**Abstract.** This study intends to investigate and evaluate the general public satisfaction level with the implementation of the "Targeted Subsidies Plan" in Ilam Province. Questionnaires used as the tool of information gathering and distributed amongst people who received subsidies payment and after a validity and reliability study; this information was used in this study. The results obtained from this investigation shows that this plan has been unsuccessful in practice, and the satisfaction level of public is low. Also this study shows that there is a meaningful relationship between the dependent parameter of this study, which is the public's satisfaction level, and independent parameters in the amount of cash subsidies paid with the associated cost of the program, weak management and lack of required long term vision and planning.

**Keywords:** Subsidy, Subsidies Reorientation, Targeted Subsidies, Satisfaction, Ilam Province

### 1 Introduction

One of the most common economic policies in the developing and even in the developed countries is the deployment of a number of appropriate supportive measures and payment of subsidies which today is regarded as an important tool in setting economic policies in order to protect and support vulnerable sections of the society as well as special production sectors.

The aim of implementation of such policies can either be to support those consumers who are unable to purchase particular goods or vital provisions, or to possibly support those producers who are unable to compete with other competitors due to increase in their total costs.

In Iran, during the last three decades, the government with an equalitarian attitude and without a predefined framework has subsidized sectors such as imports, production and distribution as well as subsidizing consumed goods such as energy carriers (petrol, gasoline, oil and gas), bread, water, electricity etc. and has tried to supply consumers with inexpensive goods at the lowest possible price to its people.

Most experts believe such payments have imposed a heavy financial burden on the government, and in practice it has failed to reach the targeted consumers which in effect have resulted in a type social injustice. This is due to the fact that the middle and upper classes of the society have received a bigger portion of these subsidies in comparison to the lower classes. Therefore, on the path to achieve social justice and supporting the lower classes of the society and vulnerable people, resolving problems associated with this untargeted subsidies payment system, reforming this system or targeted subsidies plan under the framework of economic development program was put on the agenda of the ninth government of the Islamic republic of Iran. In (2010) the parliament passed the legislation and in 1389 (2011) the 10<sup>th</sup> government implemented this legislation. Paying attention to the fact that implementation of this plan is considered to be one of the major plans in the public policy making sector after the Islamic revolution of Iran; the aim of this study is to evaluate the level of public satisfaction of its implementation in Ilam Province.

### 2 Theoretical Principles

#### 2.1 Definition of Subsidy and Reasons for its Disbursement

The definition of subsidy by the view of European Accounting System (1) is defined as gratuitous payments by the government

to producers with the aim of affecting production level, prices or to reward producers. (Farzin, 2010)

Subsidy in economic terms is defined as free of charge aids and financial contribution by the government in particular periods of time. (Farhang, 1982)

Subsidy is transfer of resources by the government to purchasers or sellers of goods and services in order to reduce prices for purchasers or to increase selling price or production cost and services for the producers. In this case, the net effect of subsidy is to support producer and consumers simultaneously. (Federal Financial Interventions and subsidies in Energy market, 1999, 17)

Subsidy is a term used for any type of transferring payment aiming to support low income classes and to improve distribution of income from government's treasury and can be paid into the treasury directly or supplied in form of cash or products to families and producers of goods and services. (Management Organization, 2002)

Different organizations pay subsidies for variety of reasons. Payment of subsidies by governments is no exception. Governments all across the globe pay subsidies in order to reach a set of special targets and in line with their general policies. For example, some governments pay subsidies to low income and deprived section of the society in order to establish social justice and a fairer society. In some states, subsidies are paid to people as a way to secure the future of the ruling political party and in other countries; subsidies are paid by powerful opposition of the government in order to overthrow the ruling system. In some other cases, subsidies are paid by foreign states in order to empower the opposition and to weaken the central government. (Sadegh Feizi, 2011)

Multiple problems of common and traditional subsidies payment systems including inefficient or non-optimal allocation of resources, high consumption rate, ineffective production, trafficking of subsidized goods abroad, destruction of environment etc. are the causes of ineffectiveness of this system and the decision by policy makers for reorientation of these subsidies.

#### 2.2 Subsidies Reorientation or Targeted Subsidies

The practice of targeting the subsidies or subsidies reorientation requires determination of the eligible and ineligible people to receive supportive programs, economic aid and social support by the government (Tootoonchi, 2009) In other words, during subsidies reorientation, groups or sectors that should receive governmental supportive programs based on special predefined criteria and priorities are determined and will be the beneficiaries. Selection of eligible people and groups within consumer and production sectors is a necessary required condition in implementing this policy. The success or effectiveness of subsidies reorientation policy is subject to the fact that low income and vulnerable groups have the lowest responsibility in securing the financial capital required and at the same time are the highest beneficiary of released resources and in return, capable groups of the society give the most help in securing the financial capital needed and will enjoy the least or none of the supportive programs offered by the government. (Zarvar, 2006)

After examination of domestic economic structure, policy and decision makers in the ninth government categorized the problems associated with the structure of domestic economy in seven categories (efficiency, taxation, backing, valuation of national currency, distribution of goods and services and subsidies) and by focusing on these categories, drafted a plan known as "Economic Development Plan" and submitted it to the Parliament in 2008, and the parliament designated a special commission to review it. In 2010 this plan was approved by the parliament under the title of "Economic Development Plan for Organizing Domestic Economic Structure". Targeting and

reorientation of subsidies payment is the key subject in the economic development plan that was submitted by the ninth government to the parliament. The Islamic Parliament of Iran, due to the huge significance of this issue formed a special committee and after many discussions and many sessions reviewing it, this bill that included 16 articles and 16 remarks was approved in 2010. The "Targeted Subsidies" legislation was finally implemented by the government in 2011, after nearly a year of delay.

### 3 Literature Review

There has been no comprehensive research on the topic of subsidies reorientation and comparison between different models of public policy making and evaluation of the level of public's satisfaction. However, there has been some published studies and research on the topic of subsidies reorientation and other related issues and some of these are as follow:

#### 3.1 Domestic Studies

1- In an article titled "Subsidies, Development and Poverty" published in 2006, Dini Turkamani studies two conflicting views of Neo-Classical and Institutional Development, and tries to assess their respective adequacy based on historical experiments of implementation of structural adjustment for economic stabilization policies within a predefined framework. He then tries to adjust these with special economic conditions of different economies, including Iranian economy. (Turkamani, 2006)

2- Mesbahi Moghadam and colleagues (2010), in an article titled "A study on Pathology of Targeting Payment of Subsidies", describes different levels of subsidies reorientation, reviews predicted problems and difficulties and concludes that reorientation of subsidies is a necessary measure to reform the economic structure of Iran ( Mesbahi Moghadam and colleagues ,2010).

3- Shahmoradi, Mehr Ara and Fiazi (2009), in their study titled "Price Liberation of Energy Carriers and its Effect on the Welfare of Families and Government's Budget"; by using Input-Output Static Analysis method and data published by Iran's Central Bank in 1378, have investigated consequences of price liberation of energy carriers on the household income deciles and government's budget. They concluded that, 100% price liberation of all energy carriers' causes an increase of 0.08% in price index of consumers and complete price liberation of energy carriers' results in an increase of 0.108% of consumers' price index. This study also investigates the effects of implementation of such policy on government's budget, and shows that an increase in the prices of energy carriers or complete price liberation results in the reduction of budget deficit of the government. This is obtained when the government has completely compensated the resulted reduction in the welfare of the society by cash payments( Shahmoradi, Mehr Ara and Fiazi, 2009)

4- Heydari and Parmeh (2011) have evaluated the consequences of the reform on the prices of bread and energy carriers on families' expenditure. This study has concluded that by eliminating the subsidies of bread and energy carriers, the expenses of urban families will increase by a minimum of 33% compared to minimum increase of 40% for rural families. (Heydari and Parmeh, 2011)

5- Rezaiepoor and Aghayie Khondabi (2012), in an article under the title of "The Effect of Imposed Shocks by Government's Subsidies Expenditure on the Real Consumption of Iran's Private Sector", investigate the long and short term relationships between the real consumption and imposed shocks by subsidies. According to obtained results in this study, they claim that during current inflationary recessionary conditions of Iranian economy, creation of negative subsidies shocks will certainly dramatically decrease the real consumption rate of private sector in the short term. This is due to the fact that the real income of people will decrease, which results in a reduction

of overall consumption rate of the private sector. However, due to the fast adjustment rate obtained from the model used, it has predicted that the effects of these shocks shall be resolved in the mid-term, and the real consumption rate of the private sector shall reach the expected equilibrium in the long term. (Rezaiepoor and Aghayie Khondabi, 2012)

6- In an article called "Subsidies: Achievements, Costs and Challenges", Zamanzadeh (2012) states that one of the most important achievements of subsidies reorientation is the reform and improvements to the energy consumption pattern and income distribution. On the other hand, the main challenges ahead are the resulting budget deficit of the government, increase in financial liquidity and high inflation rate. (Zamanzadeh, 2012, 132-108)

7- Islami et al., (2013), investigate the welfare effects of subsidizing electrical energy on the Iranian economy. According to three possible scenarios of price increase, cash payment of subsidies and simulation results of the model, the obtained results indicate that by implementing this policy the GDP of the country will decrease significantly and the economy will fall into a recession. Also by securing financial resources for these cash payments from surplus income of the government, taxation of electricity and income tax and incorporating them with the price increase policy, the GDP of the country is further reduced. The rapid rate of this reduction in GDP has a direct relationship to the price of electrical energy. (Islami et al., 2013,39-60)

8- Pezhoian and Rashti (2005) in their article called "Subsidies and the First and Second Degree Errors", defends the policy of reorientation of subsidies and believes that for a supportive system to operate successfully, it has to function objectively( Pezhoian and Rashti, 2005).

#### 3.2 Oversea Studies

1- Jensen and Tarr (2002) in an article titled "Commercial Policies" have investigated the increase in foreign currencies exchange rates and energy policies of Iran in 2003, by using a general equilibrium model. They have reached the conclusion that the structural reforms in three stated areas have resulted in significant gains and these gains have resulted in an increase of 50% of consumers' income. 7% of these benefits were due to commercial reforms, 7% due to reforms of the exchange rates of foreign currencies and 36% due to price corrections of energy carriers. In addition, applying a right subsidies reorientation policy can reduce the negative effects of price corrections on low-income sections of the society. If the obtained income is provided to all households (not only the low income ones) in the form of direct cash payments, this will have a significant positive effect on the income of poor households relative to their current status. Even the poorest of urban and rural households will experience an increase of 140% and 290% to their overall income respectively (Jensen and Tarr, 2002, 2760).

2- Son and Kakwani (2008) in an article called "Measuring the Impact of Price Changes on Poverty" have evaluated the effects of price changes of food products on poverty indicators in Brazil from 1999 to 2006. The calculated strains of poverty and the effects of total changes to prices on poverty are divided into income and inequality effects. In addition, this study determines a single price indicator for poor people, which in Brazil, this indicator has been used for such indicators of poverty count, poverty gap and poverty intensity. The results indicate that price changes in Brazil between 1999 and 2006 have been implemented in a way that benefited the low income households in order to reduce poverty gap between this section and the richer sections of the Brazilian Society. This study also indicates that poor people in Brazil experience a higher inflation compared to the rest of the society, however this effect has been reduced in the recent two to three years (Son and Kakwani (2008).

3- In their study by designing a GCE model, Kuster, Ellersdorfer and Fahl, have investigated energy policies with an emphasis on employment in Germany. In this model, the labor

market by considering two mechanisms of combating skilled-specific unemployment and electricity production technologies is described. This model has been used specifically for the purpose of analyzing capital and operating subsidies applicable to renewable energy technologies. The obtained results show that designating subsidies to this sector will not automatically result in lower emission. In addition, even if the reduction in total emissions is reachable, it is possible that due to the negative effects of a growth of the associated costs with this technology, these technologies will become inefficient. This lack of efficiency will result in an increase in unemployment of skilled and unskilled workers alike (Kuster.R; Ellersdorfer, I and Fahl, U, 2006).

4- Abooulein et al., (2009), in an article titled “The Impact of Pashing of Subsidies of Petroleum Energy Products in Egypt”, by using a GCE model investigated the impact of gradual elimination of fuel subsidies in Egypt over a period of five years. The writers show that gradual elimination of fuel subsidies, without implementation of supportive and compensatory policies, in the referred period of this study, will reduced the GDP growth of the country by 1.4% annually and results in the reduction of welfare of all income groups. Elimination of energy subsidies also reduces the inequality of income and the wealth of the richer section of the society will be further reduced (Abooulein, E-laithy and kheir-E—Din, 2009, 162).

5- In their article, “Estimates of Energy Subsidies in China and Impact of Energy Subsidy Reform”, Lin and Jiang (2010), after evaluating the amount of designated subsidies to energy sector via price gap method, in format of a GCE model and based on data from 2007, investigated the effects of energy subsidies reform on macroeconomics variables of the Chinese economy. Their results shows that under the scenario of complete elimination of subsidies, without redistribution of income, the country’s economic welfare, GDP and unemployment level will decrease by 2.03%, 1.56% and 1.41% respectively. Under the scenario of complete elimination of

energy subsidies and redistribution of 35% of its resulting income to the economy, positive effects are observed in a way that, economy welfare, GDP and employment rate have all increased by 0.16%, 0.37 and 0.53% respectively. In the third scenario, in the case of redistribution of 50% of generated income from elimination of subsidies, economic welfare, GDP and employment rate all increase by 1.52%, 1.74% and 2.07 respectively (Lin, B. and Jiang, Z., 2010).

By reviewing the literature on subsidies reorientation in Iran and other countries, it appears that even though this issue has received limited attention by researchers, no work has been performed on the evaluation of public satisfaction level of implementing such policies and this topic remains neglected by academics and researchers, which in effects enhances the importance of this study.

#### 4 Research Methods and Information Gathering Tools

Surveying method was applied for this research. The information gathering method adopted was the data from literature and field study via distribution of questionnaires amongst the public. Questionnaires used in this study included two types of information, the first being general questions on age, education and income level, location of residence and such questions, and the second parts was designed to obtain information on parameters of this research, hypotheses and evaluation of public satisfaction level.

#### 5 The Validity and Reliability of Questionnaire

In this study, content validity method has been used. Hence by a detailed literature review, a completed understanding of the concepts of research parameters has been obtained and the set of questions have been designed in way that the questionnaires contain the required reliability and validity. For evaluation of validity of collected data, Cronbach formula has been used (table 1).

Table 1. Distribution of Questionnaires Alfa values of this Study

Parameter	Item Number	Alpha Value
Satisfaction of Subsidies Reorientation Plan	8	84%
Identification of Targeted Society	5	74%
Condition of people’s welfare	7	76%
Inflation and Recession Levels Caused by the implementation of the Plan	4	70%
Consistency (or lack of it) of cash subsidies received with additional expenses caused by liberation of prices	3	76%
Condition of domestically produced goods	4	83%
Management of the Plan and long-term vision	5	75%
Questionnaire in General	36	93%

The level of calculated alpha for the questioner is 93%. This is due to the fact that all other calculated values have been above 70% for the calculation of this value, and hence can be concluded that it has the required validity and reliability level.

#### 6 Statistical Methods used in this Study

Statistical methods used were of descriptive and inferential nature, and have been adopted for analysis of obtained data by using SPSS software as well as descriptive statistical methods such as satisfaction indices of Mainland Weekend for the purpose of evaluation of satisfaction level of respondents. Indices of descriptive statistics such as binominal T1 Samples and Spearman’s linear regression methods was adopted for accepting or rejection of each hypothesis.

#### 7 Targeted Group for Statistical Research

Targeted group for the purpose of Statistical Research of this study were people who received cash subsidies in Ilam Province. According to “Organization of Subsidies Reorientation”, the population of this group is 547894 in this province. Based on Cochran’s formula and Morgan’s sampling table, 384 people were selected as the representatives of the specified group. Due to the high number of people associated with the specified group, a random approach was taken in selecting individuals. Also taking into account the high number of cities located in Ilam province, three cities were selected randomly. The cities selected were Ilam, Dehloran and Ivan. Questionnaires were distributed by taking into account the population ratio of these cities and inhabitants living in their suburbs (table 2 and 3).

## 8 Result of this Study

Table 2. Frequency Distribution of Respondent's Location of Residence

Location of residence	Distribution Level	Percentage
Urban	241	62.4
Rural	145	37.6
Total	386	100

Based on the findings of the study, 62.4% of the respondents lived in urban areas, and 37.6% were in rural areas.

Table 3. Frequency Distribution of the Satisfaction Level from Implementation of Subsidies Reorientation Plan across the Province

Satisfaction from Implementation of Subsidies Reorientation Plan across the Province		Very Low	Low	Medium	High	Very High
Satisfaction Level from Implementation of Subsidies Reorientation Plan across the Province	Frequency	146	74	97	50	19
	Percentage	37.8	19.2	25.1	13	4.9
Satisfaction Level from Specified Subsidies Payments to each person (455000 Rials)	Frequency	184	115	60	23	4
	Percentage	47.7	29.8	15.5	6	1
Satisfaction Level from the amount of Planning and Approval of Subsidies Reorientation Legislation in its Current Form	Frequency	153	91	101	48	27
	Percentage	39.6	25.9	21.8	9.8	2.8
Supporting Vulnerable people and Households	Frequency	119	91	101	48	27
	Percentage	30.8	23.6	26.2	12.4	7

Results obtained from Table 3 shows that the majority of respondents across the province had a very low level of satisfaction from the specified amount of subsidies payment designated to each individual as well as the planning and approval of subsidies reorientation legislation in its current form

by the Islamic Republic's Parliament. Majority of respondents also believed that the legislation offers very low level of support to low income individual and households (table 4).

Table 4. Frequency Distribution of Government's Performance in the First Stage of Implementing the Plan

Performance of the Government in the First Stage Of Implementation of the Plan		Very Low	Low	Medium	High	Very High
Satisfaction Level of Government's Planning of the First Stage	Frequency	158	74	68	50	36
	Percentage	40.9	19.2	17.6	13	9.3
Satisfaction Level of Government's Performance in the First Stage of implementing the Plan	Frequency	149	94	68	37	38
	Percentage	38.6	24.4	17.6	9.6	9.8
Satisfaction Level of Government's Notifications Regarding the First Stage of implementing the Subsidies Reorientation Plan	Frequency	120	115	77	60	14
	Percentage	31.1	29.8	19.9	15.5	3.6
The Success of Policy Makers and Government's Planners in Managing the Difficulties associated with the first stage of the Plan	Frequency	175	106	74	22	9
	Percentage	38.3	30.8	22.5	6	2.3

From the information presented in Table 4, it can be observed that the majority of respondents across the province have a low level of satisfaction of planning and implementation of the legislation as well as the level of notification provided by the

government. The majority of respondent also believed that the government has not been successful in controlling the recession in the market and management of problems associated with implementation of the first phase of its plan (table 5).

Table 5. Frequency Distribution of the 11<sup>th</sup> Government's Performance in the Second Phase of Implementing the Plan

11 <sup>th</sup> Government's Performance in the Second Phase of Implementing the Plan		Very Low	Low	Medium	High	Very High
Satisfaction Level of Government's Planning of the Second Stage of Subsidies Reorientation Plan	Frequency	138	128	81	35	4
	Percentage	35.8	33.2	21	9.1	1
The Success of Policy Makers and Government's Planners in Managing the Difficulties associated with the Second Stage of the Plan	Frequency	117	117	105	35	12
	Percentage	30.3	30.3	27.2	9.1	3.1

From the information presented in Table 5, it can be observed that the majority of respondents across the province have a very low satisfaction level from the government's planners and policy makers and believe they have not performed successfully in

dealing with problems and challenges of implementation of the second stage of subsidies reorientation plan (table 6).

### 9 Inferential Statistics

Table 6. Kolmogorov-Smirnov Test of Different Components of Study

Variable	k-s	Sig
Satisfaction of Subsidies Reorientation Plan	2.184	0.000
Identification of Targeted Group	2.184	0.000
Condition of People's Welfare	1.385	0.043
Resulting Inflation and Recession as the result of Implementing the Plan	2.696	0.000
Consistency (or lack of it) of cash subsidies received with additional expenses caused by liberation of prices	2.219	0.000
Condition of domestically produced goods	2.744	0.000
Management of the Plan and long-term vision	1.760	0.000

Paying attention to the data presented in the table above such as (Sig<0.05), it can be stated that hypothesis H0 is utterly rejected and hypothesis H1 which indicates that data input are not normal is accepted (table 7).

#### Hypothesis 1:

The level of public satisfaction from implementation of subsidies reorientation plan in the province is low

Table 7. Distribution of Respondents Opinions on Public Satisfaction Level of Implementation of Subsidies Reorientation Plan

Case	low	High	Average	Devation	Deviation in Calculation of Average Value	Significance Level of two line tests	t	df	Significance Level of the T test
Social Humanity aspects	0.88	0.12	15.05	7.35	0.323	0.000	-27.64	387	0.000

Results in Table 7 show that 88% of respondents believe that the satisfaction level of people in Ilam Province from subsidies reorientation plan is very low, low or average and 12% believed satisfaction level is high or very high. The average of this index is 15.5 and the t test for comparing these averages with a base of 24 shows that the obtained average in a meaningful way is lower than 24 (sig=0.000 and t=27.64). Therefore the satisfaction level of public in Ilam is at a low level (table 7).

#### Hypothesis 2:

There is a meaningful relationship between the identification of the targeted group and satisfaction level of public in Ilam province.

Table 8. Obtained Results from the relationship between targeted group and satisfaction level of people in Ilam province

Type of Examination	Dependent Variable	Independent Variable	R	P
Spearman	Satisfaction Level	Identification of the Targeted Group	0.777	0.0000

Results obtained from Table 8 show that there is a relationship between identification of the targeted group and satisfaction level of people in Ilam province variables (Taking into account (r=0.777 and sig=0.000 with an error of 1%, this statement is 99% true). Therefore it can be concluded that there is a meaningful and positive relationship between the identification of targeted group and satisfaction level of people in Ilam in regards to implementation of subsidies reorientation plan (table 8).

#### Hypothesis 3:

There is a meaningful relationship between welfare of the people and their satisfaction level of implementing the subsidies reorientation plan.

Table 9. Results for the relationship between welfare of the people and their satisfaction level of implementing the subsidies reorientation plan

Type of Examination	Dependent Variable	Independent Variable	R	P
Spearman	Satisfaction Level	Welfare of the People	0.573	0.0000

Results obtained from Table 9 show that there is a relationship between welfare of the people and public satisfaction level in Ilam province variables (Taking into account (r=0.573 and sig=0.000 with an error of 1%, this statement is 99% true). Therefore it can be concluded that there is a meaningful and positive relationship between the welfare of the people and their

satisfaction level of implementing the subsidies reorientation plan.

**Hypothesis 4:**

There is a relationship between the resulting inflation and public satisfaction level of implementing the subsidies reorientation plan (table 10)

Table 10. Results for the relationship between the resulting inflation and public satisfaction level of implementing the subsidies reorientation plan

Type of Examination	Dependent Variable	Independent Variable	R	P
Spearman	Satisfaction Level	Resulting Inflation	0.339	0.0000

Results obtained from Table 10 show that there is a relationship between the resulting inflation and public satisfaction level in Ilam province variables (Taking into account  $r=0.339$  and  $sig=0.000$  with an error of 1%, this statement is 99% true). Therefore it can be concluded that there is a meaningful and positive relationship between the resulting inflation and public satisfaction level of implementing the subsidies reorientation plan (table 10).

**Hypothesis 5:**

There is a relationship between the consistency (or lack of it) of cash subsidies received with additional expenses caused by prices liberation

Table 11. Results for the relationship between the consistency (or lack of it) of cash subsidies received with additional expenses caused by prices liberation and public satisfaction level of implementing the subsidies reorientation plan

Type of Examination	Dependent Variable	Independent Variable	R	P
Spearman	Satisfaction Level	consistency (or lack of it) of cash subsidies received	0.574	0.0000

Results obtained from Table 11 show that there is a relationship between the consistency (or lack of it) of cash subsidies received with additional expenses caused by prices liberation in Ilam province variables (Taking into account  $r=0.574$  and  $sig=0.000$  with an error of 1%, this statement is 99% true). Therefore it can be concluded that there is a meaningful and positive relationship between the consistency (or lack of it) of cash subsidies received with additional expenses caused by prices liberation and public

satisfaction level of implementing the subsidies reorientation plan (table 12).

**Hypothesis 6:**

There is a meaningful relationship between the current quality of domestically made products and satisfaction level of people in Ilam from implementation of subsidies reorientation plan

Table 12. Results for the relationship between the current quality of domestically made products and satisfaction level of people in Ilam from implementation of subsidies reorientation plan

Type of Examination	Dependent Variable	Independent Variable	R	P
Spearman	Satisfaction Level	current quality of domestically made products	0.550	0.0000

Results obtained from table 12 show that there is a relationship between the current quality of domestically made products and satisfaction level of people in Ilam province variables (Taking into account  $r=0.550$  and  $sig=0.000$  with an error of 1%, this statement is 99% true). Therefore it can be concluded that there is a meaningful and positive relationship between the current quality of domestically made products and satisfaction level of people in Ilam from implementation of subsidies reorientation plan (table 12).

**Hypothesis 7:**

There is a meaningful relationship between the Management of the Plan and long-term vision of planners and satisfaction level of people in Ilam from implementation of subsidies reorientation plan

Table 13. Results for the relationship between the Management of the Plan and long-term vision of planners and satisfaction level of people in Ilam from implementation of subsidies reorientation plan

Type of Examination	Dependent Variable	Independent Variable	R	P
Spearman	Satisfaction Level	Management of the Plan and long-term vision of planners	0.550	0.0000

Results obtained from Table 13 show that there is a relationship between the Management of the Plan and long-term vision of planners and satisfaction level of people in Ilam province variables (Taking into account  $r=0.550$  and  $sig=0.000$  with an error of 1%, this statement is 99% true). Therefore it can be

concluded that there is a meaningful and positive relationship between the Management of the Plan and long-term vision of planners and satisfaction level of people in Ilam from implementation of subsidies reorientation plan (table 13).

Table 14. Prediction of public's satisfaction level of implementation of subsidies reorientation plan based on the variables of this study

Prediction Variables	R	R <sup>2</sup>	F	P	T	P
Constant Level					-0.071	0.922
Identification of Targeted Group					0.841	0.000
Situation of People's Welfare					0.214	0.000

Resulting Recession and Inflation from Implementation of the Plan	0.81	0.66	128.027	0.000	-0.200	-2.52	0.012
The Consistency (or Lack Of it) of Cash Subsidies Received with Additional Expenses Caused by Liberation of Prices					0.373	3.662	0.000
Current Quality of Domestically Made Products					-0.081	-0.924	0.356
Management of the Plan and Long Vision Planning					0.258	3.20	0.001

As it can be observed from Table 14, based on the results obtained from linear regression, prediction of public's satisfaction level from implementation of subsidies reorientation plan based on the variables of this study and multiple correlation coefficient (MR=0.81) is possible and the value of F=128.027, which on the level of P<0.001 is logical. The results also show that 0.77% variance of public satisfaction level based on the variables of this study can be explained, and identification of the targeted group with ( $\beta=0.84$ ), consistency or inconsistency of paid cash subsidies with prices liberation with ( $\beta=0.377$ ), management of the plan and long-term planning with ( $\beta=0.258$ ), current situation of people's welfare with ( $\beta=0.214$ ) and the resulting recession and inflation from implementation of the plan with ( $\beta=0.200$ ) are the best parameters in predicting the satisfaction level of people from implementation of subsidies reorientation plan respectively.

## 10 Conclusion

The Legislation of Subsidies Reorientation and its execution has been one of the most important and largest projects in the public policy making sector in Islamic Republic of Iran. This legislation has been implemented within the framework of the "Economic Development Plan" by the tenth government of Iran to tackle and reorganize structural problems associated with the economy and to support low income and vulnerable sections of the society. Multiple problems associated with the plan such as failure in identifying the targeted groups correctly, its inflationary effects, inconsistency between the amount of paid cash subsidies to the population with the costs resulted from liberation of prices, weak management and lack of long-term vision and planning have all been effective reasons for low level of satisfaction from implementation of the plan amongst the people. Finally, this study shows that satisfaction level of Ilam's population from implementation and its planning and management during the first and second stages are low, even though the government has had some success in the second phase of the plan in controlling inflation, foreign currencies exchange rates and the market, people still are unsatisfied of the implementation of the plan in its previous format.

**Abstract.** The present study is analytical, descriptive, and field work. Library and field methods are used to collect the required data. Finally, Excel is used to draw graphs. Findings of the study suggest that factors such as the lack of a culture of coexistence and respect for the rights of each other in different parts of life, from traffic priority to cleaning of the urban environment, weakness of organizations related to citizens' affairs including the right to have a healthy city, urban welfare, and failure to provide citizens with primary and secondary services such as leisure time and green space have exacerbated the difficult situation of citizenship rights in the city of Ardabil. Therefore, both officials and citizens are recommended to improve the quality of the living environment.

**Keywords:** rights, citizenship, participation, facilities, culture, Ardabil

### 1. Introduction

Citizenship rights have had an extensive footprint in the legal literature of Islamic Republic of Iran in recent years. Studies have shown that this issue has its roots in ancient history of Iran and Orient (Esmaeli, 2011).

Observing citizenship rights in various fields is considered as one of the necessities of life, as a social phenomenon, is one of the necessities of life. Citizens generally act with different tastes and motivations in the community; therefore, social life requires the existence of legal relations between individuals and different groups of the society that should be under legal laws and regulations.

Obviously, in the absence of law and regulation in the community, coercion, extortion, and deception govern the community and cause chaos and disorder. Therefore, governments and public institutions have adopted specific policy toward setting these relations by setting out the relevant rules and regulations in recent centuries (Hashemi, 2005).

The concept of citizenship rights includes a set of rights and obligations. Basically, right and obligation are against each other and right is followed by obligation. Citizenship right is being rooted in historical status and membership in a congregation, which is of particular importance recently (Ismaili, 2011).

Legal documentation of citizenship rights show that on the basis of a general classification, citizenship rights are classified into three groups of civil rights, political rights, and social rights (Jafari, 2003, 20).

In Islam, different rights and duties have been considered for citizens, as elements of the Muslim community. Citizen is a concept based on natural law, divine law, and social rules that regulate urban and citizenship relations. These laws and rules are sometimes written, "law", and sometimes unwritten laws trusted by the majority of people, "norm" (Katoozian, 1998; 370).

To contemplate about citizenship rights and duties, the first questions that arise are: what is citizenship rights? Who can have these rights? And where can it be searched? According to social experts and sociologists, burghers are promoted to citizens when they respect each other's rights and social laws and fulfill their responsibilities toward other citizens and their communities. The concept of "citizen" can not only be defined in urban community, but also it can also be defined in the provincial and national community. Due to advances in

technology and communications, "citizenship" can be also considered for the international community. It can be argued that citizenship rights are a set of duties and responsibilities of citizens for each other and for the city and the state where they live.

Like other major cities of Iran, the city of Ardabil has had a hasty growth, which is due to the phenomenon of rural migration to the cities. Therefore, population of this city, as the capital of the province, is dense with three origins of nomadic, urban, and rural lifestyles with ethnic, economic, social and cultural base differences. Each of these social groups has different perceptions of urban life issues and its laws and regulations, which has created challenges in terms of citizenship rights in this country. Considering the importance of this issue and given the interest of researcher in this important issue of modern urbanization, researcher attempts to qualitatively and quantitatively investigate the status of citizenship rights in the city of Ardabil in this field study.

### 2. Hypotheses

Based on what was said, the most important questions are as follows:

1. What is citizenship rights and what are different types of citizenship rights and responsibilities of citizens toward each other in city?
2. How is the status of citizenship in Ardabil and in which sector of citizenship laws, the most important challenge of the citizenship rights in the city of Ardabil exists?
3. What are the applied policies and strategies of citizenship rights?

Based on the questions, hypotheses are proposed as follows:

1. It seems that members of citizen family have legal and privacy rights in relation to other citizens and the government, wherever they live.
2. It seems that citizenship rights are in the domain of citizens' responsibilities for each other and the city of Ardebil is faced with serious challenges in the field of culture and citizenship rights like respecting urban traffic.
3. The most important strategies that can be useful to promote citizenship rights are culture building through media and educational centers and being concerned with obligations of Islam about human rights.

### 3. Research Methodology

Various research methods have been used in this study. Given that the present study is a fieldwork and is descriptive and analytical in terms of methodology and nature, library and filed methods are used to collect data. Reasoning and SPSS software are used to analyze the data and Excel is used to draw charts.

Data and theoretical foundations of the related field are collected through library method, field and concrete data are collected through a questionnaire (based on a Likert scale), interviews with the target groups and organizations involved in the issue, and field review. For actual and field documentations for better analysis of the collected data, image data (video and photo) are prepared and recorded.

The study population consists of Ardabil citizens and sampling method is random sampling. Cochran method is used to determine the sample size based on the number of households in an urban context.

To analyze the data, data are first classified and entered into SPSS software. Then, cause and effect analysis has been done

on qualitative data obtained from interviews and field works. To specify the relationship between variables, Excel software is used to draw charts. Finally, data are analyzed with two descriptive and inferential statistics.

**Descriptive statistics:** data are described in the form of tables and graphs.

**Inferential statistics:** relationships between variables are tested using statistical tests and the results are explained. All statistical analyses are performed using Excel software.

#### 4. Objectives and achievements

Any research study pursues certain objectives and researchers hope to achieve these objectives.

The most important scientific goals of this study are:

1. Investigating citizenship rights.
2. Strengthening citizenship structure through the establishment of the system of rights and obligations between citizens and city managers.
3. Strengthening vision of collective life and respecting collective needs versus individualism in Ardabil city.

The most practical objective and achievement of this study could be that investigation, analysis, and pathology of reasons and positive and negative aspects of citizenship rights in Ardabil and its consequences help expand scientific discussion and related studies can be used by state organizations including municipalities, the city council, the department of housing and urban development, police stations, welfare centers, law centers, and social-service providers so that alternatives may be considered to solve these problems in society.

#### 5. Theoretical foundations

##### 5.1 The concept of citizenship rights

Rights is literally the plural form of right and includes powers, abilities, and capabilities that are considered for humans by law, Islamic law, custom, and contracts. Idiomatically, the word rights is principles, rules, and regulations that sets the relationship among people in private law and the relationship between sovereigns and obedience in public law. In fact, it is a set of rights that people having because of their citizenship status. It is also general information that refers to a set of citizens' ratings and a set of rules that refers to their status in the society they live, beyond a concept entitled as nationality, regardless of hierarchies and distinct status of individuals (Ismaili, 2011: 24).

