality management system and comprehensive proposals Agriculture Organization

Table 2. Results of Pearson correlation coefficient to determine correlation

Independent variable	Statistics	Dependent variable
		Total Quality Management
Suggestion System	r	0.239**
	sig	0.001
	N	270

\*\* Statistically significant at a significance level 0.01

According to Table 2, it can be said that the recommendation system and total quality management Agriculture Organization There is a significant positive relationship. The correlation coefficient between the two variables is 0.23.

The relationship between suggestion and comprehensive quality management system with the mediating role of organizational citizenship behavior

Table 3. Regression analysis of the relationship between recommendations and comprehensive quality management system with frequent entry through the mediating role of organizational citizenship behavior (enter)

Predictive variables	Statistical indicators				Regression			
	MR	SR	F	P	1	2	3	4
Suggestion System	0.239	0.057	16.22	0.001	B=0.23			
					t=4.02			
					P=0.001			
The proposed system mediating role of organizational citizenship behavior	0.504	0.254	45.44	0.001	B=0.14	B=0.45		
					t=2.65	t=8.39		
					P=0.008	P=0.001		

To achieve this, the OCB role in the relationship between quality management system and comprehensive proposals, stepwise regression analysis was used.

As in Table 3 can be seen, the dependent variable in the equation is that the system offers. This variable (R2a=0.05) of total quality management to predict the distribution of makes and models constitute the first. OCB as a mediator and 0.19 constitute the second model to predict the criterion variable distribution rate (R2a-R2b=0.19) and with the first version (R2b=0.25) explain this distribution. Comprehensive relationship between the two variables increases.

**4 Conclusion**

According to the results of a comprehensive quality management system, proposals and Agriculture Organization There is a significant positive relationship. Given these findings, we can say that the improvement suggestion system in Ardabil Agriculture Organization, total quality management and customer and employee relations aspects of the organization improves.

These results are consistent with findings of rescue and colleagues (2008) as well. Their research showed Job satisfaction and trust employees to managers, significant relationship with organizational citizenship behavior and organizational citizenship behavior is also positively related to perceived service quality by customers.

Also the results with the results Ahmadi et al (2012) as well. Their research showed that organizational citizenship behavior in Tehran province has no direct impact on organizational performance industrial companies, But through a management method such as the establishment of a comprehensive quality management organizational citizenship behavior and customer satisfaction and efficiency as two important factors linked to

organizational performance. Thus, total quality management play an important role in the relationship between organizational citizenship behavior and performance of industrial companies plays.

According to the results of a comprehensive quality management system with the proposals and the mediating role of organizational citizenship behavior there is a significant relationship Agriculture Organization and with the intervention of organizational citizenship behavior in the relationship between recommendations and comprehensive quality management system, the relationship between the two variables increases.

In interpreting this finding can be said that organizational citizenship behavior and its dimensions such as altruism, civic virtue and sportsmanship as mediator significant effect on the relationship between quality management system and comprehensive proposals. In other words, if the equation OCB proposals and comprehensive quality management system, the relationship between these two variables increases.

The research findings with results Asadi and Zakir (1393) as well. Their research represents a significant effect on the components of total quality management, organizational citizenship behavior (leadership, staff management, customer focus, planning, performance management and data analysis) is.

The research findings with results Gyomaras (1996) as well. His research showed that the implementation of total quality management in organizations leads to high satisfaction of employees, their participation in the job, commitment to the organization and desire permanent organization.

The research findings with results Research Joy Vay Jong and Sung Van Hung (2008) as well. Their research showed that between organizational citizenship behavior and the components

of total quality management and organizational performance, there was a significant relationship. The impact of TQM on performance software components to hardware components, and more powerful.

### 5 Application of research proposals

Welfare organization to motivate and increase employee satisfaction (up to provide services to clients) increased.

Managers Agriculture Organization of Ardabil of financial and material resources to encourage and reward their employees.

Providing services to clients in Ardabil Agriculture Organization carried out using a computer system.

Managers Agriculture Organization of Ardabil efforts to ensure that the provisions of the Charter of ethical, transparent and free from ambiguity.

Managers Agriculture Organization of Ardebil province has a plan to try new methods of work, inform the customer at the right time to raise.

Staff Agriculture Organization of Ardabil province follow all laws and regulations, even if someone is not above them.

Staff try not to use them for the benefit of the right colleagues not to step on their progress.

Employees at all meetings of the organization (formal and informal) full attention and participate.

Declarations to all employees of the organization (on site and bulletin boards) take note of and act on them really.

**Abstract.** Working capital deals with current assets and liabilities. The current asset of a company constitutes a significant portion of its total assets. The importance of working capital emanate from the fact that working capital levels can influence profitability and risk level imposed on a company and ultimately the extent of cash value held by company. Thus, the present research was performed in order to gather evidence on the influence of working capital on profitability and cash holdings of the companies listed in Tehran Stock Exchange. In the current research, using the screening, 148 companies were analyzed during the period 2010-2014. To analyze the current research, the panel data regression analysis method was used. The results indicate that working capital lacks any significant effect on profitability.

**Keywords:** Working Capital, Cash Holding, Profitability

### 1 Introduction

Capital constitutes the basis for financial management issues, and it can be argued that all business activities require capital. Capital consists of all the funds that are used by companies, and in this regard, financial management specifies framework of the relationship between capital and corporations. Considering the importance of capital in management organizational process, its management is of utmost significance. In the meantime, working capital in all companies accounts for a considerable part of capital, and managing it is highly significant. Efficient management of working capital can have a significant impact on the yield, and lack of such capital can bring about great risks for any company. Most corporate insolvencies is due to financial managers' inefficiency in planning and proper management of current liabilities and assets in the companies (Smith, 1980).

In general, managers utilize two strategies for managing the working capital. They can minimize their investment in working capital, i.e. to take the bold policy or choose a conservative policy. Therefore, before deciding on the optimal level of investment in current assets, management should create a balance between expected profitability and risk.

Minimize the investment on working capital (bold policy) may positively affect the company profitability. However, Wang (2002) pointed out that if inventory levels would reduce significantly, the risk of the company increases due to the possible loss of market excess demand. Furthermore, the adoption of restricted credit policy on receivable accounts may lead to a decrease in sales. Similarly, the increase in financing through payable accounts may result in the loss of trade discounts for early payment.

On the other hand, increased investment in working capital (conservative policy) may lead to increased profitability. Maintaining high levels of inventory can contribute to some benefits including a reduction in probable expenses relevant to delay in production process, a reduction in corporate losses due to reduced level of production, a reduction in sales expenses, and also protection of the company against price fluctuation, etc. In addition, unrestricted credit policies contribute to an increase in corporate sale. Business credit can perform effectively same as a price failure, and motivate customers to demand more goods, when demand is low.

Most empirical evidence related to working capital management and profitability corroborate the fact that a bold policy of working capital can increase profitability.

In recent years, many companies have been faced with liquidity poor condition that an investigation of the relevant factors is a matter of great importance. Efficient working capital management as an important aspect of financial management practices is known at all forms of organization. The presence of an extensive literature (discussed in the following parts) shows that the efficient working capital management will affect liquidity and profitability directly. On the other hand, the probability of bankruptcy for companies that are exposed to inappropriate management of working capital (despite their utilization of positive profitability) can be increased. Working capital management deals with current assets and liabilities. A company's working capital constitutes a significant portion of the current assets. The excessive levels of current assets can lead to the realization of return on investment lesser than the standard minimum. However, companies that have little current assets suffer from some shortages and problems in the ordinary course of operations. Efficient working capital management includes planning and controlling current assets and liabilities to be able to resolve the risk of inability to meet short-term commitments on the one hand and avoid excessive investment in current assets on the other hand (Rehman and Nasir, 2007).

In addition, if working capital management is not performed effectively, a company might be unable to pay its debt and obligations, and its activity fails to continue. Nowadays, the decision to determine the level of cash reserves in the companies has become one of the significant factors in the finance literature. The main advantage of cash holdings in inefficient capital markets is an increase in the company's ability to use valuable investment opportunities and avoid expensive external financing. Due to the important impact of cash holding levels on investment opportunities, and also the role of effective working capital management and the relationship between cash holdings, it is important to investigate the impact of working capital on profitability and cash holdings. Thus, based on what was said, the current research seeks to examine the impact of working capital on profitability and cash holdings in the companies listed in Tehran Stock Exchange.

### 2 Theoretical foundations and research background

Mohammadi (2008) in an article examined the effects of working capital management on the profitability in a company. The results obtained from the research show that there is a significant inverse relationship between corporate profitability and the factors namely accounts' receivables collection period, payment of creditors' liquidation, and cash conversion cycle (CCC). In other words, by reducing accounts' receivables collection period and inventory turnover period reasonably, managers can increase corporate profitability. In addition, the results from the current research in relation to payment of creditors' liquidation can show that profitable companies have a shorter payment period.

Jannesari (2012) in its research analyzed the effect of working capital management on profitability. The research results show that the company can reduce the number of days of cash cycle as a measure of working capital management and retention of its components (cash conversion period if accounts payable and receivable, material and goods inventories) at the optimal level, thus improve its profitability and create value for its shareholders.

Heidari and Houshmand Zaferanieh (2011) examined the effects of working capital management on corporate profitability. The findings show that there is a significant inverse relationship

between accounts payable workflow and cash conversion cycle (CCC) with profitability, and by reducing accounts' receivables collection period, increase inventory turnover period, and CCC, managers can increase the profitability. However, concerning the relationship between the repayment of payable accounts and companies' profitability, the research performed in this area achieved the same results. All research carried out in this context underline the fact that working capital management can improve corporate profitability.

Rezai and Garkaz (1392) in their research analyzed the effects of changes in working capital on investment opportunities. For this purpose, panel data of 151 companies listed in Tehran Stock Exchange were reviewed in a seven-year period. Using F Limer and Hausman test, the appropriate model was determined, and regression was used to test the hypotheses. The results show that there is a significant inverse relationship between the changes in working capital of companies and investment opportunities.

Raheman and Naser (2007) examined the relationship between with corporate profitability and the factors namely working capital management and liquidity of companies, and the results showed that there is a significant inverse relationship between corporate liquidity and debt and profitability.

Teruel and Solano (2007) examined 8872 small and medium Spanish companies during the years 1996 to 2002, and tested the relationship between working capital management and profitability of small and medium-sized firms. The results showed that management can reduce the number of working days in receivable accounts conversion and also goods and material inventories, thus create value for the company. In addition, shortening the cash conversion cycle (CCC) leads to improved profitability.

In a research performed on the companies listed in Karachi Stock Exchange, Afra and Nazir (2009) examined the relationship between working capital management policies and firms' profitability, and concluded that by adopting a conservative approach to investments in working capital and financing of working capital, managers can change corporate value.

Nyabwanga et al (2012) investigated the effect of working capital on the financial performance of small-scale companies in Kenya. The results showed that working capital management performance was not at a higher level, and the majority lacked working capital management procedures and their financial performance was not satisfactory. The research concluded that working capital management performance can impact the financial performance of small scale companies, and corporate managers are required to improve ways of working capital management as a strategy to improve their financial performance.

Mwalla (2012) performed a research on the listed companies in Oman Exchange Stock to examine working capital management strategies on corporate profitability and corporate value. The results showed that conservative policies can have a positive impact on profitability and corporate value creation, and bold policies can have a negative impact on profitability and corporate value creation.

Wang et al (2013) examined inflation, operating cycle, and cash holdings. The results show that there is a significant negative relationship between inflation indicators and monetary resources, but when inflation indicators reach a certain level, there is an inverse relationship. In addition, there is a U-shaped relationship between operating cycle and cash resources, which are similarly influenced by the changes in inflation level.

Santasaso (2014) studied the effects of debts expense on the company's profitability. The study includes 3,556 companies in 2007-2011 that are accepted at Borsa Italiana. The results show that debts expense can affect corporate profitability.

Sang and Sopeng (2015) in an article investigated working capital, cash holdings and profitability. They examined the impact of cash holdings and working capital on profitability, and the findings showed that working capital and cash holdings can impact profitability.

### 3 Research Hypotheses and Models

#### Research Hypotheses

**Hypothesis 1:** company's working capital can significantly affect profitability.

**Hypothesis 2:** company's working capital can significantly affect cash holding.

**Model 1:**  $ROA_{it} = \beta_0 + \beta_1 WCR_{it} + \beta_2 SIZE_{it} + \beta_3 GROWTH_{it} + \beta_4 GDP_{it} + \beta_5 LEV_{it} + \epsilon_{it}$

**Model 2:**  $CASH_{it} = \beta_0 + \beta_1 WCR_{it} + \beta_2 SIZE_{it} + \beta_3 GROWTH_{it} + \beta_4 GDP_{it} + \beta_5 LEV_{it} + \epsilon_{it}$

Index i relevant to the companies/periods, and index t relevant to time interval.

#### Dependent variable

ROA<sub>it</sub> profitability: as independent variable that show return on asset, and is obtained based on profit followed by deduction of tax by assets.

CASH<sub>it</sub> cash holding: as cash and its equivalent divided by gross asset.

#### Independent variable

WCR<sub>it</sub>: working capital as current assets minus current liabilities.

#### Control variables

SIZE<sub>it</sub>: firm size that is measured by the natural logarithm of total assets (Foroughi and Mohammadi, 2013).

GROW<sub>it</sub>: growth rate that is measured based on sales minus sales last year divided by sales last year.

LEV<sub>it</sub>: financial leverage based on total asset measured by total debt.

GDP<sub>it</sub>: the growth rate of production based on production minus the production in the previous year divided by production in the previous year.

The research statistical population is composed of all the companies listed in Tehran Stock Exchange, which should take advantage of the following qualifications:

- 1-They should be listed in Tehran Stock Exchange in 2009 or earlier.
- 2-They should not have any change in their fiscal year within research time interval.
- 3-The firms' fiscal year during the research duration should end in 20 March.
- 4-The study time interval should be 2010 to 2014.
- 5-Data relevant to the variables in all of the years under research must be available.

After applying the above limits, a total of 148 companies were selected as the final sample. Thus, the number of observations is 740 years-firms.

**4 Results**

Two major processing and analysis methods are performed on the data. These two methods include descriptive and inferential statistics. The data analysis in descriptive statistics begins with the calculation of the indices including mean, median, and distribution indices of standard deviation such as skewness, and skewness-kurtosis.

To test whether or not these errors are independent, Durbin-Watson Test is used. If the value of Durbin-Watson statistics becomes 2, it means that the sample is random, and there is no auto-correlation. The coefficients of the variables in the regression model are tested using Student's t-Tests. In the

current research, to test the significance of the regression model processed, Fisher (F) statistics at 95% confidence level is used. Using linear regression, the hypotheses are tested. In the research, multivariate regression is used as the statistical method. The main purpose underlying the regression method is to investigate whether the independent variables can significantly affect dependent variable or not. In addition, in this method, to test the hypotheses, pooled data are used. In pooled data methods, to choose between panel and pooling methods, F Limer method is utilized. In case of selecting panel method, Hausman test is performed to select either fixed effect method or random effects. The collected data were modified and classified using software (EXCEL) on the basis of the variables, and then incorporated into EVIEWS7, and final analysis was performed. Finally, the research hypotheses were rejected or approved using the results obtained from the software.

Table 1: Descriptive statistics

Variable	Mean	Standard Deviation	Skewness	Kurtosis	Min.	Max.
Size	13.70846	1.550704	0.623951	3.250298	10.30849	18.45456
LEV	0.649106	0.287765	2.08436	14.62917	0.01796	2.72928
GDP	-0.00308	0.078714	-0.53779	2.124712	-0.13612	0.091505
GROW	0.329173	1.6437	6.6235	59.4875	-0/98937	19.83248
WCR	-857984	5864080	-6.64787	55.97527	-0.5719204	23755908
ROA	0.25704	1.682853	11.63689	218.1035	-15.0397	31.54154
Cash	0.257807	0.154666	0.814365	3.727351	0.000595	0.87013

Table 1 presents the descriptive statistics relevant to the research variables. For example, the firm size has the mean and standard deviation 1.55 and 13.70, respectively, and the minimum and maximum values of this variable are 10.30 and 18.45, respectively. This statistic for other variables in the research is presented in Table 1.

Before the estimation of each model in Table (2), to check which pooled or panel model is more effective for estimating the research regression models, F Limer test is used. The null

hypothesis of this test indicates the suitability of pooled regression.

The results obtained from this test are presented in Table 2. As the significant level of F statistics and Chi-square statistic for Models 1 and 2 are less than 0.05, the null hypothesis of this test is rejected in favor of the alternative hypothesis. Thus, this test shows that the panel model is suitable to estimate Models 1 and 2.

Table 2: F Limer Test

Model	Statistics F	Significance Level	Chi-Square Statistics	Significance Level	Test Result
Model 1	2.1843	0.000	322.888	0.0000	***
Model 2	18.4651	0.000	12.779129	0.0000	***

\*\*\* Significance at 0.01, \*\* Significance at 0.05, \*Significance at 0.1

In the model relevant to the estimation with the data panel, there are two methods including estimation with fixed effects or random effects, and to determine whether we use fixed effects model or random effects methods for estimating the parameters in Models 1 and 2, Hausman test is applied. The null hypothesis from Hausman test based on the suitability of random effects model is used to estimate the panel data regression models.

less than 0.05, the null hypothesis regarding the suitability of the random effects in these models can be rejected, and to estimate Model 2, panel method with fixed effects are used. In addition, given that a significant level for Hausman test in Model 1 is greater than the error level of 0.0%, it can be said that regression method with random effects can be applied for Model 1.

The results obtained from Hausman test to choose between fixed and random effects in Models 1 and 2 are presented in Table 3. Given that the significance level of Hausman test for Model 2 is

Table 3: Hausman Test

Model	Chi-Square Statistics	Significance Level	Test Result
Model 1	4.4317	0.4891	
Model 2	31.3825	0.000	***

\*\*\* Significance at 0.01, \*\* Significance at 0.05, \*Significance at 0.1

**Estimation of Model 1**

The results obtained from estimating the model 1 using panel data with random effects (4) are shown in Table 4. In this table, the statistics F and its significance level are related to the testing of the certainty of a linear relationship (total regression test) between the dependent and independent variable. Given that significance level of this test for Model 1 is less than 0.1, it can be concluded that the linear relationship between the dependent and independent variables in Model 1 are confirmed. Another hypothesis considered in the regression is independence of errors (the difference between the real values and the values predicted by the regression equation), such that Durbin-Watson statistic is almost 2 and the lack of the correlation between the errors is accepted. According to Table (4), Durbin-Watson statistic for Model 1 has an almost good value.

In Table 4, the coefficient of the variable “working capital” in the model 1 is 0.00000000844. In addition, the significance level of the coefficient obtained is 0.5583, and given that the significance level obtained for the coefficient of working capital is higher than the error level of 0.1, 0.01, and 0.05, working capital has not a significant effect on profitability. Thus, it could be concluded that the hypothesis 1 “the significant impact of working capital on profitability” can be rejected.

Based on the significance level obtained for the variable namely company financial leverage, it can be concluded that this variable can positively and significantly affect company profits (the coefficient obtained is 0.655579 and significance level 0.0168).

Table 4: Estimation of Model 1

Method Dependent Variable	Regression Panel (Random Effects)		
	ROA		
Variables	Coefficient	Significance Level	
WCR	0.00000000844	0.5583	
SIZE	-0.04162	0.4617	
GROW	0.037905	0.2945	
GDP	-0.33077	0.6446	
LEV	0.655579	0.0168	**
C	0.395735	0.6257	
Statistics F	1.9100		
Significance Level	0.0904		*
Coefficient of Determination	0.0128		
Durbin-Watson Statistic	1.27		

\*\*\* Significance at 0.01, \*\* Significance at 0.05, \*Significance at 0.1

**Estimation of Model 2**

The results obtained from Table 2 using panel data with fixed effects are shown in Table 5. Given that the level of significance of the test for model 2 is less than 0.05 It can be concluded that the linear relationship between the dependent and independent variables in the model 2 is confirmed 2. Durbin-Watson statistic for the model 2 is a proper amount.

Given that the coefficient of determination for the model 2 is 0.96, it can be concluded that about 96 percent of the changes in the variable namely cash holding and cash are explained by the independent variables

In Table 5, the coefficient of the variable “working capital” in the model 2 was obtained to be 0.00000000203. In addition, the significance level of the coefficient obtained is 0.0098, and given that the significance level obtained is less than the error level of 0.1, 0.05, and 0.01, the significant impact of working capital on cash holding cannot be rejected. Thus, it could be

concluded that the hypothesis 2 “the significant impact of working capital on cash holding” can be rejected at the error level 0.01.

Based on the significance level obtained for the variable namely company size, it can be concluded that this variable can positively and significantly affect company cash holding (the coefficient obtained is obtained to be 0.023388 and significance level 0.000).

Based on the significance level obtained for the variable namely company financial leverage, it can be concluded that this variable can negatively and significantly affect company cash holding (the coefficient obtained is obtained to be -0.6816 and significance level 0.000).

Based on the significance level obtained for the variable namely company growth, it can be concluded that this variable can positively and significantly affect company cash holding (the coefficient obtained is 0.002887 and significance level 0.0109).

Table 5: Estimation of Model 2

Method Dependent Variable	Regression Panel (Random Effects)		Test Result
	Cash		
Variables	Coefficient	Significance Level	
WCR	0.00000000203	0.0098	***
SIZE	0.023388	0.0000	***
GROW	0.002878	0.0109	**
GDP	0.015714	0.3522	
LEV	-0.6816	0.0000	***
C	-0.01722	0.8021	
Statistics F	100.11		
Significance Level	0.0000		***
Coefficient of Determination	0.96		
Durbin-Watson Statistic	1.68		

\*\*\* Significance at 0.01, \*\* Significance at 0.05, \*Significance at 0.1

**Hypothesis 1:** company working capital has a significant effect on profitability.

According to the findings obtained from the data analysis, it was concluded that working capital does not have a significant impact on profitability. Thus, it can be concluded that the hypothesis 1, i.e. “company’s working capital has a significant effect on profitability” is rejected. This finding is inconsistent with the one obtained from the research performed by JanNesari (2012), Heidari and Houshmand Zaferanieh (2012), Mohammadi (2009) and secondary Nyabwanga et al (2012).

**Hypothesis 2:** working capital can significantly affect cash holding.

According to the findings obtained from the data analysis in Chapter 4, it was concluded that working capital with 99% confidence (given the coefficient mark) has a significant and positive impact on cash holdings. Thus, it can be concluded that hypothesis 2 “working capital can have a significant effect on cash holdings” is not rejected. This finding is consistent with the findings of the research performed by Samadi and Imeni (2013).

### Conclusion

In general, working capital and its components can have a significant impact on corporate profitability, and also the results indicate that investment on working capital processes and interlink between working capital management with day-to-day processes are essential for corporate profitability. As an important result, it should be said that firms must include working capital management in their financial planning processes.

Based on the results obtained from the second hypothesis, it was indicated that company working capital has a positive and significant impact on cash holding. To increase cash, working capital is suggested to be increased, such that it can provide more profits for companies, executives, investors and other stakeholders.

One issue that is not addressed in the current article is the impact of corporate governance on the relationship between working capital and profitability and the extent of cash holding. In general, the companies with different ownership structures have a different ownership structure, and can also provide more general results. Researchers can examine the impact of working capital on profitability and corporate cash holdings in various industries.

## STUDYING THE IMPACT OF CASH-FLOW UNCERTAINTY AND ENVIRONMENTAL UNCERTAINTY ON NON-CASH FLOW SHOCK RETURNS AT TEHRAN STOCK EXCHANGE

<sup>a</sup>TINA SHAHALIZADEH, <sup>b</sup>\*JAVAD GADIMPOUR

<sup>a</sup> Department of Accounting, Ardabil Science and Research Branch, Islamic Azad University, Ardabil, Iran

<sup>b</sup> Department of Accounting, Ardabil Branch, Islamic Azad University, Ardabil, Iran

Email: <sup>a</sup>tinatanshahalizadeh@gmail.com,

<sup>b</sup>JavadGadimpour12@gmail.com

**Abstract:** The aim of this paper was to investigate the impact of cash-flow uncertainty and environmental uncertainty on non-cash flow shock returns at Tehran Stock Exchange during 5 years that is from 2009 till 2013. The samples of this research consisted of 96 companies which involve 480 years number of observations. In this paper, to hypothesis and correlation coefficient, linear regression was applied. In order to analyze data and test hypotheses EVIEWS7 software was used, after designing and testing hypothesis which was done separately for each, it was concluded that cash-flow uncertainty and variability of company stock returns has significant effect on non-cash flow shock returns; however, company assets return variability has no significant effect on non-cash flow shock returns.

**Keywords:** non-cash flow shock returns, cash-flow uncertainty, environmental uncertainty.

### 1 Introduction

This study is done through presenting useful information about predicting cash-flow, giving priority to controlling cash-flow, and as well as other planning about it, and it can be said that the more non-cash flow returns be negative, the more the stocks of company will have negative earnings fluctuation and thereby the quality of accruals and stock companies reduce that it can have a significant impact on returns. As previous studies have shown, stock returns can be calculated by using the expected cash flow shocks. One of the most important factors in choosing the best investment is stock return, and investors can best allocate their assets by considering the correlation between stock returns and other accounting information. The empirical literature on macroeconomics and finance has shown a strong correlation between shock uncertainty and investment policies. Despite the changes in unconventional instability, theoretical explanations for the answers to investment have been focused on characteristics of real options. By returning costs, an increase in fluctuation, can change optimal investment timing. Moreover, after the financial crises from 2007 to 2009, as a potential mechanism that was leading to the observed association between uncertainty and investment, shortcomings in financial markets have been examined (Glover & Levine, 2015).

The achieved returns consist of three components: the expected returns, returns on cash flows, and returns of decline rate, which among all of these only the expected return reflects the company's cost of equity. Asset pricing tests that using the average stock returns are based on this assumption that, the average of realized returns and expected returns is equal. For longer periods of time, realized return cannot be equal with the expected return. Therefore, the tests that use average of realized return as a measure of their expected returns are one-sided, that this case is connected to the shock of future cash flows and changes. Ogneva (2012), has divided the total realized returns of one company stock to cash and non-cash flow shock returns. During the life of a company, the sum of cash-flow must be equal to the total revenues and as a result, a surprising earning could lead to a shock cash flow. The reaction to the stock price, by considering revised in the exploration of future cash flows can evaluate a cash flow shock. External financing for companies is very difficult consequence for uncertain cash-flow. Because these companies have higher costs for capital, such uncertainty leads to more investment risk. Generally, some companies with high levels of cash flow uncertainty will have higher expected returns and subsequently cash flow shock returns. Risky commensurate return is a key principle of financial theory. Each element of working capital can be

considered as a certain element of risk-return range. Within the paradigm of additional value, if the stockholders return be more than the cost of the capital, the company can create value to them. Then, increasing the risk of working capital will cause increasing company's risk and expected returns of stockholders. In this case, the company should offer higher returns for value creation than the expected return. One of the fundamental cases in company management is the company's cash flow forecast, because the results of this forecast will affect the company's plan. Then the management is always looking for such predictions; and therefore, the aim of this paper was to examine the effect of uncertainty on cash flow and environmental uncertainty on non-cash flow returns shock. Now the main question is whether the uncertainty (cash flow and environmental) has effect on non-cash flow return or not.

### 2 Theory and literature review

One of the most important uncontrollable environment conditions that affect the function and profitability of organization is environmental uncertainty, which points to the unpredictability of customers' reaction, raw material marketer, competitors and regulatory groups. The impact of these surrounding factors unconsciously modulates their correlation with the business unit. Through modulating correlations of above mentioned factors with business unit, the function and profitability of it, will be influenced and cause high fluctuation in profitability (Gosh and Olsen, 2009). Although all these factors can make high fluctuation in companies reported profits, by considering company size, nature of activity and its correlation with the other companies, the impact of these factors on the functions of companies can be different (Rut & Cynthia, 2010). Among these factors, unpredictability of customers' reaction is one of the most important case that can have the same effect on all the companies function and thus increase the comparability among them (Gosh and Olsen, 2009). Since customers are the only factor that associated with most companies and also because all of them live in the same society with the same culture, beliefs and relatively equal conditions, then their behavior will be similar with all companies (Jong-Hag et al, 2011). Eventually, high fluctuation in the external environment will cause extreme fluctuation in companies' profitability, and as a result their stock will face with lack of interest of stockholders and investors. Because, when functioning, sharing and dividing profit of each company from year to year doesn't have high and non-justification fluctuations, from the stockholders and investors attitude the risk of investment will increases in that company. So, fewer people trading their stock, and by passing the time decreased trading volume cause the stock prices of these companies reduce (Gul et al, 2003). On the other hand, in this situation, financial institutions and creditors are unwilling to lend and finance to these companies, or consider more interest rates and stricter requirements to them. In 1987, Moses realized effective way of profit fluctuation on borrowing rate and stock prices, and mentioned that the companies with high profit fluctuation, will receive more borrowing rate and so their stock price will decrease (Pourheydari & Aflatouni, 2005). On the other hand, accepted accounting principles granted authority to managers that enable them to minimize company reported profit fluctuation which is caused by environmental uncertainty and always report the same profit. Also some companies that are uncertain about cash flow because of the lack of liquidity in the future pay less profit to companies which are uncertain about future cash flow. External sources financing is clearly more costly than financing from internal sources, because these companies these companies are limited in terms of external financing company. Therefore, above mentioned companies need internal sources to finance, thus they can pay less profit to their stockholders and this will affect the value of the company and therefore its return.

Glover & Levine (2015) started to investigate about correlation between uncertainty and corporate investment that can vary over time, and they studied that whether an increase in uncertainty that signs and scope of the reaction depends on the salary and benefit, can stimulate managers to increase or decrease investment company or not? Lee & Hsu (2015) studied the impact of cash flow uncertainty and working capital on non-cash flow shock returns. The results showed that there is significant relationship between working capital and non-cash flow shock returns. In addition, there isn't any significant relationship between uncertainty of cash flows and non-cash-flow shock returns. Ogneva (2012) investigated about quality of the accruals, realized return and expected returns, and he mentioned that stocks with low (high) quality accruals is a reason to negative (positive) non-cash flow shock returns. This negative (positive) cash flow shock dampens expected high (low) returns of the companies with low (high) quality accruals. Regardless cash flow shocks, realized return is inversely with quality accruals. Mari et al., (2011) in their investigation as environmental uncertainty and intelligence environmental management showed that inherently environmental uncertainties influence in two ways on managers decisions which one of them is through identifying changes in management business environment and the other is through creating changes that managers themselves do to check environmental uncertainty in the business environment. Foroughi et al., (2014), the analysis of accruals quality on without on non-cash flow shock returns. The purpose of this paper is to investigate the impact of accruals quality on non-cash flow shock returns. The results show that stocks with high quality accruals, have less non-cash flow shock returns. In general, this study determines the importance of controlling cash flow shock on asset pricing models that use realized stock returns. Ghaemi et al., (2012), investigated the impact of environmental uncertainty on the way using discretionary accruals by managers, that their results show the positive correlation between environmental uncertainty and fluctuation in unmanaged profit. Positive correlation also has confirmed between environmental uncertainty and the level of discretionary accruals and Earnings Smoothing. Armat and Dastghir (2013) in an investigation as environmental uncertainties and the current stock returns studied the way of environmental uncertainty influences on companies function and profitability and also the correlation of profit and current stock returns in an uncertain condition. The findings suggest that environmental uncertainty create so much fluctuation on function and profitability of companies and managers proceed to Reported income smoothing to avoid the negative effects of it by using discretionary accruals and the Smoothed profits have significant correlation with current stock returns. Hejazi et al., (2011), investigated the impact of environmental uncertainty on profit components and also showed that it will influence unmanaged profit.

### 3 Research hypothesis

According to research questions, the following hypotheses have been explained:

**The main hypothesis 1:** Cash flow uncertainty on non-cash flow uncertainty has significant effect.

**Hypothesis 1-1:** The variability of stock returns has a significant effect on non-cash flow shock returns.

**Hypothesis 1-2:** The variability of company assets return has significant effect on non-cash flow shock return.

**The main hypothesis 2:** Environmental uncertainty has a significant effect on non-cash flow returns.

**Hypothesis 2-1:** Sales variation coefficient has significant effect on non-cash flow shock return.

**Hypothesis 2-2:** Capital cost of variation coefficient has a significant effect on non-cash flow shock returns.

**Hypothesis 2-3:** Net profit variation coefficient before tax has significant effect on non-cash flow shock return.

### 4 Methods

According to objective of this paper, it is a kind of applied research. As well as based on the method and nature of research it is correlation research. The aim of this study is to determine the correlation of variables. The way of data collection for this study is library study and the population of it consisted of all companies listed on the Stock Exchange of Tehran and 96 companies was selected during 5 years that is from 2009 till 2013, which in 2014 because of the need for the research variables in coming year data, it was not entered to research courses and its data is used to calculate some variables. In order to analyze data, EVIEWS7 software was used and through t statistical tests the calculated probability of judging and evaluating on each of the research hypotheses were discussed.

### 5. Research Model and Calculated variables

The regression model was used to investigate about the impact of environmental and cash flow uncertainty on non-cash flow shock returns and to separate hypothesis as follow that the main statistical hypothesis 1 is presented in equation (1):

$$r_{it}^{NCF} = \alpha + \beta_1 ROAVOL_{it} + \beta_2 SRVOL_{it} + \beta_3 SIZE_{it} + \beta_4 BMRATIO_{it} + \beta_5 NWC_{it} + \varepsilon_{it} \quad (1)$$

$r_{it}^{NCF}$ : non-cash flow shock returns,  $ROAVOL_{it}$ : Variable Change of return on assets (cash flow uncertainty character),  $SRVOL_{it}$ : variability of company stock return (cash flow uncertainty character),  $SIZE_{it}$ : company size,  $BMRATIO_{it}$ : the ratio of company on stock,  $NWC_{it}$ : Net working capital

Hypotheses Statistical 1-1:

$$r_{it}^{NCF} = \alpha + \beta_1 SRVOL_{it} + \beta_2 SIZE_{it} + \beta_3 BMRATIO_{it} + \beta_4 NWC_{it} + \varepsilon_{it} \quad (2)$$

Hypotheses Statistical 1-2:

$$r_{it}^{NCF} = \alpha + \beta_1 ROAVOL_{it} + \beta_2 SIZE_{it} + \beta_3 BMRATIO_{it} + \beta_4 NWC_{it} + \varepsilon_{it} \quad (3)$$

The main hypotheses (2): environmental uncertainty has significant impact on non-cash flow shock returns.

$$r_{it}^{NCF} = \alpha + \beta_3 CVS_{it} + \beta_4 CVCC_{it} + \beta_5 CVP_{it} + \beta_6 SIZE_{it} + \beta_7 BMRATIO_{it} + \beta_8 NWC_{it} + \varepsilon_{it} \quad (4)$$

$r_{it}^{NCF}$ : non-cash flow uncertainty,  $CVS_{it}$ : sales variation coefficient (cash flow uncertainty character),  $CVCC_{it}$ : capital coefficient variation (cash flow uncertainty character),  $CVP_{it}$ : net profit variation coefficient before tax (cash flow uncertainty character)

Hypotheses Statistical 1-2:

$$r_{it}^{NCF} = \alpha + \beta_1 CVS_{it} + \beta_2 SIZE_{it} + \beta_3 BMRATIO_{it} + \beta_4 NWC_{it} + \varepsilon_{it} \quad (5)$$

Hypotheses Statistical 2-2:

$$r_{it}^{NCF} = \alpha + \beta_1 CVCC_{it} + \beta_2 SIZE_{it} + \beta_3 BMRATIO_{it} + \beta_4 NWC_{it} + \varepsilon_{it} \quad (6)$$

Hypotheses Statistical 2-3:

$$r_{it}^{NCF} = \alpha + \beta_1 CVP_{it} + \beta_2 SIZE_{it} + \beta_3 BMRATIO_{it} + \beta_4 NWC_{it} + \epsilon_{it} \quad (7)$$

### Measurement Method

#### Dependent variable:

Non-cash flow shock returns: the total returns divided to two components which are cash flow shock returns and non-cash flow shock returns. According to Cremendi&Laip research (1987), the total realized returns are analyzed to three components as equation (8):

$$r_{it+1} = E(r_{it+1}) + r_{it+1}^{CF} + \epsilon_{it+1} r_{it+1}^{CF} = \sum_{s=0}^{\infty} \beta^s \frac{\Delta E(X_{t+1+s} | UX_{t+1})}{P_t} \quad (8)$$

$r_{it+1}$ : the realized stock returns  $i$  in  $t+1$ ,  $E(r_{it+1})$ : the expected stock returns  $i$  in  $t+1$ ,  $r_{it+1}^{CF}$ : cash flow shock stock  $i$  in  $t+1$ ,  $\epsilon_{it+1}$ : abnormal stock returns  $i$  in  $t+1$  that doesn't have significant correlation with profit fluctuation.  $X_{t+1}$ : profit,  $U X_{t+1}$ : profit fluctuation,  $\Delta E(X_{t+1+s} | UX_{t+1})$ : The revision in expected profit calculation over  $t$  and  $t+1$  period.  $\beta$ : The interest rate factor that is equal to:  $(r+1)/1$ ,  $P_t$ : The market value of the company's equity in  $t$ .

According to Collins & Kothari research (1989), the cash flow shock returns in (8) equation was measured by using future period fluctuation in equation (9):

$$P_{it} / U X_{t+1} = \lambda r_{it+1}^{CF} \quad (9)$$

$\lambda$ : profit response coefficient,  $U X_{t+1}$ :  $i$  company's profit fluctuation in  $t+1$ ,  $P_{it}$ : The market value of the  $i$  company's equity in  $t$

In this paper by following Ogneva research (2012), and also by using (9) and (10) equations, the returns divided into two parts which are cash flow shock returns and non-cash flow shock returns that is analyzed by cross-sectional regression equation (10):

$$R_{it+1} = E(R_{it+1}) + \lambda U X_{t+1} / P_t + \epsilon_{it+1} \quad (10)$$

$R_{it+1}$ : realized returns,  $U X_{t+1} / P_t$ : cash flow shock returns,  $E(R_{it+1}) + \epsilon_{it+1}$ : Total intercept and the regression error of the  $i$  non-cash flow shock returns stock (Froughi & et al., 2013)

$\lambda$  is variation coefficient of  $U X_{t+1} / P_t$  in cross-sectional regression model of equation (11) for each consonant stock. The cross-sectional regression of equation (11) was estimated during 2009 till 2012. In order to calculate non-cash flow shock returns in future by using regression based on profit fluctuation, first the cash profit fluctuation of future year calculated in equation (12) which in this case the profits will divided to equity of company value in the beginning of  $t$  year.

$$U X_{t+1} = EARN_{it+1} - E(EARN_{it+1}) \quad (11)$$

$U X_{t+1}$ : company profit fluctuation,  $EARN_{it+1}$ : the profit before extraordinary items,  $E(EARN_{it+1})$ : the expected profit of company,

Through using calculated coefficient, expected profit will be estimated as equation (12):

$$E_i(EARN_{it+1}) = \beta_0 + \beta_1 EARN_{it} \quad (12)$$

In order to calculate expected profit, first the coefficient of  $\beta_0 + \beta_1$  will be calculated as equation (13) through the profit in  $t-1$ :

$$EARN_{it} = \beta_0 + \beta_1 EARN_{it-1} - \epsilon_{it} \quad (13)$$

The cross-sectional regression equation (13) was estimated through 2009 till 2012.

#### Independent Variables:

1) Cash-flow uncertainty: According to Brav et al (2005), in this situation two variables of company asset returns changeability (ROAVOL) and company stock returns changeability (SRVOL) are used.

A) Company returns assets changeability (ROAVOL): Brav et al (2005), used changeability of returns on assets variable to calculate cash flow uncertainty which is equal to standard deviation of company asset returns rate during the last 4 years, they conclude that non-cash flow shock returns lead to instability of company asset returns (ROA), thus assets returns changeability was used as representation for calculating cash flow uncertainty (Brav et al, 2005) that is as follow:

$$ROAVOL_{it} = STD(ROA) \quad (14)$$

$ROAVOL_{it}$ : assets returns rate variability,  $STD(ROA)$ : 4 years ago ROA company's standard deviation.

The company's assets returns will be calculated in equation (15):

$$ROA = \frac{Income}{Total Assets} \quad (15)$$

B) The variability of stock returns (SRVOL): According to Chay&Suh (2009), when cash flow associate with uncertainty, stock price and returns become more volatile, so using variability of company stock returns variable SRVOL is exact as a way to evaluate cash flow uncertainty, SRVOL is the monthly standard deviation company stock returns during a year (Chay&Suh2009) which is as equation (16):

$$SRVOL_{it} = STD(R_{it}) \quad (16)$$

$R_{it}$ : Monthly stock returns of the Company, is to calculate the monthly stock returns as equation (17):

$$R_{it} = \frac{P_{it}(1 + \alpha + \beta) + D_{it} - P_{it-1} - C\alpha}{P_{it-1} + C\alpha} \quad (17)$$

$R_{it}$ : actual stock returns  $i$  in  $t$  course,  $P_{it}$ :  $i$  stock price in  $t$  end course,  $P_{it-1}$ :  $i$  stock price in  $t-1$  end course,  $D_{it}$ :  $i$  cash profit stock in  $t$  course,  $\alpha$ : The percentage of capital increase from and cash profit from stockholders,  $\beta$ : The percentage of increasing capital through savings,  $C$ : investor paid face value for capital increase (1000 Rials).

2) Environmental uncertainty: internal environmental variability is measured through using three parameters:

1- Sales coefficient variation (market) which the sales variability is gained in equation (18):

$$Sales\ variation = \frac{current\ year\ sales - last\ year\ sales}{last\ year\ sales} \quad (18)$$

2- Calculated cost of variation coefficient which the calculation of capital cost is as equation (19):

$$WACC = (WS \times KS) + (WD \times KD) \quad (19)$$

The weight of normal stock equity (Ws) is as following equation (20):

$$W_s = \frac{\text{Book Value Equity}}{\text{Book Value interest bearing debt} + \text{Book Value Equity}} \quad (20)$$

The weight of interest-bearing debt (Wd) is as follow equation (21):

$$W_d = \frac{\text{Book Value interest bearing debt}}{\text{Book Value interest bearing debt} + \text{Book Value Equity}} \quad (21)$$

So, calculating the WACC rate need not only borrowing cost and returns rate but also will need weight of each of these elements in entity's capital structure. It should be noted that in this paper the debt cost rate (Kd) is equal to average of government bonds release rate which is equal to 17% and because the cost of the profit is a part of acceptable costs of tax, thus, according to 22.5% tax rate we have:

$$\text{Rate cost of debt} = 17\% * (\%100 - \%22.5) = \%13.175$$

Ws\*Ks: this represents normal stock cost weighted rate, and to calculate the cost of new normal stock cost, the Gordon model is used. This is as follow (22):

$$K_s = \frac{D(1+g)}{P} + g \quad (22)$$

D= cash profit of each stock, P=market price of per stock, g= the growth rate of stocks profit, which its calculation is as equation (23):

$$\text{The Ratio of profit accumulation} = \frac{\text{Undivided cash profit}}{\text{Current year net profit}} \quad (23)$$

$$g = \text{ROE} \times \text{Accumulated profit}$$

3- Variation coefficient of net profit before tax (profit):

$$\text{Net profit changes before tax} = \text{Net profit before current year tax} - \text{Net profit before last year tax} \quad (24)$$

In order to calculate coefficient variation of each characters of environmental uncertainty the equation (25) will be used:

$$CV(Z_k) = \frac{\sqrt{\sum_{t=1}^5 \frac{(Z_{kt} - aZ_k)^2}{5}}}{aZ_k} \quad (25)$$

CV (Zkt) =uncertainty variation coefficient K, aZk= the average variability of uncertainty information K during 5 years, Zkt=uncertainty of K in t, 1, 2, 3, 4, 5 =T: from 2009 till 2012, Zk,t=(Xkt-Xkt-1), 1, 2, 3 =K: to information uncertainty of 1) market 2) technology 3) profit.

So, by calculating environmental uncertainty, equation (26) can be used:

$$EU = \log(\sum_{k=1}^3 CV(Z_k)) \quad (26)$$

Control variable are:

Company Size: Through the natural logarithm the market value of equity can be obtained.

The ratio of book value to market value: the division of each book value to each market value of per stock is calculated.

Net working capital: Subtracting current liabilities of company is gained from current company assets.

## 6 The analysis of research hypotheses

### 6.1 Descriptive Statistics

Table 1 results

	RNCF	ROAVOL	SRVOL	CVS	CVCC	CVP	SIZE	BMRATIO	NWC

Source: researcher findings

According to the results of Table 1, the average representing balance point and center of distribution exertion and also is a good indicator to show the centrality of data that for non-cash flow shock returns variable its equal to 0/43574. Median indicates that half of the data show less than this amount and half are greater than it and also equality of mean and median value shows normality of this variable which is 0/62434 for this variable. Jack-bera test is more than %5 for non-cash flow shock

returns variable, it means that this variable consist of normal distribution.

### 6.2 Stationary test variables

Stationary variables can be investigated in 3 forms of "level", "through the first difference" and "through the second difference". The unit root test results for variables in level and the first difference is listed in Table 2:

Table 2: The unit root test results for variables in level and the first difference

Variable	Statistic	Prob	The difference between first order
			Prob
RNCF	261.187	0.0007	
ROAVOL	240.889	0.0096	
SRVOL	319.034	0.0000	
CVS	27.6389	0.0000	
CVCC	400.162	0.0000	
CVP	11.7756	0.0672	0.0005
SIZE	153.102	0.9771	0.0000
BMRATIO	242.524	0.0079	
NWC	228.341	0.0373	
Dickey fuller test of co-integration			
Estimating the regression which has been done	RESID <sub>it</sub>	Statistic	Prob
		311.109	0.0000

Source: researcher findings

According to the results of table (2), the significant level of unit root test and also the size of company in unit root test is less than %5 in all variables except in net profit variation coefficient before tax and it shows that they are at zero order and static level, and variation coefficient variables of net profit became dynamic before tax and differencing once, these variables will be full of first level, and in order to avoid false regression, first we should change all variables to dynamic variables and then get the considered model. In this research, the test result along with

collective pattern which generalize by Dickey Fuller test was done to ensure that it is not false regression. As you can see the unit root test in disturbing regression is less than %5 which is zero and at the static level. So, there isn't any problem for estimating regression and it can be estimated with primary models.

### 6.3 F Limer and Hausman test

Table 3. The results of the mentioned tests

p-value	Statistic	test	hypothesis
0.0000	2.121812	Redundant Fixed Effects	The main hypothesis 1
0.0000	49.975058	Hausman	
0.0000	2.077249	Redundant Fixed Effects	Hypothesis 1-1
0.0000	47.520381	Hausman	
0.0000	1.932968	Redundant Fixed Effects	Hypothesis 1-2
0.0000	41.057799	Hausman	
0.0000	2.293048	Redundant Fixed Effects	The main hypothesis 2
0.0000	54.368745	Hausman	
0.0000	2.039569	Redundant Fixed Effects	Hypothesis 2-1
0.0000	49.210781	Hausman	
0.0000	2.113142	Redundant Fixed Effects	Hypothesis 2-2
0.0000	42.436239	Hausman	
0.0000	2.055366	Redundant Fixed Effects	Hypothesis 2-3
0.0000	49.876844	Hausman	

Source: researcher findings

As the table (3) indicates, the possibility of Limer test is less than %5 in all primary and secondary hypotheses So, H<sub>0</sub> will be rejected, and we should use clear methods. The next step is to determine the fixed effect model across random tests of Hausman test. According to primary and secondary hypotheses, the probability of Hausman test is less than %5 which is done based on Chi-square test. So, H<sub>0</sub> will be rejected and this case mentions that there is a correlation between the estimated regression error and independent variables. According to the Hausman and F Limer test results, for parameter estimation and

primary and secondary hypothesis testing, fixed effects have been used.

### 6.4 The summary of each analysis

#### 6.4.1 Analysis hypothesis 1-1

"The variability of stock returns has a significant effect on non-cash flow shock returns."

Table (4), the results of hypothesis 1-1

Durbin-Watson stat	2.333936		

Source: researcher findings

According to the results of table (4), possibility of t-statistic for variation coefficient of stock returns variable and the ratio of book value in non-cash flow shock returns is less than %5, so estimated coefficient of the mentioned variables is statistically significant and the estimated stock returns variable is 0/247945 on non-cash flow shock returns. According to t-statistic and p-Value, the significance of these variables in error level is %5. These findings indicate that variation coefficient of stock returns variable has significant impact on non-cash flow shock returns. And t-statistic variable of net working capital is more than %5 on non-cash flow shock returns. Therefore, the above mentioned estimated coefficients variables are not significant statistically, and then %95 of variables are not significant in the mentioned

model. Adjusted determined coefficient shows the explanatory power of the independent variables which can explain %32 of dependent variable. At the same time, by observing values of Durbin-Watson we can get that there isn't correlation among disturbing elements, because the values are about 1.5 to 2.5. F statistic likely indicates that the model is statistically significant and according to variation coefficient of stock returns variable and the ratio of book value on market value are significant in non-cash flow shock returns. So H0 hypothesis will be rejected, in other words it can be said that variation coefficient of stock returns variable has significant and inverse impact on non-cash flow shock returns.

#### 6.4.2 Analysis of the hypothesis 1-2

“The variability of company assets return has significant effect on non-cash flow shock return.”

Table (5), the results of hypothesis 1-2

Durbin-Watson stat			2.307130	

Source: researcher findings

According to the results of table (7), possibility of t-statistic for variation coefficient of capital cost variable, the size of company and the ratio of book value in non-cash flow shock returns on market is less than %5, so estimated coefficient of the mentioned variables is statistically significant and the estimated coefficient of capital cost variation is 1/576414 on non-cash flow shock returns. According to t-statistic and p-Value, the significance of these variables in error level is %5. These findings indicate that variation coefficient of capital cost variable has significant impact on non-cash flow shock returns. And t-statistic variable of working capital is more than %5 on non-cash flow shock returns. Therefore, the above mentioned estimated coefficients variables are not significant statistically, and then %95 of variables are not significant in the mentioned model. Adjusted determined coefficient shows the explanatory power of the independent variables which can explain %35 of dependent

variable. At the same time, by observing values of durbin-Watson we can get that there isn't correlation among disturbing elements, because the values are about 1.5 to 2.5. F statistic likely indicates that the model is statistically significant and according to variation coefficient of capital cost variable, the size of company and the ratio of book value on market value are significant in non-cash flow shock returns. So H0 hypothesis will reject, in other words it can be said that variation coefficient of capital cost variable has significant impact on non-cash flow shock returns.

#### 6.4.2.3 Analysis of the hypothesis 2-3

"Net profit variation coefficient before tax has significant impact on non-cash flow shock returns."

Table (8), the results of hypothesis 2-3

Variable	Coefficient	Std. Error	t-Statistic	Prob.
$\beta_0$	-0.550854	0.579088	-0.951245	0.3421
CVCC	-1.576414	0.264064	-5.969816	0.0000
SIZE	0.113157	0.042035	2.691970	0.0074
BMRATIO	-0.869441	0.083762	-10.37989	0.0000
NWC	0.117089	0.240410	0.487039	0.6265
R-squared	0.485290	F-statistic		3.618990
Adjusted R-squared	0.351195	Prob(F-statistic)		0.000000
Durbin-Watson stat			2.363094	

Source: researcher findings

According to the results of table (8), possibility of t-statistic for constant coefficient and net profit variation coefficient of coefficients variables before tax, the size of company and the ratio of book value in non-cash flow shock returns on market is less than %5, so estimated coefficient of the mentioned variables is statistically significant and the estimated coefficient of net profit variation coefficient before tax is 29/26524 on non-cash flow shock returns. According to t-statistic and p-Value, the significance of these variables in error level is %5. These findings indicate that net profit variation coefficient of changes before tax has significant impact on non-cash flow shock returns. And t-statistic variable of working capital is more than %5 on non-cash flow shock returns. Therefore, the above mentioned estimated coefficients variables are not significant statistically, and then %95 of variables are not significant in the mentioned model. Adjusted determined coefficient shows the explanatory power of the independent variables which can explain %30 of dependent variable. At the same time, by observing values of Watson we can get that there isn't correlation among disturbing

elements, because the values are about 1.5 to 2.5. F statistic likely indicates that the model is statistically significant and according to hypothesis net profit variation coefficient of variables before tax, the size of company and the ratio of book value on market value is significant in non-cash flow shock returns. So H0 hypothesis will reject, in other words it can be said that net profit variation coefficient of variables before tax has significant impact on non-cash flow shock returns.

## 7 Conclusion

The aim of this paper was to investigate the impact of cash-flow uncertainty and environmental uncertainty on non-cash flow shock returns at Tehran Stock Exchange from 2009 till 2013. After designing and testing hypothesis which was done separately for each, it was concluded that cash-flow uncertainty and variability of company stock returns has significant effect on non-cash flow shock returns; however, company assets return variability has no significant effect on non-cash flow shock

returns. Also sales variation coefficient and net profit variation coefficient before tax has significant effect on non-cash flow shock returns, rather this influence on capital cost of variation coefficient variables and stock returns variability is reverse and significant. As the results of hypothesis test indicated, there were significant correlation between environmental uncertainty and cash flow uncertainty along with non-cash flow shock returns, this shows that investors have been aware about importance of environmental uncertainty and cash-flow uncertainty in determining non-cash flow shock returns. Therefore based on the role of these variables on non-cash flow shock returns, it is recommended to investors, analysts of capital market and other users of financial statements that consider environmental and cash flow uncertainty level in investment and also decision making models to minimize their investing risk. It is also suggested to investors that pay attention to above mentioned points. Providing necessary training from Tehran Stock Exchange to stockholders, investors and other interested people in order to improve awareness about environmental uncertainty and cash flow uncertainty based on the determining of companies returns is essential. Researchers in their future investigation can study about environmental uncertainty and board of directors monitoring on firm function and also profit management of them so that they can be helpful in advancing science in this field. The results of this study based on Armat & Dastghir (2013), has accordance with correlation of environmental uncertainty and returns. The results of their study shows that environmental uncertainty makes a lot of fluctuation in profitability and function of company and managers using discretionary accruals to avoid the negative effects start to reported profit and also profits has significant correlation with returns.

## PRESENTATION OF AN INTEGRATED MODEL TO IDENTIFY AND CLASSIFY BUSINESS INTELLIGENCE SKILLS

\*MAHDI BAGHERI

*<sup>a</sup>Department of Management, Faculty of Humanities, Bandar Abbas Branch, Islamic Azad University, Bandar Abbas, Iran. (Corresponding Author)*

*Email: <sup>a</sup>mbagheri.sbu@gmail.com Tel: +98-9173615796*

Abstract. Business Intelligence has been proposed as a new approach in enterprise architecture based on the speed in data analysis in order to make accurate and smart business decisions in the shortest time possible and not as a tool or a product or even system. The objective of this study is determination of business intelligence skills in organizations as well as identification of relations and modeling of these elements. Identification of business intelligence skills and determination of mutual relations and their interactions have been carried out by evaluation of related literature and expert opinions. Then the relations between these skills are identified using Interpretive Structural Modeling and a structural model of business intelligence skills within organizations is offered based on the obtained relations.

Keywords: Business intelligence, Interpretive Structural Modeling, Business

### 1 Introduction

New technologies are developing at a dizzying speed, in a way that the societies in general and market in specific are searching for tricks to guarantee their survival in this chaotic field with indescribable accelerate. Organizations must accept that their philosophy of life has changed and survival no longer means having sustained profitability and must look for competition and its tools because today few of the companies in this field act in traditional way and away from new rules and companies must be fluent in new rules in order to remain competitive or move one step forward hardly and skillfully so that maybe one day they can create a new rule themselves. Thus, mastery of new technologies such as business intelligence in business is considered an inevitable necessity requirement. The objective of this study is also nothing more than reminding the growing and unstoppable trend of innovation in technology and changes in methods of business, developments which has occurred in this revolution and changes in procedures have and will cause conflicts and deep splits between tomorrow and today.

Even though there have been a lot of researches about the literature of business intelligence, there has been no study about identification of necessary and influencing skills on business intelligence and interaction of these relations as well as obtaining the effectiveness of these skills. Thus, the researchers are planning to submit this article to decrease the mentioned research gap.

### 2 Research literature

#### 2.1 Overview of business intelligence

Business intelligence which contains a more major form such as commercial or non-commercial (nonprofit and military) use is a wide range of applications and technology for collection of data and knowledge for creation of query in order to analyze the firm to have accurate and smart business decisions. Business intelligence has been formed based on a firm architecture and analyzes the trade data and makes accurate and smart decisions based on online analytical processing (OLAP) (Peter, 2010). Business Intelligence is considered not as a product or a system but rather as a new architecture and approach which of course includes a set of practical and analytical applications which helps in decision making for smart business activities according to operational and analytical databases (Barjis, 2008). But from another perspective of Business Intelligence: from the perspective of Architecture and Process, the Business Intelligence is considered as a framework which increases the efficiency of organization and integration of processes and

ultimately focused on decision-making processes at different organizational levels (Bandara et al., 2007). Market believes the Business intelligence to be a tool for competitive advantage which is monitoring and analyzing the market and customers. From the perspective of technology, Business Intelligence is an intelligent system which is considered as intervention points in the brain of hardware and software by accurate data processing. But simpler expression is that business intelligence is nothing but the process to raise the profitability of the organization in the competitive market with intelligent use of data in decision making process. If the concept of business intelligence is understood and transferred correctly, it will suddenly increase the expectations of managers and not meeting these expectations will cause issues such as lack of confidence of people, especially managers to this system because business intelligence is just looking to shorten the course of the inquiry in information and it cannot provide a strategy or proposal on its own and without proper information. Determination of business trends which is among the consequences of business intelligence makes the organization to focus on the major objectives without wasting time and money in other paths (Hung, 2006).

#### 2.2 Necessary skills to promote necessary skills

For the system to function correctly with the Business Intelligence, the relations between people and information and process implementation must be carefully evaluated in order to identify the opportunities of who shall receive which information (Melao and Pidd, 2000).

Business intelligence in the organization considers all users as well as their relations so that the enterprise value chain is covered to perfection and no process be omitted. Special skills should be arranged to implement any kind of improvement process in organization among which the macro processes such as business intelligence need special attention (Bandara, 2005).

Business skills include business process and communication with organizational strategy along with transformation processes which is very important in determining the enterprise policy (Shi, 2008). Information technology skills which technically help in management change and support analytical methodology should also exist sufficiently in the organization (Smith and Fingar, 2003). Other skills entitled analytical skills including summarizing the analysis and correct exploring and explaining are as important as other skills and these three types of skills have intersection points in some firms which is considered to be exactly the point of promotion of business intelligence and its majority will certainly lead to more business intelligence across the organization and vice versa (Vergidis, 2008).

#### 3 Interpretive structural modeling and development of the model

Interpretive structural modeling is a technique which makes the evaluation of complexity of the system possible and forms the system in a way that it can be easily understood. Interpretive structural modeling process converts non-transparent and vague mental models of the system to clear and evident models which are useful for many purposes. This approach is an interactive learning process in which a series of different elements are structured in the form of a comprehensive systematic model (Ravi and Rajat, 2008). Interpretive Structural Modeling is a suitable technique to analyze the effect of a factor on the other factors. This methodology evaluates the type and direction of the complex relations between elements of a system. In other words, this technique is a means by which the group of decision-makers can overcome the complexity of an issue. Among the advantages of this method are its comprehensibility for a wide range of users, its integration in conjunction with expert opinions and its applicability in the study of complex systems which contains a large number of components (Adeyemi and Aremu, 2008).

**3.1 Self-interaction structural matrix**

The first step in the Interpretive Structural Modeling is the analysis of conceptual relations between factors. In order to determine these factors, factor are evaluated pairwise. Self-interaction structural matrix is formed through this method (Ravi and Rajat, 2005). Following four symbols are used for this purpose:

V: factor i helps in realization of factor j.

A: factor j helps in realization of factor i.

X: factors i and j help in realization of each other.

O: factors i and j have no relation with each other.

The opinion of 14 experts familiar with the subject was used in order to determine the relation between factors. Self-interaction structural matrix of this research has been shown in table 1.

Table 1: Self-interaction structural matrix

Business intelligence skills	14	13	12	11	10	9	8	7	6	5	4	3	2
1. Recognizing the need	V	V	V	V	V	V	V	O	V	O	V	V	V
2.Connection with organizational strategies	O	O	V	V	A	A	O	V	V	V	V	A	
3.Summarizing the Analysis	V	V	O	V	X	X	V	O	V	V	V		
4.Development of options for decision-making	O	V	X	X	A	A	O	O	V	V			
5.prioritization of expectations	V	V	A	A	A	A	V	O	V				
6. identifying data	V	V	A	A	A	A	X	X					
7. Data Extraction	O	V	O	A	O	O	X						
8. data integration	V	O	A	O	A	A							
9. Explore and Explain	O	V	V	V	X								
10.transformation processes	V	O	V	V									
11. The results of the monitoring	O	O	X										
12.Change Management	O	V											
13.data storage	V												
14.Data Retention													

**3.2 Availability Matrix**

The above mentioned symbols must be converted to binary (one and zero) symbols in order to achieve the primary availability Matrix. The primary availability Matrix is obtained using this method. The following rules are used to form this matrix:

- In case of having V in (i, j) input of self-interaction matrix, (i, j) input in availability matrix is one and (j, i) input is zero.
- In case of having A in (i, j) input of self-interaction matrix, (i, j) input in availability matrix is zero and (j, i) input is one.
- In case of having X in (i, j) input of self-interaction matrix, (i, j) input in availability matrix is one and (j, i) input is one.
- In case of having O in (i, j) input of self-interaction matrix, (i, j) input in availability matrix is zero and (j, i) input is zero.

The final availability matrix will be obtained after achieving the initial availability matrix by adding the transmissibility to the obtained relations. This matrix has been shown in Table 2. Transferability indicates that if factor A affects factor B and factor B affects factor C, the factor A affects factor C. The dependence and influence of each of the key factor has also been shown in this matrix. Influence is obtained from the sum of ones in each row and dependence is obtained from the sum of ones in each column.

**3.3 Level segmentation**

The set of Input and output for each factor will be obtained in this step using the final Availability Matrix. The set of output for each factor contains the factor itself and factors which affect those and the set of inputs for each factor contains factor itself and factors which are affected by those (Vittal, 2008).

Table 2: The final Availability Matrix

business intelligence skills	1	2	3	4	5	6	7	8	9	10	11	12	13	14
1	1	1	1	1		1	0	1	1	1	1	1	1	1
2	0	1	0	1	1	1	1	0	0	0	1	1	0	0
3	0	1	1	1	1	1	0	1	1	1	1	0	1	1
4	0	0	0	1	1	1	0	0	0	0	1	1	1	0
5	0	0	0	0	1	1		1	0	0	0	0	1	1
6	0	0	0	0	0	1	1	1	0	0	0	0	1	1
7	0	0	0	0	0	1	1	1	0	0	0	0	1	0
8	0	0	0	0	0	1	1	1	0	0	0	0	0	1
9	0	1	1	1	1	1	0	1	1	1	1	1	1	0
10	0	1	1	1	1	1	0	1	1	1	1	1	0	1
11	0	0	0	1	1	1	1	0	0	0	1	1	0	0
12	0	0	0	1	1	1		1	0	0	1	1	1	0
13	0	0	0	0	0	0	0	0	0	0	0	0	1	1
14	0	0	0	0	0	0	0	0	0	0	0	0	0	1

The common parts of these sets are determined for each of the factors after determination of the sets of input and output. The common set for each factor is obtained using this method. Factors with exact same output and common set are placed at the

highest level of hierarchy of interpretive structural model. As it can be observed in table 3, factors 1, 3, and 6 are at the highest level of the model.

Table 3: the first repeat

Criteria	Output set	Input set	Common
1	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14	1	1
2	2, 4, 5, 6, 7, 8, 11, 12, 13, 14	1, 2, 3, 9, 10	2
3	2, 4, 5, 6, 7, 8, 11, 12, 13, 14	1, 3, 9, 10	3, 9, 10
4	4, 5, 6, 7, 8, 11, 12, 13, 14	1, 2, 3, 4, 9, 10, 11, 12	4, 11, 12
5	5, 6, 7, 8, 13, 14	1, 2, 3, 4, 5, 9, 10, 11, 12	5
6	6, 7, 8, 13, 14	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12	6, 7, 8
7	6, 7, 8, 13, 14	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12	6, 7, 8
8	6, 7, 8, 13, 14	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12	6, 7, 8
9	2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14	1, 3, 9, 10	3, 9, 10
10	2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14	1, 3, 9, 10	3, 9, 10

14	14	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14	14

When the factors of the highest level are determined in the first repeat, these factors must be separated from other factors and in other words be removed. This will be repeated until all the level

of all factors is determined. 8 repeats took place in this research and 2<sup>nd</sup> to 8<sup>th</sup> repeats are shown in table 4.

Table 4: 2<sup>nd</sup> to 8<sup>th</sup> repeats

repeats	Criteria	Output set	Input set	common	Level
2	13	13	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13	13	2

### 3.4 Forming the interpretive structural model

The initial interpretive structural model is drawn by considering the transfer-abilities given the level of each of the skills as well as the final availability matrix. The final interpretive structural model is formed by removing the transfer-abilities. The final obtained model has been shown in figure 1. The final obtained model in this research has been from by 8 different levels. Skills at higher levels of hierarchy have less influence. Data maintenance skills was placed at the highest level of the hierarchy. In fact, it can be stated that this skill is mainly derived from lower levels' factors.

### 3.5 Analysis of Analysis of influence – dependency

Factors are divided into four groups in this section with respect to the influence and dependency. The first group consists of autonomous factors (area 1), the second group is related to affiliated factors (area2), the third group is related to bonding factors (area3) and the fourth group is related to influential factors (area4). Skills with high influential power are called key skills. It is clear that these skills are placed in one of the two influential or bonding groups. Influence and dependency of each of the key skills of business intelligence have been shown in Table 2. The diagram of influence – dependency is formed based on this matter and has been shown in figure 2.

**4 Discussion and conclusion**

This article tries to evaluate the behavior of business intelligence skills in addition to identification of these skills. Interpretive structural modeling approach has been used in achieving this goal. A model of influencing method of these skills and relation between them has been obtained in this regard. The mentioned model is formed of 8 levels. Skills at higher levels had lower influence. Lower levels have higher influence rate. Results of the research show that identification of needs is at the lowest level and all factors affect the higher levels. This indicates that the identification of needs is the most important skill in business intelligence in organizations. Business intelligence results in change management, exploring and explaining and summarizing analysis. Thus, these skills provide the context of using relation with organizational strategies and facilitate the activities related to the development of options for decision-making, the results of monitoring and transformation process. The result of this can prioritize the expectations. Prioritization of the expectations can

also provide a context for data identification, integration and extraction. Thus, these skills provide the context for using data storage. This step can lead to data storage.

The results of the analysis of influence- dependency also show that skills are divided into our different areas. There was no skill in the first area which consisted of autonomous skills. Skills such as prioritization of expectations, data identification, data maintenance, data integration, and data storage and data extraction are in the second area. These skills have high dependency and low influence. The third area also covers skills such as decision-making options change management and results of monitoring. These factors or skills have high dependency and influence and are called bonding factors. Skills such as recognizing the need, relation with organizational strategies, and a summary of the analysis, exploring and explaining and transformation processes are in fourth area. This analysis shows that skills in 3<sup>rd</sup> and 4<sup>th</sup> areas have a high influence. Thus, these

groups have key skills and organizations need to pay more attention to these groups of factors in Business intelligence.

**Abstract.** University provides a valuable opportunity for facilitating the knowledge, skills, and beliefs that develop wellness to last a lifetime. So a sample including 60 students were selected with convenience sampling method. The results showed that mean scores of posttest is significant at the level of ( $P=0.001$ ) for physical fitness ( $F=7.78$ ), nutrition ( $F=7.78$ ), self-care and safety ( $F=8.31$ ), emotional management ( $F=12.05$ ) and Sexual and emotional awareness ( $F=4.13$ ). Also LSD post hoc test showed that the first experimental group has obtained the improvement compared to the second experimental group and the control group in both variables and this hypothesis that execution of training and counseling package with skilled helper model reinforces two variables of physical and emotional wellness of students was confirmed.

**Key Words:** Wellness, TestWel, Physical Wellness, Emotional Wellness, Skilled Helper Model.

### 1 Introduction

The notion of Wellness has grown from conceptualizations which have attempted to capture a positive perspective of health which although no longer defined simply as freedom from illness, still connotes a reactive, or negative-reducing notion of enhancing human functioning (Cowen, 1991; Hattie, Myers, & Sweeney, 2004; Swarbrick, 2006; Wissing, 2000). Wellness is a dynamic state of being in which a person's awareness, understanding and active decision-making capacity are aligned to some extent with their values and aspirations for a more satisfying life. A Wellness lifestyle is the commitment and approach adopted by an individual aiming to enhance this alignment to reach their highest potential (Ardell, 1986; Dunn, 1961).

The outcome of a Wellness lifestyle is a capacity to contribute in positive and meaningful ways to one's community, society and the welfare of the earth. An individual who adopts a Wellness lifestyle aims to adapt and balance the multiple dimensions of their health and well-being in concert with others and their environment. On a continuum between low-level Wellness and high-level Wellness, individuals continually move between various states of physical, psychological and spiritual harmony and vary in their capacity to reach aspirations and goals (Adams, Bezner, & Steinhardt, 1997; Swarbrick, 2006; Travis & Ryan, 2004; Wissing & van Eeden, 2002). Maslow's notion of the authentic individual as one who is "a little more a member of the species and a little less a member of the local group" (Maslow, 1999) poignantly reflects the possibilities for the Wellness of humanity as a whole as a by-product of the Wellness of the individual.

Research on Wellness and psychological well-being of college students in the US has shown that there is a significant positive relationship between adherence to wholistic Wellness models and psychological well-being (Hermon & Hazler, 1999) and global Wellness measures have positive correlations with both

self-confidence and the overarching process of identity development in college students (Murray & Miller, 2000).

Ford (2015) shows that training environment tissue and increase of awareness and behavior in order to wellness, encourage students in decisions related to health. However, feeling that they have to wellness is important and finally students need support to show fortune to wellness. Extensive researches in the field of wellness have achieved many developments, provided valuable experimental data and created numerous and complex conceptualizations of this structures (Goss, 2011).

Fundamentally, initially wellness has been attributed to the physical aspect and early evaluation focused on this dimension. There were cases in the physical aspect such as physical activity, nutrition and self-care. According to Sidman, D'Abundo, and Hritz (2009), "physical wellness has been defined as the ability of the body to function effectively and meet the demands of daily life" (p.2). This includes: "cardiovascular endurance, strength and flexibility, in addition to healthy nutrition, sound medical care, and personal safety" (Sidman et al., 2009).

Cooper (1968, 1970, 1975, 1977) is well known in this field and studied the relationship of exercise to health and longevity, particularly how exercise reduced the risk of heart disease. His findings revolutionized the fitness industry's understanding of health and wellness and advanced the understanding of the relationship between living habits and health (as cited in Miller & foster, 2010). Among this, sports companies increased the public interest to improve physical health through presence in sports clubs and weight loss plans.

Helliwell (2005) found optimism about good health resulted in higher wellness scores. He also found that age was of great interest because one might assume happiness decreases with age, whereas in fact 18-24 year olds and 55-64 year olds are equally the happiest of all age groups with 35-44 year olds being the least happy. Even 65 year olds and above were a lot happier than this 35-44 year old age group.

Ryff & Singer (2006) found that avoiding negative behaviors such as smoking and inactive living as well as somatotype affects physical wellness with benefits including better autoimmune functioning. Ryan & Deci (2001) noted that physical wellness, however, does not always correlate to one's sense of well-being: a person can be ill and have a positive state of mind while a physically healthy person can experience a poor sense of well-being.

Emotional wellness is conceptualized as awareness and control of feelings, as well as a realistic, positive, self-valuing and developmental view of the self, ability to deal with conflict and life circumstances, coping with stress and the maintenance of fulfilling relationships with others (Adams et al., 1997). Helliwell (2005) considered emotional wellness as a continual process that included an awareness and management of feelings, and a positive view of self, the world, and relationships.

Renger et al., (2000) defined emotional wellness as related to one's level of depression, anxiety, well-being, self-control, and optimism. From a proactive view, emotional wellness reflects one's ability to experience satisfaction and curiosity, as well as enjoyment in life, and being able to anticipate the future with a positive or optimistic outlook. Ryan & Deci (2001) describe self-determination theory (SDT) as another perspective that fits within the concept of self-realization as a central definitional aspect of wellness and that SDT specifies both what it means to actualize the self and how this can be accomplished. This involves the fulfillment of basic psychological needs autonomy, competence, and relatedness, resulting in psychological growth

(e.g. intrinsic motivation), integrity (e.g. internalization and assimilation of cultural practices), and well-being (e.g. life satisfaction and psychological health), as well as the experiences of vitality (Ryan & Frederick 1997) and self-congruence (Sheldon & Elliot 1999).

Roscoe (2009) specifically states, "Emotional wellness includes experiencing satisfaction, interest and enjoyment in life, as well as having a positive anticipation of the future, or having an optimistic outlook". Emotional wellness is specifically related to a person's feelings and acknowledging those emotions are present (Roscoe). Regarding emotional wellness of college students, Conley, Travers, and Bryant (2013) state, "college brings a host of new demands and challenges; it is not surprising that this transition entails elevations in psychosocial distress and adjustment difficulties". Being able to effectively deal and cope with these emotions is essential in becoming emotionally well (Conley et al., 2013). Typically, the largest area of emotional wellness lacking for first-year students is coping with stress (Conley et al., 2013). Howe and Strauss reported the two greatest worries millennial students face are grades and college admissions (as cited in Bland, Melton, Welle, & Bigham, 2012). Bland et al. (2012) state, "this [grades and college admissions] is in comparison to AIDS and violent crime 10 years ago or nuclear war 20 years ago". Therefore it is easy to see why Hales declares college has "been considered one of the most stressful times in a person's life".

On the other hand, Hicks and Heastie (2008) explain, "life transitions, such as moving away from home and going to college, create valuable opportunities for growth, change and individuating from one's family of origin" (as cited in Bland et al., 2012). Bland et al., describe, "the challenge for persons interested in the well-being of this age group is two-fold: to equip these young adults with effective tools that will reduce stress when present and also give them the strategies of effective coping mechanisms". Furthermore, "college students who develop essential skills in psychosocial wellness and stress management are likely to adapt to college most successfully" and "the transition to college offers a prime opportunity for promoting psychosocial strengths and skills that can chart a trajectory toward lifelong wellness, adjustment, and success" (Conley et al., 2013).

Skilled helper model theoretically has been extracted from three different theories including: Karkhuf theory about helpers with functioning at a high level (helpers possess skills like sympathy, respect, objective-oriented, consistent, self-disclosure, and encounter-maker and with urgency skills); Strong's social influence theory (helping is a social influence process; because clients consider therapists as a specific reference. This influence reaches to the highest level when possesses conditions of seriousness and authority and also with collaboration, empowerment, freedom and equality) and Albert Bandura's social learning theory (that clients learn skills through understanding the helping learning process and transition of

expectations of suitable self-efficacy or expectation to achieve goals with useful behaviors.) (Nelson, 2007)

The goal of skilled helper model is help to clients for transition of skills and enough awareness of solving current and future problems. Helper makes a treating union based on a warm and accepting relationship with collaboration to facilitate transition of client. A skilled helper helps the client to accept the responsibility of changing to a more effective person in life and develop his inner resources by helps him to formation of action plan (Nelson, 2007).

Also the skilled helper as a facilitator helps client to achieve new skills and awareness for new situations he plans realistic and appropriate goals (which is counterpart with solving problem skills of that) for clients, encourages them to become autonomous and transition of solving problem skills; helps them to develop their inner abilities and utilize outer resources and group support, helps them to identify their poetical abilities and as a facilitator stimulates them to develop goals which are certain, Measurable, attainable, realistic, ethical, reasonable and rational. In addition the skilled helper is sensitive and aware to nonverbal communications of clients in all conditions (Egan, 2013).

Egen's skilled helper approach encourages clients to accept active commentator role of the world, give meaning to actions, events and situations, encountering and overcoming the challenges, explore difficult problems, searching for opportunities and writing goals. Simply success usually is the result of person's effort through positive activities transition of problem solving strategies (Egan, 2013).

**2 Methodology**

The plan of this research is from the type of semi-experimental research plans with two experimental groups and a control group. 60 volunteers of participant in counseling and training classes were divided into three groups and they were placed in three situations randomly. The first group participated in counseling and training class with the framework of the skilled helper model. This group experienced all decuple steps of the skilled helper model to improve wellness.

The second group was placed with random replacement in a situation that just received information about wellness without framework of skilled helper model and usual methods were used to provide information like speech. The third group was considered as the control group and didn't receive any informational and training framework about wellness. Training the wellness was in six weeks and included an introduction class for the skilled helper model and execution of TestWel questionnaire in the first week and execution of steps and stages of the skilled helper model from the second week. Students group under training and consultation followed and planned the ideas and discussions about improvement of wellness (table 1).

Table 1: Demographic features of the sample group

Variable	Experimental group 1		Experimental group 2		control group	
	n	%	n	%	n	%
Sex						
Female	13	0.65	11	0.55	14	0.70
Male	7	0.35	9	0.45	6	0.30
	20		20		20	100

The five subscales of the TestWel questionnaire the version of the National Wellness Institute (2004) was chosen for pretest and posttest survey as the main tool to measure students' wellness. The first part of the questionnaire includes information on the participants' demographic features such as age, sex, marital

status, training level and occupational status. The subscales of TestWel questionnaire have 44 items and it has been chosen because of alignment with the curriculum and the availability. This tool is executed to measure the 5 domains wellness (table 2).

Table 2: five subscales and validity of physical and emotional wellness test

Questionnaire	Scales	Validity	Type of Reply
---------------	--------	----------	---------------

Five subscales of wellness test	Scale 1 Physical fitness Scale 2 Nutrition Scale 3 Self-Care and safety Scale 6 Sexual and emotional awareness Scale 7 Emotional management	(Owen, 1999; Palombi, 1992)	1. Never or almost never 2. Sometimes 3. Often 4. In most cases, 5. always or almost always
---------------------------------	---	--------------------------------	---

Although most of the Wellness inventories have been developed and validation studies conducted in the United States with university student populations (Hattie et al., 2004; National Wellness Institute, 2004; Owen, 1999; Palombi, 1992) there neither appears to be similar inventories specifically customized for the Iranian context nor are there instances of studies designed to test reliability and validity with Iranian university students. Goss (2011) with factor analysis, and has identified its components. According to the research and theoretical analysis on last survey-based validity and reliability had been acceptable

(Goss, 2011). Alpha coefficient of whole scale in evaluating the Goss (2011) had been 0.93 and Palombi (1992), only in eight cases of twelve subscale of the questionnaire had been acceptable. In the treatise the alpha coefficient was estimated as 0.95 for the whole scale. Alpha coefficient of the research of Goss (2011) for the pretest and posttest is obtained as 0.93 and 0.96 respectively. That it indicates acceptable internal consistency. These coefficients in the ongoing research were estimated 0.88 and 0.94 to pretest and posttest, respectively (table 3).