##### 5.2. Foundations of citizenship rights in Islam

In Islam, different rights and duties have been considered for citizens, as elements of the Muslim community. Citizen is a concept based on natural law, divine law, and social rules that regulate urban and citizenship relations. These laws and rules are sometimes written, "law", and sometimes unwritten laws trusted by the majority of people, "norm". Right in terms of positive law is a privilege and interest of the person that is supported by the right of any state in the administration of justice and the person is seized power on the right to prohibit others violating his rights. Foundations of rights in Islam include anthropological and specific world of ideas. Acceptance of man's responsibility before God and obedience relationship is highly effective in the delimitation of human rights. But in terms of jurisprudence, right is a kind of property that especially exists between landlord and tenant. The word right is sometimes against property and sometimes they are synonyms. In both

senses, it is a power for human beings forged for others, which is the lowest level of ownership (Al-Bahrulolom, 1982: 14).

##### 5.3. Features of citizenship rights

1. It is universal because it is the right of every member of the human family and every human beings, wherever they may be, of any race, language, gender or religion deserve it (Nasr, 2002, p. 215)
2. It can't be transmitted and it is indivisible from human beings because people can't be called human beings without it.
3. Its elements are interdependent and complement each other.
4. It is a gift of God and no human authority grants these rights.
5. It is intrinsic to human, which is not interpreted as human personality traits and is not dependent on any contract (Nasr, 2002: 215).

##### 5.4. Indices of citizenship rights

###### 5.4.1 Awareness of citizenship rights

The basis of citizenship rights is constitution of Islamic Republic of Iran and awareness of citizenship rights is that what people have in their minds about citizenship rights and how this knowledge is in accordance with reality.

In the constitution of Islamic Republic of Iran, 12 articles are about citizenship political rights, 8 articles refer to citizenship civil rights, 4 articles refer to citizenship cultural rights, and 20 articles refer to gender rights (Hezar Jaribi, 2011, 3).

###### 5.4.2 Social base

In social sciences' dictionary, Allen Biro defines social base as a place where everyone occupies in social structure and also social status or prestige that contemporary people delegate a person in the society that he lives. In other words, the place where a certain person occupies in a certain system and at a certain time is called his base (Sheibani, 2004: 10).

###### 5.4.3 Use of mass media

The use of mass media, including radio, television, press, satellite, Internet and newsletters within the enterprise is in question as follows (Hashemian, 2009: 44)

###### 5.4.6. Presence in public arena

Presence in public arena is measured with the cooperation and membership in associations and civil society. Presence in public arena means cooperation, participation, admission, membership, intellectual assistance, moral support, financial assistance, material support, participation in programs, taking executive responsibilities, and any activities done in connection with the civil society including cultural, social, economic and environmental activities with the assumption that if people are more present in public arena, their awareness of their citizenship rights is more (Shiani, 2004: 30).

##### 5.5 Classification of citizenship rights

On the basis of a general classification, citizenship rights are classified into three groups of civil rights, political rights, and social rights.

- a) Civil rights: that are also known as rights relating to personality in Iran, are rights related to preserving the essence of human. It is also known as public rights because application of all these rights is on the side of the state and government representatives rather than ordinary people (Dashti, 1999: 50). Civil rights are rights related to freedom, equality, and individual's responsibilities.

b) Political Rights: Is the second type of citizenship rights. Political rights are rights whereby the right holder can participate in his national sovereignty. The most important political rights are the right to participate in elections, the right to be selected in political jobs, and the right to have nationality (Tila, 2010: 80).

c) Social rights: are the third type of citizenship rights. These rights are related to the birthright of every person to benefit from a minimum of economic and security standards. In other words, social rights are concerned with welfare services (ibid.). These rights include:

A) Financial and income supports such as providing housing, jobs, paying sufficient salaries and benefits, entitlement to the minimum wage, social security in the event of unemployment, disability, old age, orphanage, accidents.

Freedom consists of the following factors. Freedom rights include:

1) Freedom of individual performance, such as freedom of choice of housing and residence area, freedom of communication, and freedom of movement.

2) Freedom of thought, such as freedom of opinion, freedom of religion, freedom of speech, freedom of the press, freedom of education.

3) Freedom of assembly including freedom of temporary assembly and freedom of organization links.

4) Economic and social freedoms such as freedom of property, trade and industrial freedom, labor freedom, and freedom of union.

5) Rights related to equality such as equality before the law, equality before the courts, equality in taxation, equality in terms of employment, and equality in military service (Dashti, 1999: 78).

B) Enjoying free education

C) Enjoying healthcare, such as the enjoyment of health services and medical care and public health insurance

D) judicial protections, including the right to have counsel and the right to petition the court (ibid).

## 5.6. Citizenship rights in Iran's 1404 vision plan

According to the vision plan, the society should move toward a developed society to suit the cultural, geographical, and historical needs of the community in the twenty-year horizon, and should rely on moral principles and Islamic, national, and revolutionary values with an emphasis on:

- 1) Religious democracy
- 2) Social justice
- 3) Freedoms
- 4) Maintenance of human dignity and rights
- 5) Benefit from social and judicial security

In 1404, Iranian people should be active, responsible, veterans, pious, and satisfied, and should have the following facilities:

A) National welfare (examples of which include: health, welfare, legal security, social security, and equal opportunities, proper distribution of income, family foundation away from poverty, discrimination and benefited from a favorable environment)

B) National security (secure, independent and powerful with defensive organization, based on multilateral deterrence and connection of people and government)

C) National production (with advanced knowledge, capable in science and technology, relied on the contribution of human resources and social capital in national production) (Sahife Noor, 1993: 229).

## 6. Research Findings

### 6.1. Geographical location of Ardabil

Ardabil city is located in northeast Azerbaijan in 38°15' N E. It is approximately 20 kilometers far from the border of Azerbaijan. Neighboring Caspian Sea, it is located on an open plain 1,500 meters above sea level, just east of Mounts Sabalan and Baghroo. The city of Ardabil reaches Garmi city on North, Astara and Talesh forests on East, Khalkhal city on south, and Meshkin Shahr city on west.

### 6.2. Status of citizenship rights in Ardabil

Lethargy, slight growth, and subtle changes of the face of the city are grievances heard from Ardabil citizens. When the reasons are asked, responses are not pleasant.

During the past decades, the city of Ardabil, as the capital of province, has faced massive problems and concerns. A look at different areas shows that a good conclusion and solution has not been achieved yet.

Different tastes and island performance along with selfishness have caused the development of Ardabil city not to be as much as its counterparts' achievements.

Ardabil has faced significant growth of population, massive migration from rural areas and formation of informal settlements, excessive use of God-given resources, unplanned urban development, traffic problems, and above all cultural problems in recent years. It has also witnessed brain drain because of failures, disabilities, and negligence in solving these problems.

In response to these concerns, most citizens believe that culture is the main reason. In this city, egotism, jealousy and preference of individual rather than collective work have led to the lack of development.

Meanwhile, Ardabil municipality, as an effective and decision-maker institution in urban management, always believes that it is not so free since management of urban units is not governing the current rules; therefore, it has focused on civil affairs.

Focus on civil affairs also has not been so successful because of limited income of the municipality, major mistakes in designs, and weaknesses of engineering tasks. Its achievement, in the words of one of the city council members, is that the face of Ardabil city has not changed for many years.

Managerial changes in the municipality of Ardabil were followed by distresses in the performance of executive sector from the beginning of the current year. Finally, these changes seek comfort by choosing a municipal who has entered non-governmental institution from a governmental body, and is selected by city council members.

Considering municipality's rules and also studies conducted on legal restrictions, implementing Ardabil municipality's rules and regulations about performance of the urban management system of Iran and activities of cities' municipalities gives useful insights regarding features and history of this area. However, considering basic legal challenges of Ardabil municipality's rules, especially with regard to the issue of citizenship, is essential. Such challenges are (Esmaeli, 2011: 257):

1. Not scrutinizing mutual rights of city and municipality
2. Absence of citizens in the process of preparation, review and approval of urban development plans
3. Not specifying mutual rights, obligations and duties of citizens and municipalities
4. Lack of strategies for attracting citizens' participation

5. Lack of modern informing programs for communication between municipalities and citizens

If right challenges of Ardabil municipality, municipalities' restrictions in urban functional activities are considered regardless of environmental challenges around the municipality of Ardabil city and municipality rules, they will be so abstract.

It is because there is a series of causes and effects and forces and also reasons that contribute and are involved in the formation of legal challenges. Therefore, any analysis conducted without considering the context and historical, cultural, and political backgrounds would be an incomplete analysis. Given this methodological and legal principle of the municipality and the municipality rules and regulations, some key points can be mentioned:

1. The rights challenges of municipalities are of two dimensions: internal legal challenges and external legal challenges

2. Internal legal challenges of municipalities are those that deal with the legal logic of rules and regulations of municipalities, i.e. they refer to the nature of developing rules and regulations and their legal content.

3. External legal challenges of municipalities are those refer to the urban environment of the implementation of these laws and regulations.

4. The main factor affecting internal legal challenges of municipalities is legal content that has led to the development of municipalities' rules and regulations.

5. The main factor affecting external legal challenges of municipalities is urban economic, social, political, and cultural environment, where these rules and regulations are to be run.

6. The main underlying elements that affect the formation of internal legal challenges of Ardabil municipality and refer to legal and logical content of municipalities' rules and regulations are as follows:

1. The mismatch between some rules and regulations of municipalities with urban characteristics of the country

2. The existence of legal gaps in some of the activities done by municipalities

3. Not forecasting new rules and regulations for municipalities

4. The lack of legal activities in some municipal laws and regulations

5. The incompatibility of the legal content of some rules and regulations of municipality with the laws of other institutions

6. Not forecasting legal mechanisms suitable for the implementation of relevant laws and regulations of municipalities (Esmaeli, 2011: 259).

Table 1: Observing citizenship rights with regard to distribution of respondents based on gender

Gender	Number	Percent
Female	801	68
Male	383	32
Total	1184	100

Distribution of statistical population shows that the largest group with regard to age includes 1184 people, who were in the age range of 21 to 25 years old (18%) and the smallest group with

regard to age includes people in the age range of 46 to 50 years old (7%) (tables 1 and 2).

Table 2: Observing citizenship rights with regard to distribution of respondents based on educational level

The education level of respondents	Number	Percent
Diploma	495	42
Primary school	181	15
Bachelor's Degree or higher	175	15
Graduate students.	118	10
Guidance school	116	10
high school	58	5
Illiterate	41	3
Total	1184	100

Respondents' level of education, according to statistics contained in Table 5.6, shows that of the 1184 respondents, 42 percent are diploma and 3 percent are illiterate (table 3).

Table 3: Distribution of respondents based on institutions' responsibility for the promotion of observing citizenship rights

Responsibility of the municipality, school, and family in promoting citizenship rights	Number	Percent
Training citizenship rights	450	38
Culture building	217	19
Effective informing and advertising	195	17
Raising public facilities and urban services	167	14
Coordinated and comprehensive planning of all institutions	132	11
I do not know	10	1
Total	1171	100

Based on Table 1, from among the 1171 respondents pointing out the examples of violating citizenship rights in public transportation.

Table 4: Distribution of respondents based on the introduction of institutions affecting the promotion of citizenship rights among the people of Ardabil

According to respondents, which institutions are involved in promoting citizenship rights among the people?	Number	Percent
Family	311	26
Municipality	298	25
Media	273	23
All institutions	212	17
School	109	9
Total	1203	10

Based on Table 4, from among 1253 respondents, 26% believed that family has a significant role in promoting observance of citizenship rights, 25% believed that municipality is effective, 23% believed that media is effective, and 9% believed that school is effective in promoting observance of citizenship rights.

Table 5: Distribution of respondents based on instances of violation of citizenship rights in public transportation

examples of violation of citizenship rights in public transportation from the viewpoint of respondents	Number	Percent
Ignoring turns	487	41
Pushing and overcrowd of ladies	137	12
I do not know	107	9
Other	101	9
Inconstant and unfair calculation of rents	86	7
Travelers abusive behavior towards others	80	7
Drivers' disrespect and disregard toward passengers	74	6
Loud talking on cell phones	62	5
Sitting improperly	50	4
Total	1184	100

Based on Table 6, from among 1184 respondents, the majority and 41% believed that ignoring turns is the most obvious instance of violation of citizenship rights in public transportation. The results are presented in table 6-14.

Table 6: What percentages of citizens observe traffic rules when crossing the street?

	Percent	Number
Yes	15	19
Most of the times	10	10
Sometimes	15	20
No	60	40
Total	100	89

Table 7: Percentage of respondents' answer with regard to the use of pavements

	Percent	Number
Yes	39	40
Most of the times	29	25
sometimes	23	25
No	9	8
Total	100	98

Table 8. Respondents' answer with regard to observance of cleanliness when using public transportation vehicles

	Percent	Number
Yes	36	25
Most of the times	28	25

Yes	75	65
Most of the times	9	9
sometimes	10	10
No	1	1
Total	95	85

Figure 14: Frequency of respondents' opinion of the performance of municipality in beautifying city

Instances of citizenship rights	Number	Percentage
In public transportations	1184	20
Observing traffic rules		28
Considering trashes on streets		47
Helping needy and old people		
Municipality's attention to citizenship rights		
Total		100

## 7. Conclusion

Citizenship rights have had an extensive footprint in the legal literature of Islamic Republic of Iran in recent years. Studies have shown that this issue has its roots in ancient history of Iran and Orient.

A citizen can have the following features:

1. He is global, meaning that any member of the human family, wherever he is, deserves the rights.
2. These rights are non-transferable.
3. He can have God-given gifts and intrinsic rights.

Applied policies and strategies of citizenship rights include factors such as:

1. Prioritizing executive institutions' programs that are in line with the objectives of staff
2. Monitoring observance of citizenship rights in governmental and public organizations emphasizing the urgency of this issue
3. Imposing laws and regulations necessary for citizenship rights and maintenance of public security and so on.

Citizenship rights are relatively broad concepts that encompass civil, political, economic, social, and personal rights and affairs without political nature. Generally, citizenship rights can be defined as a set of rules that govern individuals' relations in a society. According to Imam Ali, the right of a leader on people and people's right on leader is one the greatest rights in the law of God.

Principles of citizenship rights in Islam are natural law, divine laws and social rules, anthropological ideas, and specific world view.

One of the important functionalities of any government is providing security for citizens. Social security is one of the main

contexts on implementing justice and is the most suitable contexts for the emergence of balance in the society. One of the important rights of citizens is being protected against domestic miscreants and foreign enemies' attack since other affairs cannot be done without being secure. Accordingly, there is a need to an experienced, professional, and committed legion to be under the command of a strong and stable person.

Individuals' presence in civil organizations is related to cultural, social, political, economic, and environmental factors, with the assumption that the more presence in public arenas, the more awareness of citizenship rights.

Social responsibility is a burden borne by private institutions that include tasks such as not polluting, non-discrimination in employment, not doing immoral activities, informing consumers of product quality, and positive contribute to the lives of people. Duties of municipality of Ardabil toward citizenship rights are:

1. The municipality must have the spirit of serving and sincerity more than elsewhere
2. It should address the issue of plant, gardens, trees, and green spaces that have positive psychological and mental effects on urban life.
3. It should stop attacks to forests and agricultural lands and should prevent their land use change to residential and commercial uses.

Ardabil municipality is connected to people on three levels. The first level is serving people, the second level is preserving and developing green spaces, and the third level is culture.

If you throw your trash on streets, you have to pay fine. Based on Article 16 of this law: "preserving, combining, collecting, transporting, buying and selling, disposing, and draining wastes

in environment is allowed based on this rule and its implementation guidelines.”

Otherwise, if people violate the warrant of judicial authorities, they have to pay a fine of about 500 thousand Riyals to 100 million Riyals for ordinary wastes and about 2 million Riyals to 100 million Riyals for other wastes. If they repeat, their punishment will be double their previous punishment.

Legal challenges of Ardabil municipality's rules and regulation about citizenship rights are of particular importance for factors such as:

1. Not scrutinizing mutual rights of city and municipality
2. Absence of citizens in the process of preparation, review and approval of urban development plans
3. Not specifying mutual rights, obligations and duties of citizens and municipalities
4. Lack of strategies for attracting citizens' participation

The most important solutions for observing citizenship rights include:

1. We should do anything that makes the city beautiful, clean, and healthy and encourage others to do so.
2. We should try to maintain and develop green space and encourage others to do so.
3. We should try to understand the culture and urbanization and citizenship rights and contribute to its expansion.
4. We should separate and packaging wastes and put them out at the appointed time.
5. We should not pollute city by throwing trashes on streets and should be committed to the slogan of healthy city, healthy citizens.
6. We should observe urbanization, rules of apartment living, and the rights of our neighbors.
7. We should observe urban traffic rules and make others familiar with them.
8. We should love our city and be responsible with partnership and cooperation and ask others to be the same.

**Abstract.** The current study is aimed to determine the moderating effect of perfectionism on the relationships between personality traits with life satisfaction and psychological well-being. Research population was all undergraduate students of Islamic Azad University of Tehran that 140 students were selected through multi-level clustering sampling. Data collected through psychological well-being questionnaire, perfectionism list of Hill, short form questionnaire of personality traits of NEO and life satisfaction questionnaire and were analyzed in descriptive and inferential sections. The results showed that personality traits and perfectionism has significant statistical relationship  $P < 0.01$  with psychological well-being and only the variables of neuroticism, extroversion, and conscientiousness were the aspects of personality traits.

**Key words:** psychological well-being, life satisfaction, perfectionism, personality trait

### 1 Introduction

For a long time that question that what a good life is, had been drawing the attention of human being. Ancient Greek philosophers believed that good life will be obtained from virtue. In ancient China also, Confucian has considered good life as doing roles and responsibilities of people appropriately and utilitarian such as Jeremy Bentham believed that a life can be the good one which is full of happiness and joy and a good society is the one which all people in it are good. Although seeking consisting factors of good has its roots in very distance past, despite this, empirical studies have been done in recent years in the field of the constituent factors of good life and happiness (Diener and Suh, 2000). Some of researchers have raised some questions in recent years that have created great development in the field of health psychology especially health definition. Questions such as what the happiness is. Why do different people have different levels of happiness? Who experience higher level of happiness? Perhaps the most important reason of wide attention to study of subjective well-being and responding raised questions is derived from its extraordinary importance according to people. For example Diener and Oshie (2003) showed in a study that most of people agree with this opinion that being happy is their ultimate aim. Their studies have also showed that according to people being happy is more important than good health, high income, high attractiveness and experiencing love and meaning in life.

Subjective well-being is a multi-dimensional and hieratical concept which consists of two emotional and cognitive aspects. The component of life satisfaction is cognitive aspect and components of positive affect and absence of negative affect are its emotional aspect (Diener, Sue, Lucas, & Smith, 2000). Diener, et al., (1998) have included having low levels of unpleasant emotions like depression and anxiety also in subjective well-being definitions. Generally based on Diener, Oishi and Lucas (2003) subjective well-being is what, ordinary people call it satisfaction or happiness.

Initial studies about psychological well-being focused on experiencing positive and negative emotions, psychological well-being and life satisfaction which have been formed from Greek word of "Eudemonia" which has been defined as happiness (Ryff, 1989). They have defined happiness as the balance between positive and negative emotions. Providing

many scales which were built in order to assessing life satisfaction and were used in wide researches, was based on this subjective and abstract concept of satisfaction (Feicht et al, 2013).

Shafran (2002) was the first cognitive-behavioral theorist who explained perfectionism. He defined perfectionism as one of twelve irrational underlying beliefs that leads to psychological distress. He believed that perfectionism is acceptance of this belief in person that he has to be completely worthy, deserving, intelligent. Shafran defined perfectionists as people with the main goal of progress and success in life. According to perfectionists incompetence is an index of incompetence and worthless of person. He also said that by perfectionism we mean having this belief that there is always an accurate, complete and correct response for human problems and if this solution isn't found, that will be disaster. He considered self-dissatisfaction and low self-esteem as key characteristics of perfectionism.

Multi-dimensional model of Ryff et al., (1989) is one of the most important psychological well-being models. Ryff considers psychological well-being as person's attempt for realizing his real potential ability. If in an assessment a person is satisfied with his talents, abilities and activities, he will have good mental function. Psychological well-being is a multi-component concept that can be interrelated with numerous factors. One of factors that can be related to psychological well-being is perfectionism. Positive perfectionism predicts psychological well-being positively and negative perfectionism also affects psychological well-being negatively.

Different personality traits can have great role on the manner of impression and the relationship of the individual with his environment (Sapington, 2008). The personality of each person consists of his desires and dislikes, fears and privileges and capabilities and traits. These features differentiate people from each other. Personality is visible aspects of individual behavior which affect others. It also includes social, mental and emotional characteristics of person. Personality is also a set of durable and unique features that might be different in responding to different situations. People have deep traits that consist of fundamental components of their personality. Personality recognition requires accurate description of this component.

Fist (2002) introduced three personality aspects. Each one of these personality aspects includes numerous adjectives. These personality aspects include extroversion, neuroticism and psychopathic. He believed that these personality aspects can predict behavior. Fist (2002) believed that because of ignoring personality aspects, many psychological researches have ended up wrong conclusions.

Personality is the most important tool for biases and life guidance. On one hand it determines the aim and on the other hand provides the facilities for achieving the goal. The feature of requiring success can be used as an example here which is either goal determiner or provider power for achieving that goal based on the five factor theory of Fedewa et al., (2005).

A person's personality traits seem to be effective on his personality perfectionism and well-being and cause person's satisfaction or dissatisfaction from his life (Besharat, Habibnejad and Geranmayepur, 2009).

Diener (2003) believes that individual life satisfaction origins from his general assessment and attitudes toward his total life or some aspects of life such as family life, occupation, income, free time and so on.

Life satisfaction is in fact reflection of the distance between the person ideals and his current situation and whatever the gap

between person's ideals and his current situation is more, his satisfaction will decrease (Zaki, 2007). Considering life satisfaction is the reflection of balance between person's wishes and his current situation (Nasiri Jokar, 2008; quoted by Hosseini et al., 2011) and since perfectionists always look for various goals, life satisfaction seems to be less in people with high perfectionism than other people and researches have shown that perfectionists will be more confused by goal setting (Hashemi and Latifian, 2009).

Numerous researches have investigated the relationship between perfectionism with numerous factors. What seems to be investigated less is the moderating effect of perfectionism on relationships between personality traits, life satisfaction and psychological well-being that in current study researcher looks for if perfectionism can work as a moderator variable on relationships among personality traits, life satisfaction with psychological well-being.

## 2 Methodology

The methodology is descriptive, the type of correlation models because researcher is going to predict criterion variable based on predictor variables. Statistical population of current study is the undergraduate students of Islamic Azad University of Tehran Research that were 13000 during study. Through multi-level clustering sampling method and considering Julie Plant formula (2009),  $N > 50 + 8M$ , 140 students considering fallings were selected out of mentioned population and answered questionnaires.

### 2.1 Measurement tools

**Ryff Psychological well-being scale (RSPWB-18):** psychological well-being is a multi-component concept and includes below cases:

Self-acceptance, positive relation with others, autonomy, environment mastery, purpose in life

For measuring these structures, Ryff designed psychological well-being scales such as 20 phrase, 14 phrase, 9 phrase and 3 phrase questionnaires. After initial investigations, the original version of psychological well-being scales that has 84 phrases was provided (1989). Then 54 phrase versions and 18 phrase short forms were designed as well. The short version of this questionnaire assesses 6 main components of psychological well-being pattern and therefore has 6 sub-scales (each sub-scale includes 3 phrases).

### 2.2 Method of scoring

In this questionnaire which is designed for adults, participant has to identifies in a 6 degree Likert scale (1= absolutely disagree to 6-absolutely agree) that in what extent he agrees or disagrees phrases. For computing the related score to each sub-scale, the scores of related phrases to mentioned sub-scale have to be added to each other. The score of psychological well-being will be also obtained through total scores of 18 phrases. Related phrases to each sub-scale:

Self-acceptance sub-scale: 2-8-10, positive relation with others: 3-11-13, autonomy: 9-12-18, environment mastery: 1-4-6, purpose in life: 5-14-16, individual growth: 7-15-17

The phrases of 3-4-5-9-10-13-16-17 are scored reversely.

The internal consistency coefficient of psychological well-being scales short forms sub-scales and also internal consistency coefficient of whole test have been reported as 0.50. Cronbach's alpha in current research has been computed as 0.73.

Related evidences to convergent validity of psychological well-being tests represent that 6 factors of mental well-being have

positive relationship with life satisfaction, self-esteem and creativity and negative relationship with depression, chance and external control source.

### 2.3 Perfectionism scale

Persian version of perfectionism list with 58 phrases and 6 adaptive sub-scales includes purposefulness, order and organization, strive for excellence and non-adaptive includes: interpersonal sensitivity, perceived parental pressure, high standards for others that was normed and validated from Houman and Samei in 2010 in an Iranian sample.

Scoring method of this scale has been validated and reliable based on 4 degree Likert scale of absolutely disagree=1, disagree=2, agree=3 and absolutely agree=4. Sub-scales and items related to each one of them are reported as follows:

Interpersonal sensitivity: 25-58-17-45-39-59-29-23-2-9-13-31-48-15-5-47-37-38-33-52

Strive for excellence: 32-40-24-1-7-8-16 order and organize: 50-35-19-55-43-27-11

Perceived pressure by parents: 30-46-6-57-53-22-14 purposefulness 28-20-4-44-36-54-12-51

High standards for others 42-26-18-34-49-21-10-41-3

Cronbach's alpha or retest estimating method was used for Validation of this set. Cronbach's alpha of total set which is an index for questionnaire validity was equal to 0.926 and validity coefficient of perfectionism list through retest after final performance was performed again on 50 people within 2 -6 weeks (averagely 4 weeks). The value of calculated Pearson correlation between these two performances was equal to 0.736. This value has been significant statistically in level of less than 0.001. Perfectionism list retest validity represents the stability of its fundamental structures. The reliability of perfectionism sub-scales through Cronbach's method was respectively calculated in this study as 0.65, 0.72, 0.81, 0.58, 0.73, and 0.78. Face and content validity: for investigating face and content validity the idea of experts were considered in the field of psychology and face and content validity of perfectionism list was confirmed.

### 2.4 Life satisfaction questionnaire (SWLS)

The scale of life satisfaction has been developed by Diener et al., 1985 in order to assess life satisfaction. This scale is a self-reporting tool which consists of 5 phrases. The phrases of this test measure subjective well-being cognition components, scoring will be done as completely agree (7) to completely disagree (1). Diener et al., (1999) evaluated life satisfaction in a sample consisting of 176 undergraduate students. The mean and standard deviation of students' scores were respectively 23.5 and 6.43 and correlation coefficient of scores retesting after two months was 0.82 and Cronbach's alpha was 0.87. In Iran, Biani et al., (2007) performed life satisfaction scale on 109 university students in order to normalization. The reliability of this test using Cronbach's alpha was 0.83 and through retesting was 0.69. The reliability of life satisfaction questionnaire was computed as 0.83 through Cronbach's alpha. The validity of life satisfaction scale structure was estimated through convergent validity using Oxford happiness index and Beck depression index. This scale has positive correlation with Oxford happiness index and negative correlation with Beck depression index.

### 2.5 Neo five personality factor questionnaire (NEO-FF-I)

NEO test was proposed by Fedewa et al., (2005). Three main scales which were neuroticism (N), extroversion (E) and openness to experience (O) that was investigated widely were considered for the first time. The indexes of agreement (A), conscientiousness (C) were evaluated in this test briefly and generally. The test of NEO PI-R was later developed because of

that and the indexes of agreement (A) and conscientiousness (C) were included also with their related scales in initial test (Haghshenas, 2009).

Translation and adaptation of this test into Persian started in 1997. After a preliminary study and its implementation on a limited group of patients referred to the psychology clinic and people with no problem and difficulty (mentally) the ultimate form was provided and then was normalized on a sample with random selection in Shiraz and the results of this normalization were published in 2008 (Haghshenas, 2008). Short form of NEO has been used in this study. This test includes five scales of C, A, O, E, N and 12 questions have been raised in each scale. Participant is asked to identify the compliance of provided phrases with his comments on a Likert scale from absolutely agree to absolutely disagree. The questions are scored as absolutely disagree (1) to absolutely agree (5).

Reported alpha coefficient by Fedewa et al., (2005) has been variable between 0.75 and 0.89 with the mean of 0.81. In a research which was done by Bouchard et al in 1999, alpha coefficient for neuroticism 0.85, extroversion 0.72, for openness

0.68, for agreement 0.69 and for conscientiousness was obtained as 0.79. (Bouchard et al., 1999)

Correlation coefficient among the scores of indexes NEO-FF-I with NEO-PI-R for indexes E, N, C, A, O was respectively calculated as 0.92, 0.90, 0.91, 0.77 and 0.87 (Haghshenas, 2006).

Reliability coefficient of retesting for an Iranian sample group including 208 students within 3 month time gap were respectively obtained as 0.79, 0.79, 0.80, 0.75, 0.83 for neuroticism, extroversion, openness and conscientiousness (Ibid). The reliability of personality test through Cronbach's alpha in current research was respectively calculated as 0.68, 0.78, 0.91, 0.78 and 0.71.

### 3 Findings

The sample of research was 140 students including 62 boys and 78 girls in an age range of 18-30 years old. In this sample 24 people were married and 116 people were single (table 1).

#### 3.1 Describing data

Table 1 Measure of central tendency and dispersion based on the scores of Psychological well-being, perfectionism, personality traits and their sub-scales and life satisfaction

Dependent variable	Number	Mean	Standard deviation	Minimum	Maximum
Self-acceptance	140	12.67	3.23	5	18
Positive relations with others	140	12.59	2.84	7	18
Autonomy	140	10.14	2.21	6	16
Environment mastery	140	12.62	2.97	7	17
Purpose in life	140	12.55	2.76	8	23
Individual growth	140	13.36	2.81	8	18
Psychological wellbeing	140	79.76	9.92	55	96
Interpersonal sensitivities	140	47.79	9.6	1	70
Being excellent	140	20.81	4.11	2	29
Order and organizing	140	18.80	4.78	0	28
Perceived pressure	140	18.82	3.72	0	28
purposefulness	140	22.79	3.95	0	31
High standards	140	21.99	4.21	4	32
Neuroticism	140	36.26	8.85	0	55
Extroversion	140	38.16	7.60	0	53
Openness	140	30.66	6.39	0	44
Agreement	140	39.81	6.94	0	59
conscientiousness	140	41.08	8.81	0	57
Life satisfaction	140	21.39	7.07	0	33

In table 2, related results to Kolmogorov and Smirnov test about scores distribution normality have been proposed.

Table 2 the results of variables scores distribution normality test

Variables	Z	Sig	Variables	Z	sig
Self-acceptance	1.75	0.004	Perceived pressure	1.31	0.059
Positive relations with others	1.34	0.054	purposefulness	1.28	0.079
Autonomy	1.31	0.063	High standards	1.32	0.058
Environment mastery	1.36	0.051	Neuroticism	1.32	0.058
Purpose in life	1.34	0.062	Extroversion	1.16	0.132
Individual growth	2.20	0.002	Openness	0.962	0.313
Psychological wellbeing	0.817	0.516	Agreement	1.257	0.085
Interpersonal sensitivities	1.29	0.070	conscientiousness	1.338	0.056
Being excellent	1.10	0.172			
Order and organizing	1.17	0.129			

The normalization of scores distribution has been reported in table 2. As it can be seen in table 2, the only distributions which aren't normalized are self-acceptance and individual growth. Considering that modification was performed.

### 3.2 Inferential findings

In this part for testing the research hypotheses and responding research questions, statistical method of stepwise multiple regression has been used.

### 3.3 Research hypothesis

Perfectionism moderates the relationship between personality traits and psychological well-being.

For testing this hypothesis, multi-variable regression analysis assumptions including normality, linearity and multiple linearity and remained independence were investigated.

Considering establishing test assumptions of multi-variable regression analysis, the results of stepwise multi-variable regression have been reported in table 3.

Table 3 the summary of regression model and variance analysis for predicting psychological well-being based on personality traits and perfectionism

Model	Variables	R	Chi-R	F	Sig	Durbin-Watson
Step 1	Neuroticism	0.336	0.113	17.59	0.001	1.629
Step 2	Neuroticism, extraversion	0.393	0.154	12.50	0.001	
Step 3	Neuroticism, extraversion, openness	0.402	0.162	8.74	0.001	
Step 4	Neuroticism, extraversion, openness, agreeableness	0.435	0.189	7.88	0.001	
Step 5	Neuroticism, extraversion, openness, agreeableness, conscientiousness	0.565	0.320	12.58	0.001	
Step 6	Neuroticism, extraversion, openness, agreeableness, conscientiousness, discipline, perfection, purposefulness	0.600	0.360	9.20	0.001	
Step 7	Neuroticism, extraversion, openness, agreeableness, conscientiousness, discipline, excellence, purposefulness and high standards, interpersonal sensitivity, perceived pressure	0.661	0.437	9.01	0.001	

As the results of table 3 show, personality traits and perfectionism has significant statistical relationship with psychological well-being  $P < 0.01$  and  $F(11 \text{ and } 128) = 9.01$ . These variables can totally predict 44 percent of psychological well-being. Considering the value of coefficient of determination it can also be stated that personality traits predict 32 percent of psychological well-being that through coming perfectionism and its sub-scales this value increased to 44 percent. Therefore it can

be concluded that perfectionism is mediator between personality traits and psychological well-being or has moderating effect on the relationship.

For investigating regression coefficients of psychological well-being, the coefficients of their effects were calculated from every single one of predictor variables. The effect coefficients of personality traits and perfectionism have been shown in table 4.