Table 3: subscales, Validity for each in researches and the ongoing research

	subscales	Items		Comparison Study 1	Comparison Study 2	Comparison Study 3	Comparison Study 4
		others	Tamadoni	Owen (1999) (N = 185)	Botha and Brand (2009) (N = 89)	Goss (2011)	Tamadoni 2016 (N = 371)
1	Physical fitness	10	8		0.69	0.684	0.738
2	nutrition	10	7		0.67	0.655	0.537
3	self-care and Safety	10	10		0.76	0.618	0.665
4	Emotional Management	10	10	0.77	0.81	0.791	0.727
5	Sexual awareness	10	9	0.77	0.84	0.769	0.751

**3 Findings**

In this section data obtained from the execution of counseling and training package with framework of helper model is analyzed to improvement of wellness. Two methods as follows have been used to analyze the variables that were measured of counted and also to convert experimental data as a systematic collection:

- 1) Description of data on the basis of conventional methods, in the descriptive statistics, and
- 2) the interpretation of results of test and hypotheses of the research on the basis of covariance analysis test

Given that subjects of all three groups of research in the pretest and posttest stage responded to wellness questionnaire, in this section, at first the descriptive features of scores has been presented for all three groups in pretest and then posttest (table 4).

Table 4: descriptive statistics features of the studied variables in the pretest

Variables	E1		E2		Control	
	Mean	Sd	Mean	Sd	Mean	Sd
Physical fitness	30.40	3.2	50.41	1.5	70.40	2.6
nutrition	80.28	9.3	90.22	4.4	20.22	8.3
self-care and Safety	85.44	9.2	45.35	2.5	50.35	0.6
Emotional management	40.32	7.4	55.31	1.4	15.33	7.4
Sexual and emotional awareness	50.40	5.4	60.39	6.7	55.34	0.5

Note: E1 = Group with framework of skilled helper model, E2 = Group without framework

As can be seen in Table 4, the average of the three groups, especially in variables of physical fitness is almost equal to each other. Average of the score of self-care and Safety in the control group (22.20) is lower than the other two groups. In addition, the

average of group of E1 in self-care and Safety variable (44.85) to some extent is more of the two groups and its standard deviation (2.9) is lower (table 5).

Table 5: descriptive statistical features of the studied variables in posttest

Variables	E1		E2		Control	
	Mean	Sd	Mean	Sd	Mean	Sd
Physical fitness	25.48	4.4	90.42	5.6	95.40	7.4
nutrition	80.28	9.3	90.22	4.4	20.22	8.3
self-care and Safety	85.43	9.2	45.35	2.5	50.35	0.6
Emotional management	60.44	8.3	35.39	7.5	25.36	5.4
Sexual and emotional awareness	50.40	5.4	60.39	6.5	55.34	0.5

Note: E1 = group with framework of skilled helper model, E2 = group of without framework

In general, the means in Table 5 show that the training package with skilled helper model and also providing information without framework of skilled helper model had an impact in improving wellness of subjects. However, at this stage it is unclear whether these differences is significant or not. For this question it is necessary to analyze the data in relation to the research hypothesis.

#### 4 Data analysis in relation to the research hypothesis

Research hypothesis: a sample group that in situation of training and counseling package of wellness with framework of skilled helper model achieves higher level of physical and emotional wellness compared to the Frameless group and control group.

Table 6: Mbox results for significance of means

Variable	F	df1	df2	P
Overall scores	229.238	132	8715.93	0.03

Due to the significance of Mbox test among the special values of MANCOVA the Vpillai is used that is more resistant compared to violations of the assumptions.

Table 7: Vpillai Analysis for evaluating the specific values

Variable	Value	F	P
Physical fitness	0.268	1.199	0.322
nutrition	0.362	1.857	0.080
self-care and Safety	0.268	0.645	0.778
Emotional management	0.148	0.569	0.841
Sexual and emotional awareness	0.129	0.484	0.901

Table 7 shows that the difference there are significant differences between the three groups in the linear combination of dependent variables that were scale components. Thus, analysis of covariance test was used to determine the difference between the groups in subscales of dependent variable. But first its

assumption was investigated by Levene test to homogeneity of variance equality.

Table 8: Summary of Leven test for equality of variances in the means of posttest

Variable	F Levene	P
Physical fitness	1.26	0.291
nutrition	0.843	0.436
self-care and Safety	2.412	0.099
Emotional management	1.312	0.277
Sexual and emotional awareness	2.770	0.071

As can be seen in Table 8 equality of variances test with Leven test in the posttest scores in the all three groups and after the execution of counseling and training package with framework of skilled helper model is still equal with each other. So it can be

concluded that the main assumption of analysis of variance is established for its execution. Thus, analysis of covariance test was used to determine the difference among the groups in the all subscales of the dependent variable.

Table 9: Results of analysis of covariance related to physical and emotional subscales

Source and variable	df	SS	MS	F	$\omega^2$
Physical fitness	2	237.57	218.79	7.78	0.001
nutrition	2	344.02	172.01	7.78	0.001
self-care and Safety	2	681.13	360.56	8.31	0.001
Emotional management	2	530.25	237.12	12.05	0.001
Sexual and emotional awareness	2	323.68	161.98	4.13	0.022

Table 4-18 shows the differences between groups in interval of wellness component is significant in following LSD test was used to determine differences in groups.

Table 10: comparison of means the three groups by using LSD test

Variables		Mean differences	Deviation	p	Comparison
Physical fitness	2 of 1	4.25*	1.92	0.032	3 = 2 > 1
	3 of 1	7.13*	1.82	0.001	
	3 of 2	2.89	1.91	0.139	
nutrition	2 of 1	5.40*	1.48	0.001	3 = 2 > 1
	3 of 1	5.76*	1.40	0.001	
	3 of 2	3.36	1.47	0.907	
self-care and Safety	2 of 1	5.17*	2.32	0.032	3 = 2 > 1
	3 of 1	8.90*	2.19	0.032	
	3 of 2	3.74	2.31	0.001	
Emotional management	2 of 1	4.26*	2.32	0.032	3 = 2 > 1
	3 of 1	7.87*	2.19	0.032	
	3 of 2	3.62*	2.31	0.001	
Sexual and emotional awareness	2 of 1	4.23	2.27	0.052	2 = 1
	3 of 1	5.94*	2.14	0.008	3 > 1
	3 of 2	1.41	2.26	0.535	3 = 2

LSD post hoc test results showed that the four subscales (except of Sexual and emotional awareness), group that have participated in training and counseling class with the framework of (E1) skilled helper model have achieved higher level of wellness compared to without the framework experimental group (E2) and the control group. However, differences in the experimental group with framework of (E1) are more significant with the control group. In addition, the without framework experimental group (E2) with the control group is not significant in most subscales (except of Emotional management). In other words, the means of experimental group (E2) and the control group has remained unchanged.

## 5 Conclusion

Literature investigating the impact and purpose of wellness training supports its potential for creating positive change in the personal and professional lives of students, particularly in wellness. Gaps in the current literature, however, present challenges to educators and institutions. There is a paucity of research relating to the empirical measurement wellness education. In fact, the aim of this study was to assess wellness training with skilled helper model (Egan, 2013) in order to promote in the students.

Performing the pretest to determine the various aspects of wellness scores showed that most students in the total score of the questionnaire and its subscales are in average and under average. In fact, the quantitative data showed the wellness scores in the both groups is only slightly above average. The total score contained the total of five scale of TestWel questionnaire that was executed among students. These findings are supported from similar studies that have been executed based on the hexagonal Hitler model of the wellness (DiMonda, 2005).

Average grade in the wellness scores is consistent and with conducted researches on inappropriate situation of wellness in the universities and shows that act to improve biological healthy is important for students and can be considered a plan to improve biological healthy as a possible target. Researchers warn that the healthy status, physical and mental well-being, quality of life and wellness is undesirable in the universities and should be found a solution to improve it (Goss, 2011 and Tamadoni, 2005).

Evaluating subscales independently showed that student's participant in the class with framework of skilled helper model in dimension of physical fitness and nutrition have shown significantly improvement. These findings suggest that the

execution of a training package has been effective to improve the ongoing status of students. There are studies in line with this study that act to justify the education to improve healthy life in physical dimension (Sidman et al., 2009; Cooper, 1977; K Ranger et al., 2000; Ryan and Deci, 2001; ryff and Singer, 2006; Travis and Ryan, 2004).

Evaluating emotional wellness with two subscales of emotional management and sexual and emotional awareness also showed the covariance analysis is significant and execution of the package has helped to improve the biological healthy situation of students. This finding is consistent with studies that have considered into attention the emotional factor (Hu, Liebens, & Rao, 2008).

Generally, execution of counseling and training package with skilled helper model framework was proved on the wellness aspects of significant change. However, students who participated in the class without the framework of training package had no significant difference with the control group except in emotional management. Mean comparison by LSD test also showed that the group with the framework in most cases except for sexual and emotional awareness has better condition from the without the framework group and have gained the higher score in questionnaire of TestWel than the control group in all cases. In addition, the group of without framework only showed a significant difference in subscales of emotional management that showed the mere providing information even can make minor change only but do not create a significant difference. Finally, encourage to compliance of counseling and training package with framework of the skilled helper model means to increase in life returns, convert the problems into opportunities, empowerment and personal independence and prevention of the return the problems to change of thought pattern and was provided different look to the healthy subject.

## 6 Suggestions for Future Research

suggestions is presented as follow order to perform a more complete and more comprehensive researches in the future and also development of more and broader training packages to improve wellness in various fields:

It is suggested the different tools and methods of data collection such as observation, interview and experts grading tools that reduce the bias responses to be used to measure wellness order to universalize the concept of wellness.

It is suggested in future studies the other age, population and education groups reagent sample to be chosen and studied order to increase the strength of generalizing the results and further identification of relationships between variables and its components in various groups.

It is suggested the longitudinal researches to be used and be identified and measured by different and valid criteria for predictive validity of the questionnaire for wellness.

**Abstract.** The purpose of this study is to examine the impact of product perception, shopping experience, information provided or the level of perceived risk on the adoption of B2C e-commerce. To collect the data, a researcher-made questionnaire with a five-point Likert scale was used. To measure questionnaire's reliability, Cronbach's alpha was used which the value obtained was %925. Cochran method was used to obtain the sample size. The results show that attitudes toward e-commerce, subjective norms and perceived risk are the main factors that affect the decision to purchase from electronic retailers.

**Keywords:** online shopping, intention, perception, attitude

### 1 Introduction

The growth of the World Wide Web (www) and its acceptance among consumers has paved a way to the rise of B-to-C electronic commerce (EC) (Lei-Da Chen et al, 2004). According to Sawhney and Kaplan (2000) electronic commerce (e-commerce) is a means of business activities conducted using electronic data transmission over the internet and the world wide web. Hutt and Speh (2004) illustrated how transaction management aspect of electronic-commerce can also enable firms to reduce operating cost by enabling better coordination in the sales, production, and distribution process or better supply management and to consolidate operations and reduce overhead. Huang et al. (2001) considered firms are interested in e-commerce because, quite simply, it can help business and improve profits.

The Internet's capacity to access, organize and communicate information in a more efficient way has brought about new formulas for the relationship between consumers and firms. New economic agents and new business models have emerged too. In this way, the development of e-commerce offers great opportunities for both manufacturers and retailers, but it also presents important challenges for organizations, demanding an in-depth review of marketing strategies and consumer knowledge (Goldsmith and Bridges 2000, Jones and Vijayarathy 1998). Therefore, enterprises view e-commerce as the best way to form a bridge between suppliers, business partners, and customers (Timmers, 1999; Fellenstein and Wood, 2000). Internet gathers all competitors and consumers in one place. It brings new lane to promote, advertise products and services in market (Barry Silverstein, 2002). Online shoppers always want to seek information within few clicks and reach to the most relevant information according to their requirements such as competitive brands, best price offers, product specification and consumer word-of-mouth (Yuan Gao, 2005).

Online shopping basically based on individual thinking point of view and his personal perceptions. Online shopping makes its own character for its development (Na Wang 1, 2008, p. 4). While the traditional "brick-and-mortar" shopping venues are restrained by time and space, the Internet has decreased the effort and time consumers spend on shopping (Bhatnagar et al., 2000). Furthermore, the Internet makes an unlimited range of products and services accessible for consumers all around the world (Quelch and Klein, 1996). People can buy or sell virtually anything, at anytime, from anywhere, through online shopping (Ko et al., 2004).

Retailers all over the world are establishing virtual stores, which exist in the cyberspace and offer merchandise and services

through an electronic channel to their customers with a fraction of the overhead required in a bricks-and-mortar store (Hoffman et al., 1996; Yesil, 1997).

Beside our study that have focused on the commercial characteristics of the Internet as a sale system have adopted diverse theoretical approaches and have obtained contradictory results. Even though there are research endeavors to explain e-commerce system adoption and online consumer behavior (e.g., Gefen et al., 2003; Grazioli and Jarvenpaa, 2000; Pennington et al, 2004).

A business can reduce the cost of handling sales inquiries, providing price quotes, and determining product availability by using electronic commerce in its sales support and order taking processes.

Just as e-commerce increases sales opportunities for the seller, it increases purchasing opportunities for the buyer. Elberse (1996) outlined that, e-commerce provides buyers with a wider range of choices than traditional commerce, because buyers can consider many different products and services from a wider variety of sellers. This wide variety is available for consumers to evaluate 24 hours a day. Some buyers prefer a great deal of information in deciding on a purchase; others prefer less. Bloch and Catfolis (2001) explored the believe that the internet and the digital revolution more generally, will have wide-ranging impacts on marketing as well as on many other aspects of society and business.

### 2 Theoretical Background

The theory of planned behavior (TPB) (Ajzen, 1991) is an extension of the theory of reasoned action (TRA) (Fishbein and Ajzen, 1975; Ajzen and Fishbein, 1980). Both theories hypothesize that an individual's intention to perform the behavior in question is a determinant of that behavior. Intentions are "indications of how hard people are willing to try, of how much of an effort they are planning to exert, in order to perform the behavior" (Ajzen, 1991) and perceived behavioral control (PBC) influences behavior indirectly through intentions, as well as directly when the person does not have complete control over that behavior and when the individual's perceptions of control are accurate (Madden et al., 1992). TPB includes perceived behavioral control over engaging in the behavior as a factor influencing intention. TPB has been used in many different studies in the information systems literature (cf. Mathieson, 1991; Taylor and Todd, 1995a, b; Harrison et al., 1997). TRA and TPB have also been the basis for several studies of Internet purchasing behavior (George, 2002; Jarvenpaa and Todd, 1997; Khalifa and Limayem, 2003; Limayem et al., 2000; Tan and Teo, 2000; Pavlou et al., 2002; Grandon et al., 2011, Su and Huang, 2011; Sun et al., 2014). In order to communicate with customers and facilitate commercial transactions, used websites, hence companies needs to know more about customers and their intentions and also orientation with internet especially e-commerce. Thereby evaluate and improve the effectiveness and usability of it. On the other hand changes and developments of purchase methods from traditional ways and physical presence to new electrical purchase methods causes companies more pay attention to online shopping and demands of customers, in order to attract more customers. The theory of planned behavior (TPB) (Ajzen, 1991) has been adopted as the framework for our study. So that we can apply a solid theoretical basis. According to available literature we intended to offer at first, study of a theoretical model for a bunch of effective variables in e-commerce strategies in Iran. Second, understanding of behavioral variables of customers. Third, check out the acceptance from technical prospective of virtual selling. Fourth, evaluation of car companies and agencies in online shopping and how they meet the intention of customers, and at the end study for technology oriented approach base on the development of innovative technologies by focus on e-commerce features.

### 3 Literature review

#### 3.1 Consumer Attitude

Kardes (2002) said that attitude is a concept that has been explored by a lot of attitude research. Attitudes toward a behavior have been found to influence the behavior, including online information search and purchase behavior (Shim et al., 2001). According to (Ajzen and Fishbein, 1975; 216) an attitude represents a person's general feeling of favorableness or unfavorableness toward some stimulus object". The next statement "as a person forms beliefs about an object, he automatically and simultaneously acquires an attitude toward that object" (Ajzen and Fishbein, 1975) Heijden et al., 2003, stated that attitude has strong, positive and significant impact toward intention, this finding also support (Yulihastri et al., 2011) research stated that attitude has significant influence on intention. Although some recent studies have suggested that attitude may not be as important in predicting behavioural intentions (for example, Venkatesh et al., 2003) In the context of consumer website use and online shopping adoption, several researchers have indeed found positive and significant impacts of attitude on intention (Jeong and Lambert, 2001; Korzaan, 2003; van der Heijden, 2003; Shih, 2004; Lee et al., 2005; Pavlou and Fygenson, 2006). Further, favourable attitude is expected to ease online transactions and reduce barriers to the adoption of e-Commerce (Jarvenpaa et al., 1999; Pavlou and Chai, 2002). Lastly, attitude has been shown to correlate well with behavioral intention when adoption is voluntary (Davis et al., 1989) and among experienced users (Karahanna and Straub, 1999; Yu et al., 2005).

The most influential predictor of intention to search for information via the Internet was previous Internet purchase experience, a factor related to consumers' perceived risk. This finding supports other previous attitude-behavior researchers (e.g., Bentler and Speckart, 1979, 1981; Sutton and Hallett, 1989) who asserted that past behavior is a predictor of future behavior. Attitude towards online shopping has huge impact on intention to web purchasing (Limayem et al. 2000). There are some other definitions according to one of the other definition attitude towards online shopping is defined as customers positive or negative sensation connected to complete the buying behavior on internet (schlosser, 2003).

#### 3.2 Subjective norms

According to Fishbein and Ajzen (1975), Subjective norms refer to "perceived pressures on a person to perform a given behavior and the person's motivation to comply with those pressures." Thus, subjective norms reflect how the customer is affected by the perception of some significant referents (e.g., family, friends, and colleagues, among others) of his/her behavior (Schofield, 1975). Subjective norms or the approval of others, called refer-

ents, have been found to affect behavior. For example, referents have been found to influence shopping center patronage intentions (Evans et al., 1996), online apparel purchases (Shim and Drake, 1991). Numerous studies in psychology have theorized that subjective norms are an important determinant behavioral intention (e.g., Herrero Crespo and Del Bosque Rodríguez, 2010; Lin, 2007; Taylor and Todd, 1995; Yi et al., 2006). Subjective norms tend to be more influential during early stages of innovation implementation when users have limited direct experience from which to develop attitudes (Taylor and Todd, 1995).

As stated previously, the TRA identified subjective norms and attitude as determinants of behavioral intention (Davis et al., 1989), whereas the original TAM did not include subjective norms in its model. Subjective norm can be thought of as composed of two components: societal norm and social influence (Pavlou and Chai 2002). Societal norm refers to the process of adherence to the larger societal fashion, i.e., a large circle of influence. Collectivism, however, refers to the extent to which individuals are integrated into groups, forming their judgments based on group norms (Hofstede and Bond 1988). Social influence refers to the extent to which people accept a hierarchical system with an unequal power distribution (Pavlou and Chai 2002).

#### 3.3 Perceived behavioral control

Ajzen and Madden (1986) extended the TRA into the Theory of Planned Behavior (TPB) by adding a new construct "perceived behavioral control" as a determinant of both intention and behavior. Perceived behavioral control refers to consumers' perceptions of their ability to perform a given behavior. TPB allows the prediction of behaviors over which people do not have complete volitional control. Perceived behavioral control, or the ease of accessing the Internet, has been found to influence intentions to search and to purchase online (Shim et al., 2001). When customers repeat their behavior several times, they feel more and more in control and form favorable intentions about purchasing (Liao et al., 2007). Perceived behavioral control reflects perceptions of internal constraints (self-efficacy) as well as external constraints on behavior, like availability of resources. It has been found that the Planned Behavioral Control (PBC) directly affects online shopping behavior (George et al, 2004) and has a strong relationship with actual Internet purchasing (Khalifa and Limayem, 2003). When consumers perceive that control over navigation at a website is low, they limit time spent searching at a site (Richard, 2005), express less shopping enjoyment (Childers et al., 2001), and report more negative evaluations of the products (Richard and Chandra, 2005). Given these reactions, we would not expect that even a lenient return policy could overcome consumers' negative evaluations of a website with low perceived control. In contrast, when consumers experience high levels of control over their shopping experience, they express more positive attitudes toward the e-tailer. But high levels of control do not reduce consumer uncertainty about e-tailer quality. As a result, we posit that consumers will be receptive to the signal information contained in the return policy when perceived control over navigation is high (Padmanabhan and Rao, 1993).

#### 3.4 Perceived Product

Product knowledge is a perception towards definite products, together with previous experience of using the product Eze, Tan and Yeo (n.d); According to them it is the list of the information that is related to the product and helps the customers to check whether it fits to their needs or not. Prieto et al (2009) explain product knowledge as something which we collect with the passage of time by experiencing the product and to know their necessary features. It is the information which is filtered by the buyers mind, after making certain cost and benefit analysis this knowledge compels the consumer to interpret the conclusion which may or may not be purchasing behavior. Product perception, sometimes called product understanding (Dillon and Reif, 2004) or product value (Crisp et al, 1997), consists of price, product quality, and variety. Since the perceived product quality

is a pivotal reason to buy (Aaker, 1991), price is the cost paid by the customers, and variety gives the customers more alternatives to choose the products and hence motivate the customers.

The experience of searching and purchasing in particular web-sites can help consumers assess product quality based on fewer product cues. From the learning and habitual use perspectives (Murray and Haubl, 2007), by assessing particular cognitive cues using more experience-based information (rather than assessing all product attributes), consumers are more likely to reduce their cognitive loads and, thus, reduce the cognitive costs invested in online searches and purchases. Product quality has long been discussed in the literature from different points of view (Garvin, 1984; Harari, 1993). Thus, perceived product quality can be defined as the customer's perception or the judgment about the overall excellence or superiority of the products or service with respect to its intended purpose relative to alternatives (Aaker, 1991; PZB, 1988).

### 3.5 Online shopping experience

The shopping experience in the cyber world is quite different from conventional stores. Effort, life style compatibility, playfulness have been mentioned (Baty and Lee, 1995; Goldsmith, 2000; Hoffman and Novak, 1996); social interaction was added by Jarvenpaa and Todd (1996-97). Shopping experience, according to most studies, concerns the user-friendliness and aesthetics of online shopping websites. The experiences include the effort required to use a website, its interactivity, and the fun of shopping online. In line with the work by Klein (1998), Shim and Drake (1990), Liang and Huang (1998), Eastlick (1996), and Weber and Roehl (1999), Shim et al. (2001) found that previous experience with Internet shopping is a good predictor of online search behavior.

Some of the studies believe that web-shopping consumer's behavior will depend on experience quality in which the experience quality can be obtained only through prior purchase experience, and prior experiences will strongly affect future behavior. There are some studies that have mentioned to past online experience as one of the antecedents of online purchase intention (Laroche et al., 2005; Ranganathan and Sanjeev, 2007; Kwon and Noh, 2010; Shim et al., 2001; Weber and Roehl, 1999; Eastlick 1996; Li et al., 1999). Although a positive relationship between Internet usage and online shopping intention was detected in some studies (Bhatnagar et al., 2000; Citrin et al., 2000; Liao and Cheung 2001; Park 2002), the relationship was not found to be significant in some of the later studies (Cho 2004; Nysveen and Pedersen 2004).

Experience with online shopping is found to correlate positively with consumers' likelihood to shop online. The more experienced consumers are with online shopping and the more satisfied they are with past online transaction experiences, the higher their purchases amounts and the more likely they are to be repeated purchasers (Brown et al. 2003; Devaraj et al. 2002; Foucault and Scheufele 2002; Koivumi 2001; Moe and Pader 2004; Park and Jun 2003; Pires et al. 2004; Yang and Lester 2004) and the lower likelihood of them aborting an intended online transaction (Cho 2004). This is supported by the extended Technology Acceptance Model, which suggests that increased user experience has positive effect on users' attitudes toward technology and the mastering of that technology (Venkatesh and Morris 2000).

### 3.6 Access to information

Internet its helps to store data in an inexpensive way, collect information rapidly and cheaply, provide information interactively in accordance with consumer needs, and, in comparison with printed marketing materials, it offers a greater sensory experience and can serve as a medium for trade (Peterson et al., 1997). Leong et al., (1998) claimed that the most important advantage of the Internet was its ability to provide detailed information and to reach target consumers. Seo and Kim (1999)

state that consumers with online shopping experience highly value the inexpensiveness of Internet search costs of traditional shopping channels. Consumers are not only free to search for product information, but also free to compare information between competing manufacturers (Alba et al. 1997). Klein (1998) argues that information search facilities on the Internet are particularly useful for search goods due to the low perceived costs of providing and assessing objective data. Confirming this point, Liang and Huang (1998) indicate that consumers are likely to conduct transactions in a manner that minimizes transaction costs such as those related to searching for product information, receiving post-sales services, and so forth.

The view that the shopping process is composed of consumers' shopping strategies and goals could explain why information search intentions via the Internet might be an antecedent of intention to use the Internet for purchase. It is believed that consumers develop shopping strategies, that is, action plans, for performing complex shopping behaviors (Darden and Dorsch, 1990). In addition to product type, Klein's (1998) model predicts that two other broad variable categories will influence information-seeking behavior. Specifically, certain consumer characteristics (i.e., product knowledge, prior experience, attitude toward shopping, and social influence) may affect the degree of Internet search.

Today, virtual community have profoundly changed consumers' purchase decision-making process. For example, many people nowadays examine other consumers' reviews and experiences posted in VCs before purchasing new products. In this case, members engage in knowledge sharing to reduce their uncertainty prior to the consumption experience. (Lu et al., 2010). Empirical studies have shown that the intention to get information positively influences the purchasing behavior (Gefen 2002, Pavlou and Fyngenson 2006). According to the Theory of Planned Behavior, behavioral intention is the most influential predictor of behavior (Ajzen 1991). In much research on consumer behavior, researchers often use intention to represent the actual behavior (Lin 2006, Lu and Zhou 2007). Thus, we use the intention to get information and the purchase intention to represent get information and purchase behaviors, respectively.

Consumers are likely to get information from a vendor or website if they trust it and believe that it will provide credible information. Pavlou and Fyngenson (2006) found that the trust belief positively affects consumers' attitude toward getting information from a Web vendor.

Despite the steady growth in online commerce, however, there are few insights regarding how different sources of information affect consumers' purchase decisions. This lack of research is surprising considering similar decisions have been studied extensively in a brick and mortar context (Brucks 1985; Punj and Staelin 1983; Ratchford 2001). Marketing researchers, however, are now calling for more research on the role of different information sources for Internet purchases (e.g., Bucklin et al., 2002; Ratchford et al., 2003).

The online sources that we study include seeing the product online, online recommendations by a friend, recommendations by an online vendor, recommendations in an online editorial, and online ads. For several decades now, researchers have studied how consumers use multiple information sources to arrive at a purchase decision (e.g., Newman and Staelin, 1973). We focus on how consumers search in the online environment and how consumers process and evaluate the credibility of such information. So we look the use of information sources that offered by website. More recently, the growth of the Internet has increased interest in how consumers choose online and offline sources (Klein and Ford, 2003; Ratchford et al., 2003; Rohm and Swaminathan, 2004). Prior research has also investigated whether the use of different offline sources varies across product categories (e.g., Westbrook and Fornell, 1979; Beatty and Smith, 1987). We know of only a handful of studies that investigate the use of online and offline information sources and these are typi-

cally within one product category. For instance, Klein and Ford (2003) and Ratchford et al., (2003) focus only on automobile purchases.

### 3.7 Theory of Perceived risks

Shopping has long been regarded as a risky activity as shoppers may be uncertain of a purchase decision and the consequences of a poor decision (Bauer 1960). Perceived risk can be defined as consumer prediction about uncertainty potential negative result from online transaction (Kim et al., 2008). Forsythe and Shi, 2003 defined risk on online shopping as certain wish subjectively from purchase disadvantages that is considered in some online purchasing. In trying to understand the way consumer involved in consumer attitude through internet, it seems that risk is one of primary concern considered by consumer. The study of perceived risk has a long history in the marketing literature. Researchers generally agree that perceived risk is a combination of the perception of the likelihood that something will go wrong and the perception of the seriousness of the consequences if it does (Kaplan et al., 1974; Taylor, 1974; Bettman, 1973; Lopes, 1995). Perceived risk has been shown to negatively influence consumers' intention to shop online, both for products (Bhatnagar et al. 2000; Featherman and Pavlou 2003; Jarvenpaa et al. 1999; Joines et al. 2003; Kolsaker et al. 2004; Liang and Huang, 1998; Liao and Cheung 2001; Park et al., 2004; Pavlou 2003) and e-services (Ruyter et al. 2001). Such a negative correlation was found to influence both experienced and novice consumers (Liang and Huang, 1998), while others find no such linkage (e.g., Liao and Cheung, 2001; Miyazaki and Fernandez, 2001).

The effect of perceived risk may be subject to product characteristics. The risk is generally higher for high-involvement products that require the initiation of problem-solving behavior and have some degree of personal importance than for low-involvement products (Pires et al. 2004). Consumers may worry about the security of transmitting credit card information via the internet (Bhatnagar et al. 2000). It is an obstacle that people perceive lack of security and privacy on the internet in the adoption of electronic commerce (Leibermann and Stashevsky 2002). Furthermore, consumers perceive higher levels of risk when shopping online than when shopping in traditional channels (Bhatnagar and Ghose, 2004).

The Internet, just like any type of non-store shopping, makes it difficult to examine physical goods; consumers must rely upon somewhat limited information and pictures shown on the computer screen (Jarvenpaa and Tractinsky, 1999). Consumers generally associate a higher level of risk with non-store purchase rather than store purchase. Unlike offline consumers, online consumers are concerned with risks involved in buying on the Web such as credit card, fraud and not receiving the right products after ordering (Heijden et al., 2003). Moreover, there is bound to be much uncertainty regarding system security, reliability, standards, and some communication protocols (Turban et al., 1999). All these factors increase the perceived risk of online shopping so that more than half of Internet users still have not made an online purchase (Teichgraber, 2001).

Jarvenpaa and Todd (1996-97) classified the risk types as follows. (1) Economic or financial risk: This is the monetary losses due to poor purchase choice, inability to return goods, etc. In this study, economic risk refers to credit card embezzlement. (2) Social risk: This originally refers to the fact that shopping on the web will be considered as imprudent or socially unacceptable, but as online activity becomes popular, we refer it as the embarrassment of confronting people in purchasing private-oriented books. (3) Performance risk: This refers to situation where product/service fails to meet ones expectation in online book shopping, in this study since the book quality is rather fixed, thus we refer to safety of payment methods. (4) Personal risk: This refers to the harmful personal consequences to the consumer resulting from online shopping. However, any losses can be attributed to this type according to the definition; thus, we regard this type of

risk as transaction data leakage. (5) Privacy risk: This refers to the personal private information leakage when offered to the online vendors.

Research Model and Hypotheses (Expressing the relationship between studies variable):

First set of hypotheses:

Hypothesis 1a: Individual attitudes towards online shopping positively affects car purchasing intention.

Hypothesis 1b: Subjective norms towards online shopping positively affects car purchasing intention.

Hypothesis 1c: Perceived behavioral control towards online shopping positively affects car purchasing intention.

Following set of hypotheses:

Hypothesis 2a: Perceptions of products supplied by Automakers positively affects Attitude towards buying a car.

Hypothesis 2b: Shopping Experience achieved by online shopping positively affects Attitude towards buying a car.

Hypothesis 2c: Access to information supplied by the virtual store during the research and comparison processes positively affects Attitude towards buying a car.

Hypothesis 2d: Risk perception of online shopping negatively affects car purchasing intention.

Hypothesis 2e: Risk perception of online shopping negatively affects Attitude towards buying a car.

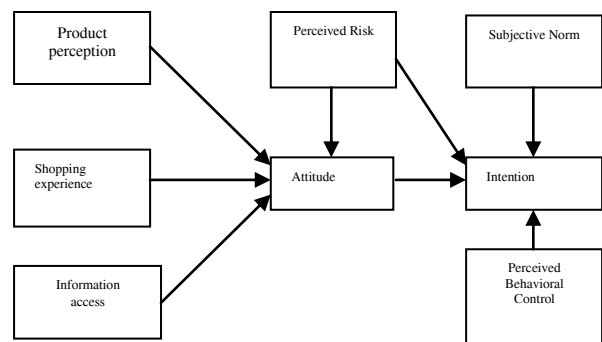

Fig 2. The research model.

## 4 Research Methodology

The present study is applied in term of objective, and also an analytical-survey in terms of methodology. The survey is based on polls who are involved in subject. Data collection has been achieved through the statistical sample and generalization of the results to the statistical population. The answers obtained from a sample that was selected carefully can be generalized to the population. Therefore, it doesn't require to be scrolled from the entire population. Statistical population consisted of internet customers at the present who intended to do online shopping to buy vehicle. To respond the questions or test the hypotheses in this survey, it's important to identify variables. Here, we considered three kinds of variables including independent variables, dependent variables and mediator variable. In this study, statistical population includes entire buyers who do online shopping from automaker companies and selling vehicle in Iran such as the following companies:

Iran Khodro, Saipa, Saipa Dizel, Pars Khodro, Pars Khodro, Kerman Motor, Bahman Khodro, Amico, Aria Dizel, Asan Motor, Mamout, Atlas Khodro, Maz Iran, Rhine, Avrin Khodro, Modiran Khodro, Modiran Pars.

To calculate statistical sample size according to big and mixed population, we can't make a comprehensive list of population from all members of population. Therefore, we use Cochran's formula whenever the statistical population size is unknown. According to the Cochran Z formula, the amount of standard probability is 96% and then P and Q are the ratio of success and ratio of failure at level of 0.5. Also, the accepted error by researcher  $d$  is equal to 0.010. According to this method, number of sample in this study is 155 objects.

In this study, according to this method, 155 subjects were selected as the sample. Study domain includes the entire buyers of online shopping from automaker companies and vehicle sellers in Iran.

## 5 Data collection

The viewpoint of the present research is in the scopes of e-commerce, e-marketing, decision making and vehicle and especially in the scope of the role of online shopping in customers' acceptance and buying vehicle. The data collection method was questionnaire which is one of the common study tools and a direct method to collect the data. Through the questionnaire, we intended to seek knowledge, attitude and customers beliefs. In addition to the questionnaire, in order to achieve precise information, we used other methods such as library method to obtain information.

A questionnaire consisting of 42 questions was used to collect the data and information. The questionnaire was prepared based on theoretical principles of the study and the hypotheses. The status of hypotheses has been realized by the questionnaire. The questionnaire was provided in the form of informative items and according to the spectrum of Likert quintet. It was tried to design the questionnaire as understandable as possible and asked from respondents in each of these factors in questionnaire to declare their option from very low until very much. The numerical values in order were considered 1 to 5. General scale and ratings of this spectrum are as follows:

General scale: very low, low, somewhat, much, very much

Ratings: 1, 2, 3, 4, 5.

### 5.1 The data analysis methods

In the present paper, the descriptive statistical techniques were used for data analysis such as creating frequency tables and designing charts for analyzing the statistical distribution in terms of age, sex and etc. the inferential statistics were also used for analyzing the research data through different analyses. First of all, in order to identify the exploratory factors, to confirm the factor analysis and studying the variable conditions such as reliability and validity, the one-sample test was used. In fact, the difference between the studied sample averages is tested by a given value. In the present research, the factor analysis is used in terms of the validity (divergent).

Moreover, in order to test the measuring model and to trust its correctness, the confirmatory factor analysis (divergent validity 5) was used. The questions of the present research are suggested that confirmed the latent variables by exploratory factor analysis then the correctness and fitting of the model are discussed by the confirmatory factor analysis (table 1).

The results of exploratory factor analysis obtained from SPSS and LISREL software.

In the present research, for the properness of the data for factor analysis KMO (Kaiser-Meyer-Olkin) was used. Furthermore, for assuring the data to be accurate (I.e. to be assured that the correlation matrix is not equal to 0), the Bartlett test was used. All derived factors in the present research were not favored of the researcher. Therefore, the goal of factor analysis is to explain the phenomena with less prior variables. To do this, mathematic criterion such as Kaiser or Scary Kettle are used for maintaining the factor.

### 5.2 The results of the findings

The electric commerce development in different areas especially in industry is the result of electric commerce capabilities which is greatly accepted in today's business. Human being tries to accelerate the development process of the electric commerce in different aspects of the social system. It kept away from traditional pattern and tries to create new pattern with the requirements of today's technology. In this regard, most of service providers paid attention to new technology of providing service to customers as a way for controlling costs, absorbing new customers and realizing the customer's expectations. They also added the use of technology in their program as a guidance (Joseph and Stone, 2003, p. 190).

Understanding the factors lead to accepting information and create the situation under which the e-commerce is accepted is one of the most important studies in domain of e-commerce. In other words, why people turn to e-commerce and how it's accepted are of the most important researches in e-commerce. In other words, why people turn to e-commerce specially purchasing from the internet or do not accept it are of the most issues in e-commerce discussions. Therefore, the researcher studied the importance of this subject.

Based on the findings of the research, the first hypothesis was accepted with 0.05 difference values. It means that the individual perspective to internet purchase positively affect the car purchase tendency.

The second hypothesis was confirmed because of the less difference level which is discussed. It means that the mental norms regarding online purchase positively affect the tendency of buying car.

The third hypothesis (with 0.02 difference level) revealed that controlling the perceived behavior in terms of online purchase positively affect the tendencies of buying car. The fourth hypothesis was accepted with the difference level of 0.08. This shows that the understanding of the delivered products by car producers positively affect the attitude toward buying car.

The fifth hypothesis indicates that the experience gained by purchase in online condition positively affects the attitude toward buying car. It was confirmed based on the difference value of 0.08 (table 2).

The sixth hypothesis was confirmed based on the difference level of 0.05. It means that accessing the delivered information by online store positively affect the attitude toward buying car.

According to different level and result, the 7th hypothesis was confirmed. The understanding of online purchase risk negatively affects the tendency of purchasing car. Based on the 0.08 difference level, the result of eighth hypothesis was confirmed. Understanding online sale negatively affects the attitude toward purchasing car.

In order to confirm or reject the hypotheses, the structural equation model was used especially path analysis. The following structural model shows the relationship between tendencies of purchasing car and online sale. The structural model in standard estimation status showed that there's a positive (0.66) and significant (8.50) effect in online purchasing and selling (Figures 1 and 2).