Table 4 stepwise regression coefficients for predicting psychological well-being based on predictor variables

Step	Variable	Beta	t	Sig	Tolerance	VIF
1	Neuroticism	-0.336	-4.19	0.001	1	1
2	Neuroticism, extraversion	-0.294 -0.207	-3.65 2.58	0.001 0.011	0.958 0.958	1.04 1.04

5	Neuroticism, extraversion, openness, agreeableness, conscientiousness	-0.298 -0.032 -0.013 -0.003 0.478	-3.90 -0.344 -0.160 -0.035 5.06	0.001 0.731 0.873 0.972 0.001	0.872 0.595 0.789 0.537 0.571	1.14 1.68 1.26 1.86 1.75
6	Neuroticism, extraversion, openness, agreeableness, conscientiousness, discipline, perfection, purposefulness	-0.318 -0.033 -0.024 -0.025 0.440 -0.219 0.064 0.264	-4.06 -0.366 -0.300 -0.255 4.125 -1.86 0.617 2.71	0.001 0.715 0.764 0.799 0.001 0.064 0.539 0.007	0.801 0.584 0.779 0.526 0.429 0.355 0.459 0.519	1.24 1.71 1.28 1.90 2.32 2.82 2.17 1.92
7	Neuroticism, extraversion, openness, agreeableness, conscientiousness, discipline, excellence, purposefulness and high standards, interpersonal sensitivity, perceived pressure	-0.143 -0.69 -0.026 -0.087 0.470 -0.081 0.093 0.360 -0.272 -0.053 -0.168	-1.64 -0.775 0.347 -0.931 4.13 -0.692 0.930 3.58 -2.28 -0.602 -1.99	0.103 0.440 0.730 0.356 0.001 0.491 0.354 0.001 0.024 0.548 0.048	0.582 0.552 0.759 0.505 0.340 0.322 0.442 0.437 0.310 0.578 0.622	1.71 1.81 1.31 1.97 2.94 3.11 2.26 2.28 3.22 1.72 1.60

Considering t statistics, from the aspects of perfectionism and personality traits only neuroticism, extroversion, agreement and conscientiousness, from the aspects of personality traits and purposefulness, high standards and perceived pressure are the aspects of predictor perfectionism of psychological well-being. The aspects of personality traits predict 32 percent and the aspects of perfectionism also predict 14 percent of psychological well-being.

**3.4 Research hypothesis**

Perfectionism moderates the relationship between personality traits and life satisfaction.

For testing this hypothesis, multi-variable regression analysis assumptions including normality, linearity and multiple linearity and remained independence were investigated.

Considering establishing test assumptions of multi-variable regression analysis, the results of stepwise multi-variable regression have been reported in table 5.

Table 5 the summary of regression model and variance analysis for predicting life satisfaction based on personality traits and perfectionism

Model	Variables	R	Chi R	F	sig	Watson-Durbin
Step 1	Neuroticism	0.225	0.065	9.61	0.002	1.82
Step 2	Neuroticism, extraversion	0.453	0.205	17.71	0.001	
Step 3	Neuroticism, extraversion, openness	0.459	0.210	12.07	0.001	
Step 4	Neuroticism, extraversion, openness, agreeableness	0.475	0.226	9.84	0.001	
Step 5	Neuroticism, extraversion, openness, agreeableness, conscientiousness	0.481	0.231	8.04	0.001	
Step 6	Neuroticism, extraversion, openness, agreeableness, conscientiousness, discipline, perfection, purposefulness	0.512	0.262	5.82	0.001	
Step 7	Neuroticism, extraversion, openness, agreeableness, conscientiousness, discipline, excellence, purposefulness and high standards, interpersonal sensitivity, perceived pressure	0.570	0.325	5.59	0.001	

As the results of table 5 show, personality traits and perfectionism has significant statistical relationship with life satisfaction  $P < 0.01$  and  $F(11 \text{ and } 128) = 5.59$ . These variables can totally predict 33 percent of life satisfaction. Considering the value of coefficient of determination it can also be stated that personality traits predict 23 percent of life satisfaction that through coming perfectionism and its sub-scales this value increased to 33 percent. Therefore it can be concluded that

perfectionism is mediator between personality traits and life satisfaction or has moderating effect on the relationship.

For investigating regression coefficients of life satisfaction, the coefficients of their effects were calculated from every single one of predictor variables. The effect coefficients of personality traits and perfectionism have been shown in table 6.

Table 6 stepwise regression coefficients for predicting psychological well-being based on predictor variables

Step	Variable	Beta	t	sig	tolerance	VIF
1	Neuroticism	-0.255	-3.10	0.002	1	1
2	Neuroticism, extraversion	-0.177 0.383	-2.26 4.91	0.025 0.001	0.958 0.958	1.04 1.04
3	Neuroticism, extraversion, openness	-0.196 0.356 0.076	-2.43 4.27 0.916	0.016 0.001 0.361	0.889 0.838 0.844	1.12 1.19 1.18
4	Neuroticism, extraversion, openness, agreeableness	0.209 0.276 0.050 0.153	-2.59 2.88 0.597 1.63	0.011 0.005 0.552 0.104	0.880 0.623 0.814 0.655	1.13 1.60 1.22 1.52
5	Neuroticism, extraversion, openness, agreeableness, conscientiousness	-0.202 0.256 0.036 0.111 0.096	-2.48 2.61 0.420 1.07 0.955	0.014 0.010 0.675 0.283 0.341	0.872 0.595 0.789 0.537 0.572	1.14 1.68 1.26 1.86 1.75
6	Neuroticism, extraversion, openness, agreeableness, conscientiousness, discipline, perfection, purposefulness	-0.209 0.263 0.020 0.078 -0.021 -0.044 0.181 0.124	-2.49 2.68 0.239 0.757 -0.184 -0.353 1.63 1.19	0.014 0.008 0.811 0.450 0.854 0.725 0.105 0.234	0.801 0.584 0.779 0.526 0.429 0.355 0.459 0.519	1.24 1.71 1.28 1.90 2.32 2.82 2.17 1.92
7	Neuroticism, extraversion, openness, agreeableness, conscientiousness, discipline, excellence, purposefulness and high standards, interpersonal sensitivity, perceived pressure	-0.039 0.264 0.061 0.011 -0.031 0.089 0.204 0.244 -0.367 -0.020 -0.023	-0.415 2.69 0.733 0.106 -0.247 0.693 1.86 2.22 -2.81 -0.206 -0.252	0.679 0.008 0.465 0.916 0.806 0.489 0.064 0.028 0.006 0.827 0.802	0.582 0.552 0.759 0.505 0.340 0.322 0.442 0.437 0.310 0.578 0.622	1.71 1.81 1.31 1.97 2.94 3.11 2.26 2.28 3.22 1.72 1.60

Considering t statistics, from the aspects of perfectionism and personality traits only neuroticism, extroversion, from the aspects of personality traits and interpersonal sensitivity and being excellent are the aspects of predictor perfectionism of life satisfaction. The aspects of personality traits predict 23 percent and the aspects of perfectionism also predict 11 percent of life satisfaction.

### 3.5 Research hypothesis

There is a relationship between life satisfaction and psychological well-being.

For testing this hypothesis, Pearson correlation coefficient has been used that its results have been shown in table 7.

Table 7 the results of Pearson test among the aspects of psychological well-being and life satisfaction

Variable	Life satisfaction	Self-acceptance	Positive relations with others	Autonomy	Environment mastery	Purpose in life	Individual growth	Well-being total score
Life satisfaction	1	0.385**	0.160	-0.004	0.259**	0.119	0.079	0.322**
Self-acceptance		1	0.314**	-0.012	0.553**	0.136	0.357**	0.713**
Positive relation with others			1	0.047	0.240**	0.119	0.228**	0.579**
autonomy				1	0.132	0.189**	-0.008	0.258**
Environment mastery					1	0.139	0.448**	0.689**
Purpose in life						1	0.060	0.471**
Individual growth							1	0.629**
Well-being total score								1

P<0.01\*\*P<0.05\*

The results of table 7 show that there is a significant statistical relationship among life satisfaction, self-acceptance and well-being total score and there isn't significant statistical relationship among life satisfaction and other aspects of psychological well-being.

### 4 Discussion

In current research, the moderating effect of perfectionism has been investigated on relationships between personality traits with life satisfaction and psychological well-being.

Psychological well-being implies on positive mental health (Edwardes, 2005). Psychological well-being is a various multi-dimensional concept (McLude and More, 2000, Ryff, 1989; Wising and One and Eden, 2002) that as result the combination of emotion regulation, personality traits, identity and life experiences will be created (Dehlan-E- Malek et al., 2010).

Psychological well-being these days is not only the lack of mental damages it is also the presence of positive aspects of performance such as positive mood, purpose in life and social cooperation (Case, 2007; quoted by Khodabakhsh and Kiani, 2013). Preliminary studies on the psychological well-being were first concentrated on experiencing positive and negative emotions, psychological well-being and life satisfaction which has been formed based on a Greek word of "Eudemonia" (Ryff, 1989; quoted by Edwardes, 2007). They defined happiness as the balance between positive and negative emotions. Providing many scales that in order to assessing life satisfaction were made and used in many researches were based on this initial and abstract concept of satisfaction (Fichet et al., 2013). Psychological well-being can be stated based on human flourishing and understanding the challenges of life. In spite of this, psychological well-being can be operationalized in different ways; it only depends on theorizing on which one of life aspects (Wood and Josef, 2010).

Most of people have considered happiness as a basis for having an ideal life and try for acquiring satisfaction in their life (King Vanp, 1998). Chang and Stuart (2003) about the importance of life satisfaction, considered it as the ultimate goal of human growth. The importance of life satisfaction and generally mental well-being have been also emphasized by Sickzent Mihali, 2000; quoted by Hiobner, 2004). He states that mental well-being not only is one of important aspects of life, but also is life. Considering the importance of subject, many psychologists have been working about life satisfaction and stated their ideas.

Diener (2000) is one of the researchers who have investigated the importance of this subject.

According to Park (2004) cognitional aspect of mental-wellbeing is life satisfaction; this structure plays an important role as a predictor, mediator and product index in positive growth. People experience high life satisfaction when the conditions of their lives are matched with the criteria which have been determined by them (Diener, 2000).

Personality five factor pattern of a hieratical organization of personality traits that have been developed based on five main aspects of dejected orientation (neuroticism), extroversion, openness, agreeableness and conscientiousness (Sholtes, 2007). Preliminary therapists and philosophers have considered perfectionism as an important aspect of human behavior. The first person who considered perfectionism was Janet (1898). He described perfectionists as people who have stable thoughts. Therefore flexibility is one of the first raised traits about perfectionism. In preliminary definitions, perfectionism has been considered as a negative trait related to psychopathology but Hemachick (1978) was the first researcher who took a different attitude and differentiates different kinds of perfectionism. He stated that perfectionists are in two kinds of normal type (adaptive) and neurotic (non-adaptive). Normal perfectionists can accept personal limitations and environmental barriers which inhibit them from realizing ideal performance while they see the environment supportive in terms of social assessment and neurotic perfectionists aren't flexible enough so they aren't satisfied with their performance although it is admirable by others, they are always affected by fear and worrisome of failure and because of that see environment non-supportive and threatening in terms of social assessment, neurotic perfectionists don't have the right of making mistake that much, they are critics in evaluating their performances (Ferasat et al., 1990).

### 5. Conclusion

In summary, it can be stated that in most of past conceptualizations, this structure has been described as a personality trait (Hemacheck, 2978) or cognitive style (Bronze, 1980; Pech, 1984). Moreover about that perfectionism reveals itself through non-adaptive behaviors, all of previous researchers (except Hemacheck) agreed.

Current research was aimed to investigate if perfectionism plays a moderating role related to personality traits with life satisfaction and cognitive well-being in students.

The first hypothesis: perfectionism moderates the relationship between personality traits and psychological well-being.

The result showed that personality traits and perfectionism has significant statistical relationship with psychological well-being  $P < 0.01$  and  $F(11 \text{ and } 128) = 9.01$ . These variables can totally predict 44 percent of psychological well-being. Considering the value of coefficient of determination it can also be stated that personality traits predict 32 percent of psychological well-being that through coming perfectionism and its sub-scales this value increased to 44 percent. Therefore it can be concluded that perfectionism is mediator between personality traits and psychological well-being or has moderating effect on the relationship.

Considering t statistics, from the aspects of perfectionism and personality traits only neuroticism, extroversion, agreement and conscientiousness, from the aspects of personality traits and purposefulness, high standards and perceived pressure are the aspects of predictor perfectionism of psychological well-being. The aspects of personality traits predict 32 percent and the aspects of perfectionism also predict 14 percent of psychological well-being.

Researchers didn't find a study based on that perfectionism moderates the relationship between personality traits with psychological well-being but to explain the findings of this hypothesis, some points need to be mentioned here; because perfectionism is one of personality traits has an important role in etiology, pathology and clinical course of mental colonialism (Shaferan et al., 2002) it can have moderating role on psychological well-being. Hoyt and Felt (2002) believe that compared to non-perfectionists, perfectionists face more stress considering their non-realistic attitudes toward life. In addition to common stressing factors for normal ones, perfectionists create pressures because they want to be perfect in many areas. A perfectionist behavior which is derived from perfectionist tendencies for evaluating self and others seriously, concentrating on negative aspects of performance and experiencing low satisfaction, can make stress. Perfectionism can increase negative effects of stress and this subject itself can affect mental well-being that is increasing negative perfectionism causes increasing stress and decreasing psychological well-being.

Second hypothesis: Perfectionism moderates the relationship between personality traits and life satisfaction.

The result showed that personality traits and perfectionism has significant statistical relationship with life satisfaction  $P < 0.01$  and  $F(11 \text{ and } 128) = 5.59$ . These variables can totally predict 33 percent of life satisfaction. Considering the value of coefficient of determination it can also be stated that personality traits predict 23 percent of life satisfaction that through coming perfectionism and its sub-scales this value increased to 33 percent. Therefore it can be concluded that perfectionism is mediator between personality traits and life satisfaction or has moderating effect on the relationship.

Considering t statistics, from the aspects of perfectionism and personality traits only neuroticism, extroversion, from the aspects of personality traits and interpersonal sensitivity and being excellent are the aspects of predictor perfectionism of life satisfaction. The aspects of personality traits predict 23 percent and the aspects of perfectionism also predict 11 percent of life satisfaction. Researcher didn't access to a research investigated perfectionism as a moderating factor between personality traits with life satisfaction but to explain this subject, Wang, Ion and Esleni research (2009) can be mentioned that represented there is a correlation between perfectionism aspects and life satisfaction. In this study, adaptive perfectionism compared to non-adaptive ones and non-perfectionists had higher scores in life satisfaction (Wang, Ion and Esleni research (2009)). People with adaptive perfectionism seem to experience more life satisfaction because they are less stressed for achieving their goals.

Anjet (2009) also investigated the role of perfectionism on life satisfaction of Turkish teenagers. The result showed that having high regularity and criteria predict life satisfaction while disparities between the personal standards and actual performance of person were negative predictor of life satisfaction.

A person who has psychological well-being considers his positive aspects adequately and realistically. Such these people step in their natural area and ultimately accept the responsibility of their behavior and thought honestly (Clark et al., 2014). Naderi (2012) investigated the relationship of perfectionism and social compatibility with psychological well-being in students. The result of this research showed that the relationship of perfectionism and social compatibility is positive, it can be concluded that whatever the rate of positive perfectionism and social compatibility is more; the frequency of psychological well-being will be more as well. In a research namely "investigating the relationship of perfectionism and personality traits in Tehran University students" concluded that there is a positive and significant correlation between perfectionism aspects and neuroticism (such as depression and anxiety).

Third hypothesis: There is a relationship between life satisfaction and psychological well-being.

The results showed that there is a significant statistical relationship among life satisfaction, self-acceptance and well-being total score and there isn't significant statistical relationship among life satisfaction and other aspects of psychological well-being. Considering that life satisfaction is one of cognitive components of mental well-being and one of the aspects of life quality (Diener 2000) psychological well-being refers to a general assessment from thoughts, emotions, attitudes and life satisfaction (Diener 2003). Since the concept of mental well-being isn't adequate for an appropriate life but results show that this structure is considered as an important index for having a good life (Diener, Sapta and Sah, 1999). People with high psychological well-being, evaluate the events and conditions of life positively. On the other hand people, who aren't happy in their lives, consider the events of life as berries for achieving their goals. According to Golman et al., (2005) life satisfaction is the comparison between the current conditions of person's life with criteria which he had determined for himself. People experience high rate of life satisfaction when their life conditions are matched to what they have determined for themselves (Diener, 2000). Satisfaction feeling in different areas of life is one of the components of people's positive attitude toward the world where they live. Life satisfaction has a close but complicated relationship with values and the criteria which people assess them based on their mental perception of luckiness are different.

## KNOWLEDGE-BASED ECONOMY AND ITS ROLE IN THE RESISTANCE ECONOMY

<sup>a</sup>MANSOUR TORKIANTABAR

<sup>a</sup>*Department of Information Science and Knowledge, Doroud Branch, Islamic Azad University, Doroud, Iran*

*Email: "torkiantabar@iau-doroud.ac.ir"*

**Abstract.** Resistance economy is one of the concepts in today's global economic literature. Hence, it is necessary to provide practical and appropriate strategies to provide grounds for the conversion of science to technology in the country. This will be possible when the knowledge-based companies literally play the role in the economy do not experiencing recession, but in line with the developments in the international community try to achieve innovations and new technologies. Accordingly, the current paper investigates the concept of knowledge-based economy and resistance economy as well as resistance economic requirements using library sources.

**Keywords:** Economy, Knowledge-based economy, Resistance economy

### 1 Introduction

Knowledge is the most strategic resource for competitiveness maintaining and strengthening with effective management of knowledge as one of the most serious challenges organizations, given the accelerated competitive environment changes and environment uncertainty in today's world. Knowledge management turns asset lies in the minds of people to institutional assets so that a wide range of people involved in decision-making have access to this wealth to use it. The first priority of resistance economy is the pressure points analysis. This means to review the foreign powers issues of sensitivity in the use of sanctions. Generally, those points of sensitivity have been our signs of weakness and our dependence on foreigners identified by the enemy, which we should focus on so that to convert weaknesses to strengths and threats into opportunities. It is obvious that being a country under sanctions requires adopting policies and measures causing growing trend in various aspects in addition to maintaining economic stability to the country.

Resistance economy is a practical way to deal with possible sanctions using it can reduce the negative effects of sanctions.

Knowledge-based companies are including institutions with special place in the resistance economy idea by the supreme leader; because these companies turn ideas and knowledge into products and services, and play an important role in the growth and economic development, while can apply to private and public sector participation in the economic development of the country. This is well understood in the speech of the leader of the Islamic Republic of Iran.

Hermans & Castiauu (2007) believed that university is a prime source of knowledge production and the knowledge can flow between private spheres and academia through making connections between university and industry.

In recent years, economic pressures caused by sanctions taken against Iran made Iran to adopt "resistance economy" as a strategy to cope with the situation raised concern among economic experts inside and outside the country. Knowledge-based economy is an important part of realizing the resistance economy with a double importance in today's world.

Although the optimal use of knowledge and apply it consistently to meet human needs attracted the attention of countries especially during the Industrial Revolution, but in today's world taking advantage of the knowledge by trying to overtake countries has become important more than ever in the international arena.

### 2 Knowledge-based economy

Over the past decade the awareness of the role of knowledge in economic development and its importance in the development of knowledge-based industrial activities has been increased.

For example, the Government of Norway in a comprehensive innovation plan 1 highlighted the importance of further research in industry and market research capabilities based on knowledge. However, it is proved that the commercialization of knowledge at the national level is not fully developed (Spellin & Stencil, 2003). Where, human societies move with unprecedented momentum towards a knowledge driven society, evidence and global trends indicate that competitiveness lies in the ability of creation, deployment and transfer of technological knowledge. Hence, we are faced with the worldwide adoption of strategies to increase the effectiveness of activities and transfer of scientific and technological achievements in industry and the market (Izadiyan, et al., 2013). In today's world, knowledge-based economy undeniably plays an important role in the economic development of many countries. The importance of this type of economy is to the extent that many countries make lots of investments to realize it. Recently, there has been considerable attention to this important issue in Iran years but it seems that conditions and grounds must be provided to should be considered achieve the goals. The term "knowledge-based economy" refers to the role of science and technology on economic growth. Knowledge has always been important for economic development, but in recent years the importance and its relation to economic growth is increasing. A certain number of factors, including technological advances, economic globalization, the importance of specialized knowledge, increasing awareness of the importance of knowledge for economic development of a country and the creation of new jobs are related to economic development. This trend shows that the knowledge economy describes the positive effect of knowledge on the economic growth (Kurtic and Donlagic, 2012).

Experience shows that countries that focus on research and benefit from the outcomes have achieved more success in the field of development. What is clear is that Iran to achieve a high level of economic development has no choice but to use the power of their scientific researchers many of them active in universities and higher education institutions that necessitates paying more attention to scientific production of universities and higher education institutes. Accordingly, it must be said that knowledge-based companies that constitute the main elements of the knowledge-based economy are with undeniable role in the resistance economy. The current circumstances of the country require the knowledge-based economy to be out of sanctions.

Knowledge-based economy and resistance economy are interdependent and chained together; because provide the motivation for the use of various opportunities and deal with problems such as unemployment, inflation, economic dependence, inappropriate consumption and so forth each of the requirements of fulfilled resistance economy.

### 3 Resistance economy

Iran's economy has always been subject to the disabilities in international relations due to the impact of the global environment and the ability in different scientific business, political and energy fields, the more recent one would be the economic sanctions on Iran. The proposed plan of resistance economy for retrofitting the economy is a necessity more than ever before as a means of defense and protection of the Iranian economy in times of economic crisis. In fact the proposed pattern is a macro outlook of in the economy requiring the long-term measures (Ebrahimi & Zirak, 2012). One-dimensionality of a country's economy and its negative impact on the dynamics of the economy have been considered by the economic experts for

years and in some ways it can be considered an economic downturn.

Needless to say, oil-dependent economy can cause irreparable damages to country and that's why the tendency to diversify of economic activities and the use all the capacities of the country is a way to achieve resistance economy. Accordingly, reliance on domestic power would be a strong barrier against external pressures to dominate the country's economy. The economic pressure and sanctions is not limited to Iran and much of the countries have experienced this situation for a variety of reasons and still trying to find fundamental solutions to deal with it. In other words, making policies that vaccinates a country's economy against pressure and sanctions and make it be self-sufficient is the core concepts of the words of the leader of the Islamic Republic of Iran as well as many economists and economic experts.

#### 4 Resistance economic requirements

##### 1- pragmatism in economic activity

There should be sustained efforts to work on theories to make them operational in order to be successful in economic activity. The cliché of slogan is a large drop in resistance economy realization with a large gap between rhetoric and action, in other words a country can take steps toward dynamics economic in case that provided it is necessary requirements in practice. According to Iran's supreme leader pragmatic view of the economy requires action, initiative and activity. This means that the country must use all their capacities for entrepreneurship, production and commercialization of scientific outcomes to the best possible use. Realizing the economic pragmatism occurs when it is institutionalized and acculturated among the nation. It also requires the institutionalization of a culture of understanding in the international community. In the current circumstances all countries are planning to expand their economic activities around the world, to achieve high profitability. Countries like Iran have the ability to take advantage of its capabilities in global markets with decent contribution.

##### 2- The knowledge-based economy

The discourse of knowledge economy has been derived from the report, compiled by a group of intellectuals and economists in the 1960s including Firenze Jelapp, Peter Drucker, Daniel Bell implying that industrial societies are becoming capitalist, industrial and knowledge-based economy societies. Manuel Castells is a prominent writer believing that the knowledge is fundamental and new factors of production is in conflict with the traditional argument that land (natural resources), labor (human effort) and capital goods are the three main factors of production (Robertson, 2008). Production and commercialization of science and technology are obvious signs of development of a country. Although science and technology is crucial to the success of communities, experience has shown that without a roadmap and policy for science and technology and to interpret brighter achieve a competitive advantage in the intense global competition is basically impossible in the absence of adjustment, development and implementation of accurate and correct policies and strategies for creating value (Bagherizadeh, 2011). Commercialization of scientific research outcomes in knowledge-based companies is a strategy in response to the country's macro objectives in line with the emphasis on national self-sufficiency, benefit from the ability and talent of young people of the country, resistance economy and achieve development has gained the increasing importance on relying on domestic force in recent years given that our country is faced with problems such as economic sanctions, therefore, identify and explain all the factors affecting the commercialization of scientific research outcomes is very important because the results of the studies will be used in presented or modified strategies in the area of commercialization of scientific research results.

##### 3- Expert human resources

Human resources as smart assets are the greatest assets of any organization. Organizations look at their human capital based on knowledge, competence and capability as a competitive advantage (Abili & Movafiqi, 2007). Human economic efforts have always been toward obtaining the maximum results out of the minimum resources. This tendency can be termed achieve efficiency and higher productivity.

Productivity is a broad concept constituting many aspects of economic and social life of a community, and is interconnected with the community aspiration on achieving economic growth and sustainable development, economic justice, social justice, the elimination of poverty, increase national prosperity, efficiency and effectiveness of management systems and human capital, and thus the ability to interact actively with the global economy, so that productivity will not be achieved regardless of close attention to each of these goals. Ideals of society realization depend on the productivity of the resources, including physical, human and social resources (Qabezi, 2013). No doubt, human resources are the most important factor in all organizational activities. Expert human capital is of a country's economic pillar; because it plays an important role in achieving the economic goals utilizing the intelligence and knowledge.

Creative and efficient workforce is a valuable asset ignoring it is associated with many negative consequences for any country. Resistance economy goals realization necessities all educated and skilled individual's involvement to provide economic success of country through implementation of their knowledge and experience.

##### 4- Domestic production

The national production is main important point in the context of the country's economy driven wheel. The strength of this axis is the guarantor of the country's economic health, self-sufficiency and economic and social independence from various perspectives ultimately leading to economic development and improves the welfare and living standards. Iran benefits from the key factors needed to strengthen national production, such as human resources, raw materials, land and energy and the art of integrating facilities referred to as management in macro and micro level can increase productivity and efficiency in production, decrease waste reduction as well as the use of science and technology to achieve expected boom. The experience of successful countries such as Japan's economy shows that Japan achieved high percentage of economic growth and development in light of the country's national effort and successful management (Asgari, 1993). The country is required to pay special attention to domestic production ultimately leading to economic self-sufficiency to achieve the resistance economy objectives. One of the main problems underdeveloped or developing countries that faced with is the welcomed use of foreign goods that in turn decreases domestic products production. This requires the acculturation. The economic growth and development will never be attained provided that all individuals in a society accept that the only way to self-sufficiency is the reliance on domestic production.

##### 5- Consumer management

Currently, despite considerable progress in the field of industry and technology, man needs to observe the pattern of consumption more than ever. He needs to deal with the problems of individual and social life with the most appropriate solutions without any adverse effects (Kalantari, 2008). Mismanagement principled consumption is one of the main problems underdeveloped or developing countries faced with. This is one of the most important concerns of state and governments in such countries. The consequence of mismanagement causes resource waste and imposes additional costs on the economy. Consumer management plays a major role in the realization of resistance

economic since it leads to saving and efficient use of all resources available in a country.

### 5 Conclusion

Knowledge Production is one of the most important indicators of growth and development but this requires the conditions necessary for the commercialization to turn it into wealth. In today's world wealth creating knowledge has attracted increasing attention; therefore, the scientific community of the county is required to pursue the production of knowledge able to bring the industry and the economy wheel to move and provide grounds for economic growth of the country. Clearly, the application of the produced knowledge is more important and valuable than its production, because the application of science creates wealth and on the other hand, by making use of knowledge helps to launch a variety of small and large industries and thereby contribute to the development of country. Commercialization of knowledge is one of the most important strategies in achieving resistance economy in underdeveloped and developing countries, so far is not taken into account by such countries. Although in recent years the Iranian government has developed programs and measures to achieve this important objective in support for knowledge-based companies, evidence suggests that more effective measures should be taken to reach the ideal situation. One of the most important challenges now the country is facing is lack of applying the results of researches done at universities and research centers without any will to make them applies, as well. In other words, knowledge production costs a lot each year in the country, without any practical measure to transform to wealth, while this can be done with proper planning and help the economic growth and development. According to definition, the economic growth and development are completely dependent two concepts, on the other hand economic growth is a prerequisite for economic development and there would be no economic development unless there is economic growth. However, in today's world knowledge-based companies can accelerate economic growth and development, paved the way for achieving the two concepts. These companies, with fundamental changes in technology and optimum use of the knowledge generated, help the economy with more accelerated move in the path of growth and development and provide grounds for economic self-sufficiency.

**Abstract.** The aim of present research is investigate the effect of brand self-congruity, Awareness of retail, Retail brand association and Perceived quality of retail brand on purchase intention of customers. Present research, in terms of the type of research is applied and in terms of methods is descriptive-survey. The sample size has been selected by using Cochran formula. In first hypothesis; brand Self-Congruity has a positive and significant impact on attitude to retail. In second hypothesis; Awareness of retail has a positive and significant impact on attitude to retail. In third hypothesis; Retail brand association has a positive and significant impact on attitude to retail. Fourth hypothesis; Perceived quality has a positive and significant impact on attitude to retail. In fifth hypothesis; Attitude to retail has a positive and significant impact on purchase intention.

**Keywords:** self-congruity, retail awareness, brand association, Perceived quality, purchase intention.

### 1 Problem Statement

Today, perhaps more quickly than any other time in recent history, competitive business environment is changing (Rakam, 2000). On the other hand, high effect of consumer behavior on intensity of competition in these markets lead to further studies in the field of marketing. In this regard, a deep understanding of consumer behavior without knowing the factors influencing on his behavior seems unlikely. Thus, there is a need to understand the factors that effect on behavioral intentions of consumer. Purchase intention is one of the key concepts in marketing and scientific research in a range of products and services that could be considered for different purposes. For this reason, many marketing efforts are focused on this stage of consumer behavior (Harmon, 1982). Purchase intention is a planning that has been created before actual purchase. In fact, for influencing on customer behavior, must be controlled a step before the actual purchase that is intention to do behavior by customer (Belch & Belch, 2011). Behavior intention indicated the severity of intention and person will to do the goal behavior. Fyshbn and Ajzen defined intention as determinant of action in a certain direction. They also defined intention as subjective probability of forming a particular behavior. For example, plan to purchase a particular product has been diagnosed as predictors of actual behavior in the product purchase (Ramayaha et al., 2010). Usually, there is a delay between purchase intention and actual purchase, especially about the products with high complexity and with high intellectual engagement. Totally, purchase intention is a basis to match between purchase incentives and characteristics of desired brands (Moharam and Shavaki, 2012). According to studies conducted, purchase intention is a variable that can be influenced by many factors such as attitude to retail (Doss, 2014). Attitude is a set of beliefs, emotions and behavioral intentions toward an object, person or event. In other words, this variable is relatively stable tendency to a person, thing or event that appears in emotion and behavior (Gholipour, 2007). In order to examine the consumer behavior, attitude also can be defined as follows: evaluational inclination of a consumer in agree or disagree directions of any element in her and his market area (Samadi, 2007). With regard to the importance of attitude as the behavioral variable, the impact of different variables has been investigated on them such as brand self-congruity, brand association, Retail brand association and brand perceived quality (Helgeson and Supphellen, 2004).

With regard to the importance of brand in the retail industry, the aim of present research is investigate the effect of brand self-congruity, Awareness of retail, Retail brand association and Perceived quality of retail brand on purchase intention of customers.

### 2 Theoretical Foundations

**Brand Self-Congruity:** always Self-congruity widely has not been accepted and for a length of time scholars discussed to confirm its importance (Boksberger, et al., 2011; Hughes & Guerrero, 2012; Aaker, 1997; Aaker, 1999). However, the theory has reached a state of general acceptance. Self-congruity's importance has been confirmed in various venues, such as sponsorship events (Mozodier & Merunka, 2011), retail store choice (Willems & Swinnen, 2011), tourism (Boksberger, Dolnicar, Laesser, & Randle, 2011), the housing market (Sirgy, Grzeskowiak & Su, 2005) and even career choice (Nolan & Harold, 2010). In response to progression in self-congruity research that suggested conflicting conclusions about the theory's validity, Aguirre-Rodriguez, et al., (2012) conducted a meta-analysis of self-congruity and found evidence of a robust self-congruity effect. Their conclusions show that "the self-congruity construct is a robust and valid basic for emerging and current consumer identity and symbolic consumption research (Aguirre-Rodriguez, et al., 2012).

**Brand association:** Brand association includes all brand-related feelings, thoughts, images, perceptions, beliefs, experiences, and attitudes (Kotler and Keller, 2006) and is anything 'related in memory to a brand (Aaker, 1991). Such associations may include personality of brand (Aaker, 1997) and relationships (Fournier, 1998).

**Brand awareness:** awareness (Brand) is the probability that, consumers are familiar about the availability and accessibility of a firm's service and product. If an organization has a successful and good brand awareness it means that the services and products of the firm have an acceptable reputé in the market (Gustafson & Chabot, 2007). The awareness of the brand has a significant role while purchasing a service or product and may have control on perceived risk evaluation of consumers and their level of assurance about the buying decision with regard to brand awareness.

**Perceived quality:** Perceived quality define as the consumer's judgment about the superiority or quality of a service or product (Zeithaml, 1988). Also, Yoon and Kim (2011) mention perceived quality refers to evaluation of customers about a brand or a product that meet the consumer's expectation. Hoch and Banerji (1993) indicated that quality is the success factor in the battle between private labels and national brands. Also, some recent research stated that perceived quality is one of the most important factors that affect intention of consumer purchase toward private label services and products (Jaafar & Laip, 2012; Wu et al., 2011).

**Purchase intention:** purchase intention widely has been used as a measure of purchase behavior of consumer after evaluating and considering the services and products (Grewal et al, 1998). Ajzen (1991) defined that intentions represent motivational components of a behavior and level of conscious effort that a person will exert for performing a behavior. Thus, intention of purchase reflects the likelihood in which the consumers will buy certain services or products in the short-term buying decision (Wu et al., 2011).

**Attitude to Retail:** attitude define as long-term organizing of motivational, emotional, cognitive and perceptual processes according to some environmental aspects that person has been

located in which. To measure attitudes to retail is used the offered items by d'Astous and Le'vesque (2003).

### 3 Research hypotheses

Ebrahimi et al., (2012) in research entitled "analyzing factors affecting consumers' attitude and intention to purchase counterfeit products of luxury brands in clothing industry" analyzed the factors influencing on Consumers' attitude toward counterfeit products and intention to purchase such products in clothing industry that has been done in Sari. Study Findings have indicated that the factors as Personal gratification ·Value consciousness ·Price-quality inference ·Social Effect ·Ethical Issues ·Subjective norm ·perceived risk ·Brand consciousness ·have meaningful effect on attitude to counterfeit products & the impact of Brand prestige ·Brand Loyalty ·Risk averseness ·was not meaningful on view about counterfeit products. Besides ·the findings have shown that attitude toward counterfeit products has a meaningful effect on intention to purchase such products.