Table 1

sex	quantity	percentage	age	quantity	percentage	education	quantity	Percentage
male	23	15%	20-28	29	18%	Under diploma	28	18%
female	124	80%	29-30	46	30%	Diploma	49	31%
uncertain	8	5%	36-45	49	31%	BS	42	27%
			46 to up	32	21%	MA	20	13%
			Without answer	-----	-----	Phd	11	7%
						Without answer	5	4%
Total	155	100%	Total	155	100%	Total	155	100%

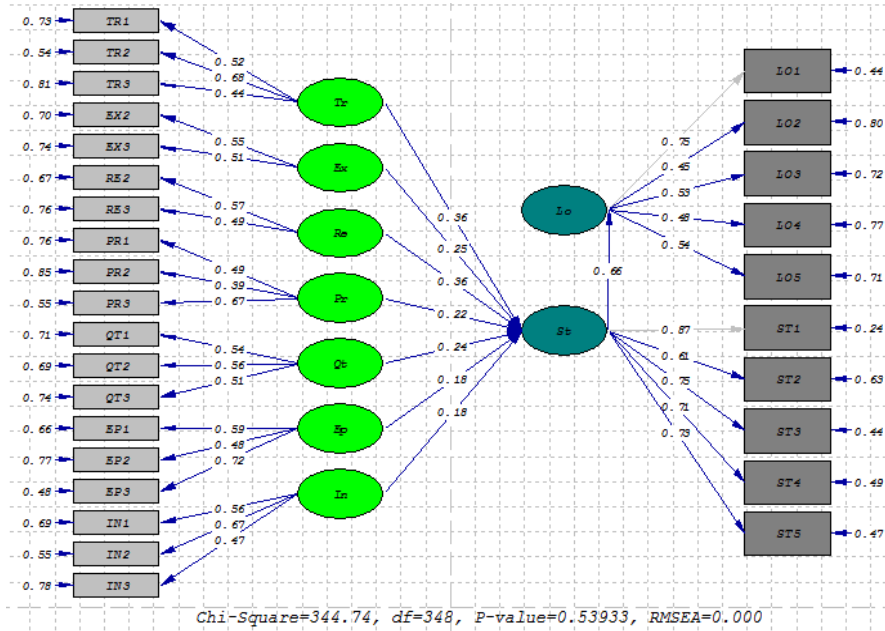

Figure 1: the structural model in standard estimation status

Suitable fitting	0.97	Higher than 0.9	CFI
Suitable fitting	0.95	Higher than 0.9	NFI
Suitable fitting	0.96	Higher than 0.9	NNFI

## 6 Conclusion

This paper studied the relationship between online sale and acceptance and purchase of car by customers. The behavior of customers in relation to online sale was studied. Based on the studies all hypotheses were confirmed. The following suggestions are introduced to the same society:

The website design should pay attention to the ease of practicality and it should also use facilities such as flash technology for the first page by focusing on products and services the company provides. Moreover, a powerful web search should be used for the user. The secure and easy pay should be provided for customers to assure the customers. It should introduce various payments such as bank account, credit card and etc. Facilities such as the designed product orders through internet should be introduced to users. Before purchasing product or service, the order process should display the good purchase to user with high resolution in a way that customers be confident in delivering method. Facilities should receive the customer addresses through websites and they should send them an email informing about the product. Since after sale services have an important role in assuring the customer, it's suggested that the company agents and centers be introduced clearly and the contact info be contained in the website. For future studies, the researchers can analyze the factors, absorb the customer's satisfaction and prioritize them. They also study and compare online sale in big and small companies, the indirect barriers of ecommerce in supply chain and the effect of ecommerce in developing the supply chain and increasing the customer's satisfaction. Studying the relationship between internet marketing and social welfare and internet democracy increase are suggested for further researches.

**Abstract:** The aim of this study is to investigate the role of market power and profitability on dividend policy of listed companies in Tehran Stock Exchange. The research methodology is descriptive-documentary and using a practical approach. Sample's data were extracted from selected Stock Exchange companies between the years of 2010-2014 and were analyzed by using the Eviews 6 software. The results showed that among the eight profitability variables, accumulated profits to total assets ratio, asset growth rate, firm size, Market capitalization to book value ratio, return on assets and cash flow rate of return on assets, the Herfindahl-Hirschman index of all variables except variable of firm size, have a direct and significant effect on dividend payment.

**Keywords:** market power, profitability, dividend policy, Tehran Stock Exchange

### 1 Introduction

Dividend policy is one of the important areas of finance literature. Many researchers have studied the reason that companies pay a large part of their revenues as dividends. Dividend payments directly benefit the shareholders, and affect the company's ability to accumulate profits in order to take advantage of growth opportunities. Any investor considering ones' tastes, buys a company's stock if finds its dividend policy desirable. The amount of dividends proposed by the board usually contains information about management's expectations about future profitability of the company. The present study sought to examine the relationship between product market competition and incentives to distort the profits reported by their managers. A large literature in economics and accounting theoretical guidelines in this area have been provided that how competition can lead to the reduction of agency problems. In a number of studies, the structure of company's products market have been proposed as an effective factor that affect investment activities, financing, distribution of cash and corporate governance Denis et al., (1994), presented and analyzed the existing literature on the effects of product market competition on the accounting methods in two opposite perspectives. Their first view suggests that managers' incentives to manipulate earnings increased competition because when earnings show the existence of a competitive disadvantage (or advantage), competition will be punished (or rewarded) in stock market. The

second view suggests that if shareholders or their stock analysts have access to the real market, more difficult competition may be used to justify the positive and negative accruals inflated reported profits. When the shareholders or analysts have the ability to view the company's output, the company's managers who are pretending that they are efficient, not only need to manipulate accounting earnings, but if their activity is really effective, they must be used in real. In this context, misleading shareholders or analyst by higher output in competitive markets is costly. Therefore, managers must report lower earnings manipulation. In this regard, many previous studies have provided evidence. When the flow of information about the industry is low, product market competition has positive effects on earnings management. However, when the flow of information about the industry is high, the competition has negative effects on earnings management companies. Denis et al., (1994), also states that increased competition increases the risk of liquidation of the company. This in turn leads managers to turn to the capital increase and debt reduction. In total, such short-sightedness of the company due to competitive pressures lead managers to manipulate earnings to influence the market thought to attract funds through their short-term performance, survival of the company and other reasons.

### 1.1 Hypotheses

1. Profitability has a significant impact on dividends of listed companies in Tehran Stock Exchange.
2. The ratio of retained earnings over total assets (RE / TA) has a significant impact on dividends paid by companies listed on Tehran Stock Exchange.
3. Asset growth rate (AGR) has a significant impact on dividends paid by companies listed on Tehran Stock Exchange.
4. Company size (SIZE) has a significant impact on dividends paid by companies listed on Tehran Stock Exchange.
5. Market-to-book ratio: (M / B) has a significant impact on dividends paid by companies listed on Tehran Stock Exchange.
6. Return on Assets (ROA) has a significant impact on dividends paid by companies listed on Tehran Stock.
7. Cash-flow return on assets (CFROA) has a significant impact on dividends paid by companies listed on Tehran Stock Exchange.
8. Herfindahl-Hirschman index (HHI) has a significant impact on dividends paid by companies listed on Tehran Stock Exchange.(figure1)

### 1.2. Conceptual Model

Fig 1. Conceptual Model

## 2. Market power

Market power in one country can be defined as a factor in price changes to higher levels of full competition. If a group of parties in a market compared with other groups have higher bargaining power, market power is created.

Market power may be in the market order (monopsony) or product sale market (monopoly) to be created. Market power in the sale makes some part of the consumer surplus in the form of higher prices to be absorbed by the supplier as in exported product, it is in the form of earning higher prices from foreign consumers.

## 3. Parameters in market structure

Important aspect of market structure is focus. In other words, we by using the concept of focus we can study market structure and size of competition and monopoly in the markets or the economy. Focus shows how the market between different companies is divided, and is to measure the relative size of firms. If the market is more unfair in distribution, the focus will be higher. And in the same conditions as the number of firm increases, the degree of concentration will be less. In fact, the size of the focus tends to correlate closely with the number of firms and unequal distribution of firms in the market. Thus, the focus can be written as follows:

$$\begin{aligned} C &= f(n, i) \\ C_n &< 0 \\ C_i &> 0 \end{aligned} \quad (1)$$

In this regard, the letter C indicates the size of concentration, n represents the number of firms and i indicates inequality in the distribution of shares that can be measured with indicators such as variance and standard deviation of the distribution of firms' share of the market size. (Denis et al., 2008).

The focus must be distinguished between micro and macro levels. When the focus is on the economic level discussions, it means the share of a few big firms and companies from any or all of the economic sectors. To measure the concentration of macro usually 50 or 100 firms larger than the share of the total value produced in the economy is calculated. And firm concentration ratio is 50 or 100. In calculating the macro focus, the firms in terms of size (sales, net production and value added) are larger than other firms. These companies can be of different industries. While in the calculation of market concentration at the level of individual industries and companies, only firms are considered, in terms of activities and produced products (and production methods) they are similar or are in a particular industry according to standard industry classifications.

The number of firms in a market and market distribution, are two important aspects of market structure, which play a crucial role in the formation of market concentration. At the level of individual markets, market concentration is only in terms of the market distribution between firms producing a homogeneous product. In such case, we face inequality measure focus. However, if the number of firms on both side of the market and market distribution be noted, focus absolute criteria is created.

To calculate the concentration, there are different indicators, each of which has advantages and disadvantages. But a good concentration index criteria must be: 1. easily understood, 2. independent of market size; 3. of the size between zero and one, and be dimensionless; 4. Theoretical-based. To understand the criteria the concentration curve is used. Concentration curve, shows the relationship between cumulative production and cumulative relative frequency or firm.

In applied economics, there are several indices to measure market structure of which can be inverted to determine the number of firms, price discrimination, Lerner indices, interest rates, focus ratio, the Herfindahl index, Pricing - Cost Margin, Hannah index, Entropy Index. , the Gini coefficient, variance and the logarithm of the firm's size (Denis et al., 2008).

### A- Inverse number of firms

This index is the simplest indicator of focus. One of the weaknesses of these indicators, is giving equal importance to all firms. (Denis et al., 2008).

### B- The concentration ratios (CRi) (share of n top firms)

The concentration ratio indicates the size of the production (or sell) i largest enterprise to the size of the production (or sales) market. More specifically, concentration ratio indicates a firm with CR1. And shows that the largest firms on the market, the size of the share of production (or sales). And n firm concentration ratio shows the CRn. N represents the ratio of the size of the largest firms in the market to the size of the production (or sales) market. Since in a competitive market, the market size is distributed among many firms and consequently size of one firm concentration ratio (CR1), four firms (CR4), eight firms (CR8) and even 16 firms (CR16) will be small. In a complete monopoly market, a firm constitute the total market size. And one firm concentration ratio is close to one.

The concentration ratio, market structure (competition and monopoly) is characterized to some extent, but does not provide comprehensive information about other firms in the market. The use of this index is high, it also has some weaknesses. The main limitation of this indicator is based on a point on the curve focus. Therefore, in calculating this index, much information is lost. The range of variation in these variables between zero and one hundred percent. One of the weaknesses of the index, is voluntary n. This index focuses only on information of first few firms. In other words, if a change is needed in the industry, so it does not affect large firms, does not change the size of the index. The concentration ratio largely depends on market definition. The broad market, decreases the concentration, whereas small market has usually adverse effect on concentration ratio.

### C- The Herfindahl index

Herfindahl Index (HHI) is used to fix some defects of concentration ratio and negative indicators of firms suggested by Herfindahl, Herfindahl index, determines the distribution of market size and market structure which improves the ratio between existing firms focus. HI, is used to consider all the points of the focus curve, and the information is used around the curve, in fact, in this indicator, unlike the concentration index of all enterprise information is used to calculate the degree of concentration. Herfindahl index (HI) is calculated with the following formula:

$$HI = \sum_{i=1}^n S_i^2 \quad (2)$$

$$HI = \sum_{i=1}^n \left(\frac{X_i}{X}\right)^2 \quad (3)$$

In this formula, n is the number of firms in the market and S is firms' share of the total market size. In the above indicators, the number of firms (x) and the size of their relative shares is (xi) as considered in the calculation. If there are a large number of firms with the same relative size in the market, Herfindahl index is very small and is close to zero. And if a few firms and measures inequality exist in the market, this index will be close to one.

Easterbrook, (1984), extended Herfindahl index with further studies. He gathered curve slopes concentration, and achieved the Herfindahl index. If the total number of firms in industry A and sales of the ni firms in the industry be ai, the industry concentration curve slope is calculated as follows:

$$\text{Slope of the concentration curve} = \frac{\frac{a_i}{ni}}{\frac{A}{A \cdot ni}} = \frac{a_i}{A \cdot ni}$$

The total weight of slope (W<sub>TS</sub>) with a market share of each firm can be written as follows:

$$W_{TS} = \sum_{i=1}^N \left( \frac{a_i}{A} \cdot \frac{1}{ni} \cdot \frac{a_i}{A} \right) \tag{4}$$

It is clear that if 1 = ni, the Herfindahl index will be as follows:

$$H = \sum_{i=1}^N \left( \frac{a_i^2}{A^2} \right) = \sum_{i=1}^N \left( \frac{a_i}{A} \right)^2 = \sum_{i=1}^N s_i^2 \tag{5}$$

In this respect,  $\frac{a_i}{A}$  is the market share of each firm (Si). Herfindahl concentration index can be written using the inequality index called the coefficient of variation. The average size of firms in the industry is:

$$\mu = \frac{1}{N} \sum_{i=1}^N a_i \tag{6}$$

Therefore, firm's size variance will be equal to:

$$\sigma^2 = \frac{1}{N} \sum_{i=1}^N a_i^2 - \mu^2 \tag{7}$$

And so the square can be written as a coefficient of variation:

$$C^2 = \frac{\sigma^2}{\mu^2} = \frac{\frac{1}{N} \sum a_i^2 - \mu^2}{\mu^2} \tag{8}$$

With the above fraction separation and means insertion, the following equation is obtained:

$$H = \frac{C^2 + 1}{N} \tag{9}$$

After the Herfindahl index, the inequality depends in the distribution of firms in the market (C) and the number of firms in the market (N). if Square of the coefficient of variation be zero and N-1 N, the Herfindahl index will be equal to one, indicating the complete monopoly of the market. In contrast, if there is a large number and size of small firms, this index will be zero indicating perfect competition market. In the Herfindahl index (as opposed to focusing index), to the market share of each firm, be given its weight equal to the square. Thus, it is clear that larger firms are more important in measuring the degree of market concentration and the Herfindahl index.

Real markets according to the Herfindahl index of concentration and monopoly to competition can be divided into 7 categories (Table 1, 2). For example, if a market concentration index is 100 percent and a firm have all market shares, it is Monopoly. Monopoly a market where a firm will have between 50 to 100 percent of market shares is called "dominant firm" market, if the cumulative share of the top four firms is a total of 100-60 percent, it is called Tight Oligopoly. And if the market share of the top four firms is less than 40 percent it is called Loose Oligopoly. In closed multilateral monopoly market, as a limited number of firms are focused in the market. Collusion and cooperation and non-competitive behavior is likely.

According to the Herfindahl index, the market index of less than 1,000 (0.1 of 1) is competitive market. And if the market has more than 1,800 HI index (0.18 of 1), it is considered as non-competitive market.

Table 1. Spectrum of market structure and its characteristics in terms of number and size of firms

Market features	(HI)	(CR <sub>i</sub> )	Description
More than 50 rival firm, are owned without any market share	0HI→	CR <sub>1</sub> →0	Perfect competition
High effective number of competing firms, no more than 10% of the market are monopolized.	15 < (1/HI) ≤ 30	CR <sub>1</sub> < 10	Monopolistic Competition
4 firms, with a maximum of 40% of the market monopoly.	10 < (1/HI) ≤ 15	CR <sub>4</sub> < 40	open Oligopoly
4 firm, at least 40% and maximum 60% of the market have a monopoly.	6 < (1/HI) ≤ 10	40 ≤ CR <sub>4</sub> ≤ 60	Oligopoly
4 firm, at least 60% of their market monopoly.	3 < (1/HI) ≤ 6	CR <sub>4</sub> > 60	Closed monopoly
A firm has a monopoly over 50 percent of the market.	1 < (1/HI) ≤ 3	CR <sub>1</sub> ≥ 50	Dominant firm
A firm's overall market monopoly.	1HI→	CR <sub>1</sub> →100	Complete monopoly

It should be noted that presented criteria are only applicable in firms and active firms in the market; as in this paper, some of these indices considered the entire country as a firm in the process of production market structure and world trade calculations. The concentration ratio and Herfindahl index compared to other proposed measures are used in the calculation of the global market and accessing their data is easier. There are also other indicators such as the Lerner Index, interest rates and price discrimination specific firms active in the market, which focus primarily on variable of market price.

Despite the development of market analysis methods and presentation of new indicators, still Herfindahl and concentration indices are widely used. These indicators, maintained their effectiveness, as some of the studies that have used the Herfindahl index and concentration ratio are available.

#### 4. Dividend Policy

Dividend policy is one of the most important issues in financial literature. The dividend represents a major cash payments and one of the most important choices and decisions that managers encounter. The manager must decide how much of the profit should be split, and how much investment in the company should be done again in the form of retained earnings. Despite the fact that dividend payments directly benefit the shareholders, the company's ability to accumulate profits in order to take advantage of growth opportunities is influenced (Grullon et al., 2002). In addition, the policy on the stock market has information content. And changing it contains information for shareholders.

Dividend policy is an important aspect of financial management because managers decide on the basis of the results of operations framework that how much of the company's profit should be distributed among shareholders and how much should be kept in the firm. While investors are interested to receive their annual profit from investment, managers consider the cheapest and the most important source for funding for growth, development and financial needs to not to share their profits, therefore there is a conflict between these two groups that needs to find an optimal solution.

There are some factors that affect the company's dividend policy

- Current cash flows are prospects of future cash flows, so with the increase in current operating cash flow, the director predicts higher future operating cash flows and dividend increases;
- Companies with growth opportunities, need financing, so they distribute little profit;
- Information asymmetry reduces the tendency of managers for external financing. So, in such situation managers reduce the dividend to increase financial resources;
- Debts of the company is an effective factor in dividend policy. To a certain extent companies can satisfy needed finance through borrowings, more borrowing will lead to an increase in debt and financial risk. So between debt repayment and dividend declaration, debt repayment is usually preferred;
- Dividend is a function of the company's profitability. In other words, profitable companies have more ability to pay more dividends;
- Company size also affect dividend policy. Small firms compared with large firms, have more difficulties in their funding. The dividend has positive relationship with company's size. The alternative view is that larger companies have more debt. Because creditors to larger firms have more confidence, so less profit will be divided;
- Dividend is a function of the previous year dividend;
- Corporate Governance is means of a balance between shareholders and management that reduces the agency problems and reduces the possibility that managers take the less than optimal dividend policy. (Easterbrook, 1984)

Dividend policy is part of the company's policy that specifies the company's profit. In general, the relationship between dividends and earnings per share reflects the company's dividend policy. Dividend policy is the most important issues in financing literature. Many researchers, have provided theoretical and empirical evidence concerning the dividend policy measures. However, the issue of dividend policy remains unresolved and specific guidelines regarding optimal dividend policy has not occurred. Stock companies usually conduct specific policy decisions. In formulating this policy several factors such as policies in similar companies, dividend policy, the legal limits and stable profitability are used and considered. Despite multiple policies, companies often use policies such as fixed amount dividends, a fixed percentage of profits, dividends margin and dividend surplus

#### 4.1. Factors Affecting Dividend Policy

Understanding the factors influencing dividend policy, in addition to protecting the interests of investors leads to the company's growth, profitability and satisfaction, and ultimately enhance the possibility of the stakeholders of company policies. Based on explanations and theories that were expressed factors affecting the company's dividend policy can be identified. The main aim is to investigate the factors affecting the dividend policy and the possibility of payment of dividends of listed companies on the Stock Exchange in order to identify a set of variables together, and explain dividend policy and dividends payments in stock companies.

#### 4.2. Profitable investment opportunities

One of the factors determining dividend policy is profitable investment opportunities. Based on studies conducted by Grullon et al., (2002), many companies follow the theory of surplus dividend. They decide to pay dividends when they expect to have surplus funds investments. The company first determines needed funds from retained earnings for its long-term projects, then it will distribute the excess to shareholders. It is therefore profitable investment opportunities on dividend policy can affect each institution. Companies that have more growth opportunities for profitable investment in the future growth and positioning distribute a smaller percentage of their profits to the shareholders.

#### 4.3. Debt ratio (leverage)

The ratio of corporate debt plays a key role in explaining dividend policy. (Howe et al., 1992), suggest that companies with lower debt in their capital structure, have a greater ability to distribute dividends. According to agency theory, companies with lower debt ratio have greater ability to distribute dividends to their shareholders, while, in theory, signaling the opposite is true. The company with ratio of debt; to finance the debt in order to pay interest and principal at maturity, it may retain a greater percentage of the profits in the company or based on debt contracts it is required not to distribute a percentage of profits.

On the other hand, increasing leverage (debt-to-equity ratio) increases financial risk in order to reduce this risk, companies are forced to reduce the percentage distribution of profits.

#### 4.4. Institutional Ownership

Institutional ownership is stock percentage of total capital shares held by state companies and public. These companies include insurance companies, financial institutions, banks, public companies and other parts of the state. This variable is also used with the same definition in researches of (Howe et al., 1992). There are two conflicting views on the relationship between institutional ownership and dividend policy:

Inverse correlation (negative): (Howe et al., 1992), believed that in existence of a conflict of interest, external monitor or external activity is an important control element. Institutional shareholders are a group of foreign observers. If large institutional investors act as representatives of the regulatory act and dividends be paid to reduce agency costs, based on the theory of representing relationship between dividend policy and institutional ownership should be substitute. In this regard, a negative correlation between the percentage of stock owned by institutional owners and dividend policy is necessary. (Howe et al., 1992), states that according to message theory, managers indicate their future benefits with higher awareness and more information. It can be argued that dividend and institutional investors may not be considered as an alternative means of messaging. The presence of large shareholders may reduce the need to use dividends as the message of proper performance because same shareholders can act as a credible message. Institutional owners may transmit to the market that agency costs is decreased due to monitor activity of this shareholders group.

Asset structure is another factor of assets structure. (Howe et al., 1992), showed in their study that companies with higher tangible assets have greater ability to exercise their dividend policy.

#### 4.5. Growth Opportunities

(Howe et al., 1992), argued that higher growth opportunities need further financing and therefore have a higher chance to maintain profits. Also, Grullon et al., (2002) showed that companies with higher growth opportunities have less dividend payout ratio, this negative relationship supported dividend policy of stock by representation theory of dividend policy. As ratio of market value to book value of a company be more, distribution of profits is lower. According to the theory of "investment opportunities" as company's investment opportunities be more, its market capitalization compared to its book value is more on average, because unlike balance sheet, stock prices reflect the company's intangible assets such as the company's growth opportunities ahead of them (Easterbrook, 1984).

#### 4.6. Company size

The effective factors on their dividend policy and dividend payments is size of the company. (Howe et al., 1992), found that corporates have greater access to capital markets and have more ability to pay dividends to shareholders of the smaller companies. With regard to the issue of "political costs", size of the company can be considered a reflection of the political effects that cannot be raised for small companies. Company size is a factor that affects the efficiency of the company. Company size can be replaced with risks that cannot be justified by beta. As company is smaller, there will be less liquidity of its shares. Therefore, the expected return on investment increases. According to Ritter (Howe et al., (1992), small companies because of more uncertainty about the future of their intrinsic value have a higher risk compared with large companies and investors are more vulnerable to speculative purposes. Therefore, the pricing of the shares of small companies is higher than actually expected.

#### 4.7. Dividend payout policy

Due to factors affecting the dividend policy of which are explained, the behavior is usually of profit-sharing institutions are placed under one of the four distinct policies.

##### 1. The payment of a fixed percentage of the net profits

In practice, very few institutions follow the policy and its reason is clear. The net profit figure is not predictable in many institutions because profits fluctuate with changes in economic conditions and conditions within the institution.

This policy causes major fluctuations in the dividend. And so shareholders rarely able to predict certain level of dividend.

##### 2. Regular Dividend

This type of policy is the most common stock dividend policy. Institutions will have to dividend at a level that can sustain it in the years thereafter. And only this level will increase in the future if they ensure they are able to pay the new level and profit sharing.

##### 3. Multiple increases

Based on this policy, rather than expecting an increase in profits in order to ensure a higher level far than the dividend, it is better to continually attempting to increase the dividend to a fixed rate. Naturally, such a policy also indicates that the Institute has been successful in communicating with shareholders about the dividend.

##### 4. Extra dividends payment

This policy will apply to institutions that divide the profits into two parts. A portion of the dividend as smoothly and the rest would be done as an additional benefit.

#### 4.8. Asset growth rate

The study of changes in fixed assets which companies are the main sources of future growth and development is very important. The main methods for the development of a company's activities by increasing a company's fixed assets can be acquired by another company, the increase in capital (equity) and the use of credit and debit cited. But the important point is that with the development of fixed assets, the company's returns decreases over time. While the decline in fixed assets of the company makes returns increase over time. Reduction of the company's assets and consequently the volume of investment in fixed assets can be used to redeem the shares, repayment of debt and payment of dividends to shareholders (Easterbrook, 1984).

#### 4.9. Market value to book value

The ratio of price to book value or share price divided by book value per share gives a new benchmark. Which can be many times the book value of its shares will be traded. If the status of the economy in exchange for various political crises and so is undesirable and the value of the shares is declined, companies' shares will be equal to the book value. In this case, smart people buy stock. Therefore, in many cases, it could be considered as the benchmark for investment.

The ratio of price to book value, which is one of the financial ratios is used to measure the market price. This type of measure to measure the value created for shareholders is also considered.

This ratio which is dependent on the market price of the stock is obtained by dividing market share price to the book value.

The ratio of market value to book value is a measure of investment opportunities. According to this theory, companies release shares when the ratio of market value to book value of the shares is high. This is because managers believe that shares in market is in fact determined more than reality.

#### 4.10. Return on assets

Return on assets is one of the financial ratios, obtained by dividing net income plus interest expense to total assets. ROA is concerned with production and sales skills and is not affected by corporate financial structure. Because of in calculating profit

with the rate of return on assets, earnings faults can be seen here, too. Given that the net book value of assets is shown on the balance sheet, therefore, the real value of assets may be lower or higher than their book values. Therefore, low ROA does not mean that assets must be utilized elsewhere. The high ROA does not mean that the company had to purchase the assets and business.

#### 4.11. Free Cash Flow

Jensen defines free cash as the operating profit after taxes plus non-cash expenses after deduction of investment (increase in variation) in working capital, property, plant, equipment and other assets (Denis et al., 1994).

Free cash flow allows management in the absence of proper corporate governance structure to act to manipulate earnings. Denis et al., (2008), argues that manipulate earnings in companies with high free cash flow is higher. Research also shows that companies that have more free cash flow with greater representation are facing the problem of cost. Especially in firms with low investment opportunities, there is a low growth.

Given the high expectations, executives of companies where cash flows are high and have low growth, maintain a higher level of excess cash to operate inefficient investments. To hide the effects of such practices, they attempt to manage earnings. Also, given that many real earnings management through non-transparent activities of earnings management is through accruals. And manipulation of accruals are more likely to be identified by auditors and inspectors. This increases the incentive to manipulate the actual activities.

### 5. Research Methodology

The research methodology in terms of classification is based on objective and applied research. The aim of applied research is development of practical knowledge in a particular field. The research in terms of methodology and the nature used correlation approach.

The study population involves companies in Tehran Stock Exchange during the years of 2010-2014 as a total of 475 manufacturing companies.

To select sample of the FA sampling (screening) is used. And companies studied in order to test hypotheses, have been selected so that all the following conditions must be met:

In terms of comparability, the fiscal period should be ended in March. This limitation is due to having same time periods in creating variables in the calculation, so that conditions and seasonal factors do not affect choosing variables and factors.

Companies that are listed in the Tehran Stock Exchange prior to 2014.

Companies in which the desired data is available.

During the study, companies should not change their financial years.

Companies should not be other than banks and financial institutions (investment companies, financial intermediaries, holding companies, banks and leasing).

According to the above conditions 75 companies have been chosen and continued to be analyzed.

### 5.1. Variables

In order to assess market power and dividend policies, the regression model is used:

$$\text{Div Pay} = \alpha_0 + \beta_1 \text{profitability} + \beta_2 \text{RE/TA} + \beta_3 \text{AGR} + \beta_4 \text{SIZE} + \beta_5 \text{M/B} + \beta_6 \text{ROA} + \beta_7 \text{CFROA} + \beta_8 \text{HHI} + \epsilon_t$$

Profitability:

Net sales revenue minus the cost of goods sold and operating costs associated with the ongoing operations of the entity.

Size:

Different criteria for measuring variable of "company size" exists which include: total assets, sales and number of employees. In this study, the logarithm of total assets to measure the variable of "company size" used (Denis et al., 1994).

AGR: asset growth rate

Growth of assets according to total assets growth.

ROA: Return on Assets

Return on assets is defined as operating income divided by total assets.

Div Pay: Dividends paid

Dividing the dividend payment of dividends on the net profit.

RE / TA: total assets / retained earnings = RE / TA

M / B: market value per share/ Book value per share = M / B

CFROA: cash flow (CF) / Return on Assets (ROA) = CFROA

HHI: Herfindahl index

With further studies (Denis et al., 1994), could extend the Herfindahl index. He added curve slopes concentration to obtain the Herfindahl index. If the total number of firms in an industry is A and sales of the industry is ni, and the firms is ai, then the slope of the curve in this industry concentration is calculated as follows:

$$\frac{a_i}{ni} = \frac{a_i}{A \cdot ni}$$

Slope of the concentration curve

The total weight of slopes with a market share of each firm can be written as follows:

$$\sum_{i=1}^N \left( \frac{a_i}{A} \cdot \frac{1}{ni} \cdot \frac{a_i}{A} \right) \quad (10)$$

It is clear that if  $1 = ni$ , the Herfindahl index will be as follows:

$$H = \sum_{i=1}^N \left( \frac{a_i^2}{A^2} \right) = \sum_{i=1}^N \left( \frac{a_i}{A} \right)^2 = \sum_{i=1}^N s_i^2 \quad (11)$$

In this respect,  $\frac{a_i}{A}$  is the market share of each firm (Si). Herfindahl concentration index can be written using the

inequality index called the coefficient of variation. The average size of firms in the industry is:

$$\mu = \frac{1}{N} \sum_{i=1}^{i=N} a_i \tag{12}$$

Therefore, firm's size variance will be equal to:

$$\sigma^2 = \frac{1}{N} \sum_{i=1}^{i=N} a_i^2 - \mu^2 \tag{13}$$

And so the square can be written as a coefficient of variation:

$$C^2 = \frac{\sigma^2}{\mu^2} = \frac{\frac{1}{N} \sum_{i=1}^{i=N} a_i^2 - \mu^2}{\mu^2} \tag{14}$$

With the above fraction separation and means insertion, the following equation is obtained:

$$H = \frac{C^2 + 1}{N} \tag{15}$$

Information and data needed for research obtained from the library method, with the application of new achievements, and by referring to the Tehran Stock Exchange and the financial statements of listed companies in Tehran Stock Exchange in the period of 2009- 2013. In this regard, in addition to the basic financial statements, the financial statements of exchange information is used, too.

In this study, to analysis the data, analysis panel is used. Panel data analysis has high validity among researchers. A panel, is a cross-sectional sample or group of data which is comprehensive. Which is examined and surveyed periodically in a certain period. Data Panel analysis provides the possibility of conducting regression research both in space and time dimension. The next place to set the units sectional can include countries, states, counties, businesses, goods, groups or even single individuals. Dimension of time is observation of a set of variables that reflect the characteristics of the units during a specific time period. As noted, the tools used to collect data, includes statistical analysis and database analysis by using the software that are analyzed by descriptive and inferential statistics.

**6. Data Description**

The following table the indices including mean and median central and dispersion indices such as standard deviation, skewness and kurtosis are calculated for different variables. As average is greater than mean because the average will be affected by these values. In these cases, the data distribution is skewed to the right. In some cases, left. The distribution of any variable is skewed to the left or right. And if the mean and the median variables are equal, distribution of variables is symmetrical. This feature is important because symmetry is one of the characteristics of normal distribution. It will be discussed in the next section. (Skewness and kurtosis of the normal distribution is zero).

$$Div\ Pay = \alpha_0 + \beta_1\ profitibility + \beta_2\ RE/TA + \beta_3\ AGR + \beta_4\ SIZE + \beta_5\ M/B + \beta_6\ ROA + \beta_7\ CFROA + \epsilon_t$$

Table 2 Data Description

	Div Pay	HHI	SIZE	RE/TA	AGR	profitability	M/B	CFROA	ROA
Average	40.04	0.155	12.81	3.08	4.60	157.3	5.7	0.59	0.20
Mean	16.010	0.157	12.62	2.10	2.26	129.2	1.72	0.60	0.10
max	2540.025	0.219	17.39	16.15	42.05	2192.5	42.05	1.31	0.55
min	438.6-	0.001	10.09	0.303	0.30	0.000	0.47	0.000	0.7
Standard deviation	150.59	0.0112	1.31	2.65	6.77	169.98	8.19	0.25	0.20

To calculate coefficients, first the diagnostic panel and data compilation (homogeneous) is determined or with their effects

(heterogeneity), the Chow test and F Limer statistics are used. The results are shown in Table 3, 4

Table 3: determine homogeneous or heterogeneous sections

Hypothesis 0	Statistic F	The significance level	Test result
Combined model is proper	0.830163	0.7494	confirmed

The probability value is equal to 0.74, so the hypothesis 0 as the use of combined model (or models without effects or homogeneous) is confirmed. To evaluate the hypothesis test of market power and dividend policies, regression model is used as below:

$$Div\ Pay = \alpha_0 + \beta_1\ profitibility + \beta_2\ RE/TA + \beta_3\ AGR + \beta_4\ SIZE + \beta_5\ M/B + \beta_6\ ROA + \beta_7\ CFROA + \beta_8\ HHI + \epsilon_t$$

The results are shown below in Table 4 panel:

Table 4: model with the combined effects

DIV PAY				
Research variables Factor	Coefficient	Standard deviation	T Statistics	significance level
Fixed amount	8106.7	18408.3	0.44	0.65
PROFIT	38690.8	6468.53	5.98	0.0000
RE/TA	37.06	10.79	3.43	0.0006
AGR	4102.2	269.62	15.21	0.0000
CFROA	29300.8	3910.20	7.49	0.0000
M/B	81.52	12.02	6.77	0.0000
SIZE	656.8-	1382.10	0.47-	0.63
ROA	9.14E-05	2.67E-05	3.42	0.0006
HHI	0.052	0.008	6.05	0.000

Coefficient of determination	0.71	Statistic F	56.45
Adjusted coefficient of determination	0.67		
Durbin-Watson statistic	2.25	significance level of F	0.0000

In Table (3) the model is estimated by the combined effects, significance level of F is equal to 0.000. The amount is less than 0.05, so the hypothesis 0 is rejected at the significance level of 95 percent. This means that at 95% significant level the model is meaningful. The coefficient of determination is 0.71, about 71% of the variability is explained by the independent variables. The Durbin-Watson statistic is equal to 2.25. Values close to 2 indicate lack of autocorrelation of regression residuals assumption (so there is no autocorrelation between residuals). PROFIT t statistic value is equal to 5.9 (positive and significant), RE / TA is 3.4 (positive and significant), the AGR is 15.21 (positive) and for CFROA it is equal to 7.49 (positive) and the M / B is equal to 6.77 (positive and significant), the SIZE is -0.47 (not significant) and ROA is 3.42 (positive and significant) and the HHI is equal to 6.05 (significant and positive). The t-statistic to intercept is equal to 0.440 at 95% of the hypothesis 0 so the amount is not significant.

### 7. Summary of hypothesis tests and research model

The first hypothesis test results, using fixed effects model and estimated generalized least squares method (EGLS) is provided. The results show a direct relationship exists between profitability and dividend payments. Thus the first hypothesis, which expresses the relationship between profitability and dividend payment is confirmed.

The second hypothesis test results, using fixed effects model and estimated generalized least squares method (EGLS) is provided. The results show a direct relationship exists between accumulated profits to total assets and dividends payments of companies listed on Tehran Stock Exchange

The third hypothesis test results, using fixed effects model and estimated generalized least squares method (EGLS) is provided. The results show a direct relationship exists between the growth rates of assets and dividends paid by companies listed on the Tehran Stock Exchange. It should be noted that the size of the company, has a significant effect on the dividend, which indicates the size has no effect on dividend payments. And

The fourth hypothesis that expresses the relationship between firm size and dividend payments is not confirmed.

Consequently, the fifth hypothesis test results, using fixed effects model and estimated generalized least squares method (EGLS) is provided. The results show a direct relationship exists between the market value to book value and dividends paid by companies listed on the Tehran Stock Exchange.

It should be noted that variable rate of return on assets, has a significant effect on dividend payment that demonstrate the effectiveness rate of return on assets and dividend payment. Therefore, the sixth hypothesis that indicates the relationship between the rate of return on assets and dividend payments, is also confirmed.

The seventh hypothesis test results, using fixed effects model and estimated generalized least squares method (EGLS) is provided. The results show a direct relationship exists between the rate of return on assets, cash flow and dividends paid by companies listed on the Tehran Stock Exchange.

The eighth hypothesis test results, using fixed effects model and estimated generalized least squares method (EGLS) is provided. The results show a direct relationship exists between dividend

payout and the Herfindahl index of companies listed on Tehran Stock Exchange. This can be emphasized that if the degree of concentration in the industrial markets of Iran is increased, the profitability of firms active in these markets will increase. In other words, the profitability of monopoly industries is higher than the profitability of competitive industries in Iran.

### 8. Suggestions arising from the research findings

1. It is recommended that shareholders and investors who want to develop or purchase new shares pay attention to this issue. Because in inflationary conditions, there is a period in which data is used. Companies that can benefit from its assets which maintain the shareholder values in inflationary conditions. Not only it does not hurt, but the minimum value of the money they keep in such conditions is mentioned.
2. The results showed that there is a relationship between cash flow and dividend indirectly, which indicates two things. Companies convert their cash flow and asset to maintain value of money in inflationary conditions or pay debt maturities as an important principle when cash flows is economical. Cash flows of interest does not exceed the cost of maintaining it, therefore it is recommended to shareholders as indirect warning sign and not sign of crisis. So they better have reviews to buy or sell their shares.
3. The high market value of equity shows shares to be very valuable. Shareholders and investors are recommended to pay much attention to these case.
4. Based on this result, it is recommended to shareholders and investors that they consider various stages of the corporate life cycle financially. It means that the financial characteristics of an enterprise is affected by the stage of the life cycle in which the firm is located.
5. Usually companies that have high sales of assets, can take advantage of the return on assets or by selling unnecessary assets they increased corporate income at a time. That is to have positive effects. Shareholders are better to consider these issues when buying.

**Abstract.** This study aimed to analyze the relationship between employees psychological empowerment and job satisfaction (Case Study: Sadra Municipal Employees) is done. The research is descriptive and correlational, for this purpose, study population was Sadra municipal employees selected by researcher in the study as their numbers at the time was 76 people, all members of society through the census designated as sample size and questionnaire distributed among the population. Validity through content and reliability of the questionnaire by Cronbach's alpha, respectively (0.86) and (0.98) were obtained, and to analyze the information obtained SPSS16 software is used. The results showed that there is a significant relationship between psychological empowerment and job satisfaction of Sadra municipal employees.

**Keywords:** psychological empowerment, job satisfaction, Sadra municipal employees

### 1 Introduction

Human resources should be considered as the most important asset of an organization that has a key role in achieving the organization goals, today, organizations spend high costs to attract and retain human resources till in competition field catch up from other competitors. At present, due to competition between organizations and companies in order to gain greater control over resources has gained importance. If organizations have the best technology and have the best possible benefit, but do not have the skilled and efficient work force and the ability to gain the necessary interest, unable to affect the environment and succeed in the competition. The quality of this investment is more favorable, the probability of success, survival and improving the organization.

### 2 Methodology

Since the factors of production, human resources unlike other corporate resources as the reason and the coordinator of the other known factors as well as the most important factor in increasing productivity and organization, so a special place and special attention should be paid to it (Allahverdi et al., 2009). Job satisfaction or dissatisfaction is the person's attitude way to job (Saatchi et al., 2008). Job satisfaction is person's general attitude towards the job (Kohistani and Shojaee Far, 2011). Job satisfaction is press mode, positive, emotional, and feel in relation to jobs as a result of individual assessment of his work experience is obtained (Keramati, Mirkamali and Gholam Zadeh, 2005). According to Specter, job satisfaction has two dimensions: the human aspect that is worthy of the employees to be treated fairly and with respect and the behavioral aspects of the behavior of employees according to job satisfaction could lead the way that is effective in organizational functions and tasks. Success largely to the efforts of satisfaction and motivation of human resources depends on their mood. Human resources for desirable behavior should be in line with the objectives of the organization, have the motivation and right to be raised and this does not happen except through whys identify behavior or desire causes and reasons for motivation and employee satisfaction. Job satisfaction is one of the most important variables in organizational behavior as well as a central variable in research and organizational theory (Darwishi, 2007).

Today, organizations progress requires to achieve higher quality and more innovative while cost savings. Knowledge of personality characteristics that influence employee motivation and belief in the organization is essential to the advancement of

human behavior (Ebrahimi Nejad and Soleimian, 2007). Managers surrounded how to motivate employees and their motivation to ease step removed. Job satisfaction is not only an issue of interested to organizations, also has attracted researchers' attention (Bushra & Usman, 2011). Increasing job satisfaction in an organization, the turnover is minimized, resulting in reputation and competitive position. Job satisfaction is one of the most important variables in organizational behavior as well as a central variable in research and organizational theory (Darwishi, 2007). Environmental changes and increasing global competition, the topic focuses on managers is employee empowerment. Why organizations with empowered employees, committed, skilled and motivated, better able to adapt to changes and compete. Empowerment, sharing the healthiest way people in power. In this way, confidence, energy, pride, self-sufficiency in people's commitment and sense of increased participation in organizational matters, improved performance will follow (Mohammadi, 2001).

Conger & Kanungo (1988) due to the following reasons for the severity of empowerment put it:

1. Studies management skills show that subordinates empower are an important part of organizational effectiveness and management.
2. The analysis of power and control in organizations suggests that employees share in power and control, increase organizational effectiveness.
3. Experience in organized groups implies that empowerment strategies play an important role in the creation and survival of the group and ultimately the survival of the organization.

#### 2.1 Research objectives

1. Explanation of relationship between psychological empowerment and job satisfaction of Sadra municipal employees
2. Explanation of psychological empowerment of municipal employees Sadra is significant predictor of job satisfaction
3. Explanation of the psychological empowerment of male and female of Sadra municipal employees is significant predictor of job satisfaction
4. Explanation of the psychological empowerment of Sadra municipal employees has significant predictor of job satisfaction

#### 2.2 Research questions

In this study, two standard questionnaires Spreitzer psychological empowerment (1995) and Minnesota job satisfaction (2012) was used.

**First questions:** is there a significant relationship between psychological empowerment of municipal employees Sadra and job satisfaction?

Table 1, the correlation between the variables of psychological empowerment (job significance, sense of competence, given the choice, feel effective, having trust in others) with job satisfaction has shown. The results obtained indicate that given the choice, job satisfaction ( $r=0.44$  and  $0.002 > p$ ) has a significant positive correlation with job satisfaction and sense of effectiveness ( $r=0.68$  and  $0.0001 > p$ ) has positive and significant relationship with job satisfaction. However, significant job with job satisfaction ( $r=0.17$  and  $p = nS$ ) and sense of competence with job satisfaction ( $r=0.17$  and  $p = nS$ ) has not a significant relationship.

Table (1), correlation coefficient result of research variables

Variable		Significant jobs	Sense of competence	Right to Choose	To be effective	Reliance on others
Job Satisfaction	Correlation coefficient	0.17	0.02	0.44	0.34	0.48
	Significance level	0.14	0.84	0.002	0.0001	0.0001
	Number	74				

**Second question:** Does psychological empowerment of Sadra municipal employees is a significant predictor of job satisfaction?

Based on the results in Table 2, observed, employee psychological empowerment 37 percent of the variance in job satisfaction predicted. The results indicate that trust to others

with regression coefficients 0.38, right to choose with regression coefficient 0.29, job significance with regression coefficient 0.22 has highest and the lowest has significant and positive predictive power of job satisfaction, but a sense of competence and effectiveness are not a significant predictor of job satisfaction.

Table (2) the prediction of job satisfaction based on employee's psychological empowerment variables

Predictor variables	Criterion variable	F	R	R <sup>2</sup>	β	t	Significance level
Significant jobs	Job Satisfaction	8.14 0.0001<p	0.61	0.37	0.22	2.07	0.04
Sense of competence					0.06	0.57	0.56
Right to Choose					0.29	2.32	0.02
To be effective					0.04	0.34	0.73
Reliance on others					0.38	3.42	0.001

**Third question:** Does man and woman psychological empowerment of Sadra municipal employees is a significant predictor of job satisfaction?

Based on the results in Table 2, observed, man employee psychological empowerment 41 percent of the variance in job

satisfaction predicted. The results indicate that trust to others with regression coefficients 0.45, right to choose with regression coefficient 0.33 has highest and the lowest has significant and positive predictive power of man employee's job satisfaction, but a sense of competence and effectiveness are not a significant predictor of man employee's job satisfaction.

Table (3) the prediction of job satisfaction based on man employee's psychological empowerment variables

Predictor variables	Criterion variable	F	R	R <sup>2</sup>	β	t	Significance level
Significant jobs	Job Satisfaction	9.06 0.0001<p	0.68	0.41	0.15	1.30	0.19
Sense of competence					0.03	0.57	0.75
Right to Choose					0.33	2.49	0.01
To be effective					0.005	0.34	0.97
Reliance on others					0.45	3.46	0.001

Based on the results in Table 3, observed, woman employee psychological empowerment 53 percent of the variance in job satisfaction predicted. The results indicate that trust to others with regression coefficients 0.86, job significance with regression coefficient 0.60, sense of competence with regression

coefficient 0.50 has highest and the lowest has significant and positive predictive power of man employee's job satisfaction, but trust to others and effectiveness are not a significant predictor of man employee's job satisfaction.

Table (3) the prediction of job satisfaction based on woman employee's psychological empowerment variables

Predictor variables	Criterion variable	F	R	R <sup>2</sup>	β	t	Significance level
Significant jobs	Job Satisfaction	4.74 0.0001<p	0.82	0.53	0.60	3.40	0.006
Sense of competence					0.50	2.40	0.03
Right to Choose					0.86	2.22	0.04
To be effective					0.44	1.21	0.24
Reliance on others					0.21	1.11	0.28

**Fourth question:** Does psychological empowerment of Sadra municipal employees with different degrees is a significant predictor of job satisfaction?

Based on the results in Table 4, observed, dimensions of employee psychological empowerment with diploma 52 percent of the variance in job satisfaction predicted. The results indicate

that trust to others with regression coefficients 0.68, right to choose with regression coefficient 0.50, job significance with regression coefficient 0.30 and sense of competence with regression coefficient 0.28 has highest and the lowest has significant and positive predictive power of diploma employee's job satisfaction, but effectiveness are not a significant predictor of diploma employee's job satisfaction.

Table (4) the prediction of job satisfaction based on diploma employee's psychological empowerment variables

Predictor variables	Criterion variable	F	R	R <sup>2</sup>	$\beta$	t	Significance level
Significant jobs	Job Satisfaction	6.88 0.0001<p	0.78	0.52	0.30	1.47	0.01
Sense of competence					0.28	1.15	0.03
Right to Choose					0.50	2.47	0.004
To be effective					0.20	0.97	0.25
Reliance on others					0.68	3.59	0.001

Based on the results in Table 5, observed, dimensions of employee psychological empowerment with associate degree 37 percent of the variance in job satisfaction predicted. The results indicate that right to choose with regression coefficient 0.68, job significance with regression coefficient 0.44 has highest and the

lowest has significant and positive predictive power of associate degree employee's job satisfaction, but trust, sense of competence and effectiveness are not a significant predictor of associate degree employee's job satisfaction.

Table (5) prediction of job satisfaction based on associate degree employee's psychological empowerment variables

Predictor variables	Criterion variable	F	R	R <sup>2</sup>	$\beta$	t	Significance level
Significant jobs	Job Satisfaction	7.82 0.0001<p	0.91	0.72	0.44	2.86	0.02
Sense of competence					0.03	0.20	0.84
Right to Choose					0.68	2.70	0.02
To be effective					0.008	0.04	0.96
Reliance on others					0.38	3.42	0.001

Based on the results in Table 5, observed, dimensions of employee psychological empowerment with bachelor degree 37 percent of the variance in job satisfaction predicted. The results indicate that trust to other with regression coefficient 0.59 has significant and positive predictive of bachelor employee's job satisfaction, sense of competence, right to choose and effectiveness are not a significant predictor of bachelor degree employee's job satisfaction.

### 3 Results

Correlation between the variables of psychological empowerment (job significance, sense of competence, given the choice, feel effective, having trust in others) with job satisfaction has shown. The results obtained indicate that given the choice, job satisfaction ( $r=0.44$  and  $0.002 > p$ ) has a significant positive correlation with job satisfaction and sense of effectiveness ( $r=0.68$  and  $0.0001 > p$ ) has positive and significant relationship with job satisfaction. However, significant job with job satisfaction ( $r=0.17$  and  $p = nS$ ) and sense of competence with job satisfaction ( $r=0.17$  and  $p = nS$ ) has not a significant relationship.

According to the results obtained from test this hypothesis; there is significant relationship between employees' psychological empowerment and job satisfaction. This means that the employees in the organization have benefited from more psychological empowerment, job satisfaction is more in them and motivating them to stay and work out more. In fact, psychological empowerment is a means to empower the individual; this means that the staff will help to strengthen their sense of self-confidence and to overcome their feelings of impotence and helplessness. So workers have this sense of empowerment in the organization are more satisfied and to leave the job less reluctant to think it does not show. The relationship between competence and job satisfaction has been confirmed that the relationship between their satisfaction and effective we can say that this feature is important because having a sense of competence is psychological empowerment element that determines and people will try to do hard work and perseverance. In fact, by increasing the effectiveness of job satisfaction also increases the sense of feeling effective in municipalities or individual tasks with the creation of a positive effect on the effectiveness of the organization. Results and significant correlation test and predictor of job satisfaction corroborates and it can be assumed that individuals are empowered with a sense of confidence and are confident that the

organization treats them fairly and staff feel more prepared to trust the honesty and sincerity to pretend they and their successor more research-oriented, autonomous, self-confidence and are eager to learn. Also significant relationship between feelings and choices with job satisfaction results show that direct and meaningful relationship between these two components is obtained. When employees feel it is important and valuable to pursue career goals and their work is important and more committed and involved and more show perseverance and the pursuit of desired goals.

Based on the results in Table 2, observed, man employee psychological empowerment 41 percent of the variance in job satisfaction predicted. The results indicate that trust to others with regression coefficients 0.45, right to choose with regression coefficient 0.33 has highest and the lowest has significant and positive predictive power of man employee's job satisfaction, but a sense of competence and effectiveness are not a significant predictor of man employee's job satisfaction.

In addition, it observed woman employee psychological empowerment 53 percent of the variance in job satisfaction predicted. The results indicate that trust to others with regression coefficients 0.86, job significance with regression coefficient 0.60, sense of competence with regression coefficient 0.50 has highest and the lowest has significant and positive predictive power of man employee's job satisfaction, but trust to others and effectiveness are not a significant predictor of man employee's job satisfaction.

The results show that the harmony and psychological empowerment significant difference between male and female employees in other words, psychological empowerment of women employees are significantly more likely than men and this is probably due to the sense of competence and means to render the top women in the municipality. However, trust others and feel significantly more effective in men than in women and this is probably due to the feeling of being effective and trust in the men in our society. Expected increases in measures enabling organizations to increase awareness and experience of the staff, enhance their sense of participation and the need to improve efficiency, especially in the years between employments, due to the inadequacy of the measures considered to be of enabler. On the other hand enabling the organization may be more focused groups that have been established in the organization at the same time until retirement and have more opportunities. Study limitations during employment, contractual employees and

contractual restrictions on access to certain institutional advantages and opportunities, greater attention to key employment categories, disproportionate allocation of educational and administrative facilities, and inadequate investment on conventional forces and could be the reason. Better empowerment of women employees in the research and commitment of women to a greater sense of empowerment knows, the result of the study is consistent with the results Abesi and Kord (2009), Cloetet et al., (2002).

Based on the results observed, dimensions of employee psychological empowerment with diploma 52 percent of the variance in job satisfaction predicted. The results indicate that trust to others with regression coefficients 0.68, right to choose with regression coefficient 0.50, job significance with regression coefficient 0.30 and sense of competence with regression coefficient 0.28 has highest and the lowest has significant and positive predictive power of diploma employee's job satisfaction, but effectiveness are not a significant predictor of diploma employee's job satisfaction.

In addition, it observed, dimensions of employee psychological empowerment with associate degree 37 percent of the variance in job satisfaction predicted. The results indicate that right to choose with regression coefficient 0.68, job significance with regression coefficient 0.44 has highest and the lowest has significant and positive predictive power of associate degree employee's job satisfaction, but trust, sense of competence and effectiveness are not a significant predictor of associate degree employee's job satisfaction.

It observed dimensions of employee psychological empowerment with bachelor degree 37 percent of the variance in job satisfaction predicted. The results indicate that trust to other with regression coefficient 0.59 has significant and positive predictive of bachelor employee's job satisfaction, sense of competence, right to choose and effectiveness are not a significant predictor of bachelor degree employee's job satisfaction.

In addition, it observed, dimensions of employee psychological empowerment with MA degree 37 percent of the variance in job satisfaction predicted. The results indicate that right to choose with regression coefficient 0.71 and sense of competence with regression coefficient 0.54 and trust to other with regression coefficient 0.45 has significant and positive predictive of MA employee's job satisfaction, sense of competence, right to choose and effectiveness are not a significant predictor of MA degree employee's job satisfaction.

The results show that the increase in average tests and psychological components of empowerment by increasing qualification. According to the results obtained by separation according to degree, these species can be deduced and the research community feels with a higher degree of psychological empowerment of employees increased. However, 53 percent of the changes in employees' job satisfaction hold a diploma predicted. In today's competitive environment, organizations with an amazing transformation must be managed. In such circumstances, managers do not have much time to control employees and must spend most of your time and energy identifying the internal and external environment, and other everyday tasks entrusted their staff. When employees can handle well in tasks of skill, knowledge and ability necessary well understand and objectives of the organization. A tool can help managers in the field to rush the process of empowerment. It enables a new method for the survival of the lead to organizations in the competitive environment. A successful organization is composed of people with intellectual and set common goals with flexible teamwork in the organization; experiences and knowledge to development of the organization are located. Therefore, each individual has a functional organization that does have a sense of ownership. The use of suitable potential is huge advantage for any organization. Today's organizations are affected by factors such as increased

global competition, rapid changes, the need for quality and after-sales service and limited resources and are under a lot of pressure. After many years of experience, the world has concluded that if an organization wants to be a leader in economic and business affairs and must not fall behind the competition from experts, creative and motivated is high. Human resources constituted the real wealth of an organization effective educational system by promoting job skills and human resources is an increased efficiency. The educational system is not efficient and is not tailored to the needs of time and business, virtually the organization's efforts to strengthen human resources to results comparable to those countries that have favorable conditions, will not get. The results of the studies are consistent with results conducted by Hassanpour et al., (2009) and Bennis et al., (1985), Clark and Stander (2014).

#### 4 Applied research proposals

Please enable their employees based on specifications and willingness to transfer its knowledge and efforts to promote the valuation. In order to comply with the payment of the salary of the actions that led to encouraging people to empower the organization. Encourage employees whose individual skills, team and improve the quality of their work. They use their own experience and others that may be useful or negative, are used. Empower people with the skills and values they admired their work and to respect all ideas and suggestions will be considered.

1) Measures such as job rotation, job enrichment and empowerment and according to the enjoyable work, perception of meaning at work improved and managers can plan with enabling employees to achieve in these areas. In particular, the results were significant aspect of influence and competence, these measures can be effective steps taken to strengthen these two dimensions.

2) Organization tries to improve relations between managers and employees. In this respect, goal setting program function can be useful. Since the quality of the relationship between employees and supervisors adequate time properly carry out the duties assigned to staff, this applies to goal setting programs, set performance targets for each employee. That the duties of staff for a clear and specific time to be determined by taking to achieve the goal. After the designated time, the assessment of individual activities and feedback given to employees finally, based on the tasks that employees do they have weaknesses, determine an appropriate educational program.

3) Identify key personnel in the organization. Key staff are very creative people and effective that will empower them to empower others and with greater participation than they used. They trained in behavior and psychological empowerment and the roots of the organization as they used to enhance the capabilities of other employees. In addition, it will lead to increase good relations between employees and increase their interest in staying in the organization and the lack of turnover.

#### 4.1 Management proposals for future research

Future researchers who are interested in research in this field is suggested that:

- The study for analysis and comparison between public and private organizations and companies to do different work environments and activities examined in this regard.
- Other factors affecting research by bringing in models such as the effect of organizational climate, organizational health, communication management, organizational commitment, personality characteristics.

**Abstract.** An experimental pretest post-test control group research design was used for the conduct of this study in which 50 junior high school students with weak performance in mathematics were selected by purposive sampling method. These participants were then assigned randomly in experimental and control groups (25 participants in each group). The obtained data were analyzed using descriptive and inferential statistics, which included repeated measures ANOVA. The results of data analysis showed that metacognitive skills training and daily short-term practice of mathematics had a significant effect on the students' attitudes towards mathematics and their performance in this course in the experimental group. It is notable that this significant impact was at play after three months from the passage of the intervention.

**Keywords:** metacognition training, academic achievement, attitudes to mathematics

### 1 Introduction

Mathematics or calculation has been called the universal language. Calculation is a symbolic language that enables human to think about things, record them, and relate thoughts and relations between quantities to each other. In the present age, education and training, and generally education constitute an important part of people's lives; furthermore, the quality and quantity of education also plays an important role in the future of people. Accordingly it is for almost a century that psychologists are widely seeking to identify predictors of academic achievement. In different societies, professional groups and psychologists have always emphasized the review of various aspects of education and the effective factors in it (Lounsbury, Steel, Loveland & Gibson, 2004). In this way, not only students and their families spend huge costs on the education of students at different levels of education, but also the society spends huge costs. Thus, the achievement of positive results in the field of education along with the identification and control of the factors affecting academic achievement can lead to all-round development of students and the community. Teachers and students believe that mathematics is essential in daily life due to its widespread use and competency in mathematics is a crucial predictor of economic efficiency in the society (Ministry of Education, Ontario, 2005). Mathematics is an important lesson in education for the preparation of students for jobs. Math skills are often considered as a filter for professional life pathway. The study of the factors affecting academic achievement in math course has attracted the attention of educators more than ever over the past three decades (Wang, Fuchs & Fuchs, 2016). The sense of inability in mathematical problem solving or a lack of talent in math along with feeling of low level of math intelligence may gradually cause negative attitudes towards math. Attitudes are defined as positive or negative emotional dispositions; and motivational elements have been composed of beliefs, attitudes, values, and concerns (Aiken, 2000). Students' attitudes toward math are among the main components correlated with performance in this course (Pimta, Tayruakham & Nuangchalerm, 2009). Research findings have shown that academic achievement in math depends on information processing procedure, science structure, and motivational factors (Bassant, 1995). It is notable that these factors (attitude toward math, performance, inability in math or lack of talent) support each other as a cycle. The improvement and compensation of students' weaknesses in mathematics can have an important role in students' academic motivation. Mathematics can be a paly as

one of the academic courses determining the future of students due to its important role in the continuity of education (Park et al., 2016).

Metacognition refers to the knowledge that people have about their thought processes; similarly, metacognition has been also defined as thinking about learning. Metacognition has been defined as people's knowledge about how to make efficient use of cognitive processes and achieve learning objectives. Successful students not only act efficiently in the acquisition, storage, and retrieval of knowledge when needed (cognitive processes), but they also supervise their own perception of the contents and the accomplishment method of these processes. They will do an appropriate action whenever they find themselves confused. In addition, such students are autonomous individuals because they themselves monitor their own understanding and learning by means of their metacognitive knowledge. Here, the teacher does not monitor their learning by asking questions (Jacobse & Harskamp, 2010). Kai (1992) concluded that progress in mathematics largely requires the awareness of different learning strategies and their implementation. Vaidya (1999) showed that meta-cognitive activities have monitoring nature and can be used as a convenient tool for learning mathematics. Montague (1996) argues that teachers cannot teach mathematics in such a way that it can come long lasting if they are not familiar with metacognitive teaching methods.

Metacognitive knowledge refers to a set of beliefs that people have about themselves, mathematics, and nature of mathematical thinking. For example, many students believe that they should remember the mathematical thoughts and formulas that are transferred by professionals in authority, such as teachers. Therefore, they expect to have ready-made formulas at their disposal for the situations that they have already studied. In this regard, they may easily succumb or cannot cope with the analysis of the situations they have been able to understand if they forget the formulas. This knowledge can be used in a variety of exercises and lesson plans. One of these methods can be taught to individuals in the form of daily exercises. This study was an attempt to embark on teaching these skills in a variety of exercises, such as presentation of problem-solving skills motivational short-term exercises, utilization of learning and imaginative strategies in mathematics performance, and attitudes towards mathematics.

The present study aims to examine whether teaching of metacognition skills and short-term daily exercises can improve academic achievement of weak students in mathematics and promote their positive attitudes towards this course.

### 2 Method

A quasi-experimental research design along with pretest posttest control group was used for the conduct of this study. All the junior high school students of Ghasem ibn al-Hasan constituted the statistical population of this study. From among this population, 50 junior high school students with weak performance in mathematics were selected by purposive sampling method. It is noteworthy that these participants were selected with the observance of inclusion and exclusion criteria, such as no consumption of psychiatric drugs, not suffering from any physical illness, and informed consent. These participants were then assigned randomly in experimental and control groups (25 participants in each group). The experimental group received metacognitive skills towards learning mathematics; furthermore, this group was provided with the explanation on the persistent factors contributing to weakness in mathematics. Also the effectiveness of the current intervention program in mathematical achievement and the improvement of attitudes to mathematics were presented. Accordingly, this group was trained by short-term mathematical practices on daily basis. Both

groups were evaluated before, during, and after the intervention based on Aiken's Mathematics Attitude Scale and academic achievement score in mathematics. The obtained data were analyzed using descriptive and inferential statistics, which included repeated measures ANOVA.

### 3 Instrumentation

#### 3.1 Attitude toward Mathematics Scale

Attitude toward Mathematics has been measured with "Attitude toward Mathematics Scale" (Aiken, 1979, Aiken & Groth-Marnat, 2005). This scale consists of 24 items that are scored in a 5-point Likert scale (SD=Strongly Disagree, D=Disagree, U=Undecided, A=Agree, SA=Strongly Agree). This scale consists of four subscales, namely pleasure, important, motivation, and fear toward mathematics. The re-test reliability coefficient of the total scale has been reported to range from 0.90 to 0.94 (Aiken & Groth-Marnat, 2005). The reliability of this scale has been confirmed in several international studies (Yushau, 2006; Wong, 2001; Olson, 2002).

#### 3.2 Intervention

In the present study, three dimensions were taken into consideration. The first one was aimed at the best way for learning mathematics. For this purpose, metacognitive strategies were taught to students in one session to learn and practice how to solve mathematical problems. The second dimension of this

intervention consisted of teaching how to do daily exercises and practices (the number of math problems that students must solve per day). This dimension also included the concentration on the short-term effectiveness of daily exercises in terms of cognitive and motivational learning. The third dimension contained the registration of activities as monitoring their own activities and reporting of daily activities. In fact, the students wrote down and reported their daily activities in a table. In addition, students were informed of their progress by self-assessment and teacher assessment. It is noteworthy that such factors as metacognition training metacognitive strategies in learning, bodily training of reading and math homework, teaching of background construction and problem solving, teaching of monitoring, review of the previous sessions, and the fulfillment of homework were the main themes of metacognition training.

#### 3.3 Academic achievement in mathematics

Academic achievement in mathematics has been measured by an academic achievement test prepared by teachers. The results were then analyzed using SPSS Software.

### 4 Results

In Table 1., the mean scores of experimental and control groups have been shown for each component of attitudes towards mathematics as well as math scores in pre-test, post-test, and follow-up stages.

Table 1: The mean scores of two groups for attitudes towards mathematics and math scores in pre-test, post-test, and follow-up stages

Variable	Group	Mean before treatment	Mean after treatment	Mean of follow-up test
Fear	Experimental	21.81 (5.08)	17.88 (4.29)	18.62 (4.25)
	Control	22.14 (5.18)	21.96 (4.56)	21.77 (4.05)
Important	Experimental	22.88 (5.02)	18.12 (4.06)	18.69 (4.85)
	Control	22.12 (4.39)	21.23 (4.68)	21.46 (3.73)
Motivation	Experimental	15.92 (2.65)	21.00 (3.77)	20.16 (4.78)
	Control	17.73 (3.40)	17.23 (3.44)	16.88 (3.52)
Pleasure	Experimental	18.05 (3.70)	23.78 (3.60)	21.69 (3.16)
	Control	19.58 (4.63)	18.77 (4.86)	18.31 (3.46)
Math Score	Experimental	10.50 (2.47)	16.00 (1.70)	15.65 (2.81)
	Control	10.07 (2.56)	10.46 (2.06)	10.81 (2.38)

Repeated measures ANOVA was used to analyze the collected data. For this purpose, the assumptions required for the conduct of this parametric test were examined. These assumptions included normal distribution, homogeneity of variances, and

sphericity. Table 2 indicates the results of repeated measures multivariate analysis of variance on the pre-test, post-test, and follow-up in terms of attitude towards mathematics and mathematical scores for the experimental and control groups.

Table 2: Repeated measures multivariate analysis of variance for the impacts between participants

Variable	Effect	Test	Value	F	Df Hypothesis	Df Error	Sig.	Effect size
Fear	Time	Wilks Lambda	0.297	10.32	2	49	0.001	0.25
	Time*Group	Wilks Lambda	0.354	9.41	2	49	0.001	0.24
Important	Time	Wilks Lambda	0.480	7.58	2	49	0.001	0.22
	Time*Group	Wilks Lambda	0.706	4.72	2	49	0.012	0.13
Motivation	Time	Wilks Lambda	0.415	8.46	2	49	0.001	0.23
	Time*Group	Wilks Lambda	0.124	13.82	2	49	0.001	0.32
Pleasure	Time	Wilks Lambda	0.862	2.37	2	49	0.077	0.07
	Time*Group	Wilks Lambda	0.795	6.04	2	49	0.001	0.20
Math Score	Time	Wilks Lambda	0.047	3.25	2	49	0.001	0.58
	Time*Group	Wilks Lambda	0.088	21.18	2	49	0.001	0.43

As it can be observed in Table 2, the time factor has made a significant difference between the pre-test and post-test scores of fear ( $P<0.01$ ), importance ( $P<0.01$ ), motivation ( $P<0.01$ ), and math score ( $P<0.01$ ). However, no significant difference was observed between the pre-test and post-test scores of pleasure ( $P>0.05$ ). In addition, the interaction of time and group effect was revealed to be significant in components such as fear

( $P<0.01$ ), importance ( $P<0.05$ ), motivation ( $P<0.01$ ), pleasure ( $P<0.01$ ), and math score ( $P<0.01$ ). This means that the experiment has made significant changes in these variables.

Table 3 shows the results of repeated measures ANOVA for pre-test, post-test, and follow-up test scores in components of attitudes towards mathematics and math scores for the experimental and control groups.

Table 3: Repeated measures ANOVA results for the impacts between participants

Variable	Source of changes	Sum of squares	Df	Mean Square	F	Sig.	Effect size
Fear	Time	125.13	1	71.46	12.87	0.001	0.26
	Time*Group	102.64	1	51.37	10.04	0.001	0.21
Important	Time	243.72	1	127.45	23.67	0.001	0.38
	Time*Group	120.36	1	62.28	11.52	0.001	0.24
Motivation	Time	146.29	1	79.63	17.41	0.001	0.30
	Time*Group	246.33	1	130.48	24.60	0.001	0.40
Pleasure	Time	116.72	1	63.12	3.58	0.036	0.10
	Time*Group	251.90	1	137.24	7.06	0.001	0.16
Math Score	Time	287.53	1	145.06	29.37	0.001	0.52
	Time*Group	197.14	1	100.62	20.72	0.001	0.34

As it is indicated in Table 3, the time factor (pre-test to post-test) has been found to be significant in fear ( $P<0.01$ ), importance ( $P<0.05$ ), motivation ( $P<0.01$ ), pleasure ( $P<0.05$ ), and math score ( $P<0.01$ ). In other words, the changes in the experimental group have been significant over time. Similarly, the interaction of time and group has been also significant in components in these variables. In other words, the changes over time were significantly different between the two groups. Therefore, the above results may lead one to arrive at the conclusion that educational intervention will significantly result in the improvement of attitudes towards mathematics and increase of math scores.

Figure 1 confirms the fact that the experimental group receiving the educational intervention has obtained considerably higher scores regarding the improvement of attitudes towards math scores than the control group in the course of the study. On the other hand, the mean score of the control group has declined following the follow-up stage. In addition to visual inspection of the graphs, the effectiveness and impact factor reflect the significant and remarkable increase in attitudes towards mathematics in the experimental group. Figure 1 shows the changing process in attitudes towards math scores in the experimental and control groups more precisely.

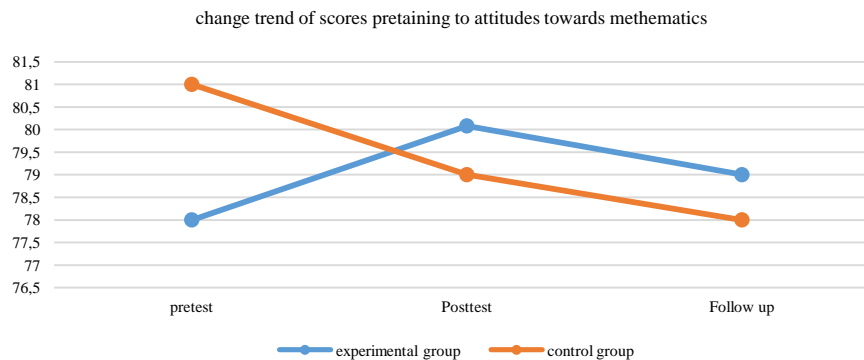

Fig. 1: Change trend of mean scores between the two groups in terms of attitudes towards mathematics in pre-test, post-test, and follow-up stages

Figure 2 also indicates that the experimental group receiving the educational intervention gained significantly higher math scores than the control group. On the other hand, the mean score of the

control group has not experienced a significant increase after the follow-up stage. The effectiveness and impact factor suggest the significant increase of the experimental group's math scores.

Fig. 2: Change trend of mean scores of math between the two groups in pre-test, post-test, and follow-up stages

## 5 Conclusion

The results of data analysis showed that metacognitive training and short-term and daily math practice of mathematical problem solving were significantly effective in the improvement of mathematical academic achievement positive attitudes among the junior high school students. These findings are consistent with those of the studies done by Rapport et al. (2013), Passolunghi et al., (2016), Witt (2011), and Bugden, DeWind & Brannon (2016). The children having difficulty in learning mathematics also encounter difficulty in applying the principles of metacognition. On the other hand, metacognitive training will naturally lead to the improvement of mathematical performance in the children having difficulty in learning mathematics since metacognition organizes and regulates the cognition and learning process. Another reason that proves the necessity of metacognition training to the students is that metacognitive process in these children is not fulfilled automatically unlike normal children; thus, they need to compensate for this shortcoming by training and teaching (Schneider, & Artelt, 2010). Since the time mathematics educators have found that non-cognitive aspects of problem-solving performance are due to the importance of its cognitive aspects, metacognition, meaning knowledge and cognitive control, has attracted much attention of the research community of mathematics education. Therefore, interest in the study of the role of metacognition in mathematical problems is quite useful (Kaune, 2006).

Metacognition training is effective in the improvement of students' attitudes in addition to the creation of some skills regarding students' reading styles. This is so because students learn that it is possible to look at the issue be a fresh and new approach and to use modern methods to establish a connection and link with the problems. In addition to the occurrence of this attitude in mathematics and its performance, this attitude will also come effective in people as well because the metacognitive ability is a general quality that positively influences people's emotions, cognition, and behaviors in addition to dealing with mathematical problems.

Daily math problem solving in a short time has some benefits for students. They solve only 3 or 4 math problems every day that is not a boring activity. On the other hand, this method of problem solving gradually leads to a large amount of learning activities (21 to 28 math problems per week, 84 to 112 ones per month, and 168 to 224 ones every two months). This is a reality that rarely happens to students weak in academic achievement who do this volume of practices in the mentioned short time. Another positive aspect of this model of math exercise is that students learn math skills gradually and this leads to deep understanding of the problems that prevents forgetting. As the research findings of the present study suggest, short-term practice of mathematical problem solving leads to students' increased scores in academic achievement tests. The current research findings suggest that the increase of math scores improves positives attitudes towards mathematics. This finding is in line with the findings of previous studies wherein it was found that there is a significant

relationship between attitudes towards mathematics and academic achievement (Goodykoontz, 2009; Pimta et al., 2009; Bassant, 1995; Hembree, 1990; Lyons & Beilock, 2012; and McLeod, 1988).

It seems that daily interaction with the mathematical course books and success in mathematical problem solving bring about positive attitudes towards mathematics. Success is pleasurable, eliminates fear of math exam, motivates students for greater achievements, and eventually leads to the improvement of students' mathematics scores and attitudes towards mathematics. Attitudes towards mathematics originate from factors such as performance, grades, concerns and worries, abilities, and self-efficacy, which can be expected to improve student performance. These attitudes subsequently promote some students' dimensions such as self-efficacy, self-esteem, and self-confidence. Finally, it can be concluded that metacognition training and short-term daily practice of mathematics are effective in students' mathematical attitudes and performance. In this way, teachers are recommended to become familiar with these concepts and methods and implement these training methods in the classroom to improve student performance.

**Abstract.** In today's competitive world, only organizations which have a strong and futurist perspective have understood the necessity of investigating brand equity. Today, there is an intense competition among banks which requires investigating brand equity among banks. Therefore, this research aims to investigate brand equity and factors affecting it in public, private and new privatized banks. The research methodology is based on investigating Banks analyzed according to similar structural models. Research results indicate that brand equity and factors effecting it influence directly creating value for customers in all kinds of banks. The final finding of the research shows the prioritizing different types of banks based on brand equity suggesting that banks have respectively the highest and lowest brand equity.

**Keywords:** Brand Equity, Brand Awareness, Brand Loyalty, Brand Association, Perceived Quality of Brand, Customer Value

### 1 Introduction

In today's competitive world, only organizations which have a strong and futurist perspective have understood the necessity of investigating brand equity. Accordingly, it requires investigating brand equity to deal with lack of coordination and unity of their mechanisms in relation with brand commitments; since brand equity is the cause of value, reliability and better performance of an organization successfully and continuously in future. Brand equity led marketing to be separated from one-sided mood and aim to achieve more effective and stronger relationship than before; therefore, it deals with a bilateral relationship between manufacturers and customers and is considered as a milestone leading the company to progress and develop in future much more than before.

Today, there is an intense competition among banks in Iran; therefore, the main question is that which kind of public, private and new privatized banks has the higher brand equity. To answer this question, the brand equity of Sepah, Parsian and Mellat banks is investigated. On the other hand, it is important that companies can determine higher price for their products according to a powerful brand and create a better commercial leverage and increase their margins and profits and finally reduce their vulnerability against competitors (Aaker & Joachimsthaler, 2000)

#### 1.1 Significance of the study

Brand is a living entity and as business needs to change, brand also needs to change, be developed and modified. Any reason for change must be carefully discussed among employees and involve them in the process of brand development rather than dictate them later. Brand implementation should be examined in terms of respecting values to ensure that fundamental features included in the heart of the brand (which have provided the way for brand success) are not distorted or forgotten (Davis, 2009).

Brand equity is a set of features experienced by customers as a basis for brand commitment. Brand equity gives it personality and leads to emotional relationship resulted in confidence and brand loyalty.

It is a key point for agencies and individuals to maintain brand equity and brand consistency and also pay attention to them and innovation all the time.

Another key point is that in today's competitive world, only customers will determine the future status of organization.

#### 1.2 Purpose of the Research

1. Investigating brand equity and factors effecting it in public, private and new privatized banks
2. Determining the highest brand equity among mentioned banks

#### 1.3 Review of related literature and hypotheses development

The concept of brand equity which is one of the most important categories in today's marketing was first formed in 1980s. Several approaches have been proposed in relation with brand equity which customer-based brand equity and brand equity based on financial value are considered as the most popular ones. Proponents of brand equity based on financial value extract brand equity from other assets of company. According to this approach, brand equity is an increasing cash flow which is obtained from named products in addition to cash flows resulted from unnamed ones (Kapferer, 2008). In contrast, customer-based brand equity is defined as various affects which brand knowledge has on customer response to brand marketing (Keller, 2008).

A brand has a positive business value when customer sees the brand name on the product, he will be more interested to purchase the product than the time he does not observe it; and this value is negative when the customer sees the brand name, he will purchase the product with less interest (Keller, 2008).

The Marketing Science Institute defines brand equity as follows:

A set of brand associations and behaviors in relation with brand customers, members of the channel and parent company which allows brand to make more money or have more margin than the time there is no brand and it makes brand strong, persistent and distinctive against competitors (Gordon, 2003).

Brand equity is a growing interest and value added to a product by the brand name such as Coke, Kodak, Levi's and Nike. (Farquhar & Ljir, 1991) Since the concept of "brand equity" was introduced, researchers and marketing activists have paid growing attention to it (Cobb-Walgreen et al., 1995). This issue has led to the emergence of many definitions of brand equity such as added value by the brand name (Cobb-Walgreen et al., 1995), growing interest (Kamakura & Russell, 1993), difference between brand preference and the preference of some features based on the targeted measured levels of features (Park & Srinivasan, 1994) and overall quality and selection bias (Agarwal & Rao, 1996).

According to customer-based approach, Keller (1993) defines brand equity as distinct effects which brand knowledge has on customer response to brand marketing (customer-based brand equity). Based on the brand equity level, Professor David Aaker (1991) defines brand as a set of assets and commitments related to a brand, its name and a symbol by which the value provided by the product, service or customers of a company is added or reduced.

According to the economic information, Erdem & Swait (1998) have argued that customer-based brand equity is value of a brand as an acceptable sign of a product status.

More generally, brand equity is defined as value added to a company, business or customer which is given to a product by brand (Farquhar, 1989).

Mc Queen (1991) defines brand equity as difference between value of a product with brand and its value without brand.

According to the behavioral customer-based brand equity, Yoo & Dothu (2001) defines brand equity as various responses between customers of an original brand and a product without brand when both have the same level of marketing incentives and product features. Finally, brand equity is an added value which is granted to products or services. Brand equity may be obvious in customers' thinking way, feeling and acting against brand as it is observed in prices, market share and profitability achieved by brand (Keller, 2008).

#### 1.4 Brand equity

**Conceptual definition:** Brand equity is a set of assets and commitments related to the brand name or symbol (mark) (Aaker, 1995).

**Operational definition:** Brand equity refers to components of brand awareness, brand loyalty, perceived quality of brand and brand image.

#### 1.5 Brand association

**Conceptual definition:** Brand association is an asset leading to distinct reasons to purchase a product and affects feelings about a product and creates the basis of brand extension (Aaker, 1995).

**Operational definition:** Brand association refers to some categories such as indicators which show positive brand image; bank modernity; from customer perspective, bank history of work is successful; bank image differs compared to other competitors; bank services are regarded as the first choice of customers compared to other competitors; bank services are used and selected by customers more than once; bank is responsible against the society; bank is honest against customers and has a positive history of work.

#### 1.6 Perceived quality of brand

**Conceptual definition:** Perceived quality of brand refers to customer judgment about the superiority of a product (Zeithaml, 1998).

**Operational definition:** Perceived quality of brand refers to some categories such as indicators which show positive quality of bank brand; up-to-date services of bank; having a respectful and an appropriate relationship with customers; ease of banking operations; comprehensiveness of bank services; superiority of bank services compared to other competitors; the time spent by the customer to use services of this bank is valuable; costs paid to be in relation with this bank be acceptable for the customer; try made by the customer to be in relation with this bank is valuable; and finally bank brand be unique.

#### 1.7 Brand awareness

**Conceptual definition:** Brand recognition and brand recall (Keller, 2008).

**Operational definition:** Brand awareness refers to categories such as understanding services provided by the bank; distinctive banking services compared to other banks; paying attention to this bank when having a banking work; understanding the difference between banking services compared to other competitors; understanding the superiority of services offered by this bank compared to other banks; being familiar with the services of this bank and finally having a positive view toward the brand extension of this bank.