Haj Karimi et al., (2009) in research entitled "A Study of Service Encounter Quality and Customer Loyalty in Business Service Organizations" have introduced six hypotheses based on conceptual model of the research. Results showed that customer's perceptions of Service Encounter Quality has a positive relationship with the Service Quality and customer satisfaction. Moreover ·results show a direct relationship between customer satisfaction and customer perceptions of service quality. Also, results show a positive relationship between service quality and customer's loyalty, and a direct relationship between customer's satisfaction and their loyalty. Finally results show customers loyalty to employees lead to their loyalty to the organization.

Helgesen et al., (2010) in research entitled "Impacts of store and chain images on the "quality-satisfaction-loyalty process" in petrol retailing" have investigated chain image and store image as well as store satisfaction are treated as mediators of assortment, service quality and price, on store loyalty. The findings suggest that chain image and store image are different concepts and that a two-level image building approach is an important aspect for petrol retailing. All the three mediating variables influence store loyalty, but image building (chain and store) seems to be more important than satisfaction creation, mediating about 23 of the impacts of the store loyalty drivers. However, the effects of chain image on store loyalty are entirely mediated by store image and store satisfaction, implying that the petrol station manager to a large extent can influence the drivers of loyalty. Service quality was the decisive loyalty driver.

Gil et al., (2007) in research entitled "Family as a source of consumer- based brand equity" analyses the role played by the family on consumer- based brand equity. In the proposed model, information of a brand provided by both the family and the firm (via price, promotion and advertising spending) is analyzed as a source of consumer- based brand equity and its dimensions. Results prove that positive brand information provided by the family has effects on the formation of brand awareness- associations and perceived quality, and this may lead in turn, to brand loyalty and overall brand equity. The effects of the information provided by the family are higher than those of the marketing variables studied. Results also show that brand loyalty is much closer to the concept of overall brand equity than brand awareness- associations and perceived quality.

Huang et al., (2004) in research entitled "Consumer attitude toward gray market goods" establishes a valid measure of consumer attitude toward gray market goods and investigates the relationships between consumer attitude toward gray market goods and their antecedents. Data analysis reveals that both price-quality inference and risk averseness significantly and negatively affect consumer attitude toward gray market goods.

Decalo (2005) in research entitled "The Effects of Sales Message and Suspicion of Ulterior Motives on Salesperson Evaluation" investigated the extent to which a salesperson's presentation and consumer suspicion of ulterior motive affect salesperson evaluations and purchase intentions. Study indicated that a salesperson's presentation plays an essential role in confirming or discontinuing consumer suspicion and that this process has important implications in the formation of salesperson attitudes. Evidence from Study also demonstrated that these interaction effects are mediated by persuasion-motive attributions. The findings also support a direct link between attitude toward the salesperson and purchase intentions.

### 4 Research Hypotheses

**First hypothesis:** brand Self-Congruity, has a positive and significant impact on attitude to retail.

**Second hypothesis:** Awareness of retail has a positive and significant impact on attitude to retail.

**Third hypothesis:** Retail brand association has a positive and significant impact on attitude to retail.

**Fourth hypothesis:** Perceived quality has a positive and significant impact on attitude to retail.

**Fifth hypothesis:** Attitude to Retail has a positive and significant impact on purchase intention.

### 5 Methodology

The aim of present research is investigate the effect of brand self-congruity, Awareness of retail, Retail brand association and Perceived quality of retail brand on purchase intention of customers. In terms of methodology, this survey is correlational research. Also, present research is descriptive research based on method of obtaining required data and based on its purpose. Present research, in terms of the type of research is applied and in terms of methods is descriptive-survey. In this research with regard to the type of research, the extent of statistical population and the complexity of statistical sample and for faster access to the opinions of respondents, the best method of data collection were considered questionnaire in this study. To formulate principles, definitions and theoretical concepts were used library resources that the most important and useful sources includes internet search engines, information banks and resources and university libraries in the country. In order to evaluate the validity of the data achieved through instrument (questionnaire) readers, advisors, and experts. A group of 30 persons were selected from the subjects and the questionnaire distributed among them. Statistical population of this research includes all customers of Tejarat Bank in Ahvaz city. The sample size has been selected by using Cochran formula. 386 questionnaires distributed collected. Sampling method in this study is non-probability available sampling. Lisrel and SPSS software's has been used to investigate the research hypothesis.

#### 5.1 Validity and Reliability of questionnaires

In the current study, to assess validity of questionnaire were used content validity methods. The internal reliability of the items was verified by computing the Cronbach's alpha. A group of 30 persons were selected from the subjects and the questionnaire distributed among them. Cronbach's alpha values was obtained for total of questionnaire factors is higher than 0.70 which shows that our research variables are reliable and there exists internal consistency between them. Reliability of questionnaire tested in the table 1.

Table 1: Cronbach's alpha coefficient

Factors	Cronbach's alpha
brand Self-Congruity	0.77
Awareness of retail	0.87
Retail brand association	0.81
Perceived quality	0.82
Attitude to Retail	0.83
purchase intention	0.80
<b>Total</b>	<b>0.79</b>

### 5.2 Age of participants

The age classification of participants are; 66 people are Under 25; 160 people are between 26 – 35; 96 people are between 36 – 45 and 64 people are more than the age of 46 (table 2):

Table 2: Distribution of respondents according to age

Age	Frequency	Percent
Under 25	66	% 17.1
26 – 35	160	% 41.5
36 – 45	96	% 24.9
More than 46	64	% 16.6
<b>Total</b>	<b>386</b>	<b>% 100</b>

### 5.3 Gender of respondents

Gender of respondents are: 250 people are man (% 64.8) and 136 people female (% 35.2) (table 3).

Table 3: Gender of respondents

gender	frequency	percent
Female	136	35.2
Man	250	64.8
Total	386	100

### 5.4 Educational background

The educational background of the participants are; 107 people diploma (% 27.7), 223 people Super- diploma and Bachelor (% 57.8), 56 people Master degree and higher (% 14.5) (table 4).

Table 4: educational background

educational background	Frequency	%
diploma	107	27.7
Super- diploma and Bachelor	223	57.8
Master and higher	56	14.5
Total	386	100

### 5.5 Describes the research variables

In table 5, research variables has been explained with regard to descriptive statistics include Mean, Standard deviation, Maximum and Minimum (table 5).

Table 5: Descriptive statistics of variables

Variables	SD	mean	Max	Min	N
brand Self-Congruity	0.77521	3.7503	5.00	1.00	386
Awareness of retail	0.72090	3.5523	5.00	1.20	386
Retail brand association	0.64324	3.4544	5.00	1.80	386
Perceived quality	0.71559	3.4497	5.00	1.60	386
Attitude to Retail	1.01537	3.1943	5.00	1.00	386
purchase intention	0.80826	3.4158	5.00	1.00	386

### Inferential statistics

#### 5.6 Investigate data normalization

The standard error of kurtosis coefficient and standard error of Skewness coefficient can be used in order to Normality tests. If value be less than 2 or greater than +2, normality is rejected. Results show that standard error of kurtosis coefficient and standard error of Skewness coefficient has been between -2 and

2. Thus, data distribution is normal (Momeni, 2008: 32) (table 6).

**H0:** Data are normally distributed.

**H1:** Data are not normally distributed.

Table 6: Elongation and skewness related to variables

	Elongation		Skewness		N
	percentage error	Statistical numbers	percentage error	Statistical numbers	Statistical numbers
brand Self-Congruity	0.248	0.656	0.124	-0.747	386
Awareness of retail	0.248	0.018	0.124	-0.381	386
Retail brand association	0.248	-0.354	0.124	0.154	386
Perceived quality	0.248	-0.199	0.124	-0.50	386
Attitude to Retail	0.248	-0.838	0.124	-.081	386
purchase intention	0.248	-0.246	0.124	-0.170	386

### 5.7 Pearson correlation test

Pearson correlation test has been mentioned in the table 7. With regard to the obtained values, it can be concluded that there is a

significant relationship between the dependent and independent variables in all relationships.

Table 7: Pearson correlation test

independent variable	dependent variable	error Level	Sig	correlation coefficient
brand Self-Congruity	Attitude to Retail	0.05	0.000	0.213
Awareness of retail	Attitude to Retail	0.05	0.000	0.394
Retail brand association	Attitude to Retail	0.05	0.000	0.264
Perceived quality	Attitude to Retail	0.05	0.000	0.510
Attitude to Retail	purchase intention	0.05	0.000	0.505

### 6. Research hypotheses test

#### Model fitting indices

Amount of Chi-square division on df is between 1 and 5 and equal to 3.25. Also, RMSEA amount has been less than 0.08 and is equal to 0.076. In result, Model has a good fit to examine the hypothesis. The following table shows the parameters extracted from the model (table 8).

Table 8: goodness of fit results

	Allowed value	Index value
<b>GFI</b>	>0.9	0.87
<b>AGFI</b>	Nearly one	0.82
<b>NFI</b>	>0.9	0.92
<b>RFI</b>	>0.9	0.89
<b>IFI</b>	>0.9	0.94
<b>NNFI</b>	>0.9	0.92
<b>RMR</b>	Nearly zero	0.068
<b>CFI</b>	> 0.9	0.94
<b>PNFI</b>	> 0.6	0.69

### 7. Research results

#### 7.1 Analysis of hypotheses

**First hypothesis:** brand Self-Congruity has a positive and significant impact on attitude to retail.

Standard coefficient for this hypothesis is equal to 0.22 that is between -1.96 and 1.96. Also, significant number for this hypothesis is equal to 2.58. Since this number is more than 1.96, it can be concluded that first hypothesis is confirmed. In other words, brand Self-Congruity has a positive and significant impact on attitude to retail. Result of this hypothesis is consistent with research of Doss (2014) and Doss et al., (2014).

**Second hypothesis:** Awareness of retail has a positive and significant impact on attitude to retail.

Standard coefficient for this hypothesis is equal to 0.33 that is between -1.96 and 1.96. Also, significant number for this hypothesis is equal to 3.39. Since this number is more than 1.96, it can be concluded that first hypothesis is confirmed. In other

words, Awareness of retail has a positive and significant impact on attitude to retail. Result of this hypothesis is consistent with research of Doss (2014), Doss et al., (2014).

**Third hypothesis:** Retail brand association has a positive and significant impact on attitude to retail.

Standard coefficient for this hypothesis is equal to 0.29 that is between -1.96 and 1.96. Also, significant number for this hypothesis is equal to 2.15. Since this number is more than 1.96, it can be concluded that first hypothesis is confirmed. In other words, Retail brand association has a positive and significant impact on attitude to retail. Result of this hypothesis is consistent with research of Doss (2014), Doss et al., (2014) and Ebrahimi et al., (2011).

**Fourth hypothesis:** Perceived quality has a positive and significant impact on attitude to retail.

Standard coefficient for this hypothesis is equal to 0.33 that is between -1.96 and 1.96. Also, significant number for this hypothesis is equal to 4.17. Since this number is more than 1.96, it can be concluded that first hypothesis is confirmed. In other words, Perceived quality has a positive and significant impact on attitude to retail. Result of this hypothesis is consistent with research of Doss (2014), Doss et al., (2014), Ebrahimi et al., (2011) and Jen Hung et al., (2004).

**Fifth hypothesis:** Attitude to Retail has a positive and significant impact on purchase intention.

Standard coefficient for this hypothesis is equal to 1.01 that is between -1.96 and 1.96. Also, significant number for this hypothesis is equal to 8.87 (table 9). Since this number is more than 1.96, it can be concluded that first hypothesis is confirmed. In other words, Attitude to Retail has a positive and significant

impact on purchase intention. Result of this hypothesis is consistent with research of Doss (2014), Doss et al (2014), Ebrahimi et al., (2011), Jen Hung et al., (2004), Decalo (2005) and Ghazizadeh et al., (2012).

Table 9: Analysis of hypotheses

hypothesis	independent variable	dependent variable	Path coefficient	T statistics	Result
1	brand Self-Congruity	Attitude to Retail	0.22	2.58	confirmed
2	Awareness of retail	Attitude to Retail	0.29	2.15	confirmed
3	Retail brand association	Attitude to Retail	0.33	3.39	confirmed
4	Perceived quality	Attitude to Retail	0.33	4.17	confirmed
5	Attitude to Retail	purchase intention	1.01	8.87	confirmed

## 8 Conclusion and Recommendations

The aim of present research is investigate the effect of brand self-congruity, Awareness of retail, Retail brand association and Perceived quality of retail brand on purchase intention of customers. In first hypothesis; brand Self-Congruity has a positive and significant impact on attitude to retail and result of this hypothesis is consistent with research of Doss (2014) and Doss et al., (2014). In second hypothesis; Awareness of retail has a positive and significant impact on attitude to retail and result of this hypothesis is consistent with research of Doss (2014), Doss et al., (2014). In third hypothesis; Retail brand association has a positive and significant impact on attitude to retail and result of this hypothesis is consistent with research of Doss (2014), Doss et al., (2014) and Ebrahimi et al., (2011). In fourth hypothesis; Perceived quality has a positive and significant impact on attitude to retail and result of this hypothesis is consistent with research of Doss (2014), Doss et al., (2014), Ebrahimi et al., (2011) and Jen Hung et al., (2004). In fifth hypothesis; Attitude to Retail has a positive and significant impact on purchase intention and result of this hypothesis is consistent with research of Doss (2014), Doss et al., (2014), Ebrahimi et al., (2011), Jen Hung et al., (2004), Decalo (2005) and Ghazizadeh et al., (2012). Based on the obtained results, the following suggestions are offered: Marketing decisions related to the brand should be taken in the long term by marketers. Given that the store brand awareness among customers can provide a ground for increasing their purchase intention, one of the most effective tools to inform the people about brand is effective and targeted advertising. Should be expressed the clear and specific definition of the brand in the first place that be easily recognizable and persuasive. Brand awareness is the first step in creating a positive attitude and brand loyalty and reflects the customer ability to identify a brand in mind. Managers and marketers should be adopt cultural practices and extensive advertising for brands. No organization cannot be confident about a positive attitude and customer loyalty and all organizations at every opportunity can increase their calls and relations with customers; Providing services during the purchase and after purchase to customers especially the principal customers for creating favorable image in them; Creating the special customers database, relationship with them and encourage them to do mouth to mouth commercials; providing products with expected quality of customers or products beyond their expectations.

**Abstract.** For the prevention and fight against economic crimes the present vacuum should be solved. This approach, is evident in terms of criminology and the criminal aspects, since past few years, in the judicial discourse of the country's executives and legislatives, especially in the promoting the health of administrative system law and fighting corruption due to focus on the situational -Technology prevention, Islamic Penal Code, to remove these crimes of the postponement, suspension, as well as the law on combating the smuggling. In this study, by matching the criminal policy of Iran and French, in line with the fight against economic crimes and money laundering, we provide useful and constructive ways and express the legal vacuum in order to prevent economic crime.

**Keywords:** Crime, Economic crimes, Comparative law, Crime, Crime prevention

### 1 Introduction

Economic corruption and fighting against it in many different countries, including France and its economic crisis and embezzlement and our country have been considered as major issues. The most important reasons for economic corruption in the public sector is related to the governmental undertakings and includes trade restrictions, industrial subsidies, price controls, multiple exchange rates, low wages in the public and business services, and natural resources such as oil. Economic corruption and slow economic growth reduce investment and ultimately cause the country's lack of economic goals development and tax revenues will be decreased and quality of economic infrastructure and public services will be reduced and as a result crime will be increased.

Crime is a multifaceted phenomenon and has always attracted the attention of sociologists, psychologists, lawyers and scholars in the field of economy.

But the study of economic crime includes: 1. Knowledge of miscellaneous laws. 2. The priority of Iranian criminal policy that is the fight against this crime. 3. The political and economic transition of the country and along with, the need for new rules and updating the Iranian criminal law. 4. The high rate of economic crimes. 5. Complexity of these crimes and 6. The devastating and global effects of these crimes.

Economic crime is one of the new concepts of modern society that has been increasingly a cause for concern in terms of its threat to the stability and security of societies, traditions and values of democracy, ethical values and justice, sustainable development and the rule of law. Warning on the risks and notifying it to the community and especially the government in Iran, was originally developed by academic circles, in 1940, Sutherland introduced the concept of white-collar crimes. Crimes which until that time had not been considered by criminologist. Thus, this category of crimes and their perpetrators, with a delay catches the criminological attentions.

What is important in the analysis of criminology and economic crime, is explaining the concept in order to understand the different aspects of economic crimes, causes, actors and how to deal with it. At first, explaining conceptual framework, defining economic crime and its reflection in Iranian law, then basic characteristics of this crime will be considered. Finally how to prevent these crimes, especially in the field of companies will be discussed ((Danesh, 1998, Delmas, 2003).

### 1.1 The importance and necessity of research

Since the importance of these crimes in the country leads to the formation of the economic headquarters to fight corruption and an increase in crimes resulting from economic corruption has become a major problem in developing countries, some believe that in principle there is no way to solve this problem. Some also believe that punishing the perpetrators of corruption is the only solution to deal with economic crime (Goudarzi, 2006, Habibzade, 2007, Hosseini, 2005).

### 1.2 Research Purposes

- 1- Exploring the nature of economic crime in Iran and France
- 2- Exploring the specific characteristics of economic criminal law
- 3- Analyzing the causes and the prevailing economic conditions in the society
- 4- Exploring the relationship between crime and poor economic conditions

### 2 Method

Research method in the present study, like most humanities research is library research method and documentation. Therefore, in this regard, domestic and foreign books and articles, websites and all documents that are relevant and serve our desired goals, will be used.

### 3 Results

#### The distinction between economic crime and general crimes

#### The First Topic: criminological criteria related to criminal act

These criteria are linked to a criminal act and have been considered in two categories, direct and indirect.

#### First clause: Indirect measures

##### A. Geographical criteria

The physical environment is same God-given environment, weather, climate and atmospheric conditions, that influence human behavior and the social environment is family, school, university, workplace, and the political regime of the country.

##### B. professional criteria

Economic crime occurs in line with an individual's professional, legal and legitimate activities. Therefore, when a person in a business environment abused his superior position and has illegal relationship with woman who is working for him, he has committed general crimes.

##### C. perpetrator's evaluation criteria of a criminal act

The purpose of the criteria is the conception that perpetrator has about his act. This means that whether he considers himself perpetrator or not? And also what is the attitude of other members of society about the committed crime?

#### Second clause: Direct Criteria

##### A: Rules

In our country in recent years many comments and contents have been discussed in terms of economic corruption, economic corruptor, Rentiers and Aghazadeh and the most important legal resources that are studied in this regard include (Jalalifarhani, 2007):

A: Article 49 of the constitution in 1358 has been set as a revolutionary response to the political system, and talks about lawful and unlawful and illegitimate wealth.

## B. Doctrines

Since Iranian law does not provide a measure of economic crime, this legislative vacuum is resolved with the lawyers' doctrines and theories. The discussion techniques in exclusive criminal books is that financial crime are discussed under the heading of crimes against property. In other words, the term economic crime is a new heading and in there is not the Exclusive criminal books.

### Article Two: The presumption of innocence

In the fight against organized crime the burden of proof is shifted (paragraph 7 of Article 12) that this deviation from the principles of human rights with many precautions is acceptable in combating against serious and complicated crimes. In other words the intensity of crime danger, violates the principles of human rights and has been violated the citizens' right to privacy and the government are allowed to limit the principle of bank customers' accounts privacy.

### First clause: non-penal prevention

Policies and procedures in financial corruption prevention: Article 5 of the Convention has urged member states that approve transparent rules in order to fight and prevent corruption and evaluated these documents and administrative measures regularly and ensure their sufficiency, lack of ambiguity and being up to date to prevent and fight against financial corruption.

### Second clause: Penal prevention

Criminal prevention is also discussed in this convention and can be examined by following directions:

#### 1- Resorting to the system of Sanctions:

Article 12 of the Convention addressed the sanction. Must be remembered that in the economic criminal law, sanctions are not necessarily penal and other types of sanctions such as administrative, disciplinary, professional, and civil law is also applicable in a case. While civil sanctions can be divided into two types and sometimes refers to compensation, property returning and reparations and sometimes refers to the rights of citizens and is associated with the each person's rights as a member of society. Therefore exclusion from participation in bids, which has been mentioned in paragraph one of Article 12, is a civil sanction.

### Third Article: criteria related to economic criminals

The perpetrators of economic crime mainly have high IQ and social status and commit crimes in the form of natural or legal persons. However from the perspective of criminology, personal characteristics deemed to be important in this context. Criminologists believe that in an economic context and more generally and more broadly in society, we are faced with such a phenomenon. In every society, a series of objectives and purpose such wealth and job promotion for economic actors and directors has been plotted, and at the same time, it is assumed that in any society, legitimate suites and means to achieve the objectives have been presented to people. For example, for is a Iranian Muslim family, going to Hajj is a target. In addition to religious aims, it is a sign of social success and distinction.

Explaining the characteristics of economic crime and the distinction criteria between economic and general crime provides a better understanding of criminological theories that have been proposed in the field of economic crime. In the next chapter we will study these theories in the five groups. First we

will describe the Jean Pynat's criminal personality theory and after a review of Merton's sociological theory, we will describe three sets of environment-based economic theories based on political and economic environment. At the end, Merton, Korakis and Bayer's multifactorial theories will be examined (Kosha, 2005).

## 4 Discussion and Conclusion

Today even in France because of the relationship between economic crime and other forms of crime, especially organized crime, Stability and security of societies, values of democracy, ethical values and justice have been compromised and certainly in the long term sustainable development and the rule of law are also at risk. Thus this crime is no longer a local matter but a transnational phenomenon that affects all societies and economies and that is why international cooperation, especially civil society and non-governmental organizations are very important in line with preventing and combating it, quantitative and qualitative dimensions of this crime have caused concern that decision-makers and perpetrators of criminal policy regarding the control of these crimes be more sensitive than ever and consider the risks and criminal acts for political order increasingly (Moazzami 2010, Moazzami 2010, Najafi, 1999, Pradel, 2003).

Prevention methods are reasonably different based on the definition of economic crime, the reason of committing this types of crime at the macro level is related to a series of factors like production level, distribution and consumption, the kind of economic system and current culture in an open society, At the micro level opportunistic situational factors are more important, so prevention strategy at the micro level and in the short term, is technical-technological situational prevention that usually use difficult and risky techniques for offenders to reduce the opportunities.

By examining the legal texts between Iran and France related to economic crimes such as bribery, embezzlement, disruption of the economy, tax crimes, smuggling, we concluded that due to the turbulence and dispersion in Iran regulatory criminal policy, basically, we cannot explain criminal a coherent policy, and purposeful modern and it will be compared with known and scientific models. However, the results obtained from this study can be expressed within clauses:

Regulatory criminal policy of the country in the face of some instances of economic crime appears to be incomplete. An example of this is discussion of crimes as bribery and receiving pursuant in international transactions. In discussing the criminalization of criminal acts that damage economic system, cleansing the proceeds of crime or money laundering is one of the most important issues that with the approval of Parliament, and confirmed by the Guardian Council, In fact, the criminal policy has a tool at its disposal to confront and fight against this phenomenon.

With regard to the legal reactions, it can be said that the nature of economic crime is so that shape the laws differently. Although about definition of this crime and its various manifestations there is no comprehensibility. But by the lawyers' attempt there is a total conclusion in this field. That defines it under that economic and criminal law. In terms of economic crime there are special measures for the prevention procedure. Economic criminology is an exclusive criminology, the study of a particular crime and the causes of it. In terms of economic criminals there are specific methods of reform and socialization them. Similarly, in the international documents related to economic crimes we can witness the assigning specific material to these crimes from different aspects such as prevention of crime and to reform and rehabilitate offenders. Economic criminals in terms of being consistent with society are ordinary persons and consistent and keep pace with the rules of society, and they use the void norms governing their working environment and the context to commit a crime. White-collars

despite having many facilities want too much social success and because they do not have the legal means they resort to illegal means and methods. For the prevention and fight against economic crimes vacuum should be solved. And prepare the community to pave the way in line with preventing the commission of these crimes.

According to the results Toda – Yamamoto test, it seems that by economic development, economic crime also increases. Also poverty and crime, have a bidirectional relationship: Between economic crime and income inequality, there is a causal relationship.

**Abstract.** The progress of science and technology in all fields, has caused the magistrate inevitably refers the matter to an expert in discovering and proving the crime. This study has been written with the aim to compare expertise in proving crimes in Iran and France law through the library and taking notes and in descriptive – analytical way. It concluded that, in Iran's rights influenced by the jurisprudence, an expert's opinion is applied just as statistics, to judge for proving the charges and it is not considered an independent reason to prove the crime. However, in French law, expertise is remembered as an independent reason, and with regard to new technologies, the new methods of discovering and proving the crime is used.

**Keywords:** Expertises, expertise theory, comparing, crime detection, crime proof, jurisprudence, Iranian law, French law

### 1. Introduction

Today, advancements in science and technology revealed their effects in all areas, including tools to detect and prove crimes, so that, in an era that is called the era of "scientific evidence", even traditional evidence, such as witness and confession, in some cases, are measured with the help of new evidence.

The most important feature of the scientific period is fading, non-empirical documentation, or in other words, the spiritual in the criminal justice system. In the past, due to the lack of development and progress of science, on the one hand and public opinion in a firm position of spiritual and esoteric matters, on the other hand were the main evidence for expressing to prove the crime was summed up in confession, testimony, and ultimately, the magistrate's knowledge. Due to the lack of tools and necessary facilities, even the magistrate's knowledge also, mainly depended on his inner perceptions. However, with the passage of time and abandon of non-experimental affairs and the emphasis on verification of all events through experimentation, the importance of this type of evidence has significantly reduced. Even the experts welcomed this and considered it closer to the administration of justice, because, disadvantages and problems related to obtaining a confession or testimony, or even authentication and real authority of the judge, was not hidden from anyone. Everyone wanted a fair and impartial approach, and proved reality and truth of a claim, that, obviously, the issue is very important in criminal allegations, due to its heavy consequences. Therefore, little by little, the tendency to scientific evidence, in terms of criminal justice increased.

The evidences that cover a wide range of measures, scientific and technical examination, are very diverse, so that providing an exhaustive list of them seems very difficult. Measures, such as research and local examinations, review the material evidence or physical evidence, scientific and technical examination, audit and inspect the premises, confiscate documents and data, interception of correspondence and communications, audio and video recording and many others actions will be done after the crime, in order to uncover the truth and achieve the main culprit. Many of these discoveries have been considered as "judicial circumstantial and hearsay evidence" in Iranian and France criminal procedure. The legitimacy of obtaining reason will be emphasized in obtaining circumstantial and hearsay evidence in the light of research and Local Examinations and resorting to scientific and technical measures, rules and legal regulations, particularly respect for the rights of individuals with human dignity and full judicial supervision over these measures to protect the credibility of enforcement, criminal justice.

With this introduction, the importance of expertise in general, the purpose of this article is to answer two important questions: (Taddayon, 2012) does expert opinions have equal importance in the rights of Iran and France. In addition, (Diani, 2005) whether the expert's theory in the Iranian law, which was affected by the jurisprudence has differences in terms of proof with French law.

In this article, with a comparative look (similarities and differences), we will study the expertise and its importance in the rights of the two countries and the new evidence that will be obtained from the Expertise in the rights of Iran and France. Therefore, the expertise differences and its share should be determined in the rights of the two countries, in terms of proof.

### 2. Expertise (scientific and technical examinations) in Iran and France right

Development and progress of science and technology in all fields has caused that, in the discovery of many crimes and even their proof, the judge will be unable to take steps to prove the crime without recourse to experts. Therefore, he has to vote according to people who, because of their expertise in a particular science or technology or even having experience and expertise and skill, have the necessary ability to illuminate the subject.

The best example of Justice Statistics is expertise. It so happens that, due to the lack of magistrate's dominance, to the subject and personal information, to recognize, the need to refer to the experts, meaning the technical experts is required, that the law has been interpreted as an expert of the people. With the expertise, the degree of specialization or expertise will be used to judicial solution and help judge, in other words, "experts will help the judge in knowing the truth in this case."

The evidence of expert's knowledge is not enjoying the senses directly, but he understands the issue through intellectual deduction and other evidence, and his credibility and expertise authority is based on respecting the terms and legal conditions and these features split it from the testimony.

Expertise, as an important judicial jurisdiction, by examining the "symptoms and signs that do not lie" is considered the language of these symptoms and by examining these signs and symptoms, helps the proceedings in creating the knowledge and judicial certainty. That is why, in an age of scientific evidence, the expertise should be called as criminal evidence Queen (Nejabati, 2008).

According to the Code of Criminal Procedure of Iran, "the experts will be invited to come, when their comments will be necessary for the scientific or technical or special knowledge ". It is the opposite concept that, when the magistrate has special expertise, or for example, "if the court finds that the value of the property is determined equivalent to collateral, expert opinion is not needed to be granted". So, we can say, cases referred to the experts is when a judge is incapable of detecting true, that in this case, it refers to experts and obviously, referring to the expert is required, when the specialized technical issue is unknown to the judge and this issue should be clarified for his conscience. Obtaining technical and specialized aspect of the issue is with the magistrate, because, identifying thematic issues is with him, and he must detect the issue with considering his limits of jurisdiction, having or not having technical and specialized aspect, and take appropriate action.

Study the Supreme Court and High Court of Judges is an indicative of the authorities' tendency of the more issues referred to experts and this matter is justified by technical progress and complicating matters which were simple in the past. However, at the same time, "if the opinion of experts does

not match with the circumstances known to the expert, the prosecutor rejects the expert opinion justifiably, and refers the subject to other experts ". The expert will take action in due time, to offer expert opinion and fulfill his mission, and after completion of an expertise operation, he gives his result and report on his work, to the reference which has given a mission. Expertise's commenting should be explicit and legitimate and, therefore, the expert cannot leave a comment in general, and should not justify his opinion with scientific basis about the issue, and he should note the tips and explanations that are necessary to explain the theory fully. This theory has judicial jurisdiction and the recognition of accuracy or inaccuracy of that depends on the dealing judge and if, it does not match with the circumstances and certain condition of the issue, the court does not comply."Expert opinion is one of the Evidence to prove claims, unless the judge decides that, it does not match with the truth, then, if necessary, other experts will be used. Therefore, if the theory of Forensic Medicine appeals the judges and, the authority diagnoses that theory consistent with the reality, it must be acted accordingly. "

In Criminal Investigation Act 1810 in France, the expertise subject was unforeseen, and it was the tenor of the provisions article of this Act that was about police operations and allowed the police to resort to the expert, in investigating the suspicious deaths, the legislator's attention on the subject was concluded. The silence of the law of criminal investigations in legal experts was quite reasonable, because "in the expert, it is assumed that we can refer to the expert, who has required knowledge and expertise, while, in 1810, scientific basis and the number of experts was not enough" and the only available specialist was a doctor. The judges also, in the silence of the law, called the experts as witnesses to the court. However, today, in French law, the expert does not count a witness, that his report has the value of simple information and the court infers the results (Jafari, 2006).

According to the provisions of the French Code of Criminal Procedure, the judicial police officer, directly in research related to evident conditions, or according to the city prosecutor's permission in basic research can refer to qualified persons if necessary for technical examination and analysis, for example, he invites the tax inspector to participate in the research. Any investigation authority or trial, "If a technical issue has been raised, may, directly or at the request of prosecutors, or parties, commands to expertise."

Therefore, the legitimacy of obtaining reason requires complying with legal terms and conditions from judicial authorities and experts during expertise operations, obtaining the reason in a way that, while respecting the rights of defense, maintaining their probative and judicial value in Criminal procedure process. Because of that, in the French and Iranian criminal law, the expert reports, in most cases, are prepared with the participation and cooperation of the parties, and for them, the right to object to the expert report, is predicted. In criminal proceedings in France, following the ratification fifth law in March 2007, the principle of adversarial presence and the expertise has been strengthened. So that, until this date, people did not inform the subject of expertise and expert missions was specified in secret at the court office. However, then, according to Article 1-161 of the Criminal procedure Code, "the copy of the expertise decision instantly, will be sent to the city prosecutor and lawyers and they have a ten-day respite... to request the magistrate, to modify or complete the questions posed for the expert, or append an their chosen expert... to the expert or elected expert. " These regulations are the full respect for the rights of the defense and adopt the principle of hearing person and, consequently, it is followed by a better monitoring of compliance with the principle of legitimacy for obtaining reason.

### 3. Expertise in genetic and biological evidence in the criminal law of Iran and France

The use of ways, which provide the access to biological evidence, such as blood tests and "DNA", are not so well known in Iran criminal proceedings and judicial process and limited applications are considered for them. In a letter dated 03.Oct.2001 with No 01.07.1137, Legal Medicine Organization, some points can be concluded about the facilities of the organization in the application of the "DNA" test and the use of the procedure of the scientific method. First, the resources of Forensic Medicine, for the "DNA" test and its applications, in judicial matters is in order to help identify individuals, or remaining parts of the human body, at scenes of crime. Most activities in this regard include identifying parents and children, determining the claimed paternity and proving the existence of the father, determining and diagnosing individual identity and proving or disproving the existence of kinship relations with other persons, identifying the culprits from the effects and materials at the crime scene. In addition, helping identify and verify it when the bodies are mutilated or remains of bodies found in different places and determining the sex of the unrecognizable bodies and aborted fetuses and finding patches at the crime scene.

Second, the first step in testing "DNA" is the sampling and because of the sensitivity and importance, and to enhance the quality of the samples and prevent potential abuses in the process of sampling, taking samples of patients is outpatient and takes place only in the presence. Regarding the dead bodies, good sample will be taken in certain circumstances, under forensics supervision, and promptly will be delivered to the laboratory.

Regarding the fingerprints as well, according to Article I of the Regulations, following amendment to a single article, canceled fingerprinting approve on 25.Sep.1989 by the Parliament, approved on 27.Sep.1989 by Council of Ministers, they attempt to fingerprint in six occasions. The most notable is in the case of a person who applies for Police Clearance with the introduction of competent authorities, those who go to prison with the order of the judicial authorities. In addition, those who are condemned to non-prison punishments, such as flogging and defendants and suspects of judicial and law enforcement, in order to keep criminal records, check the identity and background of potential abuse. They are subjected to fingerprinting (Jalali Farahani, 2007).

In Iranian criminal law, unfortunately, no certain rules can be seen about personal privacy, especially their physical privacy, and only we can confirm respecting for the privacy of persons from the tenor of some provisions in a single article of the constitution and the law rapport Legitimate Freedoms and Protecting Citizens' Rights. In the second chapter of the Privacy and Protection Act, which has not been legal, the privacy of physical persons has been emphasized and human dignity and the rights and freedoms associated with has been considered inviolable. Searching human internal organs is banned and judicial competent authority only issues examination of internal organs when there are strong suspicions that, the result of this examination can help to prove the crime. Searching internal organs should be done with the use of accepted medical procedures, by a physician, and possible by medical experts. It is only applicable if using other legal methods will be impossible or ineffective.

Blood samples from people as a proof of guilt, depends on searching internal organs. Article 12 of the bill, stipulates: If the suspect or defendant resist in the search of internal organs. Authority of Justice can take action to the extent that is reasonable to neutralize his resistance. However, in the process of Iranian criminal procedure, blood samples or other fluids, in order to perform experiments and different biological tests do not need the beneficiary's consent. Even crimes that can justify resorting to "DNA" and blood tests have not been specified and

this could be contrary to the principle of respect for the privacy of individuals, and distort the legitimacy to obtain the evidence. The situation is the same for searching foreign objects in the body. During the investigation, sometimes searching foreign objects in the body of the victim or perpetrator can be useful in uncovering the truth. However, the question is whether to search and inspect the internal organs of persons is possible. If the victim is, deceased or when the victim and the perpetrator are alive, and the parents accept that this search takes place, these actions will be legitimate and evidence will be obtained from legal and acceptable manner (Hasani, 2006). However, if persons reject searching and inspections of objects in their body, in principle, it is unacceptable that the judge can violate the principle of respect for the body and the will of the people, and in the lack of law, directly, he intervenes without legal permission. Now, in the Iranian criminal law, there is no specific law in this area and in the silence of the legislature, some prosecution authorities issue order of inspection and testing individual blood of the accused and suspects, in some cases, such as seized drugs and drinking alcohol and addiction (Rassat, 2007; Guéry, 2007).

In French criminal law, in certain cases, people carrying drugs that hide the drugs inside their body, when they cross the border, if the customs authorities suspect to them, with the agreement of them, they will be subjected to medical review. However, no wisdom and decisive required action can be used and in practice, with monitoring the people, the issue is resolved.

In the sampling of blood and exhaled air to those suspected of drinking alcohol or taking drugs, French lawmakers considered Criminal penalties for those who reject sampling. However, there is no physical coercion prescribed by law out of respect for the rights and freedoms of individuals. According to Article 4-234, rules of the road, when, tests the amount of alcohol in exhaled air gives the permission to prove the existence of the alcohol, or when, suspected people reject the test, by analyzing exhaled air or through medical, laboratory and biological analyzing of a blood sample, they can address the issue. The lack of acceptance of these investigations by the driver has the driving punishment while intoxicated with alcohol (up to two years in prison and a fine of up to 45,000 euro). According to articles 2 and 1-3354, the food and alcoholic beverages rule, the discovery of crimes or misdemeanors or traffic accident, which appears to have been under the influence of alcohol, the police are obliged to do medical and biological laboratory research, referred to Article 4-234 rules of the road, on the persons committed the act. The lack of acceptance of these investigations will follow up to one year in prison and a fine of 45,000 euros.

Article 1-235 rules of the road, the people who drive under the influence of drugs, have been raised. If the accident results in death, the police should perform medical investigations of all drivers who were involved in this accident, and when, the answer is positive, or testing is not possible or drivers do not accept these investigations, police are analyzing (medical, laboratory and bio), to prove the drug use. If the accident leading to injury, doing these measures is optional, however, denial of accepting the measures will have up to two years in prison and 45,000-euro cash.

Officers of the judicial police, during the investigation, can perform external sampling in the people that there is one or more reason for involvement in crimes. These sampling permits comparisons with the effects and the evidence provided for the necessities of the investigation. These officers, also can list the signs, especially those of the fingers, palms or shooting. These symptoms are kept in particular papers. All of these measures carried out with the consent of the beneficiaries and lack of his consent is punishable by up to one-year imprisonment. Taking fingerprints and photographs as well, could also be made in the process identity investigation.

However, regarding obtaining reason through "DNA", France had no legal regulation for a long time in this regard, until the rule June 17, 1998, was enacted about the nature of sexual offenses and victim child protection. This was raised for the first time, in Article 54-706 of the Criminal Procedure Code (National Securities auto genetic effects) that have been completed by the circulars December 14, 1998 and its Regulations, on 18 May 2000, relating to securities of genetic effects and the central unit storage of biological samples. The judicial procedures confirmed the acceptance of this type of reason.

According to the first paragraph of Article 54-706, Code of Criminal Procedure (National Securities autogenetic effects, which is under the supervision of a judge) is focusing on the genetic signs of biological symptoms and genetic effects of sentenced persons, for one of the above charges, in Article 55-706, in order to facilitate the identification and prosecution of the perpetrators.

Therefore, genetic sign documents are contained signs of "DNA" taken from the scene of the crime that the committe is unknown and genetic signs of people with definitive sentence, to one of the crimes mentioned in Article 55 of the Act 706. The documents are under the supervision of a judge and in practice, they are under the supervision of the prosecutor of Paris. Genetic signs documents are, briefly, about the perpetrators of sexual crimes, crimes against humanity and crimes and misdemeanors or intentional injury to life of persons, torture and acts of cruel, deliberate violence, drug trafficking, human trafficking, prostitution, exploit for begging and child endangerment, theft, extortion, fraud, vandalism, damage to the fundamental interests of the nation, terrorist acts, fraud in coins and concealing crimes or laundering proceeds of crime.

Generally, in the case of people non-compliance with the necessary sampling, there are three different procedures in different countries. In some countries, lack of acceptance these measures has the punishment of imprisonment or a fine, others have permitted the attorney so that according to the evidence of the crime, infer the results of this possible rejection. Another group of countries accepted the coercion and requirements, in order to do sampling. Some points that can be inferred from Article 56-706 of the French Code of Criminal Procedure. First, whenever the subject of a convicted person will be with ten years' imprisonment for crimes or misdemeanors, the sampling can be done without the consent of the beneficiaries and, therefore, the concept of the rule of law is a resorting license to coercive measures. Secondly, in other cases, rejection of biological sampling has up to one year in prison and a 15,000-euro fine, and the directors of research cannot resort to coercive measures. Thirdly, doing or start doing exercises to replacing samples of biological material for a third party, instead of their own biological material has a punishment of up to three years in prison and a 45,000 euro fine.

#### **4. Expertise of Electronic Evidence in Criminal Law in Iran and France**

In the field of ICT, two technologies, meaning the computer and telecommunications have a decisive role. Computers facilitate information processing and communications disseminate this processed information has created radical changes in the twentieth century. Because, with the discovery of prodigious capabilities, resulting from the combination of these two technologies, a revolution has been in the field of ICT that its peak can be seen in the emergence of global computer information networks. These networks, which are composed of many computer systems connected to each other, communicate with each other with the help of advanced technologies of telecommunications, and create a space with quite distinct characteristics from the physical world, which some call it virtual space and others call it cyberspace. Cyberspace is (emerged electronic integrity through global communications of the creation, storage, process and transmission of electronic data means with simulation and virtualization features). This potential space has

no limit and no central authority, so that "anonymity, fugitive reasons, lack of boundaries, pale police presence, instant communication with a simple touch, the growing complexity" has made the cyberspace to a great environment for offenders. Because, this space, like other aspects of human social life is not spared from a phenomenon called crime, so that, what is now known as cybercrime, covers two categories of offenses. The first group is offenses that, like they exist also in the physical world and cyberspace without changing criminal elements, with features that puts in the hands of criminals, facilitate their committing.

In addition to various developments that appeared in the concept of crime and the way the offense is committed in cyberspace, the field of scientific discovery-related offenses also were experiencing transformation. Therefore, from the beginning of the criminal deal with cybercrime, issues that are concerning criminal procedure, including evidence of the systems and problems surrounding it and obtaining electronic evidence and proving cybercrime have been considered and studied. In principle, for that, any information, in any format, including electronic and non-electronic have the ability to provide the court and the court also invoked, first the identity of the creator should be known, and second, the information will be valid and reliable. The absence or deficiency of any of these conditions will reject the evidence and deprive the probative value of them.

Although the law of e-commerce, adopted on 13/Jan/2005, provisions in relation to the evidence are presented, but in connection with its citation, according to experts, in this field, no provisions have been predicted. Different stages of citation, and the experts, and their comment can be cited only from the tenor of the Criminal procedure Code.

However, in France Procedure Code, in some articles, obtaining the electronic evidence is considered. In a preliminary investigation, judicial police officers can proceed with the seizure of documents and the computer information records data. According to Articles 94 and 97 of the Code of Criminal Procedure, Magistrate can inspect in every place that there are objects containing computer information, which their discovery is useful for truth, and he can use from any person or institution that was expert and have information on this topic. Also, in connection with the decoding of data, the provisions were anticipated in French law by lawmakers (such as Article 1-230), but in Iran, there is no such legal rules and as noted, the general provisions of Regulations 2013 Criminal procedure invoked by the judicial authorities can be invoked for the use of experts in the field.

## 5. Conclusion

Iranian lawmakers have been influenced by jurisprudence, and explicitly, have introduced the expertise as one of the judge's knowledge evidence along with other statistics in Article 211 of this law, provided that typically seem Science. In French law, though in principle, the validity is with spiritual reasons (as in jurisprudence and Iran) but the examples can be cited, which expertise alone can be cited by the judicial authorities in this country (unlike Rights in Iran).

In this country, expertise is as a true and impartial result, in truth and obligations of experts stem from the important principles. "The legitimacy of obtaining evidence and manage it, objectivity and impartiality in the analysis of evidence for someone who wants to help the administration of justice is essential."

The result of this paper is that, expertise in Iran as one of Justice Statistics influenced by the jurisprudence is not considered an independent reason to prove the crime and it is anticipated only in the statistics, to satisfy the conscience of the judge. It cannot alone be ruled documentary, but in French law, they pay more attention to expertise and experts comments.

However, the importance of Iran's expertise in law is not less, according to provisions of the new law and in Iran's rights, among the four reasons, namely the confession, testimony,

qasamah and the judge knowledge, the judge knowledge, is of great importance. After the establishment of the Islamic Republic of Iran, with the adoption of the Penal Code and the Law on Amendment of the Code of Criminal Procedure and subsequent laws, fundamental changes have been created in the system of crime and punishment and handling criminal matters, based on Islamic law and criminal law in Iran. Under the changes, the judge knowledge was anticipated in law, while, before the revolution, in legislation, there was no knowledge of the judge. Penal Code, enacted in 2013 has considered the judge knowledge valid in the general way, to prove all crimes.

However, it is suggested that in the new provisions of legislation, such as France, new evidence will be referred and gave more attention to obtaining reason to fill the gaps of Iranian legislator, in this context.

## 5.1 Recommendations

According to the study, the following recommendations seem to be:

1. Given the progress made, in all areas and new technologies, devoting to theological reasoning and proof value cannot answer many proofs of offenses. Therefore, it is necessary, Iranian legislator considers material evidence along with legal evidence, and consider them effective at proving crime.
2. In Iran, the material evidence, such as expertise is just as judicial jurisdiction and alone, cannot be useful in proving an offense, and it is remembered just as persuasive knowledge of the judge, that look of the legislation should be modified and expertise must be as independent reason in the rules.
3. With regard to criminal law in France, Iranian lawmakers have no technologies that have been used in the law of that country, in order to prove the crime, which is necessary to consider the new detection methods in this regard, in line with many countries.
4. In Iranian law, there is no task in particular, whether the official is obliged to call upon an expert or not, but in French law, correctly, judicial officials are obliged to quote the expert opinion and influence his view in sentencing that is necessary for Iranian legislators to clarify their homework in this regard.
5. The revision of penal and civil codes, in order to improve the probative value of expert opinion
6. Assigning judges to refer technical affairs to experts in texts and in legal bills
7. Assigning judges to provide technical and legal arguments for the rejection of expert opinions (Article 124-44 of the Criminal Procedure Code in the US)

Abstract. Based on the single article of the law on abortion, the mother is allowed, in case of children with birth defects, or hardship for the mother if the child's birth, she can perform the therapeutic abortion under specified conditions, by the legislative. Accordingly, misdiagnosis of a doctor in the deformed child born, due to the lack of therapeutic abortion, freedom of patients visiting any other expert, and a lack of legal basis and resources in calculating the damages caused by the deformed child born, will not cause civil liability. However, deliberate misdiagnosis is considered professional misconduct and is punishable.

Keywords: deformed child born - therapeutic abortion – doctor's civil liability- misdiagnosis

### 1. Introduction

The doctor's responsibility means to be accountable, liable for damages and losses that are caused by negligence, misdiagnosis, and lack of adequate skills for the patient. It is mainly the civil responsibility and in a few cases, it is involving civil liability and criminal liability as well. In the case of medical responsibility, there are two views. The first point of view is based on the forcible medical responsibility and another point of view is attached to the contract that the contractual obligation of means and obligation of result derives from the same perspective.

In French law, the physician responsibility has long been considered forcible. In 1833, the French Supreme Court, ruled that the civil liability of physicians is consistent in 2003 and 2004 of the French Civil Code; therefore medical responsibility is forcible (Abast Poor, 2013; 259). By 1936, the Supreme Court expressed a different opinion about medical responsibility, the courts of France, in the case of medical responsibility, exercised regulations governing coercive responsibilities. It means the injured party must prove the fault of the doctor. Before the Supreme Court decision of 1936, some French courts, including the appellate court of Besançon on March 20, 1933 and Lyon Appeal Court on March 19, 1935, were allowed to contract theory. The French Court in 1936, with the approval of the terms, considered the medical responsibility contractual (Bassam muhtasib, 2014; 11).

Socially, the responsibility to know the physicians regarding damage caused by the actions that he has done in the context of his time science, takes the ingenuity and talent away from him and stops the medicine, on the border of conventional treatments and harmless. From the ethical dimension as well, how can give the reward of goodness with evil, and how can ask for damage from a human who has used his efforts and medical knowledge, in the way of treatment? This means is not unlike practical reason of the sponsors' physician, the doctor is kind and a kind person is "the reward of goodness is with goodness". Under the general rule, he is not the guarantor, and then the doctor is not a sponsor. On the other hand, if the liability is subject to proof of medical fault, prejudice and complexity of the study and the lack of total and complete knowledge can be prevented that, this case will reach the desired result.

Therefore, in the assumption of causality, it is likely when the relationship between medical procedures and damage is proved; it will be enough for his responsibility. Article 319 of the old penal code, which has been developed based on Islamic law, based on this theory, says: "When the doctor, however qualified

and professionals, in the treatment of personally carried out or ordered, although with the permission of the patient or guardian, causes loss of life or violation or property damage, he will be responsible."

What is certain, in the legal systems of all countries, first, the qualified cautious permitted doctor is not responsible for the damages to the sick, and secondly, the physician commitment to the patient is the obligation of means, not the outcome. If the physician uses his tools of work that are, the degree of knowledge and skills, experience and commitment to public standards and adherence to standard procedures, properly and carefully, he cannot be blamed. Old Islamic Penal Code considered the physician commitment as a commitment to act thus it knows the doctor responsible for the patient for compensation over his life and body, even if, the cure was done with the consent and permission, and even, all experts in medicine order that the physician was not at fault in his treatment. Endorsed by the trust court experts on the lack of medical fault or negligence acquitted him merely of intentional murder, criminal responsibility and punishment, but his civil responsibility in compensation for material damage to the patient, still remains. Fortunately, the new Penal Code amended the previous regulation and returned to the fault. Acceptance of the theory of fault, in the field of medical responsibility, is based on the idea that in principle, the physician is committed to tools, not a commitment to results. It means the doctor under contract or law commits to treat the patient compliance with the standards of medical and uses his effort and skill, to treat him, however, the certain cure of the patients is not in his possession and his commitment. Therefore, the physician only can be blamed, when his fault is proved. If the physician liability will be a strict liability with no-fault, the doctor does not dare to perform dangerous treatments and surgeries and this prevents the progress of medical science and will be the detriment of patients and society (Abast Poor, 2013; 261).

However, the civil liability of physicians in misdiagnose a deformed child born by mistake, due to the possibility that abortion legislation is placed (under certain circumstances) for the mother, has great legal complexity. Proving or falling of this responsibility of the doctor is an issue that will be examined in this article.

### 2. Commitments of doctor in jurisprudence and Iranian law

Indeed, in the study of medical responsibility, regarding the misdiagnosis led to the birth of deformed children, we have to study the obligations of the physician, the patient-physician relationship and in general, the formation of civil liability, to pay the compensation.

Some say: "doctor-patient relationship, in its current form, is arbitrary. The patient chooses a physician with his liking, or accepts the physician who recommended him in the hospital, and the doctor agrees, by accepting patients and treats him. However, it should be noted that, today, the contractual relationship is established more with legal personality of hospitals and clinics, and doctors, as part of its character or experts, treating patients." (Abast Poor, 2013; 260) the doctor character, will never be nullified, but the physician's personal responsibility should be considered in accordance with the general rules and not the contract with the hospital. Except in special cases, the patient can appeal to anything he wants if the medical errors will be both contractually and enforced. In medical practice, commitment to treatment is the commitment to care, and the implementation of common techniques, and efforts in treatment, and it less happens that, the doctor guarantees patient healing, even confidence that the doctor gives about an effective medical treatment or a success in surgery is based on the doubt and it has a more psychological aspect than legal and

the courts hardly guarantees these promises. The rule is applied in the case that doctors have no contractual relationship with the patient and he is the function of his professional job. For example, doctors who treat the disease in case of an emergency or will be the contracting party and will be asked for cooperation by the hospital, he has not the duty more than care and effort and special actions.

## 2.1 in Jurisprudence

In Jurisprudence, it is known that the physicians support damages, which will be because of the treatment to the patient, though, he had the necessary precautions and the treatment will be to the patient's permission. In view of justification, it is said that: "since the act of doctors will be done deliberately, patients' loss is in decision-degree of murder." They have also argued that despite an employment obligation, resorting to innocence presumption is baseless, because in this case the principle is not current. In addition, the permission is in treatment and not in loss, so the guardian's permission in fall of loss has not been effective, there is no conflict between permission and liability (Najafi, 1398 AH; 43:47).

In return, Ibn Idris did not know the doctor as a guarantor if he is aware and he makes the necessary effort into the treatment (Shahid Sani, 1282 AH, 347). In order to justify the view, with the permission of the patient, the responsibility disappears and what is legally permissible has no liability.

There is less doubtful regarding Abra physician from the patient and his guardian before treatment. Some have said Abra has no effect because the waiver is before fixing it, but popular opinion is firmly opposed to it. The reason of popular opinion, the rest of the news from Abu Abdullah (AS), from Imam Ali (AS), the public and the public need in the influence of these conditions. The Abra has similarities with the permission of harm and like the conditioned elimination of animal and Parliament, it should be valid (Najafi, 1398 AH; 44:47). It should be added that, some scholars have considered the physicians absolute responsibility, limited to his stewardship in waste and do not consider assumptions that, the patient accepts the medical suggestions with confidence to his wisdom and authority in the scope of this guarantee. They cited on the confirmation of their view toward the news that know the treatment permissible with the possibility of health (Najafi, 1398 AH; 49:47).

In comments and criticisms of jurists, it can be summarized that if the doctor is a supervisor at Treatment, without obtaining permission, the great jurists are allowed to liability. Document waste to rule in the case, if the doctor will be in Treatment and take permission from the sick, without have acquitted him, ruling is well known with the necessity of guaranteeing before scholars as the loss rule document. Unlike Alameh Hilli that had no guarantee, document should be the principle of non-liability. Groups of jurists objected him that this principle is disposal to rule waste. To illustrate, attention to this question is necessary that if in case of loss, the rule of goodness will be obeyed or not? In most legal texts, it can be seen that goodness rule, allocates the rule and "On the hand that take even Todd Yeh ", but the waste rule has defined situations and the decision to guarantee the spendthrift, however he will be good or not (Abast Poor, 2013; 260).

However, it seems, the waste rule has no such application, but the best rule has considered the real rule in waste rule. Therefore, first, the evidence of waste rule - Anyone who damages other people's property is a guarantor – does not apply, due to the fact that, this Cobra's overall is not narrative context, but, it is, inevitably, because of the lip, which is not defined in that way. Secondly, "What the benefactors of the matter" is universal, free allocation. The language is the languages of verse that is not the allocation vector and particularly it means practical reason of Muda (Abast Poor, 2013; 262).

Therefore, Mohsen, even if it is destructive, but it is non-destructive due to its goodness. Holy legislator, in the area of law and legislation, considers improver non-destructive, and inevitably "What the benefactors of the matter" on the base of real government waste, which is a waste of the allocation rule, namely: "View improved non-underwriter", so in both cases, there is no liability to the doctor, because he is Mohsen. Because in each case, as improver is true for a doctor, in accordance with the principle of beneficence, there is no liability, including criminal, civil fixed on him. Sheikh Abdul Rahman Algeria, said to the four Sunni schools: when a doctor will be skilled and qualified and habitually, he has made no error in his operation, however, in his treatment, incidentally, he has killed or maimed, so no liability will be for him.

## 2.2 The civil liability of a doctor, in the IPC, with an emphasis on Islamic Penal Code 2013 and comparison with the Jurisprudence

Doctors' civil liability is one of the important legal and civil liability issues that have been discussed in different countries, and important ideas have been issued about it. In our country, before the adoption of the law diya, in 1982, a civil liability of doctors was subjected to the general rules of civil liability and the terms of the responsibility, primarily, the fault was appointed in 1339 civil liability law. In addition, in terms of the responsibility, primarily, the fault, which was established in 1960 in civil liability law, was applicable in this case. However, in Law of blood money in 1982, followed by in the Penal Code in 1991, some articles were devoted to this issue, which are not compatible with the fault. Moreover, the articles do not have enough coordination based on responsibility, and in their interpretation, also statistically comments can be seen. Fortunately, the new Penal Code in 2013, it amended the previous regulation and returned to the fault.

### 2.2.1 The civil liability of doctors in the Penal Code and Jurisprudence

Article 319 of the Islamic Penal Law 1991, on civil liability and legal interpretation, the liability of the doctor, it was decreed: "If a physician, though, qualified and professionals, in treatments that he does, or orders, though, will be with the permission of sick, or his guardian, causes loss of life or injury or property damage, he is responsible. "

It is noteworthy that, it has a vast territory because it includes both waste and causality: the phrase, "I do it personally" is the observer of waste and the word, "ordered" is the observer of causality. In addition, the article covers both losses of lives and limbs and financial losses. Furthermore, in this article, there is no word of blame and apparent, the legislator has accepted the strict liability or no fault. Whether we consider the theory of risk or the theory of right guarantee, with inspiration from Western theories, as its base, or by the use of words and interpretations of Islamic jurists, we consider the theory of loss negates as its basis. However, Article 319 IPC in 1991, is based on Shi'a jurists, that consider the physician, responsible, in any case, whether he has faults in the science and practice, or qualified, or permitted by the patient or guardian.

Article 321 of the Penal Code in 1991, which referred to a veterinarian, is as the Article 319, apparently, it accepts a veterinarian strict liability and decrease that when the veterinarian and the vet, however, will be an expert in animal care, however, with the permission of the owner, causes damage, he will be responsible. "This article, in terms of the responsibility is in accordance with Article 319 and the like, it has religious roots because, it has been described the vet in terms of liability to the doctor.

According to what was said, the responsibility of a doctor and a vet in liability in the IPC 1991 is a strict responsibility and it is not based on fault. In other words, for medical and veterinary obligation for compensation, it is enough to prove the harm

suffered and the causal relationship between the loss and the read operation, while the responsibility of the circumcision under Article 320 is apparently based on Shia scholars. It considers fault, just as "exceeding the limit" and in case of non-aggression guarantee as much to the lack of guarantee for their fatwa.

### 2.2.2 Basis for civil liability of doctors in the IPC 2013

The new Islamic Penal Code rejected strict liability or liability without fault of the doctor, according to some scholars and critics and it is based on returned to the fault. In accordance with Article 495 Islamic Penal Code 2013 "Whenever a physician in his treatment causes loss or injury, he is the Guarantor of blood money unless his action will be in accordance with the provisions of the Medical and Technical Standards. Alternatively, before treatment, the acquittal is made and he committed no fault... and if getting exemptions from sick is not valid due to his immature or insane, or innocence of him may not possible because of the anesthesia and the like, the innocence will be gotten from a sickness."

Note 1: In the absence of negligence or fault of the doctor in the science and practice for him there is no guarantee though is not getting innocence.

Note 2: The patient's parents are certain like the Father. In case of absence or unavailability of the special parents, head of the judiciary by seeking permission from the respective positions of leadership and authority granted to prosecutors' innocence apply to the doctor.

We infer from this article, which doctors are primarily responsible for the losses suffered by the patient, unless the lack of his fault will be proven, or the presumption of innocence is received. In this case, also, when the doctor is exempt from responsibility, he is depreciation. In other words, the context of the above article is inferred as the assumption of guilt or as the presumption of fault, which means that, for responsibility, it is not necessary to prove fault, but doctors could prove his guilt, if he proves that, he has fully respected medical regulations and technical standards and committed no recklessness. When the doctor obtained innocence from the patient or guardian, and in other words, he asked the condition of his irresponsibility, the burden of proof of guilt will be the loser's responsibility. Therefore, it is not exempt the condition of innocence from the physician liability in case of fault, and it only shifts the burden of proof. It means that, if the condition of innocence has not taken from the guarantee, the burden of proof of fault will be on the shoulders of doctors and if the certificate of innocence has been taken, the burden of proof of fault will be on the shoulders of the injured party. The use of the word fault, in the matter of law, is that the responsibility of the physician is based on fault, but not proven faulty, but the assumed fault, that it can be proven otherwise. Obviously, in strict liability or absolute, proof of guilt will not be effective. Article 495 of the new law also confirms the acceptance of fault in the law (Safai, 2013, 145).

### 3. Analysis of therapeutic abortion law

Based on a single article, therapeutic abortion law is approved on 15 June 2005: therapeutic abortion is authorized with a definitive diagnosis confirmed by three physicians and verification of Legal Medicine based on the fetus's illness. It is due to the disability or being deformed, causes constriction for the mother or the diseases of the mother that is with the mother's life threatened, before insufflation of spirit (four months). In addition, no punishment and responsibility will be considered for the doctor.

It comes from the uttered of the Article that establishing the right for abortion is with terms of reference material, for parents, with the mother's consent. We know that, to make this right, it depends on the diagnosis and prenatal diagnosis processes as

well. Diagnoses that should insist on it and it should be done four months before the fetus.

However, the question comes to mind that, in the case of medical malpractice, in the diagnosis or declare it and the birth defects, whether he will be in charge for compensation or not? If the answer is yes, what is the legal basis? How will the amount of damages be determined?

In the single article of the law on therapeutic abortion, it states: "abortion is allowed with a definitive diagnosis confirmed by three doctors and forensic experts, based on fetal diseases, which due to disability or being deformed. It causes constriction of mother or mother's illness, which, coupled with the mother's life threatened, and it can be done before insufflation of spirit (four months), with the consent of the woman. No penalties and responsibility will be realized for the doctor. Violators of the provisions of this Act shall be sentenced to the punishment prescribed in the Penal Code."

As of the uttered matter and what was expressed in the right and split it, it seems that we cannot allow therapeutic abortion as a right to be considered because:

1. Due to the illegality of abortion in Iranian law and indicating the phrase: "... punishment and responsibility will not be held to liable doctor." It seems, legislator wishes to address the cases of removal reasons of criminal liability, because abortion toys criminal responsibility and the article has excluded for therapeutic abortion, if it is subjected to confirmation by three doctors, proving deformed or fetal disability and creating hardship for the mother. It has cited all the above-mentioned condition as the doctor's defense to criminal liability.

It should be noted that, there is a distinction among the causes of criminal responsibility and the "right". For example, self-defense is one of the reasons for resolving criminal responsibility, and it is proving causes the removal of punishment, but with the description mentioned above, could we consider the right of self-defense right? In the author's view, we cannot consider a right of self-defense right, because, with all the definitions that were given; we cannot find a definition for it. Even taking into account the legitimate defense, as a right of suspension or probation, is not right, because:

First, there is a difference between right and the right owner, while, in self-defense, such a distinction is not possible and as long as, the self-defense is not approved by the court of competent jurisdiction, it does not exist. In other words, no proof of self-defense means of not realization, and if the self-defense cannot be proved, it will be denied, while, on the right belongs the right and this is the entitlement, or rightful of the person who needs to prove it. The same applies in the case of therapeutic abortion. In therapeutic abortion, if three competent doctors do not meet the conditions, abortion lacks relevance and it cannot be claimed that the owner belongs constant right. Thus, even in the event of medical errors in diagnosis, therapeutic abortion does not form because of one of its pillars' abortion.

Two other causes of criminal liability are the exceptional entry on other waiver, not creating new rights. Accordingly, obstruction of justice is meaningless in removal reasons of criminal liability. For example, removal reasons of criminal responsibility for crimes, is exceptional, the right to life and if someone prevented that the victim self-defense and prevented crime, in each case, as foreman or deputy, in crime, traceable and deprivation of the right to life will be the case, not deny the right of self-defense. Therapeutic abortion, too, is exceptional that is the right to life of the fetus, and we cannot define it as a new right.

2. The use of indicating "permitted", in the text of the article, ultimately, can indicate the permissibility and not fixing the right, because, being proved right is not the same as its license, and in the fixing of the right, determining the implementation

guarantees is necessary, while license on it, do not need to determine the sanctions. That is why the legislator, in this matter, has not determined the enforcement, to prevent abortion. Accordingly, if the doctor or medical center states the patient that, despite the circumstances and legal physician, it is not willing to do therapeutic abortion, the patient should go to another doctor at the center, although patients get into trouble for finding another place, he cannot file a lawsuit against a doctor or medical center.

To clarify this issue, we can remind an example of other authorized affairs. Smoking is allowed from the perspective of law and positive law. Accordingly, no person can be prosecuted due to smoking, or carried out civil liability on him due to smoking, but it does not mean the right of person for smoking. Thus, each vendor who can sell tobacco products, but not willing to sell it, is not responsible based on the common law and the law, or any person or institution can prohibit smoking in private and public space - even if it is not covered, such as university campuses or public courtyard of shrines and holy places, where smoking is prohibited.

In this case, since, avoiding medical examination or avoiding therapeutic abortion, despite the permission, is not causing responsibility, misdiagnosis, provided that no intentional element was included, and it is defined in the medical error, cannot lead to criminal liability. We will talk about the deliberate misdiagnosis on the next topic.

Finally, we can say, therapeutic abortion is considered a legal license, that due to the elimination of criminal responsibility, it causes the punishment fall of legal abortion, and then it cannot be considered as an independent right for the mother or the guardian of the fetus.

#### 4. Results

##### 4.1 The possibility to assign the responsibility for deformed child born compensation, to medical errors

In the realization of criminal responsibility, three elements of legal, material and psychological are essential. Thus, one can easily understand misdiagnosis of a doctor and the birth of deformed child does not cause criminal responsibility, due to lack of legal element, even be intentional.

Regarding civil liability, as mentioned, therapeutic abortion cannot be considered a right that the waiving would fall the penalty, but, apart from this, is it possible - even on the assumption of the right legal abortion - to consider a causal relationship between the births of a deformed child and misdiagnosis of a doctor? If this is so, is there a jurisprudence and legal basis to determine the extent of damage or the money?

In this article, we review the possibility of assigning responsibility for deformed child born compensation, to medical errors, and discuss the above.

##### 4.2 The causal relationship between a child born with birth defects and medical diagnostics

Although, it is possible that the misdiagnose or inappropriate drug prescribing cause damage to the fetus or cause defects in him, however, this is outside the scope of this research and this study examines the hypothesis that a child has a defect due to other reasons and misdiagnose only caused foreclose the possibility of legal abortion. In this case, we can attribute "born" of a deformed baby to the doctors misdiagnose, but this only refers to "birth" and not creating defects.

Loss is a secular sense, meaning that, in determining instances of loss, we should accept the custom judgement and in this regard, we should not follow the examples of losses that in law or Sharia, it is not mentioned to be allegorical.

On religious subjects also, the great jurists have known the custom judgment as a criteria on the occasion of the debate about the harmed rule in recognizing the concept of loss and determining its exemplified and they have not expressed a legal definition of loss (Ansari, 1995, 2: 426). Because, as the owner of the categories referred (Almraghy, 1417 AH; 2: 311), the loss is the categories of law and in matters of law, custom judgment is the criterion. However, it is seen that jurists had thought in matters of law as well, and they have not considered some of the instances in loss categories that the norm today see them as losses. Including, about spiritual harm and non-profit, for example, Imam Khomeini (RA), according to the custom judgment, did not consider desecration or insult to another as losses (Khomeini, 2006 AH; 30-33). However, some other scholars considered non-profit and spiritual harm as the loss (Almraghy, 1417; 2: 309). This is because the custom can detect loss better and give the right to suffer by the victim, and in manifestation of harm, we should be based on the norm.

Now, the question arises whether, there is a specific definition of loss and damage, which should be a standard practice in matters of law, or by the legislator? Or it is not that and the matter of law leaves the concept and examples of loss to custom and experts, at any time and place. Obviously, if each of the two assumptions will be applicable, we encounter the effects of certain results. If we consider a certain standardized criteria for the loss or damage, we should only consider the compensation for that the legislator knows it as the damage. In this case, it seems that we have the narrow concept of losses, ahead. However, if the criterion of the loss is common, we should consider what the custom knows it as a loss. In this case, it seems that the loss or damage has a more general sense and more several examples, because, custom and customary judgment is a relative thing and it is different according to times and locations. Although, under Article 728 Procedure Act, former civil, it was stated: "the loss may be due to the financial loss or by the death of benefit that has been achieved from the commitment". We cannot infer from this article that the loss is a verdict concept and matter, and it is merely the loss of property and loss of profit, and nothing else. Because the legislature, in Article 728, first of all, only has introduced two examples of financial losses, and secondly, he has spoken in the common language, and the legislature has not mentioned the unlimited sense of loss, but the rule is allegory. The proof of the matter is that in other laws, other instances, if loss is taken into consideration. Including in the Civil Procedure Act 1939, compensation of delayed payment is recognized in 719 to 726 articles and it had expressed its Rules. On the other hand, in Article 171 of the constitution, the spiritual and material loss, both were accepted and were considered compensable and in civil liability laws enacted in 1960, in Articles 1, 9 and 10, spiritual and material loss has been accepted.