#### 1.8 Brand loyalty

**Conceptual definition:** Brand loyalty refers to an advantage in which a customer is frequently purchasing a product from a

supplier instead of buying it from multiple suppliers (Boundless, 2015).

**Operational definition:** Brand loyalty refers to use of services of a bank, even if competitors offer better advantages; introducing and offering this bank to others; having a sense of ownership to this bank; having a sense of satisfaction towards the bank and being sure that customers do not use the services provided by other competitors.

#### 1.9 Customer value

**Conceptual definition:** Customer value refers to perceived advantage by the customer to evaluate products' features, features' functions and achieved logical outcomes of easy use or lack of access to overall objectives and intentions of the customer when applying opportunities (Woodroffe, 1997).

#### 1.10. Hypotheses or research questions

##### Main hypothesis

Mellat Bank's brand equity has the most effect on creating value for customers among other Banks investigated in this research.

##### Subsidiary hypotheses

1. Sepah Bank's brand awareness has the most effect on creating value for customers among other Banks investigated in this research.
2. Mellat Bank's perceived quality of brand has the most effect on creating value for customers among other Banks investigated in this research.
3. Mellat Bank's brand loyalty has the most effect on creating value for customers among other Banks investigated in this research.
4. Parsian Bank's brand association has the most effect on creating value for customers among other Banks investigated in this research.

## 2 Method of the Research

### 2.1 Statistical population and sample size

Research population includes all customers of various branches of Sepah, Parsian and Mellat banks in Tehran who use different services provided by these banks and have an active checking account. Therefore, the mentioned banks situated in five regions: north, south, west, east and central part of Tehran were randomly studied in February 2015.

To determine the sample size, random sampling method, the sample size formula of infinite population, and Cochran formula were used and 384 people were selected.

### 3 Data analysis and findings

In this study, Aaker's brand equity questionnaire was used; this questionnaire has 32 questions and for parameters of brand loyalty, brand association, perceived quality of brand and brand awareness.

To review questionnaire components and to ensure the representativeness of necessary parameters which the researcher aimed to measure, content validity was applied. For this purpose, the questionnaire prepared by several professors and scholars was investigated and confirmed.

To evaluate the reliability of the questionnaire, first a sample containing 60 pre-test questionnaires were prepared. Then, the reliability level was calculated using Cronbach's alpha by SPSS and data obtained from these questionnaires. Finally, the Cronbach's alpha has been calculated for each parameter in 60 questionnaires using SPSS 23 (table 1, 2, and 3).

Table 1. Cronbach's alpha coefficient for each parameter studied and the questionnaire

No.	Concept	Number of items	Cronbach's alpha coefficient value
1	Brand loyalty	5	0.835
2	Brand awareness	8	0.853
3	Perceived quality of brand	9	0.931
4	Brand association	10	0.930
5	Total questions	32	0.969

To analyze data, SPSS 23 was used. Kolmogorov-Smirnov test was applied to investigate data distribution (table 2).

Table 2. Results of Kolmogorov-Smirnov test

Hypothesis	BEM	Loyalty	Quality	Association	Awareness
Test statistic	0.046	0.095	0.058	0.091	0.086
Sig	0.200 <sup>c,d</sup>	0.007 <sup>c</sup>	0.200 <sup>c,d</sup>	0.11 <sup>c</sup>	0.22 <sup>c</sup>
$\alpha$	0.05	0.05	0.05	0.05	0.05
N	128	128	128	128	128
Result	Normal	Un Normal	Normal	Un Normal	Un Normal

### 3.1 Investigating the effect of variables using binomial test

To investigate the effect of independent variables on the dependent variable, binomial test was used. In this part, the effect of variables is investigated in relation with each hypothesis (table 3).

### 3.2 Main hypothesis

#### First hypothesis:

1. Mellat Bank's brand equity has the most effect on creating value for customers among other Banks investigated in this research.

**H0:** Mellat Bank's brand equity has no effect on creating value for customers.

**H1:** Mellat Bank's brand equity has effect on creating value for customers.

Table 3. Results obtained from first hypothesis

Hypothesis description	Sample group	Probability tested	Observed probability	Significance level (sig)	result
Mellat Bank's brand equity has effect on creating value for customers.	Group 1 (less than or equal to 4)	0.50	0.80	0.000	Hypothesis H0 is rejected and research hypothesis is confirmed.
	Group 2 (more than 4)		0.20		

Since the significance level (sig) is less than alpha ( $\alpha = 0.05$ ), Mellat Bank's brand equity is effective on creating value for customers.

Results obtained from data analysis related to Sepah and Parsian Banks indicated that brand equity was effective on creating value for customers (table 4).

#### Subsidiary hypotheses

#### Second hypothesis:

Table 4. Results obtained from second hypothesis

Hypothesis description	Sample group	Probability tested	Observed probability	Significance level (sig)	result
Sepah Bank's brand awareness has no effect on creating value for customers.	Group 1 (less than or equal to 4)	0.50	0.85	0.000	Hypothesis H0 is rejected and research hypothesis is confirmed.
	Group 2 (more than 4)		0.15		

Since the significance level (sig) is less than alpha ( $\alpha = 0.05$ ), Sepah Bank's brand awareness is effective on creating value for customers.

Results obtained from data analysis related to Mellat and Parsian Banks indicated that brand awareness was effective on creating value for customers (table 5).

#### Third hypothesis:

2. Sepah Bank's brand awareness has the most effect on creating value for customers among other Banks investigated in this research.

**H0:** Sepah Bank's brand awareness has no effect on creating value for customers.

**H1:** Sepah Bank's brand awareness has effect on creating value for customers.

3. Mellat Bank's perceived quality of brand has the most effect on creating value for customers among other Banks investigated in this research.

**H0:** Mellat Bank's perceived quality of brand has no effect on creating value for customers.

**H1:** Mellat Bank's perceived quality of brand has effect on creating value for customers.

Table 5. Results obtained from third hypothesis

Hypothesis description	Sample group	Probability tested	Observed probability	Significance level (sig)	result
Mellat Bank's perceived quality of brand has no effect on creating value for customers.	Group 1 (less than or equal to 4)	0.50	0.76	0.000	Hypothesis H0 is rejected and research hypothesis is confirmed.
	Group 2 (more than 4)		0.24		

Since the significance level (sig) is less than alpha ( $\alpha = 0.05$ ), Mellat Bank's perceived quality of brand is effective on creating value for customers.

Results obtained from data analysis related to Sepah and Parsian Banks indicated that perceived quality was effective on creating value for customers (table 6).

#### Fourth hypothesis:

Table 6. Results obtained from fourth hypothesis

Hypothesis description	Sample group	Probability tested	Observed probability	Significance level (sig)	result
Mellat Bank's brand loyalty has effect on creating value for customers.	Group 1 (less than or equal to 4)	0.50	0.80	0.000	Hypothesis H0 is rejected and research hypothesis is confirmed.
	Group 2 (more than 4)		0.20		

Since the significance level (sig) is less than alpha ( $\alpha = 0.05$ ), Mellat Bank's brand loyalty is effective on creating value for customers.

Results obtained from data analysis related to Sepah and Parsian Banks indicated that brand loyalty was effective on creating value for customers (table 7).

#### Fifth hypothesis:

Table 7. Results obtained from fifth hypothesis

Hypothesis description	Sample group	Probability tested	Observed probability	Significance level (sig)	result
Parsian Bank's brand association has effect on creating value for customers.	Group 1 (less than or equal to 4)	0.50	0.77	0.000	Hypothesis H0 is rejected and research hypothesis is confirmed.
	Group 2 (more than 4)		0.23		

Since the significance level (sig) is less than alpha ( $\alpha = 0.05$ ), Parsian Bank's brand association is effective on creating value for customers.

Results obtained from data analysis related to Sepah and Mellat Banks indicated that brand association was effective on creating value for customers.

4. Mellat Bank's brand loyalty has the most effect on creating value for customers among other Banks investigated in this research.

**H0:** Mellat Bank's brand loyalty has no effect on creating value for customers.

**H1:** Mellat Bank's brand loyalty has effect on creating value for customers.

5. Parsian Bank's brand association has the most effect on creating value for customers among other Banks investigated in this research.

**H0:** Parsian Bank's brand association has no effect on creating value for customers.

**H1:** Parsian Bank's brand association has effect on creating value for customers.

### 3.3 Prioritizing variables using Shannon Entropy

Shannon Entropy was used to prioritize variables. Variable which has the greatest weight has priority over other variables.

Results obtained from Shannon Entropy related to each parameter of brand equity are shown in the table 8.

Table 8. Prioritizing variables

Parameter of brand equity	Bank	Weight	Priority
Brand awareness	Sepah	0.288866	Mellat
	Parsian	0.330953	Parsian
	Mellat	0.380181	Sepah
Perceived quality of brand	Sepah	0.263989	Mellat
	Parsian	0.335052	Parsian
	Mellat	0.34813	Sepah
Brand association	Sepah	0.195506	Mellat

	Parsian	0.280539	Parsian
	Mellat	0.312246	Sepah
Brand loyalty	Sepah	0.214038	Mellat
	Parsian	0.296397	Parsian
	Mellat	0.34813	Sepah
Brand equity	Sepah	0.242984	Mellat
	Parsian	0.361755	Parsian
	Mellat	0.365871	Sepah

As shown in the table 8, Mellat Bank's parameters of brand equity have the greatest weight and have priority over other variables.

#### 4 Conclusion

The model used in the present study was Aaker's brand equity model. It was used to compare the brand equity of public, private and new privatized banks in branches of Sepah, Parsian and Mellat Banks in Tehran. In this model, brand equity and its parameters as dependent variables are effective on creating value for customers. According to the binomial test, the research results show that brand equity and its parameters are effective on creating value for customers in any kind of public, private and new privatized banks; in all cases, the significance level was 0.0, the probability of error %5 and confidence level % 95 suggesting the effectiveness of all variables. This is based on research model that Aaker's brand equity model also shows the effectiveness of brand equity and its parameters on creating value for customers. According to the Shannon Entropy model, the research results show that brand equity and its parameters have the greatest weight in new privatized banks; therefore, they have priority over other banks. Brand equity and its parameters in private banks are ranked after new privatized banks. Finally, brand equity and its parameters in public banks are placed.

**Abstract.** The present study aimed to identify occupational competencies of taekwondo coaches of Iran. The study performed repeatedly using combined qualitative and quantitative exploration methods and in two stages. The samples consisted of managers, experts, coaches and Taekwondo athletes with a sample size of 177 individuals. The survey questionnaire, was the Mansfield questionnaire (1996) and consists of two parts: The first part including coaches' indicators and the second part related to demographics of the community. The results showed that the overall eligibility criteria of Taekwondo instructor's lies in 10 groups are as follows: Techniques and Characteristics of coaching, managerial and leadership competencies, humanity skill, demographics and individual competencies, personality traits and social features.

**Keywords:** professional competence, coaches, Taekwondo

### 1 Introduction

Nowadays human resources is considered as one of the most important factors in advancing and improving the productivity of organizations. Experts believe that human sources in organizations are more effective in the foundation, maintenance and development of performance levels and completing the mission of the organization, and improvement of the quality and productivity relates to human factors involved in the growth and evolution of the organization. Therefore, investments in the areas of talent identification, selection and implementation of appropriate human resources jobs at different levels of the organization, monitoring performance and human resource skills and guidance is essential (Saadat, 2000). Today, as to the success of an organization is directly related to the performance of its employees and staff selection and the development of an organization is identified with the quality and performance of its employees and naturally, coaches and physical education trainers are considered as a functional group of employees (Automotive Industry, 1983). There is no doubt that the selection of the entitled person for an organizational position is very difficult. In some jobs the working relationship is such that individuals only requires a limited set of qualifications in order to hold the job. In some jobs the individual knowledge and experience is of great importance while in others the work experience and qualifications are more important and in some other jobs the behavioral traits and personality is more important. However, we need a selection criteria to choose a right one for a job. These criteria can be of different degrees of significance or importance, or having the same degree. As there are different criteria in the assessment of any individuals, so specific criteria should be considered for selecting a person. In this regard, it is difficult to select coaches in sports. A coach must go through several features including knowledge and expertise, experience and coaching experience, great personality, good communication skills and motivational (Seyed Javadein, 2002). There is no consensus on the definition of merit, but according to its definition, it seems as an umbrella that covers anything which directly or indirectly have an impact on job performance. In the other words, competency shows a picture of a grown individual with required qualifications for doing a job. In fact, competency has a systematic approach to employees' which includes all those traits, characteristics, skills and attitudes related to effectiveness in carrying out the duties and responsibilities (Morgeson et al., 2009). There are different

models for competency, in which some emphasize on the general abilities and the quality of human resources, while the other models emphasize on the technical skills of human resources. Mansfield in 1996 in an article entitled 'preparation of competency models', in the Journal of Human Resource Management expressed their views in the form of the two categories (Newsom et al., 2004). Goleman and Buyatzis (2002) classify competencies in two categories, individual competencies and social competencies (Vaikramasing and Zaviza, 2008). Determination of managerial competencies and effective leadership in the British Royal Navy with four "Competency Cloud" under the heading of competencies perception, aligning, interactive and successful entrepreneur with a solid base (Young and Doloyk, 2009). After the flourishing of several studies on the human resource competencies by Ulrich and colleagues and offering multiple models in this field in 2007, the research group continued on focusing on the importance of competencies related to individual and organizational performance and proposed a dynamic model in the human resource departments in which coaches are expected to play the roles of each of the six domains of competency including, pragmatic, credible, culture and change agent, talent manager/designer of organization, architects of strategic and allied business and operational execution (Ulrich et al., 2008). Goudarzi and Farahani (2003) argue, it would be so desirable if designer provide evaluation criteria to determine the success of program and select the suitable plan after implementation of the first evaluation. For example Shafiee (2007) stated that in order to choose a coach, we cannot only rely to staff selection criteria apply in administrative posts, as the factors leading to the success and effectiveness of a coach and in turn the success of a country's national team is far beyond this criteria. A successful coach should have some unique features. These characteristics can be considered in personality, interpersonal, technical and social knowledge management fields. Selection of coach is a difficult and controversial work in sports. A coach must have several attributes including knowledge, experience, coaching experience, great personality, good communication skills and motivation. Henry et al in their research entitled "ranking of selection criteria of Iranian National Football Team" showed that there is a significant different between the coach selection criteria in four characteristics of, personality, technical, humanity-emotional and managerial. According to the obtained results and based on the ranking of each of the indices the proposed frameworks can be considered as a rules for selection of suitable coach for the Iranian National football team in different age groups. Martens (2004) identifies 15 feature some for choosing of coach which include: knowledge of sports coaching, sports science knowledge, motivation and skills of communication and motivation, evaluation of their own work as well as athletes, organize and plan and evaluation. But, some organizations have several standards for coaches, for example, the National Standards for Physical Education and Sport Sciences coaches from the perspective of the National Association of United States (NASPE) (2009) include: coaching philosophy and ethics, safety and injury prevention, physical condition, growth and development, teaching and social interaction, sports skills and tactics, organization and management. There is no framework and rule for choosing a coach in Iran which has led the concerned authorities have no convincing answer for disqualification and evaluate factors of coach selection (Nasiri, 2008). Koenigsfeld et al (2012) designed a model for competency of private club managers. They investigated 58 index in 10 dimension through exploratory and. The results of confirmatory analysis verified 51 indices in 10 dimensions of competency including , golf, maintenance of facilities, human resources, leadership, interpersonal, beverages and food, public affairs, sports and recreation centers, accounting, marketing and strategic management. Shamsudin and Chutipattana (2012) also investigated determinants factors of managerial competencies in a group of Thai primary care managers aiming to identify the most important managerial

competencies and the relationship between motivation and personality. The obtained results identified six key competencies, including leadership, management, diagnosis, planning and evaluation, health promotion and disease prevention, information management, collaboration and communication. Also, both the character and motivation had an impact on managerial competencies. Santos (2010) in a study entitled "The coaches' perceptions of their professional competencies" collected the results of the self-assessment of 343 coaches. Competencies related to annual programming (3.58), Competencies of recognition of the training and competition situation (4.07) and personal training and coaching competencies (3.69) were as the three general competencies review in this study. The National Association of Physical Education and Sport Sciences of the United States (2012) on a instructions of coach qualifications indicates the importance of coaches such that: coaches have a profound impact on our youth. Thus, high expectations are set for them from public. So if they get money or simply be a volunteer, they are responsible in the performance of professional coaching principles. There is no doubt that the process of selecting people for different jobs is closely related to the effectiveness and productivity of the organization. To select a particular position, having a series of features associated with the job is essential in volunteers. If the heads of organization have required criteria for the selection of personnel in obtaining a particular post they can use these pre-determined criteria to select people (Saadat, 2000) which is tangible in today's environment and organizations in such a way that the environment is faced with continuous changes And business managers are faced with globalization, rapid technological change and competition based on merit their and need to acquire competencies appropriate to the new situation (Vitala, 2005). Managers also can lead to valuable successes and for their organization. They have an important role toward the excellence of the organization with their strategic planning, resource allocation, organizing employees, leadership, management, evaluation and control of performance, (Armstrong, 2008). Designing competency model, is among the methods which has been created for continuous adaptation of modern organizations with the changeable working environment. On the other hand if we investigate system of human resource of organizations it is obvious that in most cases there is no relation and continuity between its different sub systems such as education, evaluation of performance and ... which lead to failure of human resources. One of the best and most appropriate approaches to achieve coherence between the processes, is to involve the competency approach in human resource management. The competency model can be applied to human resources as a way to integrate the different measures. It can be said that in this approach, competency is the core of all human resources activities. In National Sports Team where representatives of a country participate in international competitions coaches are considered as a key factor in the success of the national team. We have always seen that coaches have changed the status of a team and have replaced defeat with victory have or vice versa with their decision, which shows the importance of the selection of a competence coach for sport teams. Because coaches, are the managers who utilize a same science and the art of management in leading a team and tries hard for a long period for success and because he benefits all his power and expertise to maximize the students physical and mental capacities, it seems that he requires to be experienced in different fields of technical, expertise, mentality, humanity and sociality and have to use all his power to serve his sport organization. The researcher aims to grade the level of importance of these indices based on the previous studies and the obtaining the comments of specialists and finally codify the required indices for the selection of the national and international coaches of these research. These problem lead to

arise question that what has led to selecting a coach, thus it is essential to have an index for coach selection. All of the above mentioned specify the importance of having competencies for the coach and managers and it is essential to have such a nationally important major in universities and research centers and it should be considered for taekwondo. In these research we aim to collect the job competencies of taekwondo coach through the available literature and ranking each of the indices. Considering all of the above articles researcher aims to find the answer of this question: What is the required criteria for the male and female taekwondo coaches? And what pattern can be proposed for this purpose?

## 2 Research methodology

The study was performed in a combined qualitative and quantitative exploration in two phases successively. In this research job competency training method was used for designing local qualitative-quantitative. Thus, a group consisting of professionals and experts and certified trainers were employed for design of the model. In the qualitative section the study population included all sports management professors, coaches with national history, champions and senior managers of the Federation. In the quantitative section the size of this study was a total of 177 people, including: groups of specialists and experts in research, team coaches working in the Premier League and National team, team managers and active players. The survey questionnaire, was the Mansfield questionnaire (1996) and consists of two parts: The first part was the indices of the Iranian Taekwondo coaches' indices and second part was related to demographics of the community. The questions of the questionnaire was obtained through the available literature and discussion session with the experts of the field including the technical group (the active coach of national and premier league club teams) and managers (including Taekwondo Federation technical committee, all the members of the Technical Committee of the Federation, provincial authorities, staff and administrators of the taekwondo premier league teams) as well as reading books and scientific articles and internet. A preliminary questionnaire, was given to the sport specialist to determine the validity of the content and finally the research questionnaire was developed and distributed between samples. Delphi survey method was used for the validity of the contents of the questionnaire. The questionnaire was distributed among 20 qualified professionals. The participants were asked to express their idea about the contents as well as on the writing and the possible errors. After gathering data both the inferential and descriptive statistics were used to analyze the data. To analyze the information, descriptive statistics such as tables, charts, indices such as mean and standard deviation of the distribution center including standard deviation were used. In the inferential statistics confirmatory factor analysis and exploration, Kolmogorov Smirnov test for normality of data distribution and AMOS software for the modeling of structural equation was used.

## 3 Research findings

Table 1 presents descriptive findings on the demographic characteristics of the samples. According to the results, 60 percent of samples participated in this study are Taekwondo coaches, 20 percent are athletes, 10 percent are managers and 11% are specialists and experts in the field of coaching and taekwondo. According to the results of the research study, 30% of the samples were women and 70 percent were male. The results also showed that most respondents i.e. 45 had a bachelor's degree.

Table 1. Descriptive data on the demographic characteristics of the samples of the research

Samples of the Research	Frequency		% Frequency
Athlete	35	20	
Coach	106	60	
Manager	17	10	
Specialists	19	11	

Gender	Female	53	30
	Male	124	70
Education	Diploma and lower	40	23
	B.Sc.	80	45
	M.Sc. and higher	57	32

Either of the research instrument has designed to measure a particular variable which is known as the goal or structure variable. In relation to the types of validity, construct validity indicate that how the measuring utility measures a construct. Based on the assumptions, the researcher investigated the construct validity. Results showed that due to the nature of the confirmatory of the study, the internal consistency of the factors that were higher than 3.0, are selected as appropriate factors for variable competency indices of the national Taekwondo coaches. The results of factor analysis showed that all the parameters related to the competence of the National Taekwondo coaches, have an acceptable t values and are appropriate indices to be used to measure these variables. In this study, exploratory factor analysis was also used to identify the competencies of the national Taekwondo coaches. Thus before the factor analysis, in order to ensure adequate sample size, Kaiser- Meyer-Oklin measure of sampling adequacy (KMO) and for correlation of the variables Bartlett' Test of Sphericity were used respectively. According to the findings of the test the value of KMO was obtained as 0.894. This value ensures that the number of samples is adequate for factor analysis and performing the factor analysis is applicable for such a data and data can be reduced to a series of hidden factors. The results of Bartlett test (Sig=0.001,  $\chi^2 = 14505.229$ ) shows a strong correlation between the variables, thus continuing and using of the other stage of factor analysis is

permissible. It was also observed that the variance of the variables are all greater than 0.5. So all the variables will remain in the analysis. The results of Eigen values, the percentage of variance and the cumulative percent of variance explained by each factor were obtained from the data set.

According to the Kaiser, only the factors with an Eigen value greater than 1 are selected and other factors are neglected. Thus according to the research it was found that the 100 variable of the research can be reduced to 10 variable and a new structure can be developed using the new factors. In the initial Eigen value analysis it was found that the share of either of the factors the contribution of each factor in explaining the variance of 100 variables related to the merits of different national coaches for Taekwondo is bearish. According to the variance of the data it was observed that the first factor has the largest share, 39.716, and the share of first to tenth factors are 4.776, 4.616, 3.446, 2.665, 2.464, 2.057, 1.894, 1.823 and 1.703 respectively. Cumulative variance of the 10 identified factor with an Eigen value greater than 1 explain 65.08 percent of 100 variables of coach selection competency. Based on the results of exploratory factor analysis and extraction of 10 factors in the questionnaire, the questions corresponding to the extracted factors are as follows:

Table 2. Description of the variables of the first factor (managerial and technical characteristics)

variable	Variable	Load Factor
Q8	The ability to control their players and psychological domination	0.606
Q24	Specialized ability to lead the team in the tournament and being successful	0.59
Q30	The ability to de-stress relaxation and relieve anxiety in athletes	0.536
Q31	Prevention and elimination of overtraining and plateaus run at athletes	0.629
Q38	Ability to motivate athletes in competitions	0.661
Q57	Knowledge of international laws and regulations of the competitions	0.637
Q58	Reading of the game and identify the strengths and weaknesses of their opponents and their own athletes	0.655
Q96	The ability to generate interest, enthusiasm in the athletes to learn and participate in exercises	0.748
Q97	The ability to reconstruct the physical and mental ability of the athletes after the race	0.567
Q98	The ability to use the most effective management practices for leadership of the athletes	0.829

According to the finding of the research 10 variables out of 100 variables lies in the first factor, (Table 6) and because most of the variables are related to skill of the coach in educating athletes and his ability during exercise and competition and after

competition and because the motivations and psychological issues of the athletes are examined, it is entitled as "coaching and technical competence". Each of the loadings factor of the variables have been reported in Table 2.

Table 3. Description of the variables of the second factor (managerial and technical characteristics)

variable	Variable	Load Factor
Q10	appropriate incentive to encourage and motivate athletes to progress	0.557
Q25	Consult with residents and coach assistant	0.544
Q32	The ability to promote the spirit of tolerance in defeat and victory	0.538
Q37	The ability to evaluate opponents	0.527
Q59	The ability to evaluate his own work and that of the athletes at the end of each practice session or race and fixing the problems	0.725
Q60	The ability to evaluate his own work and that of the athletes at the end of each season	0.644
Q61	Consultation with the players in the training, racing, nutrition and ...	0.644
Q88	Hold review meetings with the athletes	0.61
Q89	Creating discipline during workout	0.715
Q90	Explaining the duties of athletic	0.703
Q100	appropriate usage of feedback to improve players' mistakes	0.625

Based on the results it was found that 11 variables lie in the 2nd factor and as these are mostly related to the managing characteristics of the coach to self-evaluation and assessment of

the athletes it is referred to as "leadership competencies" (table 3).

Table 4. Description of the variables of the 3rd factor (Programing competencies)

variable	Variable	Load Factor
Q 33	Documenting the activities and experiences of coaching	0.549
Q34	The ability to make short-termed plan	0.657
Q35	The ability to make medium-term plan	0.589
Q36	The ability to develop long-term plan	0.538
Q62	The ability to create perspective for athletes and team	0.598
Q63	Trying to achieve team goals	0.527
Q64	The ability to control and direct supervision of the implementation of the tasks of the athletes	0.586
Q65	The ability to schedule match and prepare logistics for athletes	0.658
Q99	Ability to apply precise timing of the implementation of training programs	0.741

The results of this analysis indicated that the nine variables from 100 variables in this study were in the third factor (Table 4). As the variables of this factor is mostly related to the ability of the

coach to organize short term, medium term and long term program for the team, it is named as "planning competencies".

Table 5. Description of the variables of the 4th factor (scientific, technical and educational competencies)

variable	Variable	Load Factor
Q22	Understanding and mastering the techniques of taekwondo training	0.511
Q23	Organizing theorist classes	0.513
Q29	The ability to implement their theoretical knowledge in practice	0.502
Q39	The ability to analyze Taekwondo techniques in coaching	0.615
Q53	Knowledge of introductory sport sciences such as pathology, first aid, nutrition and....	0.518
Q54	The ability to design and implement training programs tailored to the characteristics of athletes	0.670
Q55	The ability to use teaching aids and computer technology, video and ...	0.540
Q56	Utilization of IT for Sports Studies	0.677
Q66	Ability to analyze players and resolving technical faults	0.629
Q67	Help to create a mental focus on athletes in training and competition	0.604
Q68	Membership of the technical community inside and outside the country	0.594
Q86	Trying to learn new scientific knowledge and Taekwondo techniques	0.726
Q87	provide an environment to encourage athletes to ask freely and without intimidation and fear	0.661

As can be seen in Table 5, 13 variables out of 100 variables lies in the fourth factor. As the variables of this factor are mostly related to familiarity of the coach with the techniques and

tactics, exercise method and the ability of the coach to utilize novel method, it is named as "scientific, technical and educational competencies.

Table 6. Description of the variables of the 5<sup>th</sup> factor (Sport history and record)

variable	Variable	Load Factor
Q5	Record on national team	0.690
Q7	History of education and the introduction of talent athletes to national teams	0.662
Q16	History and place as the veteran coach	0.536
Q46	Teaching coaching classes	0.692
Q77	membership record of provincial teams and club	0.592
Q78	History of education and the introduction of talent athletes to national teams	0.560
Q79	having Degrees of coaching	0.549

Based on the results, it was found that 7 variables are in fifth factor (Table 6). Most of these variable are related to sport history of the coach so it is named the "sport history".

Table 7. Description of the variables of the 6<sup>th</sup> factor (Humanistic skills)

variable	Variable	Load Factor
Q19	Effective verbal communication with athletes	0.518
Q20	Effective listening to the athletes Comments	0.548
Q27	Language and communication difficulties between foreign coach emotional difficulty with athletes	0.579
Q28	Positive thinking and attention to positive features of the athletes	0.515
Q69	Ability to mentally Administrate athletes	0.734
Q70	The ability to gain the respect and confidence of athletes and partners	0.659
Q71	The ability to motivate athletes	0.725
Q80	Close and friendly communication skills with players and partners	0.589
Q94	Nonverbal Ability to communicate effectively with athletes	0.654

According to the study, it was found that 9 variables are placed in the sixth factor and its constituent indices refers to the friendly

behaviors of the coach with athletes and other coaches which is named as "human skills" is named (Table 7).

Table 8. Description of the variables of the 7th factor (personal characteristics)

variable	Variable	Load Factor
Q1	Age trainer	0.505
Q2	Iranian coach	0.556
Q3	Foreign coach	0.702
Q4	direct verbal communication with of the Foreign coach with athletes	0.689
Q44	Level of Education	0.700
Q45	education in physical education and physical education	0.509
Q81	Physical fitness and the ability to view exercise techniques for athletes	0.598
Q82	Fluency or familiarity with a foreign language	0.521
Q83	Rhetoric and oratory	0.523
Q91	Physical characteristics and appearance	0.658
Q92	Shrewdness and acumen in coaching	0.578

The findings showed that 11 variables are in seventh factor. Their constituent indices refer to variables such as age, nationality of the coach, coach field of study, coach appearance ,

etc., has been named as "demographic and personal characteristics" (see Table 8).

Table 9. Description of the variables of the 8th factor (Moral Characteristics and competencies)

variable	Variable	Load Factor
Q12	The ability to gain the trust of the athletes as a faithful and trusted	0.531
Q13	Love to athletes	0.594
Q14	Compliance with laws and regulations of the game	0.534
Q18	Avoid pride, arrogance and megalomania	0.567
Q26	Justice and fairness and avoid discrimination among athletes	0.519
Q47	secrecy and confidentiality for the athletes	0.702
Q48	The ability to solve problems and problems of athletes	0.579
Q49	Dominate the nerves and control his actions when conductivity athletes in competitions	0.705
Q72	Avoid pride, arrogance, egotistical and self-indulgence	0.577
Q73	Courtesy and respect, and refrain from insults and ridicule to others	0.689
Q74	Working in a spirit of sportsmanship and fair play	0.661

Based on the results 11 variables were in the factor 8. The variables of this factor refer to coach statements such as politeness, integrity and confidentiality and the ethical issues

related to the coach, so it is named as "moral characteristics" (Table 9).

Table 10. Description of the variables of the 9th factor (Characteristics)

variable	Variable	Load Factor
Q6	Self Confidence	0.658
Q9	Decisiveness and consistency in decision-making	0.557
Q11	Love of coaching career	0.585

Q15	Criticism towards colleagues and athletes	0.586
Q17	Ingenuity in the way of training, guidance and coaching	0.563
Q40	Having self-esteem, dignity and self-respect	0.595
Q41	having humility	0.531
Q42	Have patience	0.569
Q43	The ability of maintaining composure during training and competition	0.534
Q75	Hard work, effort and perseverance	0.660
Q76	Have the spirit of achievement, challenge and victory	0.524
Q84	Honesty in word and deed	0.642
Q85	Humor and openness	0.554
Q93	Commitment and sense of responsibility for players, teams and countries...	0.549

Based on the results of study 14 variables was in 9th factor. The study shows the variables of the statements refers to the

character of a coach, so it is named as "personality characteristics" (Table 10).

Table 11. Description of the variables of 10th factor (social characteristics)

variable	variable	factor
Q21	Having social acceptance and popularity of the truth	0.539
Q50	Respect the culture, customs and religious and social affairs of the athletes	0.767
Q51	Skills to communicate constructively with the media, team staff and higher officials	0.619
Q52	Cultural differences of the coaches and their impact on athletes	0.651
Q95	respect towards senior executives and athletes, referees and opponent	0.706

Finally, as it can be seen in Table 11, 10, 5 variables out of 100 variables lies in the 10th factor. According to the variables of this factor, the concepts of these variables are related to work behavior, communication skills, answering to sport community and media, respectful behavior of coach with managers, referees and opponents, so it is named as "social characteristics".

#### 4. Conclusion

There is no doubt that the role of the coach is an undeniable in the success of sports teams. Coaches are considered as one of the main members of sports federations which have a significant effect on the performance of the organization and the failure or success of the organization strategy is directly related to the success or failure of the national team (Martens, 2004). The conventional methods of selecting employees in an organization cannot be extended for coach selection as the factors beyond the success and effectiveness of a coach is beyond these factors. A successful coach must have unique characteristics. These characteristics can be considered in areas of personal, interpersonal, managerial, technical knowledge and expertise, social, etc. of the coach. Thus the lack any of the features can cause failure of the coach to get optimal results (Shafiee, 2006). The present study aimed to develop a competency model of the national and international taekwondo coaches of Islamic Republic of Iran. The results showed that coaching characteristics and technics of taekwondo coaches are among the competencies of the coach and this results are in line with that of Kohandel (2000). Understanding and mastering the skills required in a sports activity, especially activities that involve practices, processes, procedures and techniques are called technical skills. Technical Skills of the coaches includes mastering of the coach in the related techniques of the sport field. In addition some examples of the general and technical skills in the field of coaching that should to be considered include: setting goals, plans, integrated training and the ability to detect and correct technical mistakes players (Dabaghian, 1996). Technical skills for a taekwondo coach can be reconstruct the athletes after the race and so on, Such as the ability to control their players and psychological mastery, Specialized ability to lead the team in the tournament and to win, The ability of relaxation and de-stress and relieve anxiety in athletes, Prevention and elimination of overtraining and plateaus run at

athletes, The ability to motivate athletes in the tournament, Physical and mental ability to reconstruct the athletes after the race. Coaching skills are process which is used to direct the sports program toward the specified goals. The first task of the coach is to lead the athletes. Responsibility of the coach mandates maintaining effective communication with officials, athletes and coaches. In the area of leadership coaching duties are: to motivate athletic, good relations with them, make necessary changes and investigation of inconsistencies. The use of different practices led by coach depends on the fitness of athletes. The familiarity of the coach with leadership styles and method and utilizing the best leadership method is an important factor in the success of the coach and a constructive relation with the athletes (Hersi and Blanchard 2004). The results also showed that the ability of the coach to design and writing of a short-term, medium-term and long-term plan for the team is among the competencies of the coach which has be entitled "Planning competence or ability to plan". The results of this research is consistent with the results Santos (2010). In fact, when the coach wants to adjust the programs he requires planning table for increasing annual training sessions, to determine seasonal goals, planning for travel and sports, and the like. Through the plan, he can predict what actions should be taken, who and how the action must be done. Planning means setting goals and making decisions about what order or what the outcome of these goals are met. Planning is one of the most valuable factors for successful of the coaches (Dabaghian, 1996). Humanity skills of the coaches are another competency skill identified in this research and the results of the present study is in line with that of Kohandel (2000). Humanistic behavior with the athletes is among the core success factor of the coaches. Basically, there are two types of behavior in organizational relations. First one is the humanistic behavior comprised of building a relationship with people on an individual basis according to the needs, interests and feelings. In this method the coach does not considers his followers as mean to reach his own goals. The second one is responsibility based behavior, including making relation with individuals based on responsibility and works, in this method the coach just guide his followers to perform their own task correctly and there is a poor humanistic relationship between the coach and the members, and implementing the assigned task are the main factor to reach the organizational goal (Hersey and Blanchard, 2004). The results also indicated that

social characteristics of the coaches are among the competency factor, the results is consistent with the research of Shafi'i (2006), Myers et al., (2011). Coach someone through systematic application of a series of activities, talents, physical, motor, intellectual, social and moral existence of learners and learners will flourish; therefore innate human abilities and forces reinforced by coach and favorable for the development. Coach is an individual which glorify its follower physical, movement, social and talents of his trainee through organized program. However, the person in charge of the above mentioned issues, is the coach. A coach is more involved with problems in group activities, because in addition to guide individuals and improve their performance, he has to coordinate among all members and the guidance and coordination is necessary for the prosperity and success of the coach. In addition to the above, coach also deals with emotional and social problems of the athletes. The ability to motivate athletes to improve the performance and success of the tournament is as an important skill in coaching. Motivation is an internal force which guide the individual to his goal. The results showed that personality of the coaches are also among the competencies in managers. The results of this research is in line with the results Kohandel (2000), Tabrizi (2001), Shafi'i (2006). Grover (1992) considers the characteristics of a coach in practice, including giving feedback, encouragement, reward, problems solving, and challenges and develop performance. He believes that a coach should be able to use his skills in the above areas, to help the team succeed and also suggests that successful coaching depends on the development strategy, the use of personal evaluation, training, feedback and preparation of the coach. He has designed a model for modeling success of the coach and in this model defines three basic concepts, which include: coach reaction, training and educational results and outcomes (Grover, 1992). People who are motivated by intrinsic, have internal ferment and competence and a specific decision to carry out tasks with skill on the path to success. Characteristics of competence, self-determination, skill and success are the targets of individuals who are motivated from inside. Athletes participating in sports competitions is have a love match which is based on an internal motivation. Coaches should encourage this kind of motivation in athletes (Khabiri, 1994). The results showed that the track record of the coach can be considered as a competency factor this part of the research is in line with the results of Kohandel (2000), Tabrizi (2001), Shafi'i (2006), Myers et al., (2011). The previous record of participating in national teams, teaching in coaching classes makes them to be experienced which provide them with the required competency. The results also showed that competencies and moral qualities of taekwondo coaches underlying competency of Taekwondo coach and the results is in line with the results of Nasiri (2008). ASCTA Forum (1998) describes the characteristics of a coach in the eyes of the athletes as: consistency, ability to tolerate criticism and crisis, positive, polite, belief in their work, be optimistic, being a good listener and advice to and tight-lipped, being humble, committed, self-esteem, courage to re-do work .... So these characteristics can make the coach be successful in the field of coaching. Yousefi et al in a research entitled "evaluation of the role of coach in spreading sport behavior from the eye of national teams of the country" have positive effect on spreading sport behavior while they had negative effect in sport commitment, social responsibilities and refusal of win oriented thoughts, and this difference was significant. The results showed that the scientific, technical and educational characteristics of the coach is among the competencies of the Taekwondo coaches. The results is in line with the results of Kohandel (2000), Tabrizi (2001), Larson (1990), Mayer (2006), Santos (2010). Jefferie and Stephen (1992) refer to the required skills that are essential for a coach, and point out this skills as a power for succeed of the coach. One of the most important skills, technical skills, these skills include methods, processes, procedures and techniques of a coach to succeed in his work. The goals of the coach in technical skills includes: Procurement of equipment for the implementation of a training session, assessment of conducted exercises and competitions, the development team's goals and philosophy, Organizing and participating in competitions. As well as the ability to recognize how different functions of coaching communicate with each other and how

changes in one aspect of coaching can affect other aspects, called perceptual skills. Concrete examples of these skills, the ability to understand the interaction of various aspects of psycho-physiological fitness to create a sports movement. Thus mental training should be included in the sports program (Dabaghian, 1996). The results showed that individual demographic characteristics and other factors can also (2000), Shqyy (2006), Nasir (1997). Direct verbal communication of the coach with athletes, level of education, education in physical training and other fields, physical fitness and the ability to perform sport tactics, proficiency in a foreign language, physical characteristics and appearance and being keen in coaching is among the personal characteristics. Finally because of the importance of the coach selection and the effect of an appropriate selection of the coach on the success of the national taekwondo team internationally, having a suitable indices for selecting coach in different level will help the authorities to find the best one for this position.