Accordingly, although the losses look compensable, but it must be said, there are drawbacks in the ability to assign it to the doctor. These problems include:

1. The single article about abortion has emphasized the diagnosis of three specialists, without tying the description of a specialist in a certain constraint - such as a coroner or a reliable doctor. In this case, two presumptions arise. The first assumption is that the mother - or father- know the malformed fetus in some way- and visit specialists to confirm this. In this case, they will have the freedom to select and refer to any of the physicians, and in case of detection of birth defects, by each of them; there are other possible medical care. Also, not only misdiagnosis of three doctors at the same time seems far-fetched, that in case of one or two doctors' misdiagnosis, determining their contribution to the damage arising from the birth of deformed children, faced with uncertainty and the attribution of harm to them qualified difficulty, due to the possibility of the patient, in reference to other doctors. In this case, no recourse to other doctors is a stronger reason that influences the causal relationship of the doctor's misdiagnosis. Another assumption is that the mother - or father does not know

the deformed fetus, and physicians will not be able to detect it (or the diagnosis is wrong). In this case, though the causal relationship between wrong detection and the birth of deformed children will be formed more complete than the first assumption, but still, the right of a patient to refer to other doctors is reserved. Moreover, in this case, misdiagnosis was not observed and only, lack of diagnosis the defect is important, and if the misdiagnosis happens, despite respecting therapeutic diagnosis norms and necessary tests, there will be no malpractice or negligence of the doctor that he could be blamed.

2. Recognition of medical errors, if he acted within his jurisdiction and on the basis of common medical practices and clear principles of diagnosis, he has never been considered responsible by the legislator, that if this happens, the medical community safety encountered a serious hazard.

#### 4.3 Lack of legal and jurisprudence resources in the calculation of damages

If we consider this assumption, despite all the discussion we had, that the doctor is responsible for the loss due to the birth of the deformed child, is there a base or source of jurisprudence and legal basis for compensation?

In terms of Jurisprudence as well as matters of law in Iran, there is no difference between healthy people blood money and people with a disability or disorder. On the other hand, proving of blood money entitlement, in Jurisprudence and Iranian Law, subjects to the conditions that, none of them apply in the discussion. Therefore, the possibility of determining damages, based on the blood money table, under titles such as the value of healthy individuals and malformed blood money! Healthy person and a person with a disability blood money! Or the blood money of members with malfunctions, or in general, does not make sense - both First matters or in this topic, the third matter does not make sense.

On the other hand, the possibility to determine damages, based on the length of treatment determined by the legal medical examiner, in this case, will not apply, because, basically, the concept of duration of treatment relates to injuries and they are the damages that are treatable and not about disability or birth defects, that no treatment can be imagined for them.

However, even if, contrary to the author's view, we consider the abortion right, it will be non-financial right, so that, in that case, the possibility to determine money damages in this right will have no image of what is raised in methods of financial compensation.

Finally, we can say, regardless of whether or not abortion rights, payment of damages and losses caused by the birth of deformed children, in jurisprudence and Iranian law has no source, and a way to calculate compensation.

#### 4.4 Intentional mistake of the doctor in the diagnosis, leading to the birth of deformed children

There is an assumption in which the possibility of Therapeutic abortion will be lost with intentional misdiagnosis of a doctor. According to what was mentioned, Therapeutic abortion is not a right, and on the other hand, there is no basis and the source, to compensate for loss or damage resulting from it, therefore, in this case also, there is no possibility to carry civil liability for a doctor. However, this does not mean absolute impunity of a doctor, if intentionally misdiagnosed.

The doctor is obliged to use all possible facilities and his ability to make the patient better and does his medical duties in the diagnosis and treatment of a disease. Misdiagnosis causes responsibility and violation of the mentioned issue is considered

a professional violation, if it is deliberate and regardless of the subject.

In other words, misdiagnosis, which takes place on purpose will deprive an independent right of a patient, meaning the right to have access to diagnosis and treatment, and in this case, the doctor will be traceable from the Medical Council Disciplinary Board of the country, and in case of intentional misdiagnosis, he can be fined, suspended of employment licenses and even, in some cases, revoke of license to engage in practice.

It should be noted that fine, whatever the amount is, should be paid in the right of the government and it is a form of punishment, thus, it should not be mistaken with compensating for the losses and damages.

#### 5. Conclusion and Recommendations

According to what was studied and analyzed in this article from the single article of the law on Therapeutic abortion, the doctor cannot be responsible for compensation, in the case of wrong diagnosis, which leads to the birth of deformed children. However, this misdiagnosis, whether intentional or not intentional or misdiagnosis affiliation to health care non-compliance can create professional or in some cases, legal liability for doctors, which this is different from civil liability of a doctor, in compensation, because:

Firstly: Therapeutic abortion is one of the removal reasons of criminal liability - abortion crime-and not independent right

Secondly, the medical profession demands and providing health care system security is that, the doctor did not be the sponsor, except in cases of negligence and fault, as long as following the rules and the existing system.

Thirdly, there is no base and a source of jurisprudence and Iranian law for compensation damages caused by the birth of deformed children, because Islamic law does not consider a difference between respecting healthy individuals and individuals with disabilities, and the blood money for both has been specified the same.

Fourthly, even if, contrary to the author's view, we consider therapeutic abortion as a right, the right will be non-financial and there is no mechanism for calculating its value.

Fifth: the deliberate misdiagnosis of a doctor is one of the instances for professional misconduct and it is traceable, from the union, and it can not be considered wrong with a doctor's civil liability in compensation the loss due to the birth of deformed children.

**Abstract.** Persian language is widely considered as one of the factors of keeping and transferring a part of the culture of Iran. By the formation of monarchy of Delhi sultanate. Persian literature and language had a special place. So, Persian poetry and literature is one of the most important factors that helped them in this issue. This research is going to investigate how the Persian poets' role has been in the promotion of ethics and Islamic mysticism in Delhi. In response to this question, this claim is raised: Persian poets through the provision of human concepts, piety-oriented, justice and fight against oppression, in the promotion of ethics and Islamic mysticism in the Indian sub-continent had an important contribution.

**Keywords:** Persian poets, Ethics and Islamic mysticism, India, the Sultans of Delhi.

### 1. Introduction

At the beginning of the seventh century AH, the Delhi sultans was formed by Turkish slaves in the north of the Indian subcontinent. By the formation of this government as the first Muslim rule and its continuation until the year 962 AH, in the Indian subcontinent, Islam was spreading dramatically. Sultans of Delhi in the beginning, to manage the affairs were facing the shortage of Muslim skilled labor. So Muslim immigrants were welcomed in the Indian sub-continent and placed them at great positions of the rule.

Immigration of poets and scholars of Persian language in India and the arrival of some of them to the court and the government promoted the Persian language and its expansion in the period of the Sultans of Delhi. The Persian language and literature in this period considered as a cultural instrument in the promotion of Islamic culture, especially ethics and mysticism. Promote Iranian poets in the court of Sultans and princes, and sometimes Persian poetry by Sultans, princes and courtiers shows the status of Persian language in the reign of Delhi. So it is not possible to Persian poetry and literature be considered as one of the dominant features in the period. In this study, it is tried to be investigated ethic and Islamic mysticism function in Persian literature in the Indian subcontinent in the centuries 7-10 AH that is at the same time with the rule of the Sultans of Delhi. Although in the field of Sufism, mysticism and Persian literature in the Indian sub-continent, independent research has been done, however, research on the role of Persian language and literature in the promotion of ethics and mystical ideas and modify the views and attitudes of the people and the rulers of Islam, no independent study has not been done. Hence in this study, the role of Persian language poets and writers in promoting poetry and mystical beliefs has been investigated in the Indian subcontinent.

### 2. Approach of Sultans of Delhi to poetry and Persian language

In the early beginning of the reign of Delhi, court of Naser Al-Din Ghabache the ruler of Sindh (the famous supporter of the theologians and grace) was one of the centers of literary and art. After the defeat of Ghabache in during the campaign of Ilutmish to Acheh and his death, literary and scientific center of the subcontinent was transmitted from Sindh to Delhi (Naqavi, 1962). Learned and scholars such as Awfi joined Shamsuddin Ilutmish and under his patronage, continued their scientific work. Awfi due to skill in rhetoric was considered by Sultans and in their court had special status. He ended Javame Al-Hekayat by the order of Nizam al-Mulk Ghavam al-Din

Muhammad Joneidi minister of Ilutmish. By the beginning of the Mongol invasions to Iran, the number of Iranians emigrated in Delhi increased. The history of Fereshte has only cited the number of princes 15 people who migrated to India during Balaban (Fereshte, 1999: 1, 267). It is apart from twenty-five thousand political and scientific elite that following Mongol attacks to India escaped and they were present in Naser Al-Din Mamluki in his government (Fereshte, 1999: 1, 262). At the same time, Multan the center of ruling Muhammad Khan (Son of Sultan Balaban) was also a center for poets and writers. Poem understanding of some commanders like Mohammad Khan led the court poets more than ever be considered and area of their prosperity to be grown since they be able to be equal with elders of literature in Iran. Shahnameh, Khaghani Divan, Anvari, Khamse Nezami and Poetry of Amir Khosro Dehlavi was read in his royal circle and his poem understanding from lyrical poems of Iranian poets was such that Lord of the knowledge was admitted his understanding poem (Fereshte, 1999: 1, Barani, 1862). The importance and interest in Iranian culture and civilization in this period caused to Sa'di Shirazi was invited by Mohammad Khan to the Indian Sub-continent (Barani, 1862).

Attention of Mamluki sultans (602-696 AH) especially during Shamsuddin Ilutmish to poetry and poem and payments that Barani in his book was always regretted for that periods (Barani, 1862: 83) and in the same book, Amir Khosro Dehlavi cited it unrepeatabe periods caused the spread of migration of Iranian scholar and scientist to the Indian sub-continent. Unprecedented attention of Balaban (Delhi Sultan) to Iranian culture and rally of companions of Seif and pen and Master of Arts in court of Balaban (Fereshte, 1999), causing widespread of Iranian literature and art in this period. So this era in terms of promoting Iranian culture was unique in India and the Persian language and Iranian culture was flourished more. Although these poems showed a part of the ancient Iranian culture but it should not be overlooked of Islamic culture in the works and ethics and Islamic mysticism. During khalaji period (696-720AH), importance also continued to poetry. Ala Eddin khalaji at the beginning of his rule seemed not interested in poetry (Narges Jahan, 1990); but after a while he supported poets that perhaps his goal has been magnificent of this period and remain his good name in history.

Fakhr al-Din Mobarkshah Qawwas Ghaznavi from the literary elders of court of Alaei and including poets who received poetic stipend, he had a special place due to writing Qawwas dictionary because this dictionary is the oldest Persian dictionary that is written in the period of Alaei. Qawwas dictionary was soon imitated by many literary greats. Dastur Al-Afazel written by Hajib kheirat Dehlavi, Bahr Al-Fazael by Mohammad Bin Rostam and Sharaf Name by Ibrahim Bin Ghavam Farughi is including cultures that have taken advantage of the Qawwas dictionary. This book was written at the request of friends and to explain the words of Shahnameh (Narges Jahan, 1990).

During the reign of Tughluqs (720-815AH) poetry was still considered by the court. Tughluq rulers to strengthen their rule, has attracted many immigrants in government and ordered to respect them, rather than a strange word use the term of Aziz to call them (Ibn Battute, 1997). Increase the number of Iranian population in this period was caused to title immigrants as "Khorasani" (Ibn Battute, 2). In this period, support from poetry was flourished to the point where Ibn Battuta has cited the payments of Mohammed bin Tughluq the most granted of Sultans to poets (Ibn Battute, 2). Government elders who had come from Iran to India, with taking the government positions in addition to supporting the poets and writers supported copyright of books. They were attempting to expand sciences that were prevalent in Iran by the help of Persian teachers in the Islamic territory of Indian subcontinent (Mirkhord, 1978). Support culture and Persian literature in the period of Firuzshah Tughluq also continued. This support is not limited only to financial

support of poets. His activity in the field of literature and poetry (Fakhri heravi, 1869), including maintaining the poems of Iranian poets as Sa'di (Afif, 2006).

Seyed Hassan Bin Ala Eddin Sajzy which had the nickname of Ziyaedin and Najmuddin (Hashemi Sindhilavi, 1968) is commended in the history of Firuzshah by Ziya Barani. He says: I have not seen someone in elegance and endurance of intellect and refinement of morality and the need for contentment and abstraction and individuation and funny as Khaje Hasan. People of Indian sub-continent called him Sa'di, the Indian sub-continent due to follow Sa'di Shirazi style. This trait is because as Jami has said in Baharestan, his poetry is simple and impossible, which is the features of poem of Sa'di Shirazi. While Samarghandi wrongly considers his simple and impossible poems arose from his imitation of Amir Khosro (Samarghandi, 2003). His lyrics mystical was ordered in such rank that was read in the event of Sufi along with the lyrics of Sa'di (Mirkhord, 1978). He has pointed out several times that I wish to instead of all the books that I had written, Favayed Al-Favad was his book (speeches of Sheikh Nizamuddin Oliya) (Mirkhord, 1978) He has passed a five-year period, with Amir Khosro Dehlavi in Multan near Muhammad bin Balaban (Barani, 1862) and has had the responsibility of inkstand office. His ethical and poetic features were so that elders liked companionship with him (Hassan Dehlavī, 2006: 19). Khwaje Hasan in late life (Samarghandi, 2003: 248) in Delhi was fascinated by Sheikh Nizamuddin Oliya and joined the ranks of the disciples of Sheikh and his mystical poetry has soared since by the order of Sheikh was called at the behest of Khanghah (Samarghandi, 2003). In the reign of Sultan Mohammed Ben Tughluq and in the city of Diyogir in 638-637 AH, he was died. He Court consists of nine thousand poems in the form of Ghaside, sonnet, quatrains and Masnavi that much of it is covered by Islamic and ethical issues. His most important work that remains are the book of Sheikh Nizamuddin Auliya that is called Favayid Al-Favad (Hassan Dehlavī, 2003), the book that has always been the envy of Amir Khosro Dehlavi (Sindhilavi, 1968).

Other scholars in the court have been Sultan Muhammad ibn Taghlaq and other Indian Sultans Badr Addin Chachi (Hedayat, 2003: 1, 602). His poems have been very popular among the people of India. According to the author Tazkere Riyaz Al-Shoara, it can be understood that her residence in the Indian sub-continent has not been until the end of his life (Vale Dagestani, 2005). His ability in Laghz (Lyrics of mystery) was so high that the Mulana Seifuddin Asfarangy emulated him (Samarghandi, 2003). Some consider Badr Addin Chachi's enigmatic lyrics as the changing point in creating the Indian special style (Aziz Ahmad, 1980).

Amir Khosro Dehlavi (651-725 AH) is including Turkestan poets (Razi, 1, 358). His father went to Delhi and in the reign of Sultan Mohammed Ben Tughluq achieved government officials. After his death, his son, Amir Khosro could take the place of his father (Moddresi Tabrizi, 1990). He is the poets of Sultans of Delhi that could accompany seven sultans of the period (Barani, 1862). His position in poetry was such that he was termed the Indian parrot and Sa'di expresses the cause of non-coming to court of Mohammad Bin Balaban in addition to physical disability (Barani, 1862), exist of poets as Amir Khosro and Amir Hassan Sajzy. Several his collections of poetry included: Khamse includes eighteen thousand poems, Quran Sa'dein in four thousand poems, Noh Sepehr in four thousand poems and Tughluq Name in three thousand poems. Most his books reflects Islamic ethics and mysticism. After the death of Firuzshah Tughluq due to political chaos and civil wars and attacks of Teimur Gurakani, attention to literature and poetry (one of the most important factors in the spread of Islamic culture) fell, as some consider Persian poetry decline in India related to the period (Salimi, 1993).

During the reign of Ludis (855-932 AH) though poetry was not so important, but Persian language passed path of perfection and growth in the Indian subcontinent. Formality of Persian language

by the government that had political and economic power in the Indian subcontinent attracted people of Indian Territory to Persian language. In the period of Sultan Sekandar Ludi, including the Persian-speaking Afghans, the importance of Persian language was prominent; Sultans of Dehli benefited the Persian language in other way for being familiar with Islamic culture. As Persian Language and Literature did a part of his duty on the transfer of Islamic culture to the land of the Indian sub-continent during the rule of the Sultans of Delhi, through the translation (Salimi, 1993).

### 3. Components of ethics and Islamic mysticism in the poems of Persian poets

#### 3.1 Mystical thought and Islamic behavior

Persian poetry as a part of Iranian culture over time reflects Islamic ethics and human correct behavior. One of the main tasks of literature (both prose and order) is that it should be the indicative of ethics and behavior. Court poets in their odes that the most important structure of it was panegyric; to enhance public behavior and properties expressed ethical issues. In the literature of Dehli Sultans, there are many poems from Iranian poets and Persian language that express the ideas of moral and Islamic mysticism, a part of the lyrics that included odes, a series of meditations and thoughts expressed in a tone of warning which they can be called poetic advices (De Bruijn, 1999). Some of the ideas can be found in parts of Persian odes of this period that is in the principles of the Islamic community; the unity of God and praise of the Prophet of Islam and of Muslim leaders and the so-called "virtues" is called (De Bruijn, 1999).

Poetry of poets as Khaghani that in their poems have had ascetic writings as withdrawing from the world, condemning it and preparing self for life of other world cause the development of the mystical and ascetic ideas among the people, Kings and courtiers. Sana'iy in addition to his Masnavi that has been teaching and reflects Islamic morality (De Bruijn, 1999) is considered as the oldest poets of mystic sonnets (De Bruijn, 1999: 80). His poems among rulers such as Muhammad ibn Balaban was popular, and read in his court, Love poems of greats such as Iraghi, Amir Hassan Dehlavi and Amir Khosro Dehlavi that each of them in a way depended on the doctrine of Sufism of the Indian sub-continent, and his poems were read in the halls of Sema, can be considered as the most important source of their inspiration have been mysticism. Poems of Amir Khosro in five sets of Tuhfa Al-Seghar, Vasat Al-Hayat, Ghare Al Kamal, Baghiy Al-Naghiya and Nahaya Al Kamal have been collected. (De Bruijn, 1999).

Sa'di and his poems have been very popular in the Indian subcontinent. Lyrics Sa'di in Golestan due to raise issues of Islamic behavior, such as humanism, peace, family issues, education and training is very important. His Bustan was also somewhat influenced by Sufi poetry and its first chapter is considered in the ruling Seir Al-Muluk that expresses the ethics of governance. The moral outstanding of this book forced elders of Dehli to plan memorizing Bustan for their children alongside the Quran (Mohaddes Dehlavī, 2004). The two valuable books was considered at the view of government and the Grand Royal Delhi and could affect in guiding the thinking and encourage people, elders and rulers in Islamic and human behavior. Placing Iranian elite in the head of state and scientific system of this period not only caused the promotion of Persian language words and terms, but allocating the language to scholars and literature caused to its knowing for the court considers a positive feature. The importance of this point was until the Sultans of Delhi learned poems of poets as Sa'di's by heart (Afifi, 2006) or self-composed poetry in Persian language (Narges Jahan, 1990) and said Persian literary sentences (Ibn Battuta, 1997).

On the other hand, the role that Sufi had by utilizing Persian literature in promoting the values, ethics and Islamic mysticism in the Indian subcontinent has been great. Cheshti Sufi and Suhrawardiye as a part of Muslim community in India that gave a

new special thought to the community of India and given the close relationship that Sufis had with the people and the rulers, could affect their audience. This group of society of Indian subcontinent to convey their intentions used Persian Literature and language. Religious and mystical books written in the Persian language was not only an important factor in the development of Persian language (Naqavi, 1962), but it led to the promotion of ethics and Islamic behavior among people. The number of these works is to the extent that some have cited the number of Persian texts in the Indian subcontinent more than its number in Iran (Schimmel, 1994). Sufi mystics and disciples during this period acted to write Sheikhs ideas in the Persian language, as religious and theological books about Islam, Islamic morals and manners was written in Farsi (Schimmel, 1994).

Taking advantage of the love poems was one of the parts of mysticism and Sufi in the Indian sub-continent that was normally read in their Sema rites. The presence of Sufi elders like Khwaje Nizamuddin Auliya in Delhi at sultans of Delhi period had been caused to poetry (from the Masnavi to Ghazal) is not deprived in the course from mystical themes. The position of poetry of mystic in the propagation of Islam was to where that Farid Al-Din Ganj Shekar started propagation of Islam in the first place by Persian language and then he began to compose poems by the Persian language. Although due to more effectiveness on the people of the region, he paid attention to the moral and mystical poems in the local language of Penjabi and in this way, it has been pioneer among elders of Persian Sufi; But many of the words and the thought and culture of the poems of poems have taken effect of Persian poem (Lahuri, 1971). Attention and importance of sheikhs to poets such as Nezami that Khamse was popular near Nizamuddin (Mirkhord, 1978) caused in addition to publicity of Persian literature and poetry and the introduction of Nezami and Sa'di in the Indian sub-continent, morals, manners, and Islamic mystic spread. Read the poems and sometimes poems in the style of Persian mystical poetry by the Sufi elders (Hosseini Ghoreishi, 1992) showed interest of elders in these poems. This forced their disciples to get attention and approval of them acts to compose poems with style and their content. Amir Khosro was a poet who worked at the court and also was associated with Sufi elders was adorned his poems to properties of Iranian-Islamic culture. In Seyar Al Auliya is cited when Amir Khosro Dehlavi listed his first poems for Nizamuddin Oliya, Sultan al-Mashayekh India asked him to compose by poetry style of Esfahan in which symbols of hair, wine and spot was used (Hoseini Ghoreishi, 1992). Although Persian poetry of Amir Khosro has moral and human implications but with mystics directs such as Nizamuddin Auliya went so far that his poetry was called in Sufi community (Mirkhord, 1978: 344). Nizamuddin Auliya due to dominate the Persian language, to convey moral and human concepts used Persian poetry. The lyrics of the poets have been considered for disciples and ordinary people, and sometimes Sultans and have had attractiveness; As Soltan Ala'ddin khalaji after the resolution of their dispute with Nezammudin Auliya was interested in the statements and his poems, and always collected his poems and statements and kept them their (Bulaq, 1997). Mentioned measures due to continuation led to spread Islamic morals and manners through the Persian language among the government and the people.

### 3.2 Asceticism oriented, personal and social ethics

Makhzan Al-Asrar Nezami (that is doctrine and influenced by Sanai's poems) was faced with welcome in the Indian sub-continent (De Bruijn, 1999: 80, 1999: 132). His poems that have been popular with greats such as Nizamuddin has stated ethical issues and stated morality in two categories of personal and social (Sotoudeh, 1994: 120). But Matla Anwar Dehlavi has dedicated most of his work to the expression of Islamic teachings. In the individual ethics calls human to perfection (Amir Khosro Dehlavi, 1975), theology Amir Khosro Dehlavi, 1975: 8), escaping the world (Amir Khosro Dehlavi, 1975) and devotion in practice (Amir Khosro Dehlavi, 1975). In social

ethics calls man to keep him from harming others (Amir Khosro Dehlavi, 1975), observe modesty and chastity (Amir Khosro Dehlavi, 1975), treated with justice (Amir Khosro Dehlavi, 1975), respect for parents (Amir Khosro Dehlavi, 1975) and has forbidden from hurting people (Amir Khosro Dehlavi, 1975) and injustice (Amir Khosro Dehlavi, 1975) and betrayal (Amir Khosro Dehlavi, 1975).

The author has divided his book into twenty-three parts that much of it is advice to the Ethics and Religious Affairs. In his book, which is called "private" calls the reader to worship and obedience to God and. Although he considers worship initially difficult (Amir Khosro Dehlavi, 1975), but he believes the end of slavery is being special to God. He requires courage and will to pass the path (Amir Khosro Dehlavi, 1975).

Dehlavi in Article Fourth of his book has considered the basis of Muslim in five things and called the reader to respect them. He has considered the first pillar Declaration of Faith and the second pillar prayer that everyone that wants the world and the Hereafter through which can access to it. He in describing the second case considers the aim of the creation of man to worship God. He believes all things, each as much as possible are worshiping God (Amir Khosro Dehlavi, 1975). He blames man due to negligence in prayer and blames people for not accepting Islam in the heart and mind. He considers prayer due to the fact that by the truth of prayer, all the pillars of human will be true. The third pillar of slavery and Muslims is Zakat that saves man from worldly and eternal injuries. He calls rich people to pay Zakat as Allah has given them without obligation. The next element is fasting in the perspective of Dehlavi that makes purity and protecting people from the fire of hell. He states pilgrimage as the last pillar and calls Muslims to bring the divine and inspired by Hindus who worship their idols by suffering and difficulty (Amir Khosro Dehlavi, 1975).

In the fifth article of Matla Anwar, he calls the reader to the greater jihad that is the struggle with esteem and respect virtue. He considers limited period of human life in this world and calls him to have opportunity, trying to please God, quit drinking that was customary during the Sultans of Delhi. He introduces wine causes the weakness of will and corruption of ideas. He criticizes his era and its people and he nagged because they not consider the debauchery and corruption as shame but they are very proud of it. He considers the way of life of Muslims based on Hindu custom that only claim Muslim (Amir Khosro Dehlavi, 1975). Another part of the book that reveals Islamic moral and behavior individually and socially is an argument that Dehlavi states about respect and honor to relatives. In this case, in the tenth article calls the reader to honor parents and the position of mother of the child and considers nothing the efforts of children to compensate for any trouble. He considers the beginning of training children from childhood and the result of oppression to parents will be oppression of children of Men to him.

Author has preferred nobility to a large number of children and more children makes difficult economic situation. The other thing he mentioned is that if a man was considered the great of family, he should support members of family and tolerate difficulties because of it (Amir Khosro Dehlavi, 1975). As the author has dedicated the fifth introduction to fight with soul, in the twelfth article suggest fighting against external enemies and martyrdom. He considers fight against external enemies causes to destroy the sins of man. He considers masculinity in preparation for full-scale to fight and while praising Islamic fighters likens looters who for looting by the army of Islam to the pilgrims on the Hajj to trade; in fact, their main purpose is trade (not worship). He has named rites of battle in Islam to fight and kill for God, punishing opposition and the defeated based on the amount of crime and hatred, not kill women, not mistreated prisoners of war. He also calls fighters to strengthen weapons to be resolved areas of meanness and thorns of them from path.

Amir Khosro Dehlavi in Article Fourteenth of his book praise cases such as self-respect, contentment and lawful and unlawful

respect, fairness, integrity and recommend human to it. In this section of his book, he criticizes pretending to Islam and trick in social issues and those who truly fear Allah considers little. The fear of Day of Judgment is another case that was studied in this paper (Amir Khosro Dehlavi, 1975).

In the book of Javame Al-Hekayat of 'Awfi, also it can be observed numerous social and moral issues. The book is written in four parts and in twenty-five chapters as follows: The first kind: the knowledge of God, the miracles of the prophets, saints' dignity, caliphs; the second type: express morality of Hamida and Marzieh, the third part: indecent ethic and the fourth part: state of servants, territories and natures wonders and animals natures. The content of book (as lutmish court minister has pointed out) due to past way in personal and social matters from mystic to the king and the result of their actions in this world is considered experience and capital for life ('Awfi, 2007) In this book, two thousand one hundred and thirteen narratives are mentioned, most of which has been documented and name of their references is listed. In addition to the history of Islam that is much of the contents of this book, the use of narrative books like Qabus Name indicates the comprehensiveness of this book so that all issues related to the history of civilization, literature, ethics and Islamic Sciences is discussed and in the development of ethics and Islamic mysticism among the people, courtiers and kings of Indian subcontinent has been affected ('Awfi, 2007).

### 3.3 Advice to Islamic ruling

Article Thirteenth of the book of Matla Al-Anvar Dehlavi reminded the Muslim ruler. He advised the Sultan to the accounts and the Day of Judgment and warns him from the oppression of the people and subordinates and asks him about the judgments and decrees that exports to be careful because on the Day of Judgment must answer for his actions. Sultan should not spend all his time to binge and hunting since it will follow their discontent and dissatisfaction of them in the fall of the government will be very effective. Sultan should note concerning the taxation that observes fairness and moderation. Sultan justice is as an amulet that by the lack of it in judicial matters and punishment of individuals, disaster key of government will be made. Justice Sultan although have many enemies, but with the support of the people that are pleased of his justice, he would continue to rule. The government needs to consider accumulate treasury and living conditions of people and especially the poor together, and while people are living in poverty not only just think about treasury stock. From the perspective of Amir Khosro Dehlavi, governing conduct in state affairs should be something like saws that observes justice and equality and does not like ax that not to complied other side. He must be careful to relatives and people around him because the lack of attention and auditing of their work will cause to oppress the peasants. Rulers at the top of society are such as lights that give the community light and make around facing difficulty. So it is natural that the Sultans to improve and advance their goals put brokers in the government in hardship. The ruling of Islamic society should be religious in state affairs, and not pass the night with drinking. He must have spies who have eyes and ears and seeing and hearing news from different parts of the government to transfer him. Sultan should note that the difference in commands will be disruptive and state and government will lose its true function. The governor must adapt and compromise in matters of government and does not apply severity in all cases. Nickname of ruler is due to family and good brokers and should not be expected despite the wicked brokers remain a good name of Sultan. Sultan should note that his sentence is as the sun in the sky that for all equally have light and heat so that in largesse should be visited all and does not discriminate. Largesse has big name when the obtained wealth not be through oppression; otherwise it will follows infamous for ruling. Sultan must be careful that his job as governor is to protect the people and not the oppression and bullying that it is the feature of thieves and bandits (Amir Khosro Dehlavi, 1975: 251-241).

### 3.4 The fight against oppression and injustice

Amir Khosro Dehlavi in Majnun and Leyli also sporadically has raised ethical issues. The authors first asked God to help him, to not be flatter others. He speaks about his hatred of oppression, injustice in his effect Leyli and Majnun and likened oppression to bloody sword that its cause is the destruction and hatred for others only for oppressor humans and asked the reader to not have mercy and compassion towards ruthless humans as he also not had this sense to the oppressed (Amir Khosro Dehlavi, 1974)

### 4. Conclusion

Immigration of Persian poets to the Indian sub-continent was along with the formation of the first Muslim state in the region. Among the poets were some immigrant has the ability and competence of the government, and some pursued Islamic objectives, so that they could affect the behavior and performance of rulers and sultans gradually and accompanied their moral and Islamic mysticism. Persian poetry because of its moral themes reflects the Islamic and human behavior. Immigrant poets and scholars with their Persian poetry that sometimes clearly imitated Iran's Persian poetry and literature tried to achieve satisfaction of sultans and rulers who were interested to the moral poetry and Sufi of poets of Iran. In summary, the formation of an Islamic state by servants of Ghori government that not had Islamic background as well as neighboring Iran with the Indian sub-continent and improper conditions of Iran in terms of social and economic and in contrast good conditions in the Indian sub-continent led to Most scholars of Persian language to be present in this area. Sultans of Delhi government need to scholars, poets and artists were allowed songwriters that have different abilities in the Indian sub-continent to have appropriate cultural position and by the continuation of their cultural activities, in the promotion of Islamic ethics and behavior in Delhi sultans' state to be effective.

## RENEWABLE ENERGY SITUATION AND WAYS TO IMPROVE IT

SEYED NEMATOLLAH MOOSAVIO<sup>a\*</sup>, FARIBA AZIK<sup>b</sup>

<sup>a</sup>Associated Professor, Department of Agricultural Economics, Marvdasht Branch, Islamic Azad University, Marvdasht, Iran

<sup>b</sup>PhD Student of Agricultural Economics, Department of Agricultural Economics, Islamic Azad University, Marvdasht, Iran

\*Seyed\_1976mo@yahoo.com, <sup>b</sup>Fariba.azik@yahoo.com

**Abstract.** Renewable energy is energy that is collected from renewable resources, which are naturally replenished on a human timescale, such as sunlight, wind, rain, tides, waves, and geothermal heat. Opposition is the culprit behind many delays in renewable energy (RE). Use of renewable energy is in the field of power generation, heating and Transportation. Renewable energy can reduce air pollution. Cut global warming emissions, create new jobs and industries. Diversify our power supply and Decrease dependence on coal and other fossil fuels. Mainstream technologies is included wind power, hydropower, solar energy, geothermal energy and bio energy. Market and industry trends Is a source for Energy storage. Move America toward a cleaner, healthier energy future.

**Keywords:** Renewable energy, Types of renewable energy, improving renewable energy

### 1. Introduction

Renewable energy is energy that is collected from renewable resources, which are naturally replenished on a human timescale, such as sunlight, wind, rain, tides, waves, and geothermal heat (Ellabban, et al., 2014). Renewable energy often provides energy in four important areas: electricity generation, air and water heating/cooling, transportation, and rural (off-grid) energy services (Sawin, et al., 2004). Renewable energy provided an estimated **19.1%** of global final energy consumption in 2013. The share of **modern renewable energy** increased to 10.1%. The share of **traditional biomass** was of 9%, same as in 2012. Renewables accounted **27.7%** of global power generation capacity and **22.8%** of global electricity demand.

•Renewables made up for **59%** of net additions to global power capacity.

•Total RE power capacity: **1712 GW**, an increase of more than 8.5% over 2013 (Komor, 2015).

Renewable energy often displaces conventional fuels in four areas: electricity generation, hot water/space heating, transportation, and rural (off-grid) energy services:

#### 1.1 Power generation

By 2040, renewable energy is projected to equal coal and natural gas electricity generation. Several jurisdictions, including Denmark, Germany, the state of South Australia and some US states have achieved high integration of variable renewables. For example, in 2015 wind power met 42% of electricity demand in Denmark, 23.2% in Portugal and 15.5% in Uruguay. Interconnectors enable countries to balance electricity systems by allowing the import and export of renewable energy. Innovative hybrid systems have emerged between countries and regions.

#### 1.2 Heating

Solar water heating makes an important contribution to renewable heat in many countries, most notably in China, which now has 70% of the global total (180 GWth). Most of these systems are installed on multi-family apartment buildings and meet a portion of the hot water needs of an estimated 50–60 million households in China. Worldwide, total installed solar water heating systems meet a portion of the water heating needs of over 70 million households. The use of biomass for heating continues to grow as well. In Sweden, national use of biomass

energy has surpassed that of oil. Direct geothermal for heating is also growing rapidly (Gowlett, 2015). The newest addition to Heating is from Geothermal Heat Pumps which provide both heating and cooling, and also flatten the electric demand curve and are thus an increasing national priority (Kris Hirst, 2013; Density, 2013).