## DEVELOPMENT AND GLOBAL ARCHITECTURE OF EDUCATION

“HESAM PESIANZADEH

*“Oslo University College*

*Email: “Hesampesian@gmail.com*

Abstract. Globalization is one of the contemporary events that have affected many different aspects of life. Although globalization has many positive aspects, its negative aspects also affect the living conditions of human beings. This impact has challenged the sub-identities of social cultures in different communities. From this point of view, social development of the societies is also one of the most complex concepts in the humanities. This concept becomes more complicated when some societies are trying to develop other societies by transition of serious of thoughts and manners which has no suitability with the culture of targeted societies.

Globalization has led the global architecture of education to be considered as a tool for socio-cultural development of underdeveloped societies. This tool is used for transferring the dominant culture which is not only different but contradictory in terms of social, cultural, and historical aspects with the culture of many other societies. Furthermore, many international organizations and executors trying to make positive changes in different societies are facing with such challenges mentioned above because their thoughts are based on western epistemology discourse. This paper briefly has tried to study the theoretical and practical support of global architecture of education and show the challenges of these international organizations. In order to clarify this issue, two countries such as South African as a country affected by socio-educational changes by international organizations and Cuba as a country whose education system is based on historical and cultural values of Cuban society has been analyzed.

Key words: Globalization, developments, educational development, Global architecture of education.

### 1 Introduction

Educational development in a global world is one of the complicated contemporary concepts today. In one sense to have “education” is a fundamental right for human beings and is essential to have development in society. However at the same time, education for who and for what is a very important question. “Development” itself also is a very contestable concept because in post-colonial countries some people see development as a new tool to colonize their mind and use the society’s resource as their previous historical experience was. Another concept that is very complicated is “Globalization” which has a positive and negative side to it. Global organizations are practical side of globalization that have advantage and disadvantage role over the many years in world.

However, it is important to understand relationship between education and development in an African context in order to understand the positive and negative role a global organization may have in developing their life condition.

The first part of the article will discuss education and development as concepts. Secondly the article will continue by discussing global architecture of education and the role of global organizations like the World Bank and UNESCO in an African context. To have more practical discussion both in terms of broader socio-historical and cultural relations in development, South Africa and Cuba will be looked at.

### 2 Education and development

In the first part of the article, the writer will try to examine the relation between education and development at a global level. To put light on this, the article will try to use Serpell (1993) as a theoretical framework to understand education in a developmental sense.

According to Serpell (1993), the economic, cultural and pedagogic agendas of schooling, seek to promote ‘economic progress, transmission of culture from one generation to the next, and intellectual and moral development’ (Serpell, 1993, p. 1). Serpell is trying to explain how those three agendas have an important role in educational policy around the world. Earlier,

the schools’ role was to transfer culture from generation to generation, however, much attention has turned to economic and pedagogic role of the school (A. Breidlid, 2003; Hoppers, 2002; Serpell, 1993; Tucker, 1999). Therefore, nowadays education is seen more as an economic, cultural and pedagogic agenda system to reach development in societies.

As Fagerlind and Saha (1989) mentions: “There have been few concepts in social and economic thought which have been as ambiguous as that of development the terms has been used in a variety of contexts, often clouded with political and ideological overtones” (p.4). In addition, Holmarsdottir (2006) explains there is two differing conceptions of development “development conceived of as increased prosperity, measured in terms of economic growth”, which is a neo-liberal assumption. Secondly, development is to meet human needs, which enables the potential of human personality to be realized (p.2). The dominant view to development is to see countries develop based on the “economic-growth paradigm”. Though there are disputes over this, still the dominate perspective categorizes countries into “First world” and “third world”, the first world referring to industrial western countries and the third world applying to countries where the economy growth is not high and they are usually located in the global south.

Therefore, it is very clear that the dominant understanding of development is the neo-liberal perspective of development (Hon, 2002, Holmarsdottir, 2006) that plays a crucial role in educational policy at a global level. Further, the discussion now turns to the background of development theory in order to show how it has affected educational policy.

According to Fagerlind and Saha (1989), “Ideas and concepts do not occur in a vacuum but are products of the social, cultural and historical events surrounding them. Such has been the case in the thinking about development” (1989, p.5). So after World War II, the European people experienced horrible times and thus, different development theories emerged. One of the theories that effected education was human capital theory that “postulates the most efficient path to the national development of any society lies in the improvement of its population that is its human capital” (Fagerlind & Saha, 1989, p.18). Furthermore, human capital theory was developed by economist as a reaction to other theories that were developed by sociologists and named it modernization theory (ibid.).

Modernization theory is a “intellectual responses to the World War two” (Fagerlind& Saha, 1989, p.15). In modernization theory, modern values like achievement motive which is seen by McClelland as essential to have open societies, which in turn provides economic and technological advancement which is necessary to have modern and civilized societies (Fagerlind &Saha, 1989). For modernization theory, education is directly related to the acquisition of modern values to reach economic development. Likewise, for human capital theory education is viewed as productive investment, as Schutz (1961) states: that “educated population provides the type of labor force necessary for industrial development and economic growth” (Fagerlind& Saha, 1989, p.19).

It can be argued that these two perspectives are linked to the global architecture of education. I think as Fagerlind and Saha mention “As with modernization theory, human capital theory provided a basic justification for large public expenditure on education both in developed and developing nations” (1989, p.18). Furthermore, this view helped global organizations to enforce a Western epistemology on to countries with a different social-historical context. Hence, they are affecting their cultures and values. Now the article will explore the nature of global architecture of education. In addition, it will discuss the World Bank as one of the oldest global organizations that is involved with education.

### 3 Globalization

As Levin Institute (2011) point out:

“Globalization has become the new buzzword and is often defined as a process of interaction and integration among the people, companies and government of different nations, a process driven by international trade and investment and aided information technology” (Sited in Breidlid, 2013; p.16). Hence, globalization is one of the difficult concepts to define, but there is some common understanding of it. As Held (1999) mention “Globalization as the widening, deepening and speeding up of world-wide interconnectedness in all aspect of contemporary social life, from the cultural to the criminal, the financial to the spiritual” ( Crossley& Watson,2006; p.53). In addition, as Wallerstein points out, there are two sets of globalization, old and new one. With the old one we refer to colonization and capitalism that began 500 years ago. So for some societies, “globalization” is the continuing of modernization and westernization of other cultures. As Chakrabarty (1992) point out: “Modernity is something exclusively invented in isolation in North-western Europe, but has been assimilated, incorporated, molded, and universalized to fit European colonial expansion” (Breidlid, 2013, p.16). Hence, some people see globalization as new a version of colonization which has changed face in the later years. For them global architecture of education is the main tool that western is using to colonize their mind and ignore their cultural value.

Globalization has also some advantages as H.S Bhola (2003) states optimistically: “Brought about its dialectical opposite; the desire for localization, the search for community, indigenous values, mother tongues; and the wish to search preserve cultural heritage, and indigenous knowledge” (sited in Breidlid, 2013; p.16).It can be argued that, we should see social phenomena form two angles before judging. For example, globalization has opened many doors to spread information between people which can provide more understanding about each other and can bring more peace to our world.

### 4. Global Architecture of Education: Historically and in context

Global architecture of education is part of complex a process that emerged with “Globalization”. As Jones (2007) points out “A complex web of ideas, networks of influence, policy framework and practice, financial arrangements and organizational structure (2007; p.325).

It is important to discuss the global architecture of education because it plays a homogenizing role in many countries with different social and cultural contexts “The global architecture of education or the global educational discourse has had and still has, enormous consequences for how the school systems function in various parts of the world” (Breidlid, 2013; p.54).Furthermore, it is essential to understand the historical background of that concept to fully comprehend the effects of it today.

Since Enlightenment, to have modern values and modern society became the main discourse in Western European. A main feature of modernity is the idea that everything from the western world is scientific and logic. Any culture that does not fit into sciences is unscientific. This view has led western society to take their assumptions as universal and led them to spread it to other regions. In global architecture of education “The view that education should be a part of the market is normalizing which results in governments taking less responsibility for the education sector in their country, leaving it to the private sector (Jones, 2006; p.59).

Likewise, modernity and westernization with privatization of education that was background for globalization led western

societies to understand their education as “right” education system that can be fit with other context. Consequently, “Transferring of education” emerged.

When transferring of education, it was done to improve other countries’ socioeconomic situation, and it was thought a need to transfer western understanding of education to the global South. The idea was that education could be exported to other countries in third world, so from practice to theory would produce what already existed in western society. Although all experience show that idea of transferring is not really sufficient, according to Tucker: “The transfer of goods, gadgets, capital, technology, hospital and roads (...) The economic policies and the economic accomplishments of the west cannot be replicated in the Third world counties (1999, p.2).

As was mentioned above, one of the main tools to transfer Western epistemology to the Third world is global organizations. One of the most important organizations that is active in educational development is the World Bank, and therefore, the article will now discuss the structure of the World Bank structure and how it has been a source of failures and frustrations in countries in the attempt to make developmental progress.

### 5. World Bank as global organization:

There are many organizations that are active in the sector of education since it is often regarded as a means to a better end. Therefore, “it has gained a central role in the international system of development and aid” (Shiotani, 2010, p.5). Based on the World Bank report in 2011, the organization is one of the important actors in education:

“The World Bank has probably been the most important contributor around the globe in education over the past 50 years; it has been the single largest source of support in the field of international education. The Bank has, since its inception, invested more than \$69billion globally in education through more than 1500 projects. The Banks support for education in terms of loan commitments was more than \$5 billion in 2010” (Breidlid, 2013; p.73).

It can be argued that the World Bank plays important role in transferring Western educational discourse to the South. As Breidlid (2013) states:

“The world Banks entire history, its creation, and its rational are rooted in the post-war reconstruction (and development) of capitalist economies according to the dominant Western/Eurocentric paradigms that scientific knowledge leads humankind's dominance of nature for endless, linear growth, and development” (p.73).

This quote here is to show the nature of World Bank is as a main actor in education, which is based on economic and western scientific understanding of the world. It is discourse because power and practice have significant role on it. In other world, “development has uniform characteristic” (Crewe & Harrison, 1998; p.17). This uniform is economic (both modernization theory and human capital theory) which believes that to have modernity and development in society, we should try to have modern humans as well.

From that point of view, the World Bank take knowledge produced in North and transfers it to South in order to aid development in society. In other words, their policy “is one size fits all” (Kless, 2002, Breidlid, 2013). According to Breidlid: “In the last decades the World Bank has been associated with neo-liberal ideology, and although there have been some changes (...), its belief in the Western educational discourse have remained constant” (2013; p73).

Consequently, World Bank is not just an organization that distributes money to develop the educational situation in the South but is also a promoter of the western hegemonic discourse on education (Jones, 2004). It is a kind of discourse that is more European-centered understanding of education which ignores cultural and historical context of countries in the South. "This one-size-fits-all approach, besides its modernist and unsustainable profile neglects the fundamental differences in educational topography in the various countries where the World Bank enters to assist" (Breidlid, 2013; p.74).

This is the place that global organizations have failures and frustration result in educational development because firstly, they teach their partners in South to be dependent on them so they are not as self-reliant as they could be. Secondly, those countries that normally have corrupt political systems, try to attract more money, and aid money can end up financing corruption instead of helping people. Thirdly, the price of development may be that people forget their own societal cultures.

## 6. Two sides of the same coin:

It should not be forgotten that the World Bank has also had a role in helping people in different countries to have a better standard of living. Furthermore, World Bank has had a positive role to give basic education to children and youth in different countries so that they are able to know about their culture and indigenous knowledge. Secondly, the World Bank activities are helping to spread educational technology like computer and internet in the South countries. Spreading knowledge around the world can give countries more opportunity to see different points of view and opportunities to know different ways to face their problems. Third aspect of the World Bank is that they are trying to change their programs as Kless (2002) status: "The Banks changes in development rhetoric to include empowerment, participation, even partnership, have positive aspect" (p.464). Also, as Breidlid (2013) points out, World Bank education Strategy 2020 includes three new areas: "Knowledge generation and exchange, technical and financial support, and strategic partnership" (p.73).

Hence, it may be noted the World Bank has progressed from their neo-liberal perspective to recognize their partner's rights to organize their education system based on their social-cultural context. We should keep in our mind that change is not something that can happen in one night. For the World Bank (2011) "Education is fundamental to development and growth" (Breidlid, 2013, p.73). Before moving to the second part of the article which will discuss South Africa and Cuba, it is necessary to explore what is meant by African values and culture? Which aspects of societal cultures are neglected by global organization?

## 7. Tradition, Home culture, Modernity in Africa:

We cannot find any society without inherited cultural values as Gyekye (1997) argues:

"It may be said that from the point of view of a deep and fundamental conception of tradition, every society in our modern world is traditional inasmuch as it maintains and cherishes values, practices, outlooks, and institutions bequeathed to it by previous generations" (p. 2018).

However, behind each modern society, tradition has taken place. Often, unfortunately, everything that is modern looks better than tradition, and tradition is usually seen as "rural, unscientific, and resistant to change" while "modernity is characterized as scientific, change-oriented, dynamic and urban" (Breidlid, 2002; p. 38). From here, it could be helpful to discuss tradition in general and what is tradition and culture in Africa, in abroad sense.

Fleischacker defines culture as a set of practices and beliefs that persists over several generations and tradition as a set of practices and beliefs that persists over several generations hence "practices-rituals, customs, superstitions-that passed down from generation to generation are tradition (Gyekye, 1997;p.220).Therefore, to understand what is tradition, it is good to try to have an idea about concepts that play a traditional role in Africa, such as: Ethnicity, place and space, land, spirituality, indigenous knowledge, ancestor. Because of space limitation the writer will explain briefly some of these concepts in order to understand the Western epistemology discourse in relation to alien educational system introduced to South Africa particularly. The explanation will be related to educational part of those concepts.

## 8. Ethnicity and education

South Africa is not a homogenous society. The region suffered from colonization still South Africa has very diverse ethnicity that "requires awareness, sensitivity and responsiveness on the part of school leaders" (Woods, 2004, p.98). As Chabal and Daloz (1999) mention, colonization wanted to establish the nation-state based on European understanding of it which in turn greatly impacted the multi-ethnic nature of Africa.

Colonial powers and the apartheid system had significant role in the process of establishing education policy because they transferred curriculum that was not based on student home culture of the indigenous students in South Africa. Thus, they suffered because the knowledge they bring from home was not being discussed or valued in the classroom (Breidlid, 2013; p.54). So many students have to study an alien culture that is completely different to what they experience in their daily life. This can be more problematic if we think how these children should construct their identity in school. In other words, they will have socialization process that is not fit with their cultural background.

As Breidlid argues: "There is an Othering here when your own culture and self-understanding is constantly being marginalized and looked down upon" (2013; p.56). On a large scale, what some scholars argue is that global architecture of education brings to Africa an education system which is completely different with the African context. This may affect the African situation negatively. Abdi states that: "Globalization is not designed... to develop the African people and its educational prescriptions are making the situation worse for African children" (Breidlid, 2013; p.57). Hence, the global architecture of education greatly impacts on education systems, such as the one in South Africa.

It is very important to remember that there is not only one path to development, in other words: "What kind of education is appropriate for what kind of development, and in whose interests?" (Fägerlind&Saha, 1989, p. 58). This is a relevant question when global organizations want to make policy for educational development. Western development in education system is impressive, however, experience shows, it cannot always have the same good results in different contexts. Any educational system should be fit with people's cultural background.

## 9. Indigenous knowledge

One of the important concepts in global south, and in South Africa particularly, is indigenous knowledge. Semil and Kincheloe(1999) define it as: "Indigenous knowledge (as) are knowledge produced in specific historical and cultural contexts or rules and orally passed down from one generation to the next"(as cited in Breidlid,2013, p.31). Further, "indigenous" people can also be defined "...in terms of a shared experience of domination" (ibid).

Indigenous people were affected, and still are by historical issues like colonization or that they are a minority group in their land within a dominant state system. In other words, they are not living in their cultural context due to historical or political events.

Indigenous knowledge is relevant to our discussion because it is important part of African culture as Ebdowo (1982) have exposed the “importance of metaphysics, spirituality, and religion in African epistemologies” (sited in Breidlid, 2013, p.33). Likewise, indigenous knowledge is coming from African context that is best way to reach sustainable development in Africa. As African philosopher Gyekye (1997) sees culture as socially created and nurtured meanings constituting and the greater portion of our necessary social context (Breidlid, 2013, p.33).

A western epistemology discourse, which was discussed earlier, has had an important role in the construction of the global architecture of education, which in turn has impacted on the development of educational policy in Africa. However, the context of such a discourse is that it ignores indigenous knowledge in Africa, since from the western point of view, Western means “developed, industrialized, urbanized, capitalist, secular and modern” (Hall, 1996; p.186) and every other concept that cannot be related to that discourses is usually referred to as underdevelopment. From this view, indigenous knowledge can exist just in religious ceremonies or rituals, while numerous Africans practice it in their everyday life. African societies often see the world differently than how the western society sees it, as Chivaura (2006) states:

“The African worldview declares that our world has two aspects: they are the physical and spiritual...the difference between African and European worldviews concerning earth and heaven relate to differences in their attitudes towards the material and the spiritual” (sited in Breidlid, 2013, p.34).

Problems rise here because from western epistemology, knowledge should be secular and scientific and not spiritual, while an African understanding of knowledge is related to both the physical and spiritual part of life. Therefore, a western based educational system which is transferred to a differing context may produce an alienated person from their African culture.

## 10. Ecology and indigenous knowledge

One of the areas western epistemology ignores when transferring educational system to Africa, is the ecological part of the indigenous worldview in the African context. As Semali and Kincheloe (1996) point out: “Indigenous knowledge focus on relationship of human beings to both one another and to their ecosystem ... an emphasis which has been notoriously absent in the knowledge produced western science over the last four centuries” (sited in Breidlid, 2013, p.35). Therefore, the educational system that comes from different context cannot be fit with an African context since it lacks the three most important parts, which are the human being, land and spirituality. The kind of education given teaches children a completely different set of values and has little relation with who they are historically, socially and environment part.

As Max Webers (1905) argues that capitalism is based on the assumption that “...there is a close relationship between Protestantism and capitalism (...) the idea is that domination over nature through hard work and frugality will be rewarded by God” (as sited in Breidlid, 2013, p.23). However, African understanding of ecology and environment is as Nahtani Wane (2006) explain based on spirituality: “is vital life force that animates African peoples and connects them to the rhythms of the universe, nature, ancestor and the community” (sited in Breidlid, 2013, p.36). Hence, it can be understood there is a

difference between the epistemologies of western and African societies.

African world view has different understanding of ecology and environment which can be helpful for our world when it comes to serious ecological problems. Some ecological problems have root in western understanding of environment, where man controls nature.

However, it is important to point out that indigenous knowledge does not have all answers to environmental issues in the modern world and should also be looked at critically. As Breidlid (2013) points out: “The potential rebirth of indigenous knowledge does not mean that indigenous knowledge should be essentialized, romanticized, or presented as monolithic and uncontested even by indigenous populations”(p.43). Furthermore, though indigenous knowledge are essential aspects in how one views the world, it does not mean it should form new discourses to manage world views. However, it is essential to value alternative epistemologies to solve world problems and also is necessary that African can be able to have education based on their culture, society and ecology.

To have clear idea about African context article will turn to second part that is about South Africa and Cuba. In second part, the article will explain socio-historical and cultural relations in development in a South African context in order to understand what is the role of the global architecture of education in that particular context. Then Cuba will be discussed as a country that established a different educational system, which differs from the western epistemology. This is done in order to see an alternative to education which other countries can use to build their own systems.

## 11. Part Two; South Africa

South Africa experienced a harsh apartheid education system that had different educational opportunities for black and white people. After Apartheid, South Africa tried to have an educational system based on a post-apartheid condition, therefore, they had different policy from 1994 to 2005 that resulted in curriculum 2005 (Breidlid, 2002, 2013).

Nelson Mandela and Thabo Mbeki had important roles in African renaissance and their “focus is related to building a nation where African values, knowledge and heritage are central” (Breidlid, 2013, p.78). To reach that aim, curriculum 2005 stipulates that indigenous knowledge such as their technology and science should be included in the curriculum so that students can be familiar with indigenous cultures (Breidlid, 2002). However, despite this statement in the curriculum, the South African education system is based on western science, and indigenous knowledge “play peripheral or even exotic role” (Breidlid, 2002, p. 46). Hence, children’s socialization process may be alienating them because this separates students’ home and school culture. To show how it may be, article will continue to explain relationship between indigenous and western education in South Africa.

According to Breidlid (2013): “majority of school children in South Africa come from backgrounds where the key concepts and epistemological orientation that are linked to a modernist education system are alien” (p.93). In addition, as other research performed among other ethnic groups in South Africa shows, indigenous worldviews is based on “spirituality and ancestral beliefs” (Leclerc-Madlala, 1999; Mbiti, 1969 sited in Breidlid, 2013, p93). The challenges that curriculum 2005 face is because it “...is modeled on a Western discourse, depending heavily on different international context” (Breidlid, 2013, p.98). Although, other part of the curriculum which is about giving skill and knowledge to the learner so they can be useful for their country in a post-apartheid society is very worthwhile. However, these skills and knowledge may not fit with their context and what this

can produce is a learner, alien to their identity. As Olugbemiro J. Jegede and Glen S. Aikenhead (1999) point out:

“When the culture of science is generally at odds with a student’s life world, science instruction will tend to disrupt the student worldview by trying to force that student to abandon or marginalize his or her life-world concepts and reconstruct in their place new ways of conceptualizing” (sited in Breidlid, 2013, p100).

Interestingly, the revision of curriculum 2005 did not recognize indigenous knowledge and it tried to adapt its national curriculum to other international curriculums in the world (Breidlid, 2013). So, after many years, educational policy-making in South Africa does not recognize their own culture and society, which can offer a different alternative for educational development beyond a liberalist one. Furthermore, students in South Africa have to practice western educational system while they could be learning about their cultural capacity to contribute for sustainable development.

Department of Education (1997) in South Africa seeks to construct “a shared understanding of a common South African culture” (sited in Breidlid, 2013, p.97). This ignores the fact that their context has multiple identities based on their historical background and social reality. Hence, what the curriculum is doing is trying to create “a sense of constructing a national identity where certain cultural values are promoted and others are not” (Breidlid, 2013, p.97). Consequently, C2005 want to create a society based on Western understanding of a nation-state with the belief that introducing modern education will help reach western economical standard.

The growth that western societies have experienced is not being experienced in the general society of South Africa. Partly, the reason for this can be that the education system is divided into two parts. In one part, western educational perspective affects all their institutions, have a very formal structure as presented by Department of Education. On the other side, is the indigenous knowledge that is represented by indigenous peoples and communities (Breidlid, 2013). Combining these two parts can in turn have “...the possibility of generating cultural centered knowledge in a third space” (Breidlid, 2013, p. 103).

Another example of westernization is that the South African education system has English language as its language of instruction in schools which can be an obstacle in children’s socialization process and is a heritage from colonial time. Ngugiwa Thiong’o states that: “from a word, a group of words, a sentence and even a name in any African language, one can glean the social norms, attitudes and values of a people” (1986, p. 8), underlining the importance of one’s own language. This is another challenge which comes from C2005 that does not recognize South African context and believe that only way to develop is to fit with a western standard of education.

## 12. Cuba

Cuba has one of the best educational systems in the global South. Here, the writer will discuss Cuba’s educational and social context in order to explain: how Cuba can establish a different, yet “successful” educational system apart from the global architecture of education; and, what are the characters of the educational system which makes it a unique educational system.

The Cuban “educational system is famous for its focus on inclusion and equality of opportunity, but also for its focus on political and ideological conformity” (Breidlid, 2013; p.141). It can be discussed that to have an ideologically hegemonic educational system is a negative side of Cuba’s education system, which forces people to have certain education and certain jobs. Most human beings wish to be free to choose their

own lifestyle. This ideological part of education is a negative part of any education system that is ideologically based; either it is Islamic ideological education system in Sudan or Iran, or western education system that wants to force liberal values upon the global south. However, as Breidlid (2013) point out “when analyzing the Cuban educational discourse there is needed to distinguish between the educational systems ideological and epistemological foundation” (p.141).

The Cuban communist government emerged after the revolution in the 1950’s. The communist party runs the economy and the society. In fact, based on undemocratic and hierarchical structure of Cuba there is no other political party (Carnoy, 2007; Breidlid, 2013). Fidel Castro sees education as a very fundamental right for society as he states: “the happiest country is the one which has the best educated sons, both in the instruction of thought and the direction of their feelings”(Sited in Breidlid,2013,p.147). From that point of view after revolution, Cuba established a literacy campaign in order to have “Free education and health care were factors that contributed positively to the improvement of the lives of those people who had been oppressed by the Batista regime” (Breidlid, 2013; p.147).

As UNESCO research in 1997 and 1999 show: “Third and fourth grade children scored much higher in math and language than pupils in other Latin American countries” (Sited in Carnoy, 2007; p.6-45). This research is important because Cuba has shown it can have a successful educational system without assistance from the World Bank or any other global organization. As Breidlid states: “Cuba has resisted the globalized drive for privatization, and its merits have been accomplished with no assistance from the World Bank” (2013, p.163).

Cuba’s education is free of charge from kindergarten to university so their success is not dependent on their parents’ economic background. In other words, “students in the Cuban system are not disadvantaged because of present forms of racism, present forms of structural inequalities” (Breidlid, 2013; p.162). Cuba’s education system is not just good in a quantitative way, rather as EFA Global Monitoring and UNESCO Report in 2005 mention “Cuba is one of four countries mentioned which have achieved high standards of education quality” (Sited in Breidlid, 2013; p.165).

In addition, Cuba is trying to combine indigenous knowledge with their educational system as Breidlid explains how Cuban children in primary school are “trained in herbal remedies, which they can prepare at home as poultices, tinctures, salves and teas” (2013; p.159). Further, students in “Grade 8 focuses on energy and renewable energy sources and their relationship to the environment” (Breidlid, 2013, p.159).

To understand how Cuba can do better with their educational system, Carnoy (2007) introduced four criteria: first) State-Generated Social Capital Matters as Cuba education system spend resource to have equal and high-quality education for all children in a safe and healthy environment. Second) Curriculum Matters, but its Implementation Depends on Teacher capacity as Cuba curriculum is more practical and is more covered in school because it is more fit with teacher’s educational background. Third) Teacher training education in Cuba is more professional approach to teacher training. In addition, it has a clear vision of a high-quality, successful teacher education program. Fourth) Cuba education system is organized around high-quality instruction to make sure that required curriculum is being implemented. Therefore, Cuba education has an evaluation system that helps them to improve their teachers and curriculum (pp. 143 - 153).

Recently, Cuba got a new secondary education policy that has some negative effect on the quality of teaching because teachers in Cuba used to teach in their special subject but now “teachers are expected to teach all subjects with the exception of foreign

language, computing and arts” (Bredlid, 2013; p.151). Likewise, the effect of tourism and oil industry has brought different social class with different economic ability, which expects to have private schools. Therefore, Cuban educational system is facing some challenges but the important point about Cuba educational system is that students do not experience an alien educational discourse like what happened in South Africa. In addition, the main reason Cuba was used as an example was to show how the global south countries can have other alternatives in front of them. They should trust their resources such as their people, culture and environment in order to have development.

### 13. Conclusion

The article tried to introduce some of the most complicated concepts in the world today. Concepts like education, development, western hegemonic discourses, Indigenous knowledge were discussed. Firstly, the article wanted to show the background of global architecture of education is. Secondly, how global architecture of education effected Africa and South Africa in particular. Thirdly, to show how the World Bank as a global organization is active in transferring educational system from west to global south. Even though the global architecture of education affects educational systems, it is not white and black. In other word, organizations like World Bank and UNESCO have a lot of positive effect to educational development as well. Lastly, the article tried to bring Cuba in as an example that can do better with their educational system even though it is not connected to western discourses in education. Other countries may learn from this.

With all the discussion around concepts about how educational systems should be in the 21<sup>st</sup>- century, I hope educational policy-makers can agree with what Freire suggests that: “every human being is a repository of knowledge, not an “empty vessel” devoid of knowledge, and he has valuable experiential knowledge to be applied in problem-posing dialogues” (sited in Bredlid, 2013; p154).

## ESTIMATING THE DEMAND FUNCTION FOR GASOLINE AND DIESEL AND THE EFFECT OF SUBSIDY REMOVAL ON DEMAND RATE OF THESE PRODUCTS (CASE STUDY: IRAN)

<sup>a</sup>SAJAD BOROUMAND, <sup>b</sup>ZAHRA SEYED ALI LAVASANI

<sup>a</sup> *Department of Economic, college of Humanities, Kermanshah Branch, Islamic Azad University, Kermanshah, Iran.*

<sup>b</sup> *Master of Media Management, Tehran, Iran.*

Email: <sup>a</sup> *Borus\_181@iauksh.ac.ir*, <sup>b</sup> *elavasani@gmail.com*

**Abstract.** Our aim in this study is to measure the effect of the policy of removing subsidy on the demand for gasoline and diesel, we have estimated the function of demand for the desired products using conventional econometric methods and applying Ordinary Least Square (OLS) technique and calculated price and income elasticity for them. It was determined that short-term price elasticity for gasoline and diesel was respectively -0.10 and -0.15 which was also consistent with theoretical foundations. Also, long-term price elasticity for petroleum and diesel is respectively a significant number of -0.42 and -0.49. Therefore, removal of subsidies can play a role in controlling demand and reducing the growing process of their consumption.

**Keywords:** indirect subsidy, econometrics, ordinary least squares, price and income elasticity

### 1 Introduction

The present structure of production and petroleum and diesel consumption in the country is affected by political and social conditions of the past and different factors including economic structure of the country in one hand and public management in energy section in other hand to the consumers of these products regardless of income status and their role in national production. In other words, the government without achieving the goals of establishing subsidies has fueled to the inefficiency in consumption of these products by paying huge sums as subsidy to the consumers of these products. It is natural that the first step (but not the only step) of the government to rationalize the process of gasoline and diesel consumption is revision of the pricing policy of these products and as a result revising the policy of paying subsidies to all consumers no matter what their situation is. However, it should be considered that discussing and commenting on the way of implementing the program of paying subsidy to the consumers is not in the field of this study and there should be an independent study in this area. In other words, here, we don't mention the conditions that recipients of subsidies should have to pay them subsidies and also mechanism of paying subsidies that need thorough investigations (Gujarati, 2003).

In this research, we have estimated the total demand for gasoline and diesel which is obtained from total demand for different parts.

Also, the important point is that in this research, the purpose of changing the amount of demand due to the policy of removing subsidies is the amount of reducing demand relating to the consumers.

Hence, in this research, we will estimate the demand model for gasoline and diesel in Iran after reviewing the studies in this field. After analyzing the estimated model, we will evaluate the reduction rate in demanding for petroleum and diesel due to the policy of removing subsidies.

### 2 Research Methodology

The documentary method in this research is applied to identify and collect data and statistical methods and econometric are used for analysis.

Data applied in this research is in form of time series data annually and for a period of 41 years from 1971 to 2011.

Since, in this study, we aim to measure the effect of the policy of removing subsidies on the demand for the main oil products, we

will estimate the demand function for the desired product by the use of conventional econometric methods using OLS method and Eviews software and price and income elasticities will be calculated for them. Assuming other conditions to be constant, and to not change the structure of demand function of each product within the price increasing of that product, and according to the theory of demand, we will calculate the reduction rate in consumption of each product due to removing subsidies and pricing based on Persian Gulf Free On Board (FOB). The important point is that in this research, changing the amount of demand due to the policy of removing subsidies is the amount of demand reduction which is related to consumers.

### 3 Research literature

Theoretical basis of this research is based on microeconomics and theory of demand. Demand function in its general form shows the amount of the good that an individual will buy according to different prices of that good and his income.

Two important functions are derived from these functions,

1. Demand for each product is a function of price and income level.
2. The demand functions are homogeneous from zero degree with respect to price and income. This means that if all prices and income change to a same amount, there will be no change in the amount of demand.

In economic texts, other variables have been considered as factors affecting determination of demand level of consumer.

Usually, 4 important factors are named in this regard:

1. Price of the studied good as the most important determinant factor
2. The consumer's money income
3. Consumer tastes
4. Price of alternative and complementary goods

This can be written as follows:

$$Q_x = f(P_x, Y, P_c, P_z, T, \dots) \quad (1)$$

In which,  $Q_x$  is the demand rate for the good  $x$ ,  $P_x$  is the price of good,  $y$  is money income,  $P_c$  is the substitute good price,  $P_z$  is the complimentary good price and  $T$  tastes and preferences.

The demand law says that assuming other conditions to be constant, if the price of a good increases, its' demand rate will be reduced. This means that except in extreme cases (Giffen good), if individual consumers want to maximize their satisfaction according to their limited money income, their individual demand and the price of good will move in the opposite direction. In other words, we will have:

#### 3.1 Price elasticity of demand

It is defined as a relative sensitivity of the rate of demand towards changes in price. Price elasticity of demand is calculated by the following equation:

$$E_{xx} = \frac{\partial(\ln X)}{\partial(\ln P_x)} = \frac{\partial X}{\partial P_x} \times \frac{P_x}{X} \quad (2)$$

\* If the demand curve is descending, numerical value of this elasticity will be negative.

### 3.2 Income Elasticity of Demand

It is defined as the relative sensitivity of the rate of demand towards changes in income. Income elasticity of demand is calculated via below equation:

$$\text{Exy} = \frac{\partial(\ln X)}{\partial(\ln Y)} = \frac{\partial X}{\partial Y} \times \frac{Y}{X} \quad (3)$$

\* If the good is normal, the demand for good is increased by increasing income.

Therefore, since our aim in this review is to measure the effect of the policy of removing subsidies on gasoline and diesel demand, we can see the effect of removing subsidy (pricing based on Persian gulf FOB instead of subsidized price) on demand for these products by estimating the demand function and determining the price elasticity.

### 4 Definitions and Concepts of subsidy

In dictionaries, subsidy or subside (in French) is mostly defined as free help and government financial donations to people from time to time and include:

A kind of government support from a certain stratum of society (or sometimes the entire community) in certain time periods or emergency in order to provide social welfare through reducing the costs.

There are also other definitions for subsidy in the following:

Subsidy is "direct or indirect payment of government, economic privilege or grant especial preference which is given to private institutions, households or other governmental departments in order to achieve the government desired goals.

Subsidy: it is a payment by the government (or by private persons) which creates a gap between the price that the customer pays and expenses that manufacturer will be incurred.

Subsidy: a transition from taxpayers to manufacturers or consumers of a particular good in order to influence on the behavior of suppliers through the mechanism of supply elasticity or demand elasticity in order to keep fix or low the price of certain goods.

Direct subsidy: it is the amount of costs that government pay directly to protect the interests of society for using the goods.

Indirect subsidy: it is a part of state aid which offers a good to the consumer with lower price than its' finishes expenses. The paying subsidy to gasoline and diesel is classified in this category.

#### 4.1 Existing views on subsidies for oil products and our view in this research

A view that seems to be traditional-popular and usually has been discussed in the society is that Iran due to having rich oil reserves and these resources belong to all people of Iran, thus, the full payment of the cost of consuming products such as non-oil countries is not necessary.

The second view existing among the experts of the country in favor of the policy of paying subsidy to energy, especially oil products is according that Iran has oil reserves and resources and is an oil exporter, hence, the existence of these resources should be an advantage for the country domestic production which should be competitive using the advantage of cheap energy with similar foreign products which use expensive energy. Regarding the second view, it should be noted that although in the theory, such an advantage can be imaginable for competitiveness of locally manufactured goods with similar foreign goods; but having a look at the consuming structure of these products in Iran which more than 60% of these products are consumed in services parts, thus they have no role in production. About the rest, also due to lack of an efficient use of energy in our economic manufacturing section, energy consumption is non-working. On the other hand, lack of attention to the energy consumption in locally manufactured goods has also taken the possibility of exporting these goods from the domestic industry. For example, many of domestically produced cars would not be exportable to many parts of the world due to high gasoline consumption. The third view is that the lack of appropriate pricing of oil products and stabilization of their prices so that the real price of these products has been decreased sharply has led to unreasonable consumption of these products and if the growth of current consumption continues, Iran would be a net importer of oil for its domestic consumption in a very near future. Therefore, it is necessary to determine the price of these products synchronized with the international price and taken from consumers.

In this case, both the consumption of these products will be saving and growing demand will be controlled and also the efficiency of production system, especially industrial products will be increased by correcting the relative prices. The other hand, financial problems of Iranian Oil Company will be resolved and required resources will be supplied to invest in energy section. In short, these experts believe that subsidy of oil products should be completely removed and the economy will adapt to the new situation in long term.

#### 4.2 The results of some estimated models about the price and income elasticities

As the following table 1, indicates, the short-term price elasticity calculated for motor gasoline demand is between -0.0048 and 0.39 in numerous studies. In these studies, long-term price elasticity of gasoline was between -0.033 to 1.15. In investigations, the rate of long-term price elasticity has been increased by getting closer to the present time. The range of changes for short-term income elasticity has been from 0.18 to 0.725 and between 0.56 and 1.89 for long-term income elasticity.

Table 1. The short-term price elasticity calculated for motor gasoline demand

	short-term price elasticity	long-term price elasticity	short-term income elasticity	long-term income elasticity
Plan and Budget Organization model	-0.38	-	0.72	-
Model of Mohammad Amin Kianian 38-57	-0.004	-0.032	0.23	0.91

Model of Ali Arabmazar Yazdi	-0.18	-1.15	0.30	1.89
Model of Abbas Karimzadeh	-	-	0.31	0.75
Model of Mohammad Ali HAJimirzaei	-0.39	-	0.19	-

Below table 2 has provided the calculation of price and income elasticities of demand for gas oil, derived from studies done in

the past. The table indicates that the change range of short-term price elasticity of these products is between -0.04 and 0.63. This

range for its' long-term price elasticity is from -0.2 to -0.59 which shows the low elasticity of these products in long-term and short-term towards the price. Short-term income elasticities

show the figures between 0.17 and 2.78 and the figures between 0.15 and 6.6 for long-term.

Table 2. change range of short-term price elasticity of these products is between -0.04 and 0.63

	Short-term price elasticity	Long-term price elasticity	Short-term income elasticity	Long-term income elasticity

### 5 Demand model for gasoline and diesel and evaluate the effect of removing subsidies on demand value of these products

Given that removing subsidy of gasoline and diesel means to increase selling price of these products and since these products are known as normal goods, thus, we expect that the demand for these products face reduction by increasing the price of these products considering other factors constant; the reduction rate of demand in short-term depends on the size of price elasticity of these products (Pin Dyck, 1997).

If the good is normal, its' demand curve will be descending. Hence, the numerical value of price elasticity of demand for that good also should be negative. Given that our reviewing goods which means petroleum and diesel are normal goods, so we expect that their demand rate is reduced by increasing their price.

In this section, we will introduce the model and its' variables. The model applied in this research is in form of full two-way logarithm (log-log).

The overall shape for each of these products is as below. It can be found from the shape of model that this model has many similarities with fitted model.

$$\text{Log } q_{ijt} = \alpha_{ij} + \beta_1 \text{Log } y_{ijt} + \beta_2 \text{Log } P_{ijt} + \beta_3 \text{Log } q_{ijt-1} + \epsilon \quad (4)$$

In which,

q: represents the use of each of these products in the country at t time. y: is gross domestic product. P: indicates the real price of the desired product. The real price of each product is obtained from dividing its' nominal price on the retail price index (cpi). qt-1: it shows the consumption of desired product in last year. This is entered into the model in order to convert the model to a dynamic model and considering the variables which have not been considered.

According to enter this variable (delayed dependent variable) in the model, our model can be classified with partial adjustment models.