### 1.3 Transportation

Bioethanol is an alcohol made by fermentation, mostly from carbohydrates produced in sugar or starch crops such as corn, sugarcane, or sweet sorghum. Cellulosic biomass, derived from non-food sources such as trees and grasses is also being developed as a feedstock for ethanol production. Ethanol can be used as a fuel for vehicles in its pure form, but it is usually used as a gasoline additive to increase octane and improve vehicle emissions. Bioethanol is widely used in the USA and in Brazil. Biodiesel can be used as a fuel for vehicles in its pure form, but it is usually used as a diesel additive to reduce levels of particulates, carbon monoxide, and hydrocarbons from diesel-powered vehicles. Biodiesel is produced from oils or fats using transesterification and is the most common biofuel in Europe.

A solar vehicle is an electric vehicle powered completely or significantly by direct solar energy. Usually, photovoltaic (PV) cells contained in solar panels convert the sun's energy directly into electric energy. The term "solar vehicle" usually implies that solar energy is used to power all or part of a vehicle's propulsion. Solar power may be also used to provide power for communications or controls or other auxiliary functions. Solar vehicles are not sold as practical day-to-day transportation devices at present, but are primarily demonstration vehicles and engineering exercises, often sponsored by government agencies. However, indirectly solar-charged vehicles are widespread and solar boats are available commercially (Sartori, 2008).

### 1.4 The power of renewable energy

Renewable energy is a practical, affordable solution to our electricity needs. By ramping up renewable energy, we can:

- Reduce air pollution
- Cut global warming emissions
- Create new jobs and industries
- Diversify our power supply
- Decrease dependence on coal and other fossil fuels
- Move America toward a cleaner, healthier energy future (Boyle, 1997).

### 1.5 Ramping up renewables: Energy you can count on

Renewable energy is growing rapidly, with record numbers of new wind and solar installations coming online in the U.S. over the past few years. We can readily continue this rapid expansion of renewable energy by utilizing existing technologies, investing in improvements to our electricity system, and making smart policy decisions that move the country toward a clean energy future (Masters, 2013).

### 1.6 History

Prior to the development of coal in the mid-19th century, nearly all energy used was renewable. Almost without a doubt the oldest known use of renewable energy, in the form of traditional biomass to fuel fires, dates from 790,000 years ago. Use of biomass for fire did not become commonplace until many hundreds of thousands of years later, sometime between 200,000 and 400,000 years ago (Marszal, 2011). Probably the second oldest usage of renewable energy is harnessing the wind in order to drive ships over water. This practice can be traced back some 7000 years, to ships on the Nile. Moving into the time of recorded history, the primary sources of traditional renewable

energy were human labor, animal power, water power, wind, in grain crushing windmills, and firewood, a traditional biomass. A graph of energy use in the United States up until 1900 shows oil and natural gas with about the same importance in 1900 as wind and solar played in 2010. In the 1860s and '70s there were already fears that civilization would run out of fossil fuels and the need was felt for a better source. In 1873 Professor Augustine Mouchot wrote: The time will arrive when the industry of Europe will cease to find those natural resources, so necessary for it. Petroleum springs and coal mines are not inexhaustible but are rapidly diminishing in many places. Will man, then, return to the power of water and wind? Or will he emigrate where the most powerful source of heat sends its rays to all? History will show what will come.

In 1885, Werner von Siemens, commenting on the discovery of the photovoltaic effect in the solid state, wrote:

In conclusion, I would say that however great the scientific importance of this discovery may be, its practical value will be no less obvious when we reflect that the supply of solar energy is both without limit and without cost, and that it will continue to pour down upon us for countless ages after all the coal deposits of the earth have been exhausted and forgotten.

Max Weber mentioned the end of fossil fuel in the concluding paragraphs of his *Die protestantische Ethik und der Geist des Kapitalismus*, published in 1905.

Development of solar engines continued until the outbreak of World War I. The importance of solar energy was recognized in a 1911 *Scientific American* article: "in the far distant future, natural fuels having been exhausted [solar power] will remain as the only means of existence of the human race".

The theory of peak oil was published in 1956. In the 1970s environmentalists promoted the development of renewable energy both as a replacement for the eventual depletion of oil, as well as for an escape from dependence on oil, and the first electricity generating wind turbines appeared. Solar had long been used for heating and cooling, but solar panels were too costly to build solar farms until 1980.

The IEA 2014 World Energy Outlook projects a growth of renewable energy supply from 1,700 gigawatts in 2014 to 4,550 gigawatts in 2040. Fossil fuels received about \$550 billion in subsidies in 2013, compared to \$120 billion for all renewable energies.

## 2. Mainstream technologies

### 2.1 Wind power

Main article: Wind power

Figure 1 The 845 MW Shepherds Flat Wind Farm near Arlington, Oregon, USA

Airflows can be used to run wind turbines. Modern utility-scale wind turbines range from around 600 kW to 5 MW of rated power, although turbines with rated output of 1.5–3 MW have become the most common for commercial use. The largest generator capacity of a single installed onshore wind turbine reached 7.5 MW in 2015. The power available from the wind is a function of the cube of the wind speed, so as wind speed increases, power output increases up to the maximum output for the particular turbine. Areas where winds are stronger and more constant, such as offshore and high altitude sites, are preferred locations for wind farms. Typically full load hours of wind turbines vary between 16 and 57 percent annually, but might be higher in particularly favorable offshore sites.

Wind-generated electricity met nearly 4% of global electricity demand in 2015, with nearly 63 GW of new wind power capacity installed. Wind energy was the leading source of new capacity in Europe, the US and Canada, and the second largest in China. In Denmark, wind energy met more than 40% of its electricity demand while Ireland, Portugal and Spain each met nearly 20%.

Globally, the long-term technical potential of wind energy is believed to be five times total current global energy production, or 40 times current electricity demand, assuming all practical barriers needed were overcome. This would require wind turbines to be installed over large areas, particularly in areas of higher wind resources, such as offshore. As offshore wind speeds average ~90% greater than that of land, so offshore resources can contribute substantially more energy than land stationed turbines. In 2014 global wind generation was 706 terawatt-hours or 3% of the world's total electricity.

Estimated Renewable Energy Share of Global Final Energy Consumption, 2013

Estimated Renewable Energy Share of Global Electricity Production, End-2014

Figure 2. Estimation of renewable energy worldwide

## 2.2 Hydropower

Main articles: Hydroelectricity and Hydropower

Figure 3. The Three Gorges Dam on the Yangtze River in China

In 2015 hydropower generated 16.6% of the world's total electricity and 70% of all renewable electricity. Since water is about 800 times denser than air, even a slow flowing stream of water, or moderate sea swell, can yield considerable amounts of energy. There are many forms of water energy:

- Historically hydroelectric power came from constructing large hydroelectric dams and reservoirs, which are still popular in third world countries. The largest of which is the Three Gorges Dam (2003) in China and the Itaipu Dam (1984) built by Brazil and Paraguay.

- Small hydro systems are hydroelectric power installations that typically produce up to 50 MW of power. They are often used on small rivers or as a low impact development on larger rivers. China is the largest producer of hydroelectricity in the world and has more than 45,000 small hydro installations.

- Run-of-the-river hydroelectricity plants derive kinetic energy from rivers without the creation of a large reservoir. This style of generation may still produce a large amount of electricity, such as the Chief Joseph Dam on the Columbia river in the United States.

Hydropower is produced in 150 countries, with the Asia-Pacific region generating 32 percent of global hydropower in 2010. For countries having the largest percentage of electricity from renewables, the top 50 are primarily hydroelectric. China is the largest hydroelectricity producer, with 721 terawatt-hours of production in 2010, representing around 17 percent of domestic electricity use. There are now three hydroelectricity stations larger than 10 GW: the Three Gorges Dam in China, Itaipu Dam across the Brazil/Paraguay border, and Guri Dam in Venezuela.

Wave power, which captures the energy of ocean surface waves, and tidal power, converting the energy of tides, are two forms of hydropower with future potential; however, they are not yet widely employed commercially. A demonstration project operated by the Ocean Renewable Power Company on the coast of Maine, and connected to the grid, harnesses tidal power from the Bay of Fundy, location of world's highest tidal flow. Ocean thermal energy conversion, which uses the temperature difference between cooler deep and warmer surface waters, has currently no economic feasibility.

### 2.3 Solar energy

Figure 4 Satellite image of the 550-megawatt Topaz Solar Farm in California, USA

Solar energy, radiant light and heat from the sun, is harnessed using a range of ever-evolving technologies such as solar heating, photovoltaics, concentrated solar power (CSP), concentrator photovoltaics (CPV), solar architecture and artificial photosynthesis. Solar technologies are broadly characterized as either passive solar or active solar depending on the way they capture, convert and distribute solar energy. Passive solar techniques include orienting a building to the Sun, selecting materials with favorable thermal mass or light dispersing properties, and designing spaces that naturally circulate air. Active solar technologies encompass solar thermal energy, using solar collectors for heating, and solar power, converting sunlight into electricity either directly using photovoltaics (PV), or indirectly using concentrated solar power (CSP).

A photovoltaic system converts light into electrical direct current (DC) by taking advantage of the photoelectric effect. Solar PV has turned into a multi-billion, fast-growing industry, continues to improve its cost-effectiveness, and has the most potential of any renewable technologies together with CSP. Concentrated solar power (CSP) systems use lenses or mirrors and tracking systems to focus a large area of sunlight into a small beam. Commercial concentrated solar power plants were first developed in the 1980s. CSP-Stirling has by far the highest efficiency among all solar energy technologies.

In 2011, the International Energy Agency said that "the development of affordable, inexhaustible and clean solar energy technologies will have huge longer-term benefits. It will increase countries' energy security through reliance on an indigenous, inexhaustible and mostly import-independent resource, enhance sustainability, reduce pollution, lower the costs of mitigating climate change, and keep fossil fuel prices lower than otherwise. These advantages are global. Hence the additional costs of the incentives for early deployment should be considered learning investments; they must be wisely spent and need to be widely shared". In 2014 global solar generation was 186 terawatt-hours, slightly less than 1% of the world's total grid electricity. Italy has the largest proportion of solar electricity in the world, in 2015 solar supplied 7.8% of electricity demand in Italy.

### 2.4 Geothermal energy

Figure 5. Steam rising from the Nesjavellir Geothermal Power Station in Iceland

High Temperature Geothermal energy is from thermal energy generated and stored in the Earth. Thermal energy is the energy that determines the temperature of matter. Earth's geothermal energy originates from the original formation of the planet and from radioactive decay of minerals (in currently uncertain but possibly roughly equal proportions). The geothermal gradient, which is the difference in temperature between the core of the planet and its surface, drives a continuous conduction of thermal energy in the form of heat from the core to the surface. The adjective *geothermal* originates from the Greek roots *geo*, meaning earth, and *thermos*, meaning heat.

The heat that is used for geothermal energy can be from deep within the Earth, all the way down to Earth's core – 4,000 miles (6,400 km) down. At the core, temperatures may reach over 9,000 °F (5,000 °C). Heat conducts from the core to surrounding rock. Extremely high temperature and pressure cause some rock to melt, which is commonly known as magma. Magma convects upward since it is lighter than the solid rock. This magma then heats rock and water in the crust, sometimes up to 700 °F (371 °C).

From hot springs, geothermal energy has been used for bathing since Paleolithic times and for space heating since ancient Roman times, but it is now better known for electricity generation.

Low Temperature Geothermal refers to the use of the outer crust of the earth as a Thermal Battery to facilitate Renewable thermal energy for heating and cooling buildings, and other refrigeration and industrial uses. In this form of Geothermal, a Geothermal Heat Pump and Ground-coupled heat exchanger are used together to move heat energy into the earth (for cooling) and out of the earth (for heating) on a varying seasonal basis. Low temperature Geothermal (generally referred to as "GHP") is an increasingly important renewable technology because it both reduces total annual energy loads associated with heating and cooling, and it also flattens the electric demand curve eliminating the extreme summer and winter peak electric supply requirements. Thus Low Temperature Geothermal/GHP is becoming an increasing national priority with multiple tax credit support and focus as part of the ongoing movement toward Net Zero Energy. New York City has even just passed a law to require GHP anytime is shown to be economical with 20 year financing including the Socialized Cost of Carbon.

## 2.5 Bio energy

Figure 6. Sugarcane plantation to produce ethanol in Brazil

Figure 7. A CHP power station using wood to supply 30,000 households in France

Biomass is biological material derived from living, or recently living organisms. It most often refers to plants or plant-derived materials which are specifically called lignocellulosic biomass. As an energy source, biomass can either be used directly via combustion to produce heat, or indirectly after converting it to various forms of biofuel. Conversion of biomass to biofuel can be achieved by different methods which are broadly classified into: *thermal*, *chemical*, and *biochemical* methods. Wood remains the largest biomass energy source today; examples include forest residues – such as dead trees, branches and tree stumps –, yard clippings, wood chips and even municipal solid waste. In the second sense, biomass includes plant or animal matter that can be converted into fibers or other industrial chemicals, including biofuels. Industrial biomass can be grown from numerous types of plants, including miscanthus, switchgrass, hemp, corn, poplar, willow, sorghum, sugarcane, bamboo, and a variety of tree species, ranging from eucalyptus to oil palm (palm oil).

Plant energy is produced by crops specifically grown for use as fuel that offer high biomass output per hectare with low input energy. Some examples of these plants are wheat, which typically yield 7.5–8 tonnes of grain per hectare, and straw, which typically yield 3.5–5 tonnes per hectare in the UK. The grain can be used for liquid transportation fuels while the straw can be burned to produce heat or electricity. Plant biomass can also be degraded from cellulose to glucose through a series of chemical treatments, and the resulting sugar can then be used as a first generation biofuel.

Biomass can be converted to other usable forms of energy like methane gas or transportation fuels like ethanol and biodiesel. Rotting garbage, and agricultural and human waste, all release methane gas – also called landfill gas or biogas. Crops, such as corn and sugarcane, can be fermented to produce the transportation fuel, ethanol. Biodiesel, another transportation fuel, can be produced from left-over food products like

vegetable oils and animal fats. Also, biomass to liquids (BTLs) and cellulosic ethanol are still under research. There is a great deal of research involving algal fuel or algae-derived biomass due to the fact that it's a non-food resource and can be produced at rates 5 to 10 times those of other types of land-based agriculture, such as corn and soy. Once harvested, it can be fermented to produce biofuels such as ethanol, butanol, and methane, as well as biodiesel and hydrogen. The biomass used for electricity generation varies by region. Forest by-products, such as wood residues, are common in the United States. Agricultural waste is common in Mauritius (sugar cane residue) and Southeast Asia (rice husks). Animal husbandry residues, such as poultry litter, are common in the United Kingdom.

Biofuels include a wide range of fuels which are derived from biomass. The term covers solid, liquid, and gaseous fuels. Liquid biofuels include bioalcohols, such as bioethanol, and oils, such as biodiesel. Gaseous biofuels include biogas, landfill gas and synthetic gas. Bioethanol is an alcohol made by fermenting the sugar components of plant materials and it is made mostly from sugar and starch crops. These include maize, sugarcane and, more recently, sweet sorghum. The latter crop is particularly suitable for growing in dryland conditions, and is being investigated by International Crops Research Institute for the Semi-Arid Tropics for its potential to provide fuel, along with food and animal feed, in arid parts of Asia and Africa.

With advanced technology being developed, cellulosic biomass, such as trees and grasses, are also used as feedstock's for ethanol production. Ethanol can be used as a fuel for vehicles in its pure form, but it is usually used as a gasoline additive to increase octane and improve vehicle emissions. Bioethanol is widely used in the United States and in Brazil. The energy costs for producing bio-ethanol are almost equal to, the energy yields from bio-ethanol. However, according to the European Environment Agency, biofuels do not address global warming concerns. Biodiesel is made from vegetable oils, animal fats or recycled greases. It can be used as a fuel for vehicles in its pure form, or more commonly as a diesel additive to reduce levels of particulates, carbon monoxide, and hydrocarbons from diesel-powered vehicles. Biodiesel is produced from oils or fats using transesterification and is the most common biofuel in Europe. Biofuels provided 2.7% of the world's transport fuel in 2010.

Biomass, biogas and biofuels are burned to produce heat/power and in doing so harm the environment. Pollutants such as sulphurous oxides (SO<sub>x</sub>), nitrous oxides (NO<sub>x</sub>), and particulate matter (PM) are produced from the combustion of biomass; the World Health Organisation estimates that 7 million premature deaths are caused each year by air pollution. Biomass combustion is a major contributor. The life cycle of the plants is sustainable, the lives of people less so.

## 2.6 Energy storage

Energy storage is a collection of methods used to store electrical energy on an electrical power grid, or off it. Electrical energy is stored during times when production (especially from intermittent power plants such as renewable electricity sources such as wind power, tidal power, solar power) exceeds consumption, and returned to the grid when production falls below consumption. Water pumped into a hydroelectric dam is the largest form of power storage.

## 2.7 Market and industry trends

Main article: Renewable energy commercialization

### Growth of renewables

Figure 8. Global growth of renewables through to 2011

Figure 9. Comparing worldwide energy use, the growth of renewable energy is shown by the green line

From the end of 2004, worldwide renewable energy capacity grew at rates of 10–60% annually for many technologies. In 2015 global investment in renewables rose 5% to \$285.9 billion,

breaking the previous record of \$278.5 billion in 2011. 2015 was also the first year that saw renewables, excluding large hydro, account for the majority of all new power capacity (134GW, making up 53.6% of the total). Of the renewables total, wind accounted for 72GW and solar photovoltaics 56GW; both record-breaking numbers and sharply up from 2014 figures (49GW and 45GW respectively). In financial terms, solar made up 56% of total new investment and wind accounted for 38%.

Projections vary. The EIA has predicted that almost two thirds of net additions to power capacity will come from renewables by 2020 due to the combined policy benefits of local pollution, decarbonisation and energy diversification. Some studies have set out roadmaps to power 100% of the world's energy with wind, hydroelectric and solar by the year 2030.

According to a 2011 projection by the International Energy Agency, solar power generators may produce most of the world's electricity within 50 years, reducing the emissions of greenhouse gases that harm the environment. Cedric Philibert, senior analyst in the renewable energy division at the IEA said: "Photovoltaic and solar-thermal plants may meet most of the world's demand for electricity by 2060 – and half of all energy needs – with wind, hydropower and biomass plants supplying much of the remaining generation". "Photovoltaic and concentrated solar power together can become the major source of electricity", Philibert said.

In 2014 global wind power capacity expanded 16% to 369,553 MW. Yearly wind energy production is also growing rapidly and has reached around 4% of worldwide electricity usage, 11.4% in the EU, and it is widely used in Asia, and the United States. In 2015, worldwide installed photovoltaics capacity increased to 227 gigawatts (GW), sufficient to supply 1 percent of global electricity demands. Solar thermal energy stations operate in the USA and Spain, and as of 2016, the largest of these is the 392 MW Ivanpah Solar Electric Generating System in California. The world's largest geothermal power installation is The Geysers in California, with a rated capacity of 750 MW. Brazil has one of the largest renewable energy programs in the world, involving production of ethanol fuel from sugar cane, and ethanol now provides 18% of the country's automotive fuel. Ethanol fuel is also widely available in the USA.

Table 1. Selected renewable energy

Selected renewable energy global indicators	2008	2009	2010	2011	2012	2013	2014	2015
Investment in new renewable capacity (annual) ( $10^9$ USD)	182	178	237	279	256	232	270	285
Renewables power capacity (existing) (GWe)	1,140	1,230	1,320	1,360	1,470	1,578	1,712	1,849
Hydropower capacity (existing) (GWe)	885	915	945	970	990	1,018	1,055	1,064
Wind power capacity (existing) (GWe)	121	159	198	238	283	319	370	433
Solar PV capacity (grid-connected) (GWe)	16	23	40	70	100	138	177	227
Solar hot water capacity (existing) (GWth)	130	160	185	232	255	373	406	435
Ethanol production (annual) ( $10^9$ litres)	67	76	86	86	83	87	94	98
Biodiesel production (annual) ( $10^9$ litres)	12	17.8	18.5	21.4	22.5	26	29.7	30
Countries with policy targets for renewable energy use	79	89	98	118	138	144	164	173

### 3 ways to improve renewable energy communications

Opposition is the culprit behind many delays in renewable energy (RE). Some is due to misconceptions, while others are legitimate environmental concerns. Because the growth of renewable energy seems inevitable, many governments and stakeholders worldwide have developed communications strategies to debunk myths and provide actual facts about RE. The IEA-RETD recently released "Communication Best-Practices for Renewable Energy (RE-COMMUNICATE) – Scoping Study" analyzing 15 case studies on renewable energy communications campaigns and highlighting areas for improvement. Below are a few areas that the study notes can increase campaign success:

1. Increase partnerships to increase RE communications campaign funding. Currently, the lack of funding resources represents a significant barrier to effective communications strategies.
2. Thorough pre-campaign research aids in better understanding the public's opinion on RE. This helps segment and define the audience allowing the creation of specific, targeted communications messages.
3. RE campaign strategies should be developed in stages to maximize effectiveness and impact.

4. Behavioral economics should be taken into consideration when developing RE communications strategies. The goal is to influence attitudes, raise awareness, and change behaviors toward RE.

5. For quality control, ongoing and post-campaign evaluation should be consistently applied at all stages of the RE communications process. The results can be used for future campaigns.

6. Proactive communication strategies are key when responding to negative media coverage about RE. Increased communication with the media helps avoid misrepresentation of the facts.

More targeted, effective renewable energy communications campaigns are possible through the use of consistent, and comprehensive approaches to pre- and post-campaign development. Read the entire case study here or visit International Energy Agency – Renewable Energy Technology Deployment (IEA-RETD).

**Abstract.** The emergence of man on earth is always with coherence and inseparable solidarity of values and norms. Education is including the areas of human perfection that attention to it follows effective results in the field of human behavior that this area includes cases such as procedures, goals, methods, and so on. One of the characteristics of education issue or human is the stages of his life that is divided to infancy periods, childhood, adolescence, adulthood and old age. The aim of this study is to investigate philosophy of critical period of life or childhood and adolescence. The results indicate that the triple relationship between parents and child and God is formed based on the love and emotions and by the shortcomings of the essence of Islam, the human character will be defected.

**Keywords:** childhood, adolescence, axiology, ontology, education

### 1 Introduction

Education of human based on values and divine teachings is an issue that follows useful results or with disadvantages in human life. Each of the eras of human life is with features that attention to them is based on Islamic injunctions shaping feature for him. As we know, according to the Quran, every religion has a separate identity and special for its own that action and behavior based on those traits determine the survival of life on the realm of cultures systems and varied ideas. Among the most important issues of anthropology in Islamic teaching is the period of man's life. Two critical periods of childhood and adolescence are including cases that while Islamic teachings taken into consideration. According to Islamic beliefs and assumptions contained in the Islamic world, there is a kind of continuity and link between the material world and the Hereafter of man. Man is somehow that always a balance between these two worlds can be seen. The human world is not confined to this material world. Based on the teachings of Islam, man tries to find his actions and activities in another world. On this basis, two limit of excess and wastage not have any place in human thought. On this basis, Muslim man pays attention to dual aspects of body and soul, and in this regard, he tries to fully meet the dual needs of its existence. Child and adolescent of Islam, unlike Christian thoughts, not merely pay attention to asceticism and seclusion. Also, unlike schools of liberalism, materialism does not limit itself to the world of small and minor.

Here we introduce what, why and how childhood and adolescence, or as the dominant philosophy on these two important periods of human life (axiology and ontology) and its implications in the field of education.

**The axiology of childhood and adolescence:** the human existence and mystery of his creation is an idea that has occupied his thought many times. In line with the formation of such thoughts, every ritual and religious, Christian, Jewish and ... with a particular conception of man has tried to raise the human characteristic and properties of man in different periods of childhood, adolescence, youth, etc. based on his intellectual beliefs. Islam has tried to draw distinctive character and identity to the man while attention to the importance of this periods. As we know, philosophical approach to the man follows inevitable effects in different fields of social, political, cultural and ... Education is also among the areas that the seeds and seedlings of the formation of these periods in human determines good and evil path and perdition or guidance. On this basis, drawing identity and character of childhood and acting it is a necessity, which naturally follows influences in the field of education and should be considered by specialists of various fields, including education. Themes and motifs of various fields and including

philosophy refer to the words of defects and benefits of this sensitive territory as well.

The rise of good and evil roots in childhood is a fact that Islam while spreading its basic teachings has mentioned it. As well as forming the foundation of monotheism and Islamic beliefs in childhood and elementary ages and dealing with such reality is considered by Islam. In the field, Quran has sent command of Imamate in childhood to its own prophets and religious leaders. Jesus says: "No adult will go ascension unless returns to his childish" (Karimi, 2011).

### 2 Importance of existing child and adolescent:

Existing pivotal and fundamental beliefs of any religion specifies the nature of the issues that needs more attention. More explanation is that beliefs about the world and the hereafter, God and ... affect man's attitude to other things. For example, in Islam due to the belief in the Hereafter and monotheistic approach, considering the issue of heritability and genetic reflects in a different way. Prophet in relation to the importance of child's inheritance and one's past role in his training believes: "Look in what position you placed your child (Khansari, 2006). "Marry to worthy families (Ibn Athir Jazari, 1988). Cohesion of intimate relationship of children and adolescents and their parents in Islam and the Quran have been considered. The purpose of this sort of attention to being together is nothing but correct implementing Islamic education principles in Muslim people.

The importance of child and childbearing, according to the vision and intellectual beliefs of individuals and the various schools have been interpreted in different ways. In total, human being and consequently child and adolescent have had great importance. Prophet Muhammad emphasizes this notion that child has had value and special status in Islamic insight: "Marriage to be increased, I am proud to you on Judgment Day, even to a child who has been aborted" (Kashani, 1421) Prophet with his word gives great importance to the people and his group and Muslims and promotes Muslim people and their numbers. Divine caliph as a human being not allows dealing with children and adolescents in any way. Child and Adolescent have God spirit and we don't have right to behave them against God's command.

When it was given good news to Imam Sajjad that has child, before asking a boy or a girl, He asked! Is it healthy? And when he realized, he is healthy, he said: I thanked the gods that not created unhealthy creature from me. So the wisdom of the existence of child and adolescent, regardless of their gender, it is a rating and privilege that attracts the man's thought. As we observe in Imam Sajjad's word, he has emphasized on health and baby's health status.

**The value of childhood and adolescence from the perspective of Islam:** According to religious worldview and Islamic view, human character has different periods of childhood, adolescence, adulthood, old age and ... (Bagheri, 2006). In Islam, child's existence has a great importance. In Islam and based on religious approach, child has the highest and most precious status and childbearing is the most serious responsibilities and mission. In the God's worldview, child is as a gift that from the realm of God's grace is given to parents:

The absolute dominion of the heavens and the earth is for God; Whatever He wills, He can create, to anyone who wants, gives daughter and to whom He wants, gives son; Or gives them son (s) and girl (s) with each other and whom He wants, makes sterilization, He is the Knower mighty. It seems the idea of reforming society and progress and excellence perspective of human not restricted to his thinking and the overall impression of the community, but to educate human beings, individual

elements and train them must be always considered by those involved in the programs of various spheres of human thought. Child and his training is the elements that should try a lot for training and protecting him from intellectual and cultural risks. Childhood and adolescence is including periods that is the time of forming their personality and thinking ideal bases. It is based on the value of childbearing and consequently education of two critical periods of childhood and adolescence that pleadings of parents about asking in such a way from Qur'an and word of the Lord are expressed, and those who say Lord, give us wives and offspring that causes the joy of our eyes and make us leader of the righteous".

According to emphasize religious texts, the Prophet and the Imams of Islam, parenting plays a key role in the sequel, and the fate of the parents. It is according to the importance of this period that in Islam, a kind of continuity and coherent communication and coordination between the relationship with God, parents and children can be seen. Childhood and adolescence is point of hope and the removal and disposal of some weak points that parents during lifetime have tried to experience it. Based on the teachings of religion, child and adolescent are continuant and heritage of Islamic culture that achieved it by parents.

**1. The role and value of love to child and adolescent in religious education:** love to human being is a need that at various schools of thought has responded it in different ways. Islam in this regard has a view that pay attention to it has a significant role in the upbringing of the individual. Imam Sadiq in love and happy the child said: Anyone who kisses his son, Allah writes for him the reward and anyone who makes him happy, God will make him happy at Day of Resurrection, too and whoever teach him Quran, his parents will be invited and two dresses are covered by them that from their light, paradise faces will be luminous.

Integrity and not break and distance between the various elements of human character, nature and God is the creator of a new look to the man and his activities. As we know, Islam according to the Prophet and harbinger of this religion is a moderate and balanced creed in all areas and away from any excess and defect. In such a way that the Prophet has mentioned in this context that, "the best practices and affairs is average of them". This saying of the Holy Prophet inspired the notion that Islam not accepts excess and defect in any matter by the excuse to ignore other aspects. Prophet blame on a person, who prayed and had neglected the family income, represents a comprehensive look of Islam to humans. (Shariatmadari, 2000).

By these descriptions, it seems in the education system and upbringing of the child and adolescent should also note this issue that excess and defect creates great loss; Description that school and education system is as a teaching and learning environment on cognitive aspects and its important aspect that Islam gives great importance to it, ie emotions, feelings and emotions of man is forgotten man. However, according to Islam, religion is not something other than kindness. The Holy Prophet says "love children and be kind with them"

As we know, by expanding the mankind activity of current era in various fields, education of person has been associated with problems. Some of these cases are facing men and women to work and economic activity. Because of the men and women working and job and changing life patterns, we can see the spread of kindergartens and the arrival of children to this strange land. An environment that by various excuses, child separates from the warm and friendly arm of kind mother and spends the best time of creation and the need to love in an unfamiliar environment of kindergarten. What is the Islamic model to receive such love? What should be the role of parents, especially mothers in this area?

So we see that the need and the base of activity of Muslims and believers is in love and it is affection that creates ripple moves

and echo rate of change, dynamism and movement in person. Imam Ali says: "Be gentle with children of your family and respect for your family's elders. (AL-Amali, Mofid, 2009)

Love is a need that should be answered it and did not neglect of its value in the live of child and adolescent. Imam Sadiq in the field of love to child said: (22) Allah has mercy on a man who loves his child. Man according to time position and lifetime needs to receive love in childhood and mother's arm is the most natural place to grow seedlings of hope and perfection. To fit the ages and the time, the child enters adolescence stage and called for love and affection. Here the way of fall and rise and error and guidance based on receiving love of childhood represents the importance of love or lack of it. An adolescent who not received the love of family and in this way acted to get it improperly, is likely to receive much damages from the environment. For example, one of the areas of contacting an adolescent who passed childhood is to deal with the phenomenon of relationship with the opposite sex. A child, who received affection from his parents in childhood, not feels deficiency or malnutrition and in connection with opposite gender has a reasonable behavior. But the opposite point is the adolescent that according to the situation and family conditions not received much love from parents and in here to compensate for psychological complexes and love, according to his need faced with any wrong action although inappropriate in connection with the opposite gender.

So pay attention to love children and adolescents according to their position is the necessities that in the case of non-attention will bring irreparable damages. As a result, turning to sub-activities to the main operations or receiving affection is a point that should be considered by parents and education authorities. The Holy Prophet has emphasized the love of man, especially in childish ages. In this context, he says: "love children and be kind to them". Love and linking the father, mother and children and the importance of the family foundation in the perspective of Islam is necessary that has raised the basic foundations related to cognition and enough attention to human.

### 3 Educational value of curtsey and adherence to religious practices

The realization of the fundamental ideas related to religion and matters related to it is in such a way that the implementation of its orders in real life is the major concerns. For this purpose, Quran and its teachings should be used in human life. Including commands that the Quran emphasizes it a lot is social customs observance of human being contact with each other or the courteous of sociality. In other words, teachings of Islam are based on observing commands and attention to them. Imam Sadiq (AS) said that Loghman said to his son:"

O son, if you taught curtsey in childhood, you will benefit it in adulthood. someone who is going to learn curtsey tries to get it and one who efforts to learn curtsey and learns the educational sciences and with the most intensity gets ethics and one who separately tries finally will be succeed, and he gets its benefits "(Bahar al-Anwar, 1998).Compliance difficulties and behavioral problems in children and adolescents reflects the human desire to Islamic education with an approach that is promising. Many Islamic educational concepts since the beginning of the ceremony to present time have been rooted in the observance of this religious customs.

Imam Baqer in the field of child rearing based on values and religious norms believe that raising children is the best way of familiarity of child with religious themes and concepts that is important for the development of the personality of Muslim man." Let your child to be free up to seven years to play, and seven years later care him, if he accept religion and education, it will be good otherwise any good in him" (Baharolanvar, 1995).Child-rearing practices and situation and his condition is the way of human education in life. Freedom with considering the limitations of human life is the cases that appear in the Liberal school (Gotak, 2009).

It seems three periods raised by prophet is the most essential things that draw the perspective of how to train human. In the first period, individual has freedom and more opportunity to his own activities and in the field, little restriction for his activities can be seen. In other words, in this period, child has the opportunity to develop and display his innate talents. It seems that familiar with the norms, rules, principles, etc. in the next period ie second seven years that can be seen.

Certainly freedom of the child in the previous period will not give the criterion of any activity to human. In other words, one must show Islamic education in his behavior and realization of such an issue is adherence to the laws and rules that expected him. So the child is required to follow some orders during his own life.

Amir Al-Momenin says: Anyone who not suffers from hardship in his childhood, in adulthood does not reach to be smart and dignity (Ghararohakam). Customs and observe some rules is necessary for human education. Children's education as a fundamental activity is rooted in the fundamental elements of society, culture, etc. It seems that education and extracted comments is on the basis of ideas of personal and individual that people have inferred it from texts and sources and have neglected of other important elements in shaping education and customs and curtesy and adherence to the principles is the cases that have been neglected by human.

Naturally, expect of child and especially adolescent, according to growth stage and new property and his character is the creator of questions and curiosity about the cosmos. On this basis, child and eager expect to benefit and profit of religious teachings and explaining them is in practice and reality. Teen welcomes the affairs that have a result. It seems to have a plan and an efficient use of time and resources is always an idea that in Islamic teachings can be seen. Islam not accepts spirit of absurdity and futility on human activities and on this basis that it believes to spirit ultimate on human activity "Do you think that God has created you in vain (). So, Muslim man draws an outlook for the activities and affairs of life. Accordingly, Aman Ali (as) in this area suggests a kind of purposive activity for teens:

The best thing that teenagers should be learned is the things that they will need in their adulthood. Imam Ali's word (AS) is a kind of accepted custom and practice governing human activities that should always be the priority of human activity. As we know the customs of Islamic education in various fields of value and educational practices in the field of education of child and adolescent can be seen. Holy Prophet (pbuh) said to a man who kissed one of his sons and not the other one: why you did not observe equality among them?