In these models it is assumed that the effect of changes in independent variables is not reflected on dependent variables in real time, but also this is done with delay. One of characteristics of this model is that Durbin-Watson index (D.W) in these models tends to number 2 unrealistically and as a result, it makes

it difficult to judge about presence or absence of autocorrelation. So, h-statistic is used to judge about the presence of autocorrelation which is calculated as follows:

$$h = (1 - 1/2 d) \sqrt{n/1-n} [\text{var } \beta_3] \quad (5)$$

In this formula, d is statistic of Durbin-Watson and n is the number of observations. If the calculated h is in the range of -1.96 < h < 1.96, the autocorrelation assumption can be excluded.

In econometric studies, we should consider our expectations about the values and symbols of estimated parameters based on theoretical foundations.

According to theoretical foundations, it is expected that the sign  $\beta_1$  (income elasticity) be positive for each of these parameters. It is also expected that the sign  $\beta_2$  (price elasticity) occur with negative signs for them. About  $\beta_3$ , since this coefficient can reflect the effect of consumption habits of consumers, it is expected to occur with positive sign.

Considering that in complete logarithmic models, coefficients represent elasticities,  $\beta_1$  and  $\beta_2$  coefficients indicate short-term income and price elasticities.

### Data

The data used in this research for estimating demand function for the oil main products is from the type of time series and related to the years 1966-2006.

In this section, referring to our desired model, we will evaluate each of variables, the way of their calculation and the source which has been referred to for each data. Some variables have been considered which have been better descriptors for changes of demand value of petroleum and diesel in previous studies. We pointed out that our model is as follows:

$$\text{Log } q_{ijt} = \alpha_{ij} + \beta_1 \text{Log } y_{ijt} + \beta_2 \text{Log } P_{ijt} + \beta_3 \text{Log } q_{ijt-1} + \epsilon \quad (6)$$

In which, q is the indicator of the product per capita consumption. For each product per capita consumption, we have used q instead of benq for gasoline and gasoq for diesel. Statistics of consuming these products have been extracted from available statistics of National Iranian Oil Company (2009) Consolidated Plan Management for the years 1966-2006. Also, consumption of these products are based on million liters per year (figure 1, 2, and 3).

Figure 1. Diagram of gasoline consumption for the period 50 to 90 years (based on million liter).  
Source: National Iranian Oil Company Consolidated Planning management

Figure 2. Diagram of diesel for the period 1970 to 2010 (based on million liter)  
Source: National Iranian Oil Company Consolidated Planning Management

Also, we have used gdp capita instead of income y representing GDP per capita at constant price in 1997. These information are

extracted from time series statistical collection of economic statistics of Central Bank.

Figure 3. Diagram of GDP for the period 1970 to 2010 (in billion RLS)  
Source: Central Bank

Figures (4, 5, and 6) related to qt-1 which in our model is benq1 for gasoline and gasoq1 for gas oil, are obtained according to the statistics of consumption with a one-year delay.

services in urban areas has also been used (consumer price index). The data source is related to the nominal price of petroleum main products of Iranian Oil Company Consolidated Planning Management.

For the real price of each product, the nominal division of each product on the index of total price of the good and consuming

Figure 4. Diagram of the real price of petroleum for the period 1970 to 2010 (per RLS/liter)  
Source: National Iranian Oil Company Consolidated Planning management

Figure 5. Diagram of diesel real price for the period between 1970 and 2010 (per RLS/liter)  
Source: National Iranian Oil Company Consolidated Planning management

Thus, total figure of demand function of each of main oil products will be as following:

$$Lbenq = 1.7282 + 0.3328 \lgdp + 0.7545 lbenq1 - 0.1052 lbenp - 0.9701 ma(1) \quad (9)$$

D.W=2.26      R2=0.9842      h=1.15

**5.1 Demand function of petroleum**

$$Lbenq = \alpha + \beta 1 \lgdp + \beta 2 lbenp + \beta 3 lbenq1 \quad (7)$$

In which,

L indicates the related variable logarithm. Benq: gasoline per capita consumption. gdp: Gross Domestic Product in constant prices of 1997. Benq1: per capita consumption of gasoline with a delay. Benp: real price of gasoline.

**5.2 Demand function of diesel**

$$Lgasoq = \alpha + \beta 1 \lgdp + \beta 2 lgasop + \beta 3 lgasoq1 \quad (8)$$

In which,

L: indicates related variable logarithm. gdp: GDP per capita in constant prices in 1997 Gasoq: per capita consumption of gas oil. Gasoq1: per capita consumption of gas oil with a delay. Gasop: real price of gas oil

**5.3 Results of model estimation**

In this part of study, we will evaluate the results of model estimation in demand for each of these products. Estimation of each of demand function based on ordinary least squares (OLS) method. These estimations are done using Eviews software. The estimation results for each of desired products are given below separately.

**5.3.1 Estimation results of gasoline demand function**

According to the available figures, the gasoline demand function has been fitted as follows:

Table 3. Short-term and long-term income and price elasticities of gasoline

Product name	Short-term price elasticity	Short-term income elasticity	Long-term price elasticity	Long-term income elasticity
gasoline	-0.1052	0.3328	-0.4285	1.09

Source: research findings

As is shown in above table 3, long-term income and price elasticities in this product is more than income and price elasticities of the product under the discussion. The long-term price elasticity of demand for gasoline is -0.42 which is a significant figure. The calculated income elasticity in long-term for demanding this product is about 1.09 which implies luxury of this product in economy of Iran.

\* The model was under the following tests to evaluate the classic assumptions

Model interpretation:

As we can see, the t-statistic is significant for all explanatory variables at one percent of confidence level. R2 is also higher than 0.98. Durbin-Watson (D.W) statistic is close to 2, but since the model has time delay, it cannot be invoked due to the lack of autocorrelation. Hence, h-statistic should be applied. h-statistic for this model is equal to 1.15 and is indicative of lack of autocorrelation in the model due to being in the distance of -1.96 < h < 1.96.

\* The numbers in parentheses are also indicator of standard deviation

\* In the above model, short-term income elasticity is equal to 0.33 and price elasticity is also equal to -0.10 which will be discussed more in next sections.

\* We have used below relations to calculate long-term price and income elasticities:

**Coefficient of desired product with delay -1/ price coefficient of each product-long-term price elasticity**

Coefficient of desired product with delay -1/ coefficient lgdp-long-term income elasticity

\* We used the mentioned relations to calculate long-term price and income elasticities. Below table 3 indicates short-term and long-term income and price elasticities for gasoline:

1. We applied White test in order to detect heteroskedasticity and the assumption H0 based on homogeneity of variances was rejected. So, we used Eviews software to remove this problem and clicking heteroskedasticity.

2. We used Lagrange Multiplier (LM) test to detect autocorrelation and Moving Average cubic MA (3) was used to remove autocorrelation.

3. We used Dickey Fuller test to detect stability of explanatory variables of the model and found that these variables were stable with one time differencing and integration of all of them was

from first order or I(1). After Dickey Fuller test on the residues, we found that the integration was zero-order I(0).

\* In this equation diesel is considered as the nearest substitute for gasoline and that is why the price of diesel has been entered into the model. But, it was observed in investigations that according to the figures available, gasoline and diesel cannot be replaced with each other. Hence, we removed the price of gas oil from the model.

### 5.3.2 Estimation results of diesel demand function

According to available figures, gas oil demand function is obtained as follows:

$$L_{\text{gasoq}} = 1.2952 + 0.3227 I_{\text{gdp}} + 0.6956 I_{\text{gasoq1}} - 0.1505 I_{\text{gasop}} \quad (10)$$

D.W=2.12    R<sup>2</sup>=0.97    h=-0.42

- Model interpretation

Table 4. Short-term and long-term income and price elasticities for diesel

Product name	Short-term price elasticity	Short-term income elasticity	Long-term price elasticity	Long-term income elasticity
Diesel	-0.1505	0.3227	-0.4944	1.06

Source: research findings

As can be seen in the above table, long-term income and price elasticities about this product is more than its' long-term income and price elasticities. Long-term price elasticity of diesel demand is -0.49 which is a significant figure. The calculated long-term income elasticity for demand of this product is about 1.06 which implies the luxury of this product in Iran economy.

The model was under below tests to review the classic assumptions:

1. White test was used in order to detect heteroskedasticity and the assumption H<sub>0</sub> was approved based on consistency of variances.
2. The LM test was used to detect the autocorrelation and the assumption H<sub>0</sub> was approved based on the lack of autocorrelation.
3. Dickey-Fuller test was used to detect stability of explanatory variables and concluded that these variables with one differencing which means that they were all integrated from the first order I(0). After Dickey-fuller test on residues, we found that the integration is from zero-order I(0).

\* It is expected that petroleum be the nearest substitute for gas oil due to the more use of gas oil in transportation; but, since replacing gasoline with gas oil requires some changes in cars' system, this substitution cannot be done due to technical and economic limitations. Thus, the substitute variable in this demand equation is not intended.

### 6 Evaluate the effect of removing subsidies on demand for gasoline and diesel

Since in complete logarithmic models, coefficients indicate elasticity; therefore, in above models coefficients of lbenp and lgasop are indicative of price elasticities of demand.

Since the price elasticity indicates the percentage rate of change in demand rate of a good per one percent change in prices and also, removing subsidies of petroleum and diesel means to increase its' selling price. Hence, price elasticity of above models indicates that consumption rate of gasoline and diesel is with complete low elasticity compared with its' price. In other words, if the price of gasoline increases for one percent, its' demand value will be reduced in short-term only for 0.10 percent. But, it will be a significant value in long-term and will

According to the results obtained, t-statistic has almost significant reliability for all explanatory variables. R<sup>2</sup> of the reviewing model is equal to 0.97. Durbin-Watson statistic for this equation is approximately equal to 2 but is not reliable, because delayed depended variable is used in the model. h-statistic for this model is equal to -0.42 and is indicative of lack of correlation in this regression because of being located between the distance of -1.96 and +1.96.

\* In the above model, short-term income elasticity is equal to 0.32 and price elasticity is also equal to -0.15.

\* The numbers in parentheses are indicator of standard deviation.

\* We used the mentioned relations to calculate long-term price and income prices; the following table 4 indicates short-term and long-term income and price elasticities of diesel.

be equal to -0.42. But in long-term it will be significant and equal to -0.49.

### 7 Conclusion

In this research, since our goal was to evaluate the effect of the policy of removing subsidy on demand value of oil main products, we estimated the demand function for desired products by the use of econometric methods via OLS method and the use of Eviews software and price and income elasticity's were calculated for them. It was found that short-term price elasticity for gasoline and diesel were respectively equal to -0.10 and -0.15 and long-term price elasticity for them were respectively significant figures of -0.42 and -0.49. Then, assuming other conditions to be constant and in process of price increase of each product, the structure of its' demand function will not change. We calculated the reduction rate in consumption of each product due to removing subsidy and pricing based on Persian gulf FOB according to demand theory. It was clear that a significant value of consuming these products will be reduced by implementing this policy and thus greater financial resources will also be achieved. In addition to reduce the damaging environmental effect and so on, obtained resources can be spent on infrastructural investments and increasing development activities.

In fact, the lack of appropriate pricing of oil products and fixing their prices so that the real price of these products has been decreased sharply has led to unreasonable consumption of these products. If growth of current consumption continues, in a very near future, Iran would be a net importer of these products for domestic consumption and enormous amount of money would be spent on paying subsidy to these products. Hence, it is recommended to determine the price of these products synchronized with their international price and be taken from consumers. As a result, changing the price in order to make efficient the consumption of these product is essential in Iran despite many political and economic obstacles. In this case, both the consumption of these products will be saving and also the demand growth will be controlled. Efficiency of production system especially industrial production will be increased by correcting the relative prices and economy will also be adapted with new situation in long-term.

## THE CONCEPT OF “ BECOMING ” IN *THE RED BADGE OF COURAGE*: A DELEUZIAN READING

<sup>a</sup>KHADJIEH OGHBAEE, <sup>b</sup>SAEED YAZDANI

<sup>a</sup>MA Student, Department of English Language and literature, Boushehr Branch, Islamic Azad University, Boushehr, Iran

<sup>b</sup> Department of English Language and Literature, Boushehr Branch, Islamic Azad University, Boushehr, Iran,

Email: <sup>a</sup>khadjieh.oghbaee3@gmail.com, <sup>b</sup>saed.ani.sy2@gmail.com

Abstract. The present article seeks to investigate Crane's *The Red Badge of Courage* in terms of Deleuze and Guattari's concept of "Becoming". It examines the impacts of "Becoming" on individual's mind and behaviors, and also the impacts of "Subjectivity", "Body without Organs", "Desiring-machine", and "Death" on the main character in the novel. Identity is gone when there is no stability for it, and people are identified through their becomings. *The Red Badge of Courage* is an epitome of man's struggle in search of way to establish his identity in a complicated situation. The article investigates the way each individual loses its individuality by becoming; it also exhibits a more analytical view on the process of subjectivity produced by emphasizing the operation of body without organs and desiring-machine.

Keywords: Becoming, Identity, Subjectivity, Body without Organs, Desiring-machine, Death

### 1 Introduction

"The term "becoming" is a part of a critique of Plato. In Plato, the concept of "becoming" (French :devenir) means to be in a state of change. According to Deleuze, a becoming occurs in a site where many stratifications interact. It is a direction within intersections, but a direction which is not fully controlled, either consciously or unconsciously by the person. Becoming is in-between space from which it arises. Deleuze and Guattari suggest that in the spaces between strata there are loopholes that allow persons or groups to develop in ways which are not fully determined by the antecedent state of that person or group" (Due 141-142). According to Deleuze, "becoming passes between points, it comes up through the middle. A line of becoming has neither beginning nor end, departure nor arrival, origin nor destination. A line of becoming has only a middle. The middle is not an average. A becoming is always in the middle. It is the in-between" ( *A Thousand Plateaus* 293).

According to Deleuze, "a becoming is a general type of process. It is a composition of activity and passivity, such that it is undecidable what a person does and what simply happens to that person. It is a process that integrate into itself the parameters by which it makes sense and becomes meaningful. The becoming is a movement and the question for the individual is whether to continue or to interrupt it. According to Deleuze becoming, designates for any individual a process of alteration that changes that individual's most basic relation to the world

and to itself" (Due 141-142).

For Deleuze, "identity itself is always in motion: the identity of the individual subject, pressured from all sides by forces that will make him or her but also the collective subject, pushed together through environmental, governmental or social forces, or coming together in a resistance to these. In Deleuze's opinion, identity is always in motion, no matter how rooted it seems or how fixed. Not only that, but all identifications are in motion, since any fixed

state of an object is merely a stage of apparent rest before another change. If we pick up a coffee mug and look at it, we can have no doubt that it is a fixed object in time and space. It is, in fact, fixed to the extent of being brittle. It will smash if we drop it, and it's

'essential' identity would be at an end. What we are really looking at, however, is a moment (no matter how long)

of apparent rest in the life of its molecules and atoms. It was once wet clay, formed and shaped, glazed and fired under pressure. It continues to change, cracks and fissures forming on its surface, until we break it, when it will be tossed aside as rubbish, returning it to the earth. This 'fixed' object in space is also a fixed object in time (Deleuze called this an 'objectile') only in as much as we isolate it in our minds from the continual change of the universe. If identity is always in motion, it is always coming into being, a never ending project of *becoming*" (Martin-jones 61-62).

Stephan Crane (1871-1900) lived only twenty-eight years. In that time, he earned a reputation as a great American novelist, poet, and short story writer, and became a respected war reporter. Crane's chosen profession as a writer helped to spark a revolutionary change in American literature. He published his first novel, *Maggie: A Girl of the Streets*, a grim, Naturalistic novel about an impoverished woman in a desperate situation. In 1894, he had finished *The Red Badge of Courage*, his best known novel about a soldier's experiences in the Union Army during the Civil War.

### 2 Discussion

In the novel, *The Red Badge of Courage*, we see becoming in the main character, Henry Fleming. There are many reasons that Henry changes during the war. At the beginning of the story, he seems to indulge in his dreams. He is a young boy from the North of the U.S.A, who believes that war does not happen because of historical reasons and war is impossible because people have become more civilized or more timid. He has no other choice but to go to the front. He remembers that he had told his mother that he wanted to go to the front; thus he enlisted in army privately. He tried to prove himself that he would not run from the battle. He condemned the generals. He had great anxiety in his heart and struggles in his mind. He was depressed and grim. He wished that he could stay and work on the farm instead of joining the army. He keeps on telling himself that he was not destined for a soldier. He suddenly remembers that he has not desired to join the war, and it was the merciless government that had dragged him obligatorily. Henry has a romantic vision of war as a "sort of a play affair", and he despairs "of witnessing a Greek like struggle", fears "the throat-grappling instinct has been effaced"; in short, Henry has a callow and unreal view of war. There is no place to run in real life. Although he attempted to escape but he accepted life and his responsibilities. On his way, he saw a soldier's corpse. Finally, he decided to become another man because he had learned how a man would be made in the wars. He saw his salvation in this changing. But when the war starts, he thinks that it is better to flee. But he forgets everything about himself and he feels that he is a part of his country and he cannot flee. Some moments later, the captain's company is killed at the early stage of the battle. A soldier near him throws down his rifle and flees; he does not think at all, but simply acts. He throws

down his gun and flees. The soldier is not ashamed of his act of cowardice. He runs like rabbit. Fleming has become an observer. He watches the behavior of the soldiers around him and acts like them. On his way, Henry comes across his friend, Jim Conklin, who had been killed because of his wounds. There was struggle between him and his doubts again. These incidents has made Henry think again. He has decided to fight and to show that he is a man of experience. He intends to overcome the obstacles. His attitudes towards the world is changed. During the war, he has

noticed that it's better to go toward the unpleasant situations. He feels that he is filled with a new confidence. He intends to challenge the officer who had said the soldiers "mule drivers", and "mud diggers". He has decided to move, else he would be killed. Therefore, he tries to hold the flag firmly. After the victory, he feels that he is a good soldier. He found himself capable of profound sacrifices. He had thought that bullets are the only things that could prevent him from reaching his aims. Now, He is able to control his fears. He finds that the world of battle is a grotesque and fatal one. In the course of one frightful day, Henry achieved a profound understanding. Henry has learned that life is not dream. He has changed now.

### 2.1 Becoming in *The Red Badge of Courage*

In the novel, we see that Henry changes in the middle of the war. So, "becoming" occurs in the middle of the war for Henry. It was Henry who has undergone a "becoming" in the middle of the war; there have been unavoidable conditions that Henry could not flee from. He could not even come back home. Because if he came back home, his mother would oppose him rather than support him. Because he remembered that when he volunteered, it was a pang at his mother's helplessness for his departure and her gift of black berry jam. He was ashamed of looking back at her tear-stained face as she knelt among the potatoes parings. He wanted to come back home in glory. He acquires maturity and self-awareness. He is sufficiently matured by his experiences with terror, anguish, anger and his suffering of his wound to deserve him into manhood. The process of becoming starts when he begins to believe that, a faith in himself had secretly been blossomed. There was a little confidence growing within him. He was now a man of experience.

According to Deleuze, "a becoming is a general type of process. It is a composition of activity and passivity, such that it is undecidable what a person does and what simply happens to that person. It is a process that integrate into itself the parameters by which it makes sense and becomes meaningful. The becoming is a movement and the question for the individual is whether to continue or to interrupt it". It means that becoming is not just important, moral principles are important and a becoming is a constitution of specific actions which do and do not. What a person does and what happens to that person are inevitable. Becoming causes to create conditions which these conditions combine together and this new condition is meaningful and acceptable. If this person expresses, or shows becoming apparently, it has had becoming in its brain. For Deleuze, "becoming designates for any individual a process of alteration that changes that individual's most basic relation to the world and to itself". Deleuze believes that the change is not due to the person taking on a new profession or falling in love or suffering from grief, although such events can trigger a further process of changes that may develop into a becoming. Since a becoming is fundamentally unpredictable because it does not flow from an antecedent state. The changes that a person undergoes in becoming can perhaps best be characterized as a process of absorption. A person is absorbed in an activity or in a situation and this increasing absorption changes him or her" (Due 142). We see Henry Fleming's becoming either in his point of view or his actions. He is doubtful to continue or interrupt. If he continued, he would be killed. If he interrupted, he could not come back his home. The events in the story shows Henry's vacillation between certainty and uncertainty. There is conflict between ideals and reality. But he has to continue and in a moment when he can see that the color bearer is getting killed, and he decides to hold the flag and to fight for his country. Here, as the rival color bearer dies, Henry is reborn. What Henry does, is unpredictable. Because he desires to run but when he sees that his friend (Jim Conklin) has been killed, his regiment has retreated, and many soldiers have been killed, he is determined to hold on to the flag.

When two friends grabbed the flag from the dead color bearer, Henry pushed Wilson away to declare his willingness to further risk himself and it makes the outcome unpredictable. He finds that he is a part of this regiment and this country.

According to Deleuze, "what changes in becoming are the person's priorities and general sense of his or her place in the world. According to Deleuze, becoming relates directly to bits of thought and social reality" (Due 143). We see that after some struggles that Henry has had in his mind, he concludes that he should change. First of all, he changes his mind. He believes that he is capable of making his destiny. According to Deleuze, "becoming defines immanence as an infra-symbolic realm in which not only parts of the physical environment but also the social and symbolic world surrounding it can be transformed into a component of its development without being mediated through a representation. Becoming is thereby a process of making oneself select and be affected by forces and parts of the environment that one would normally exclude" (Due 143). Here we see that those who had called the soldiers, specially Fleming "mule drivers" and "mud diggers" they have been changed too Fleming's becoming occurs here. Because he has been greatly affected by the war. Henry's identity is changing. He used to be a naive boy who lived in a village with his mother. He was a student. He was affected by newspapers, the gossip of the village and forced to enlist. He did not know himself very well. He was doubtful to stay in, or to run from the war. He did not have a stable opinion about war. This was Henry's state before his changing. This was his fixed state in time and place before changing. This was what Deleuze call 'objectile'. Henry's identity changes at the end of the story. He feels proud of himself. He has reached to his self-awareness and his identity is formed by his oppositions in the past and in the present. He has redeemed himself by adopting a new, more heroic identity.

According to Deleuze and Guattari, "identity is created only by "reactions by others to what are seen as characteristics" (Martin-Jones 64). According to Deleuze, the individual, be it a phenomenon, a quality, a concept, a person or a species is inseparable from individuation" (Weinbaum 25). For Deleuze, "it is important to note that becoming is inherently complex and intractable because it is a progressive determination. This means that determination of trajectories does not take place at all once but in a succession of determining events. Every such event is selective in the sense that subsequent paths and events are indeterminate before the event took place. Becoming is inherently non-deterministic; its outcome can't predicted in the general case" (Weinbaum 28). In this story, we see that Henry goes beyond his mind and his village. He goes to the front to see the real war, to know himself. Henry is a person who is not separable from his identity like the other people. Henry's becoming happens during such events like, his friend's (Jim Conklin) death and the other soldiers' death, his desire to run from the front, retreating of his regiment, the regiments' generals calling the soldiers, "mule drivers" and "mud diggers", and death of the color bearer and other soldiers. Jim Conklin had been killed for all his bravery. When Fleming finds himself among a troop of wounded soldiers, he is able to see that there is a gap between how these soldiers have been acting and how he himself used to acts. He wonders how he should stare at the faces of the men around him. So, he becomes ashamed and self-conscious only when he finds himself the object of the other's gaze. Fleming is filled with shame when he flees while his comrades fighting. Hence he must be a coward.

Henry is wounded with the butt of a gun, not with a bullet. Here Henry builds his courage. He starts to set aside his fear. When he carries the regiment's flag, he distinguishes himself through his courage on the field. When he comes across some wounded soldiers, he feels ashamed. Because of his shame Fleming wishes

that he too had a wound, a red badge of courage ; such a wound would give him a justification to cover his guilt .When he returns to his regiment with a wound by a plausible explanation for his absence, Fleming is welcomed by his comrades. In fact, they treat him as a hero. These incidents has changed Henry. It is not predictable at all from the beginning of the story that Henry would become the hero of the war. Because he had low self-confidence. In *A Thousand Plateaus* , Deleuze and Guattari say that " becoming is involutory , involution is creative". The evolution for Deleuze and Guattari is 'involution', something spiraling inwards, entangling and interweaving" (Ballen 30).

According to Deleuze , " as one changes, one also creates change to the surrounding. Individuation is full of factors of change , coincidence and accidents beyond control; it is fluctuation , like waves taking a shape of the rock on a shore , never-stopping, sometimes in a strong wind , sometimes in a dead calm. In this differentiation percepts work as forces and affects as becomings" (Ballen 32) . Here, it is the climax of Henry's becoming, a becoming which is a stage of evolution for Henry. Moving near the flag made Henry feel that he is a savior of people and an appealing cry went from his mind to go forward. He moves from darkness of war toward lightness of victory. Henry has reached from immaturity to maturity, from doubtfulness to assurance, from cowardice to courage.

## 2.2 Subjectivity in *The Red Badge of Courage*

According to Deleuze "subjectivity is derivative to the expression of thought (Semetsky 20). " subjectivation is the *relation* to oneself . Subjectivity is always posited as collective and plural". Subjectivity is being produced in a process of individuation which is always already collective , or as Deleuze says, "populated" (Semetsky 2 - 3). In Deleuze 's term, " this in-between perpetually in progress, between yesterday and tomorrow, between here and there, between before and after constitutes becoming-other.

According to Deleuze , the self would be defined as a singularity, that is, the one who , in terms of real-life events, may have experienced separation and probably even isolation as a precursor to individuation. This singular self , for Deleuze and Guattari, is a haecceity-or thisness. The haecceity is an event , that is a singularity in a dynamic regime of multiple transformations. According to Deleuze , the sense of the self as singular is derived from the individuation not limited to just a person but encompassing the whole event in a context described by Deleuze as " a draft , a wind, a day, a time of day, a stream, a place, a battle , an illness . It is an experiential situation distributed along the space-time continuum where "something [ is] passing through you". The self "consists in choosing choice, [therefore] is supposed to restore everything to us". To restore , as Deleuze uses the term, means to have a freedom to choose, that is not to go back to the old, but to be able to make a choice *per se* a mode of existence "( Semetsky 12-13 ) . Henry knew wars as far away phantom and considered them they have heavy crowns and high castles. He thought that a part of the world's history belonged to the war. But he sometimes thought that the period of war disappeared forever. He considered the war as a kind of a play affair. He thought about the next dangers that he might face. He tried to stand on his feet but he couldn't. Whatever he learned about himself was useless. As he walked along in careless line of his regiment he was stern and disappointed. Suddenly he thought that it is better to get killed and end his troubles. He decided to glance the war's dragon and then he thought that it is better to flee. First of all Henry thought that it is impossible to occur war. He looked on war with distrust. He believed that battles belonged to the past. He did not take for serious war. He was timid and doubtful. He had low self-confidence . But we see that in the process of becoming and

producing a new individuality Henry became a new man with a new point of view. He saw the real war and found that what the real war is. Becoming is not for a specific person in a specific place. Becoming may happen for everyone in everywhere . Henry experienced separation and isolation from his mother and village and his regiment. These incidents create a new identity for him. This new identity makes him unique. Henry reaches to the threshold of a new self. This is haecceity or thisness. This haecceity or uniqueness makes numerous changes in Henry. This new self makes him to be a member of a group. He understood that man's courage appears from self-realization. So, he must participate as a member of the group. In this novel, according to Deleuze, the sense of the self is not limited to just Henry. It is containing the whole event. Here, the sense of the self who is containing the whole event described by Deleuze as a battle. The self has a freedom to select. It is the moment that Henry was doubtful to flee or not. he should kill the enemy or to be killed by the enemy or when he gives his wound with the butt of a gun, he could tell the truth but he preferred to tell a lie. So, He was free to select one of them. He was free to select a way of existence. For Deleuze , " the subject is never complete , because it is always in the process of becoming .The Deleuzian subject is capable of political actions precisely because it is embodied in relational networks with both others and its environment and is therefore not individualistic but collectively constituted " (Stark 132) . According to Deleuze, " the subject is necessarily changes (Stark 135). Subject is a product of the world it contains (Stark 141). By situating the subject in time , it is able to differ from itself perpetually (Stark 143). According to Deleuze, the larval subject can't be the foundation of thought , because it is only the effect of other processes; it is the site rather than the source of thought " (Stark 152). Henry is not complete , because he has always been in the process of becoming. It means that he keeps on changing his attitude towards the world and his surroundings during the war. Henry has been capable of fighting actions because he has been in relation with the other soldiers, the commanders and generals. When Henry joined the group of wounded soldiers, he was forced outside of his own thoughts and emotions. Fleming must define himself in relation to these men. So, the collection of environmental and personal factors made Henry collective. According to Deleuze , " the real subject is set in motion by sensation , expresses Ideas , falls into actual identity (Williams 185) . In the process of individuation , the individual is put in touch with a differentiation of all Ideas and with a transformation of an actual situation" (Williams 188). Henry himself is surely changed . Henry has under the effect of his surroundings. His world has been limited to his mother, the merciless government, his warriors, his commanders, the wounded people, the killed people , and the battle. By placing Henry in the period of war, he has been contrasted with the old Henry , permanently, because before the war, he used to live in his dreams. He had been in incessant conflict with his own ideas. He didn't have a static character. But during the war, he is changed. At first Henry was an immature person. Because he was not thoughtful. We see Henry in this story by expressing his different ideas, different sensations before and during the war.

## 2.3 Body without Organs in *The Red Badge of Courage*

According to Deleuze and Guattari , " the best way to understand a body is to ask what it is capable of. Jacob von Uexküll in *Mondes animaux et monde humain* describes the relation of a tick to its environment. According to Uexküll a tick is capable of only three things: it can climb, fall, and dig. A tick is capable of being affected by sunlight , so it climbs up a tree to the end of a branch . A tick is also capable of sensing warm-blooded animals. When it does, the tick drops to the animal. At this point, the tick begins to search for a suitable place to burrow . When it finds a place it burrows its head under the skin and begins

to draw blood from the animal. The effects that this tick is capable of are the result of the relations of its various parts. For example, the tick's body must also be dense enough to fall relatively straight. If the tick's body caught too much air as it fell, it might fall too slowly to land on the passing animal. If the tick were too heavy its landing on another animal might be noticed. If the tick's body were too broad it might not be able to move through the thick fur of some animals to get to a place where it might dig. The same thing might occur if the tick's body were rough instead of smooth. The tick's body is thus the particular relation of motion and rest peculiar to it and its place in its environment and powers granted to it by this relation to affect or be affected by its environment. The affects themselves are limited by two thresholds: a maximal and a minimal. Deleuze and Guattari speak of this range between maximal and minimal thresholds in terms of intensity. The minimal threshold of a tick would have an intensity of degree zero. Suppose a tick finds itself in a particularly desolate segment of forest, or at least no animals appear within its drop zone. During these times the tick sleeps. It cannot exercise any of its affects so it enters a period of stasis. This is the tick's minimal threshold of intensity. The tick achieves its maximal threshold of intensity when it is full. That is, when the tick has exercised all three of its affects to their fullest extent, the tick can suck no more blood, and it dies.

Deleuze and Guattari take their cue from Spinoza in conceiving of a body. For Spinoza a body is an infinity of parts (or modes) with a fixed relation of motion and rest among its various parts, and this relation of motion and rest allows one body to be distinguished from another. 'Bodies are distinguished from one another in respect of motion and rest, quickness and slowness, and not in respect of substance'. A body is identified by the unique relation of its parts to one another. The identity of a body is the result of a unique intersection of modes that relate to one another in a peculiar and limited way. If this relation among the parts is changed, the specificity of the body is lost. For example, upon returning from a walk through the woods with my dog I discover a tick attached to the dog's ear. If I take a lighter and burn the tick so that its hard outer shell melts and its legs shrivel and curl under its body, the tick no longer maintains the same relation of motion and rest among its parts. As a result it is no longer capable of the same affects as it was prior to its burning. This new relation of motion and rest among its various parts create a new body. This new body would still be referred to the original tick, but the unmistakable change would also be registered by calling the new body 'burned tick' or even 'dead tick'. This extensional relation of parts Deleuze and Guattari call a body's longitude. It means that the body (taken as a composition of infinite particles) is defined in terms of its rest and movement. The affects that extensional relations make possible are called a body's latitude. It means that the body is defined in terms of its capacity to affect other bodies and in turn be affected by them. The capacity for affection is not fixed but elastic. Affects increase or decrease a body's power to act. This takes two forms: sad passions result from a decrease in the body's capacity for action, whereas joyful passions are the result of an increase. A body's individuality is determined by its longitudinal and latitudinal coordinates. For Deleuze and Guattari an analysis of the tick's affects, what sort of body could produce such affects, and the limits of those affects is the best way to understand the tick. All bodies have limits. The limits of anybody are produced by that body. In other words, for a body to have particular affects it must be organized in a particular way. This limit that is, on the one hand, produced by the organization of a body, and, on the other hand, precludes the body from exceeding it, Deleuze and Guattari call the 'body without organs'. Sometimes Deleuze and Guattari use the term 'full body without organs' is used to refer to the maximal limit, it means that the full body without organs is in a state in which it can maximize its potential to form connections but more often 'body without organs' is used to refer to both the

minimal and maximal limit" (Adkins 125-129). Here, the researcher surveys Henry's characteristics before and after the war. Before the war,

Henry is in his dreams about the war. He considers himself the defender of people. This is Henry's minimal intensity. He thinks that he must be a hero. When the regiment approaches to the field of battle. He thinks that it is better to flee. He is frightened. He is filled with great anxiety. He is stern and disappointed. But at the end of war, when he sees that his regiment is retreating and many soldiers were being killed. He held the flag and persuades the soldiers to fight and to go forward. This is Henry's maximal intensity. After the war he feels happiness and calmness. He thinks that he is a good soldier. Holding the flag has been Henry's longitude, and Henry's influence on his regiment and the effect of environment on him has been Henry's latitude. This is Body without Organs. When Henry makes his regiment win, it is called full body without organs. Sad passions occur when he witnesses his friend's (Jim Conklin) and the other soldiers' death. He becomes anxious or when he came back to his regiment after fleeing, he feels that he has done something wrong. He is filled with shame. Henry knows that his greatest despair has been that when he was alone and isolated from the rest of the army. But joyful passions has made him feel manhood, experienced, skilled, useful. For example, when he carries the flag and encourages the soldiers to go forward and its outcome is victory. He becomes happy.

According to Deleuze, "the body without organs can never be entirely free of the sedimentation of social coding, because it must articulate itself against (and thus exist within) the structures that organize the world" (Stark 159-160). Henry was not free from social coding. Because he did not want to come to the war, the merciless government forced him to enlist. War forced him to kill the other people or to be killed himself.

According to Deleuze and Guattari, "the Body without Organs is non-productive; nonetheless it is produced, at a certain place and a certain time in the connective synthesis, as the identity of producing and the product" (*Anti-Oedipus* 8). Here, Henry is considered as a nonproductive individual. Because he is produced during the war. He has shown his talents and potentials during the war. He has sacrificed himself for his country in a certain place and at a certain time.

#### 2.4 Desiring-machine in *The Red Badge of Courage*

Deleuze and Guattari argue that "desire attaches itself to part-objects. Deleuze and Guattari's typical example of this relation is a baby sucking at her mother's breast. For Deleuze and Guattari the connection made here is not a connection between mother and child. Rather, it is a connection between mouth and breast. Moreover, this connection is not a connection born out of a lack in either the mother or the baby. On the face of it this claim seems absurd. The Body without Organs breaks these connections. In the case of the child at her mother's breast, not only is a connection made that allows the flow of milk from breast to mouth, but also this flow is periodically broken as the child stops sucking and swallows. This break is the result of the relation of motion and rest among the parts of the child's body.

The child's body is such that it cannot suck indefinitely. It must break the connection in order to swallow. This oscillating cycle of making and breaking connections Deleuze and Guattari call a 'desiring-machine'" (Adkins 133-134). According to Deleuze and Guattari, "desiring-machines are binary machines, obeying a binary law or set of rules governing associations; one machine is always coupled with another. This is because there is always a flow-producing machine, and another machine

connected to it that interrupts or draws off part of this flow ( the breast- the mouth ). And because the first machine is in turn connected to another whose flow it interrupts or partially drains off.

Desire causes the current to flow, itself flows in turn , and breaks the flows. Hence the coupling that takes place within the partial object-flow connective synthesis also has another form :product/producing. Producing is always something “grafted onto” the product ; just as every machine is a machine connected to another machine (*Anti-Oedipus* 5-6). *Partial objects are direct powers of the body without organs , and the body without organs, the raw material of the partial objects”* (*Anti-Oedipus* 326). Henry, flag, regiment , war, each of them is considered as a machine. When Henry joined to the army and when he held the flag, there was a reasonable desire. Henry’s desires were that he wanted to examine himself, see the real war, save his regiment and soldiers. There is a connection between Henry’s thoughts , dreams, the war’s reality and flying the flag as machines. These machines connected to each other. They have created a desire for Henry to enlist and to go to the front, because he considers himself as a defender of people and he considered the war as the far- away phantom. Courage has connected Henry to the flag. Fear, anxiety , courage are “body without organs” and these machines have made Henry go forward. Of course, in some moments he stopped but he continues and becomes a hero. This is a desiring- machine. The product of this desiring- machine was the victory of Henry’s regiment and offering the red badge of courage to Henry.

In one part, Henry’s desire was destroying either Henry or his regiment. When Henry sees the soldier’s corpse , his enthusiasm vanishes or when the war starts , many soldiers decide to flee like Henry. That turns catastrophic for the regiment. But the officers’ shouting and punching made them stay. So, Henry’s desires are controlled in an acceptable way. Henry and Wilson notice that the color bearer has been killed , so they try to grab the flag, but Henry succeeds in taking the flag.

### 2.5 Death in *The Red Badge of Courage*

Deleuze and Guattari , are arguing that" the death instinct is a recent invention, the result of the the way capitalism constrains desire. For Deleuze and Guattari the death instinct is a function of Oedipus(The hero of Sophocles’ play: *The Oedipus Rex*) .As Oedipus slowly migrates from the limit of the socius in the primitive society , to residing in the person of the sovereign in the despotic society, and finally to representing desire in an Oedipal complex in capitalistic society, the death instinct migrates along with it. Or better, death can only become an ‘instinct’ where the subject is constituted around a lack. According to Deleuze and Guattari whenever desire is interrupted , this is death" (Adkins 178-181). As Oedipus, when Henry and the other soldiers move from their home, their villages or cities to defend their state in the battle to show their courage to their regiments’ generals, the death instinct walks side by side along with them, and it manifests itself through the sight of the body of a dead soldier who lay upon his back, staring at the sky. The flag that Henry carries symbolizes the group’s loyalty, it does not belong to the living men. The corpse from whom they grab it tries to warn Henry and Wilson that to serve the flag is to die but the warning seems useless. For Henry, death becomes an instinct, when he feels that he does not have enough self-confidence; for him, courage, hope and war is an expression of death and grotesque disorder which produces corpse. He did not have any enthusiasm to continue. This is zero intensity or minimal limit for him .When Henry feels that his desires are finished and flees the battle, he is closer to death. It is a personal death for him. Henry has been experiencing death when he has moved from minimal limit to maximal limit. It means that he has decided to put aside all his disappointments and to do an acceptable action . It is a becoming. Henry ’s lack is that he had

low- confidence . He didn’t know himself and war’s reality very well and used to be in his dreams. When he is desperate, hopeless ,frightened and separated from his regiment, it is death for him.

### 3 Conclusion

According to Deleuze and Guattari ’s theory of becoming , it occurs in a space between spaces , in a person between people and there are unavoidable condition that a person or groups can never flee and these conditions are not determined by previous state of the person or group. It means that the person’s changings are not controlled , either consciously or unconsciously. The changings are inevitable. Becoming causes to create conditions which these conditions combine together and this new condition is meaningful and acceptable. If this person expresses , or shows becoming apparently, it has had becoming in its brain. Different events cause changes but changes are unpredictable because changes occurs without previous state of a person and these changes cause the person to be absorbed to do an action. Becoming is a process in which a person is under the influence of environment forces that she or he was not before.