This kind of message of the Word of God is on this basis that the formation of the concept of justice is essential in human behavior. So teen and his parents in the form of custom as a courteous manner learn that discrimination and violence should be one of the ideas of human. One must realize the fact that the only criterion for acceptance of correct behavior on nearness to God is the behavior based on accepted Islamic rituals and customs. Preparing teens for religious practices and admission of unity is from the other cases that from the time of childhood have been emphasized by prophets and imams of religion. In this case, it can be referred to the performing of religious practice by children and adolescents. In this context, the Holy Prophet said: "when our children became seven years old, we should command them to perform prayer and fasting as much as they can perform."

Expanding the boundaries of human access to information and knowledge with issues such as globalization and cultures engagement is the provider of opportunities and threats for various fields, including culture, education and more. In some cases, the mentioned threats are as this that engaging family and child with the issues of the so-called educational that was merely superficial replaces the traditions and the duties and obligations

of children and adolescents. Therefore, in education, the ultimate goal of education for child and adolescent in Islam and his religious identity and distinctive should be considered.

An example that Imam Ali has stated about the traditions of shaping the Islamic character is the compliance and tolerance of problems that give the exalted status of the person. In the field, customs of dependence and follow the directions by their followers is the reality that represents following and obeying of infants and children from religious leaders and the commands of the Qur'an. For example, stating patterns as Ali Akbar and Ali Asghar in Karbala shows the deep respect and love of children and parents, as well as respect for God's orders. So endure hardships, according to verse 4 of Surah Balad reflects the principle and the concept of tolerance of suffering and its important role in education of human. Therefore, according to Alawi (2013) hardness and problem for child not seems as unexpected practices and it is a situation unlike this case that is the creator of abnormal situation in human life. Courtesy and display it in the behavior of Muslim shows belief and practice of his activity. In addition, it represents environment and atmosphere that man has grown in it. Religious stories in this field indicate the effects that the individual has accepted from his religion.

For example, the story of man's encounter unfamiliar to perform ablutions for the prayer and Imam Hossein and Imam Hassan behavior suggests religious appropriate behavior that these two dear Imam in adolescence have done ": One day, Imam Hassan and Imam Hossain peace be upon them passed from one place, they saw that an old man was performing ablution, the ablution was wrong, meanwhile, Imam Hasan and Imam Hossein PBUH & HP each said: my ablution is better! In this case, they came to old man and said: O old man! We two perform ablution and you watch and then tell us and say ablution of which of us is better! Since then, both brothers performed ablution and when the ablution ended, they asked ablution of which of us is better?! The ignorant old man, said: ablution of both of you is good, this is my ablution that is not true, however, by blessed love and kindness that have for your ancestor, I learned.

Courtesy and manners in Islam in various aspects of personal, social, political, sexual is the cases that are considered in Islam. It seems that sexual education is one of the issues that by the expansion of human communications technology, the Internet, satellite and ... is more important. In this context, in accordance to adolescence and beginning of the physiological changes, physical and sexual, and changes in appearance between males and females, it should be noted to sexual problems and solutions applicable in this regard. Lack of attention to the issue will follow irreparable damage in education. In this regard in the Qur'an with the arrival of the man to this era is bound to respect the religious customs that holy Quran has stated it: (59 / Noor) and when your children reach puberty, they must ask permission, as those before them asked permission.

#### 4 Conclusion

Investigating what, why and how phenomena of the universe or the dominant philosophy on the universe is among the issues that affects all fate of human beings. Including philosophical influences of intellectual systems and human thought is to create and produce intellectual productions in the real world. It seems that events surrounding the world and universe explain the philosophy dominant on the human mind. Among the intellectual schools and owner of culture and the eternal teachings can be cited Islam. Islam is able to promote moderate and balanced ritual according to the old motto of the ritual by expressing its teachings in all fields as well. Islam in all fields and areas of human knowledge, including education, sociology, politics, and so on is the owner of idea and practical teachings. Man is the owner of style, expression and ideas.

It seems that education and human ethics is one of the important areas that man has created fundamental transformation in life. As

the Prophet (pbuh) has considered the purpose of his coming and his great mission conducting and completing ethic: "I was motivated to complete the moral goodness". So education is a great mission in the process of human activities. As we know, education has various elements such as teachers, students, target, and so on. In the course of education, human as a teacher and student has an obvious and fundamental role. As we know, man spends different times of his life in the center of the universe. According to Islam, childhood and adolescence is including the most important periods that man creates the fields of who and what of its own, creates fields of being familiar with the values and religious and moral education in itself and provides fundamental knowledge that its critical roots and fields form in man that takes the path of human life to the perfection or error. In the words, imams and religious scholars, childhood education is as the carved on the rock. So child's education should be formed in child such that fields of formation of character and religious identity, intellectual and cultural to be created in person.

Adolescence is the stage between childhood and puberty that is called pressure and storm periods, and man is full of energy during this period that according to religious teachings and the compliance of balance limit is the creator of healthy personality. As it was said from the continuity of human life, training of each period is the result of acquiring and learning general knowledge of previous generations as well as the training of later periods of life. Islam has a special focus on Muslim and the existence of child and adolescent with any feature and attribute is acceptable to it.

As it was seen, prophet values and respects for aborted fetuses. So the existence and value of human spirit regardless of any criterion is a point that can be inferred from the teachings of Islam. In Islam school, child and adolescent, poor and weak, black and white ... none have superiority over another and the only criterion of superiority of Islam is closeness to God and observing piety.

In addition to the philosophical ontology, it seems values, ethics and important religious principles in the field of norms is a point that in the education of child and adolescent must be considered. Islam is the religion of values. The Final of what, how and why of values is closeness to the presence of God and faith adherence to his presence in life. Love is including the fields that human by appealing it communicates with each other and finally communicates with his God. Seems link children and adolescents to parents is in the second degree of human relationship after God.

Human by creating such a link flourishes his talents and power in their fields of interest. Thereby by receiving family affection from parents, security, avoidance of psychological problems, depression, anxiety and ... can be achieved. Thereby by hankering in the way of prosperity and gaining the knowledge of God tries to spend its best moments.

Observing a set of religious common rituals and commands with faith in God and his knowledge with tolerance of hardships is achievable for human. In every religion, necessarily there are some necessary and obligatory instructions for human excellence and his access to the ideal points. Obligatory, abominable, permissible and recommended are including customs and laws

that are accepted in Islam. Child and adolescent in order to achieve success must adhere to these matters. In this case, they will be able to see its effect in his life. Among these religious customs, it can be noted to preying that follows much parenting effects in human life. Night prayers and historical evidence and religious patterns represent the importance and value of this obligation that it should be considered. Explain the nature and how religious practices is as this that in Islam all cases, obligatory, abominable, permissible and recommended have appearance and reality that compliance of both aspects of appearance and reality must be taken into consideration in Islamic Education. Sometimes at first glance, adherence attracts one of the two appearance and reality matters of the human mind and considers adhere to one as criteria for a correct and appropriate behavior of its own, while in Quran and Islam, it is emphasized on both aspects of achieving Godly success. So the criteria of customs and religious rules for Muslim child are both aspects of appearance and reality that follows considerable implications in human life.

Although much research in the form of books, theses, papers titled child and adolescent's literature in the country is conducting, but a research in the field of child and adolescent field with an Islamic approach and Quran and its Educational contents will not be considered. According to the Supreme Leader and policies of the country to carry out projects and studies in the field of indigenous and Islamic and religious sciences and in line with the identity to Islamic culture and perspective of the religious character with a scientific approach, it seems childhood and adolescence is including areas that can be fostered new ideas in new form and independent in Islamic culture.

**Abstract.** The faithful implementation approach that teacher enforcement, the official ideology of both starting point and the destination point and the intended curriculum as well as a slightly colored in the curriculum operating is dominant. The adaptive approach, the official and operational ideology at all stages of reforms and implementation of the curriculum from starting point to the end point in both curriculum intended and curriculum operational are present. The enactment approach, according to the role of educational practice factors such as teachers and students involved in the process of curriculum changes, operational ideology strong role in all the processes of implementing changes from the starting point to the end point as well as in curriculum intended and operational.

**Keywords:** curriculum ideology, official ideology, operational ideology, curriculum implementation approaches.

### 1 Introduction

The ideology of Greek origin and is composed of two words, ideas and logy, meaning science ideas are used (Sather, 2003). Ideology word was first coined in the eighteenth-century French philosopher Destutt de Tracy. He applied ideology in the sense of science ideas. It then served in the tradition of Marxism, Marx and Engels and their supporters in the twentieth century Gramsci and Althusser's theory of ideology. As well as some sociologists and philosophers began to conceptualize ideology that they are the most famous Emile Durkheim and Karl Mannheim noted (Van Dijk, 1998). Eisner (1994) mentions the network and matrix values as ideology. Meighan (1981) for educational ideology, a vast collection, but related, ideas and beliefs about the world which by a group of people both in behavior and in their speech becomes apparent with other people, has defined (Shkedi & Horenczyk, 1995). Eisner (1994) curriculum ideology as a system of beliefs about what schools should teach, what is their purpose and what they use as a source, has defined. Eisner (1994) ideologies curriculum is divided into two categories: operational and formal. The official ideology of the state, in fact, consistent with the educational philosophy and as the educational system is predominant approaches by policy-makers and decision-makers curriculum is predetermined. But the ideology of operations related to the context and situation of educational practice and daily classroom activities. According to Eisner operating ideology has both hidden and obvious. Some of the values, beliefs and attitudes are explicit and the implicit and hidden some of the values and beliefs and in their individual behavior does not show clear and not easily understood (Eisner, 1994).

Curriculum implementation, means the process of making a change in practice. Classification of various kinds of curriculum implementation approaches has taken place. Chu (1998), approaches to the implementation of the curriculum is divided into three categories: 1. faithfully apply the approach that this linear approach is a technical process. 2. Adaptive approach (adaptation), this approach to the complexity of the context and situation where change takes place, insists. 3. Enactment approach that the participation and involvement of teachers and students in the process of change. Ideology plays an important role in the structure of the curriculum. Ideology as an umbrella,

covering the entire curriculum development process (Littledyke, 1996). Ideologies have a major role in the curriculum (Alexander, 2005) and one of the key concepts in the field of curriculum studies are (Musgrove, 1978) as well as ideologies determine what should be taught in schools (Musgrave, 1972). So the curriculum as a project of cultural, social and political, ideological and military on the basis of beliefs, values and attitudes shaped a social group (Ferreira et al., 2008) and cannot be value-free or value-neutral act against the system (Littledyke, 1996). Changes in education in any country is absolute and necessary, and no one denies it. Fundamental change requires deep involvement with the ideologies of Curriculum (Leonardo, 2003). Given the importance of ideology, which was mentioned in the curriculum, the role of ideology in the structure of the curriculum, especially in the process of curriculum implementation is very important. The main players in practice and curriculum will be implemented in the practice environment and should be accurate and comprehensive execution environment and value system of the execution environment exist. As mentioned, there are different approaches to the implementation of the curriculum and the value system prevailing in each of the approaches of curriculum implementation role of the different forms. So the fact that, according to Giroux (1983) an urgent and immediate needs of the educational system, the ideologies and value systems (Bartolome, 2007) and there have been few studies on this topic in this study the role of ideology in a variety of approaches to curriculum implementation will be discussed. The important implications of this study may help to reduce the gap between official ideology and operational at different levels of implementation of the curriculum and the role and importance of their role in a variety of approaches to curriculum implementation. Thus, according to the ideology of the curriculum, the official ideology and the ideology of operation, the implementation of the curriculum is effective, in this study, to analyze and evaluate the various curriculum implementation approaches and clarify the role and status of official ideology and operational in each of these approaches will be discussed.

### 2 Curriculum implementation approaches and models

The curriculum changes in practice is be said curriculum implementation. Approaches and different views on the implementation of the curriculum has been propose here are the approaches to the implementation of the curriculum in terms of Chu (1998) because of the comprehensiveness and attention to all levels of curriculum implementation were discussed. Most of the assortment that has taken a variety of approaches to curriculum implementation is often ambivalent and the involvement of non-involvement change elements in the implementation of curriculum are considered, but in the classification Chu (1998) approaches curriculum implementation, attention has been paid to various aspects of curriculum implementation and in each of these approaches has pointed to a different model for curriculum implementation. Chu (1998) approaches to the implementation of the curriculum is divided into three categories:

**Faithfully approach:** In this approach change is linear and a technical process. The idea of this approach, implementing faithfully and without any change curriculum that is intended by program planners. Participants are changes in the approach to decision-makers and planners. The process of change in this approach is a top-down process and new initiatives and changes have been made up by decision-makers and planners to low levels and the regions, districts, teachers and classroom are sent. In this approach the only system of beliefs and values of decision makers and planners in the design and implementation of changes are effective and system of beliefs and values of individuals involved educational action such as teacher and student is ignored. Chu (1998) points that each of these approaches has its own curriculum implementation models.

Models faithfully implementing or planning approach designed for two purposes, first to increase the effectiveness of the delivery system innovation, second to explain and predict the progress of the issues that the anticipated steps used by the user.

**Adaptive perspective:** Consistent with the notion of the adaptive perspective is the sensitivity of post positivism that emphasizes the complexity of the context in which a change takes place. Opposed to the over specification and rigidity of implementation goals and objectives, this perspective stresses a process that permits implementation policy to be modified and revised according to the unfolding interaction of the policy with its institutional setting. Accordingly, most educational concerns are to fit a proposed innovation to the institutional setting that encourages reducing the gap between an ideal implementation goal and given local contexts. In short, the success of a new curriculum results from the consequence of trade-offs within a local context in which multiple values are embedded. Curriculum implementation in adaptive approach are two models, one model of mutual adaptation which the teacher cannot help the change process but can be that change and innovation fit with the position and texture of its own. Implementation of adaptive thinkers have accepted the assumption that a predetermined curriculum framework must be properly interpreted by users within their location. The second type of adaptive implementation models, models that would assume responsibility for the tasks change, the change facilitator models are called. According to this model, users can engage the process of change and development programs are implemented. In these models, a cooperative relationships between managers, planners, researchers, educators, teachers, parents and administrators all there. The features of this model change, cooperation between schools, professional development of teachers, the students and the community to meet the needs, gather information systematically and monitor and amend true. In these models, facilitators are trying to implement the curriculum social distance between the target and the image they give of a person trained decrease (Beirami pour et al., 2010). Teachers in these models at different levels are active because their knowledge and skills in different levels is different.

**The enactment perspective:** Argued by Snyder et al. (1992), the enactment perspective refers to intra contextually in creating meaningful educational experiences "shaped by the evolving constructs of teachers and students"(p. 404). What makes this an alternative perspective, compared to the previous two perspectives, is the way it defines the concept of "curriculum." In this perspective, different priorities for "successful" implementation can be made WHILE the teacher and students enact the curriculum. In this respect, "curriculum" is not necessarily the taken for granted notion of "a document." Nor is it captured by the a priori instrument by which researchers are able to measure the enactment of the curriculum in light of predetermined goals and objectives. The enactment perspective points out the misnomer of the term implementation due to an unnecessary application of top-down bureaucracy.

Curriculum implementation models in the enactment perspective have key differences with two models of previous approach. One is that personal and moral growth of teachers are so important that one of the specific results of their efforts curriculum, Second, planning, acceptance and approval of curriculum are ongoing activity at the same time, Third, the active participation of students in the syllabus of the most successful methods to fully guarantee. To improve the curriculum reform process, researchers from the central role of teachers in curriculum reform and the need for teachers to have a sense of ownership and engagement in the reform of the change to favored. In the late 1980s, the emergence of new approaches to curriculum reform, including school-based curriculum development and research, practice, a new path towards putting schools and teachers in the curriculum reform efforts began. In this model, teachers and curriculum development control these models were in fact a kind of attention to democracy in the curricula. This type of model is based on the strong belief that teachers and

students are the ones who can create results that have both social acceptance and self-acceptance. Absolute authority of teachers and students in the planning and implementation of the curriculum is at the heart of these models.

### 3 Operational and official ideology

Eisner (1994) mentions the network and matrix values as ideology. Eisner (1994) curriculum ideology as a system of beliefs about what schools should teach, what is their purpose and what they use as a source, has defined. The concept of curriculum ideology in the literature and by experts in the field under different titles used. Mehrmohammadi and Aminkhandaghi (2009), ideology of curriculum normative theories were applied curriculum which are known as macro theory and philosophical training to be remembered. Miller (1983), the curriculum ideologies mentioned as curriculum orientation and Schiro (2008) and Kliebard (1986) are cited as the theory of curriculum.

Eisner (1994) ideologies curriculum is divided into two categories: operational and formal. The official ideology of the state, in fact, consistent with the educational philosophy and as the educational system is predominant approaches by policy-makers and decision-makers curriculum is predetermined. But the ideology of operations related to the context and situation of educational practice and daily classroom activities. According to Eisner operating ideology has both hidden and obvious. Some of the values, beliefs and attitudes are explicit and the implicit and hidden some of the values and beliefs and in their individual behavior does not show clear and not easily understood (Eisner, 1994). Operational ideology and daily classroom curriculum that refers to educational activities, in fact, the system of beliefs, values and attitudes of teachers, students and other people involved in educational practice that can at the success or failure of every decision and action training to be effective. The official ideology from the outside and operational ideology or lived within the curriculum and the educational system is derived from and operational ideology is in fact influenced by the official ideology, but it is possible, comply or do not conform to the official ideology and the compliance and non-compliance can have a degree.

### 4 Status and role of official and operational ideology at the curriculum implementation approaches

As was mentioned, changes in the curriculum is said curriculum implementation that there are different approaches to implement changes in the curriculum. In this study three approaches faithful implementation, adoption and ratification is examined. The successful implementation of the curriculum changes with different approaches need attention to the official and operational ideology of the curriculum. In this study the role of official and operational ideology at the curriculum implementation approaches, each approach separately role and status of operational and official ideology is examined.

**Status and role of official and operational ideology at the faithfully approach:** As was mentioned, in this approach change is linear and a technical process. The idea of this approach, implementing faithfully and without any change curriculum that is intended by program planners. So based on this approach, objectives, content and curriculum evaluation and also designs and new ideas advance by program planners and decision-makers determined and communicated to the teacher and the classroom and the teacher's role is simply implementing those changes and reforms. If the official ideology to recognize as system of beliefs and values of the curricula and the educational system and operational ideology know as belief systems that dominant at the classroom and people involved educational practice, can be said that the official ideology at the faithful implementation approach, starting point and start of in curriculum and the point of destination at the end of planning and curriculum intended as well as a little more color in the implemented curriculum is dominated. As Figure 1 shows only

implemented curriculum, and it is at the end of ideology operational can be seen. That all changes to the officially by politicians and decision-makers and program planners intended to dictate curriculum and run and the system of beliefs and values their dominated and people involved administrative and operational curriculum such as teacher and student do not have any role in curriculum planning, but at the beginning and end of the curriculum implementation subconscious beliefs and values

of the people involved in educational practice are effective, and although objectives, textbooks and curriculum guides, lesson planning and decision-making by the central organization and planning are identified curriculum but in the classroom by the teachers, managers and students are implemented and behaviors that after Implementation of the curriculum in the student takes shape only arising from the curriculum intended will not be by decision-makers.

Figure 1: Status of official and operational ideology at the faithfully approach

Status and role of official and operational ideology at the adaptive approach: Consistent with the notion of the adaptive perspective is the sensitivity of post positivism that emphasizes the complexity of the context in which a change takes place. Unlike previous approaches to educational goals and objectives for dry runs were predetermined, in this approach is the emphasis on the process of change and a policy that can be changed based on interactions policies with educational contexts reviewed. In this approach change to adapt with the conditions and characteristics of the local situation and individuals opinion involved action and national policy planners and decision-makers begin and the individuals involved educational practice and decision-makers and program planners involved in the change process. In this approach, the individuals involved educational practice and program planners and decision makers there is an interaction. So the relationship between the official and operational ideology at this approach as in Figure 2 is shown, official and operational ideology at all stages of reforms and implementation of the curriculum the starting point to the

end point and the intended curriculum and implemented curriculum at present. The intended curriculum is designed from the beginning that the people involved in educational practice and curriculum implementation and the decision-makers and program planners are involved. And the participation in change and implementation of curriculum intended and curriculum implemented is likely to continue until the end. And the participation in various forms within the different levels of decision-making can occur, that can be delegated to provinces, and schools in designing and producing textbooks, curriculum guides or in school curricula filling happen. In this approach the system of beliefs and values of individuals involved educational practice or the operating ideology and system of beliefs and values of decision makers and planners of educational system or official ideology involved and based on this approach the Central Authority sole responsibility of deciding on the goals of the curriculum, textbooks and other curriculum components do not have.

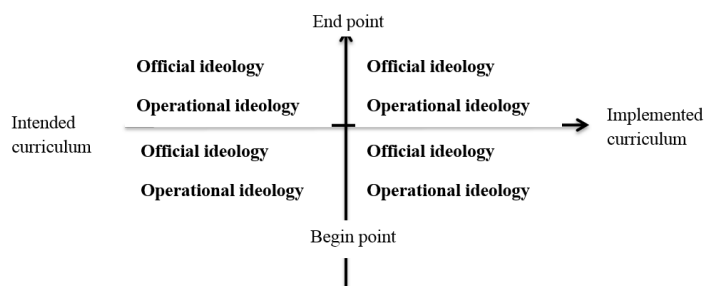

Figure 2: Status of official and operational ideology at the adaptive approach

Status of official and operational ideology at the enactment approach: This approach, an approach in a position to create meaningful educational experiences, and engage with the participation of teachers and students has been formed. This approach is based on the successful implementation of the curriculum can happen with the participation of teachers and students. The curriculum in this approach is essentially a document preset. This top-down bureaucratic approach to the implementation of the curriculum appropriateness and relevance, but the opposite is bottom-up. The relationship between the official ideology and operational approach as in Figure 3 is shown, in this case, is due the role of involved individuals in educational practice such as teachers and students in the process of curriculum changes, the operational ideology a strong role in all the processes of implementing changes from the starting point to the end point and as well as the intended curriculum and

implemented curriculum. That changed completely endogenous and the people involved in the action happens Education and Classroom, and start designing curriculum planning and implementation of the curriculum in both administrative and operational actions by the people involved such as teacher and student takes the responsibility to formulate guidelines for the curriculum and textbooks and learning resources from headquarters and taken decision makers and local districts, schools, teachers, parents and students are given and decision-makers and program planners have not a strong role here, of course, since the attitudes, beliefs and values of the people involved in educational practice and philosophy of education influenced the educational system of the country will be the dominant approach, official educational philosophy educational system either faint or official ideology can be involved in this approach.

Figure 3: Status of official and operational ideology at the enactment approach

Figure 4, the overall operational status of official ideology and faithfully apply the three approaches, adaptive implementation and enforcement of the adopted curriculum. As was explained and Figure 4 show the faithful implementation approach, the official ideology and the role of the Central Authority bold Curriculum unlike the enactment implementation approach which operational ideology and the role of individuals involved in educational practice such as teachers, parents and students more pronounced. The adaptive approach to implementation of the partnership between decision-makers and central organizations and individual's involved Educational practice such as teachers and students is very important.

## 5 Conclusion

As explained, the official ideology, in fact, consistent with the educational philosophy of the educational system and the educational system are also predominant approaches by curriculum specialists and decision-makers have already been determined. But the ideology of operations related to the context and situation of educational practice and daily activities are classroom. Approaches and models of curriculum implementation, including faithfully approach that are prescription and technical models, adaptive approach to participatory approach models on the one hand due attention to policy makers and program planners and on the other hand, because according to teachers and students and other individuals involved action can be implemented in practice and is successful. And enactment approach models that have full power to teachers and students in curriculum implementation is high. The official and operational ideology role in the implementation of the curriculum models is an important factor in the success or failure of the implementation of the curriculum is considered.

Official ideology at the faithful implementation approach, starting point and start of in curriculum and the point of destination at the end of planning and curriculum intended as well as a little more color in the implemented curriculum is dominated. In the adaptive approach, official and operational ideology at all stages of reforms and implementation of the curriculum the starting point to the end point and the intended curriculum and implemented curriculum at present. In the enactment approach the operational ideology a strong role in all the processes of implementing changes from the starting point to the end point and as well as the intended curriculum and implemented curriculum. So we can say that the approach and the approach to curriculum implementation models tend to be adaptive and collaborative models and the participation of all individuals are entitled, the gap between official ideology and the operating time will be reduced and the official and operational ideology will be considered and how these approaches and models run contrary to the faithfully approach and enactment approach, the distance between official ideology and operational also increases, and one of these ideologies is neglected. Hence it is recommended that the design, development and implementation of curricula, both politicians and decision-makers and program planners, and others involved both teachers and students involved in educational practice, has not neglected the official ideology and operational ideology and distance between official ideology and operational ideology reduced and curriculum implementation accompanied with greater success. So the results of this study may help to reduce the gap between the central organization Curriculum and schools and educational context for the development and designing curricula and learning resource and also attract the attention of politicians, decision makers and headquarters to the context and environment in the implementation of the curriculum changes noted.

Figure 4: Status of official and operational ideology at the approaches of curriculum implementation

**Abstract:** This study pathology of citizenship in the category Architecture Behbahan in 1395 was carried out. The aim of this study was a - applied manner. Thus, in order to prove hypotheses, the survey involved people (those living in Behbahan) is used, the methodology is correlation. Using a sample of 384 subjects was selected and sampling. Data collection, using a standard questionnaire was used. Cronbach's alpha for reliability and for its validity and content validity were used in the analysis, the results are valid and reliable indicator of the questionnaire. In this study, the hypothesis to answer t techniques was used. The results showed that satisfaction of citizens' rights is less than average, that the unfavorable situation and bad (the average response is the lower 3).

**Keywords:** Pathology, civil rights, architecture, Behbahan.

### 1 Introduction

Citizenship is derived from the city. Citizenship is the advanced farm of citizen's. According to some experts, when city dwellers who respect each other's rights and their responsibilities towards the citizens of the city and their communities have improved. Before it citizens of this city were studied (Balan, 2010). In the social sphere but then your concepts of citizenships and country's state.

Today, many think about global citizenship. Citizenship today has various meanings and applications. Citizenship refers to a person's daily life and business activities of community and social activities are also in general set of behaviors and actions of individuals. Dynamic citizen or citizen activities actually comes from this attitude. Citizenship from the perspective of a bread set of individual and social activities. Although the individual, but their resultant activities that with help to improve the social situation (Katz, 2008).

Citizen is the wide range of social activities and individual activities, although this activities are individual but contribute to the advancement of the socially although the economic contributions, public service, volunteer activities and social activities that are effective in improving the lives of citizen, in addition to the rights of citizenship in the bigger picture of social and ethical behavior. Citizen education unofficially at home or work or workshops on carrialm separately, in fact. It teaches people how to take responsibility. The basis of the training pattern raise a good citizen is not (Petoft, 2015).

But also teaches them how their decisions according to their responsibilities toward society (and their individual their live.) (and affected their individual live. Citizenship education is one of the branches of citizenship that according to the rapid developments in technology and contemporary political and social concerns including planners and they were the education policy. Makers of the world. In developed countries the concept of citizenship from childhood to adolescence is fought and the government provides the necessary framing to the teachers and parents (Petoft, 2015).

In fact the citizenship rights was the set of which people are said to have the validity of their citizenship status, so the definition of civil rights is a fairly broad concept that includes individual civil and political rights and economic, social and that set the relationship between people and government and civil institutions and to set out the rights and obligations that is the split of political rights within the country's constitutions and to respect and protect the human rights of individuals and socially of large (Petoft, 2016).

In fact, the general applicability of civil rights, the total points for citizens, as well as a comprehensive set of rules that govern their position in the society (Monfared, 2010).

The holder of the rights of the citizens refers to the individuals who lives on the society beyond the concept of citizenship without regard to hierarchy as distend situation for people and there are special conditions for the recognitions and the rulers and the rule specifically against and based on multilateral relationship between state, society and the citizens and the existence of a moral position to activity partiapate. In other words rights and privileges as citizens of a country with respect to the two principles of human dingily and non-discrimination for provide citizens backgrounds and development of individual and social personality of the citizen that in the legal system of a country is granted as citizenship rights. The ultimate goal of establishing a citizenship is happiness for all life stages obviously the number of rights that are innate, for example the rights to life, freedom of rights that have always been present in humans and not exclusive to yesterday and today, but things like workers' rights and employers or trading rights and rights to the education, such matters are contractual or common law that are various according to the requirement of day in any time period but it is important to note that according to observance and enforcement of rights that cannot distinguish the difference between them and all rights should be respect equally human society in the course of their change have been forced to minimum wage. As the board accepted the demands of the citizenships and every society due to their efforts to this content the more and quantitative and quantitative expansion in a favorable spot, the emergence of the city dates been to the earliest human civilizations humans create amazing changes in culture and by factors such as agriculture revolution, promote treacle and commerce the invention of writing and political factors administrative and military and political allow to provide the development of the city, the industry revolution also as a strong stimulant with the administrative institutions of social, economic political and cultural not only changed the city's three-dimensional space lout various changes and modifications it will be in the areas of social life. The destruction of residential neighborhoods space by urban plans change more and undermine ethnic solidarity neighborhoods and city had a harmful impact on social relations. Therefore the study of the city and the consequence of changes in the social system and personality it helps to the various in the society. Can also fer-hle ground for measures and procedures to organize and the social life because cities are a valuable actual treasures that represent the history of social community each of this elements and spaces is a rational part of the social features that with the review and identification of unknown dimensions that can winning the territorial social history. According to a forecasts to the 2015 years the number of metropolises in developing countries will be a 486 city number in while 1966 this umber was only 54 city. The cities are largely centers that a high percent of the population have in that happen the massive consumption of resource. From about 1950 years for various reasons cities in the third worked have had unprecedented grout in developing countries each year 50 million added to the urban population (Monfared, 2010).

Demands that its adherents housing and municipal services arises. With urbanization and migration increasing urban population in different areas and login technology, regulations

and rules and the great human Iranian community to maintain order and concept such as citizenship and civil right were met and experts and scholars from different fields of science began to study the concepts of the city. Although the citizens have a long history but it is still unclear and problem ate (Meenu, 2007).

Juny argued that citizenship rights is a serious of public communication between people that they want the state of nature hat is the case for a speculated life there meanly away from the dirt-protecting to avoid the animal life (Meenu, 2007).

Citizenship is a kind of social contract that the main objective is to promote the welfare and security at the community Lakeland concerns that members of a society must necessarily how to behave to reach this. In fact trends citizenship or capabilities city and its objectives are not necessarily in relation to the expectations of community members of certain communities and nation understood because they have the knowledge and attitudes skills and values along with participation or transfer of mass civil although created to prepare citizens to know the political and social duty but friends citizenship subjected to the citizenship education and community rules to in calculate the values of citizenship and is the rule of the law (Petoft, 2013).

Rule friends three discussion the nature the political state and the nature of the relationship between the individual and society and citizen linked. The history of this discussion can be found in photo's republic and in explaining to prepare the young Athenian found the medal for social life according to Plato's ideal orientation, citizenship depends on education that the primary of individual rights against governments and the role of constitutionalism in the governance stability (Petoft, 2013).

According to Aristofk friends citizenship udge and evaluate and consultation and under the terms of the entry rules and taking into account the interest of others (Petoft, 2013).

Citizenship is one of the concepts that recently due to H'S plentiful in various fields and particularly focuses on justice and equality and had a special place in the political and legal theories (Petoft, 2013).

### 1.1 Review of the literature in the field of research

Malihe sheiany (1381) the sociological analysis of citizenship status in lorestan city that was conducted through the survey method has concluded that the rights and duties are the main elements constitution of the citizenship so there are people in very community empowerment through different relation which are a prerequisite for the realization of citizenship.

## 2 Research methodology

This study applied research is in terms of objective and as the method of doing, it is placed among the researches of the survey- Correlation. Because in the current study, the researcher has used the inferential statistics method and structural equations modeling to examine the impact of variables and their relationships. This research also examines the data related to a period of time, so this research belongs to a special time (Khaki, 2006).

The Statistical population of this research comprises people who living in Behbahan. Cochran's formula is used to determine sample size, given that the variables of research are quantitative and average able and size of population also is unlimited. In this formula, considering that the standard deviation of the society ( $\sigma$ ) is unknown; Accordingly the Cochran unlimited formula, the number of review sample 483 was determined. The sampling method in this study has been selected by available. In order to

gather the required data, we used questionnaire. Items of the questionnaire through the review of previous studies were extracted and by referring to the professors of Group, its reliability was confirmed in terms of content. To measure the reliability of the questionnaire, Cronbach's alpha coefficient was used. The first part, Questions is about the demography, the second part is related to rights of citizenship and is used the Keshavarz's questionnaires. (Momeni, 2011).

### 2.1 Reliability and Validity

Validity means that, how can we be sure that the questions in instruments measuring, the same thing it should measure, is measured. To ensure the validity of the questionnaire in this research, we used content validity, structural validity. Kaiser-Meyer-Olkin determines whether the variance of the variables of the research is under the influence of common variance and some of the secret and fundamental factors or not. This index is in a range from zero to one. If the value of the index is close to one, the considering data are suitable for factor analysis; And otherwise, less than 0.5 are not suitable (Rezvani et al, 2015).

**Bartlett's test:** This test examines when the correlation matrix, in terms of mathematical is the same and unit matrix. The correlation matrix has two modes: The first mode is the time that the matrix of correlations between variables is the same and unit matrix, otherwise the variables don't have significant relationship together and thus the possibility of identifying the factors new, based on, there is no correlation between variables with each other. The second mode when the correlation matrix between the variables is not the same and unit matrix, in this case, there is a significant relationship between the variables. And therefore, there is possibility of identifying and definition new factors on the basis of correlation between variables. If a significant Bartlett's test is less than 5%, it is appropriate factor, because of the known hypothesis is rejected the correlation matrix (Trujillo, 2009).

The meaning of reliability is that, if we give the measuring tool at the distance of short time in several times and to single group of people, the results are close together. To measure the reliability, we use an index that called the "coefficient of reliability". Its size usually varies between zero and one. The reliability of coefficient of "zero" represents unreliability and reliability coefficient of "one" represents the perfect reliability. The main purpose of using the Cronbach's alpha test is the evaluation of the internal consistency of items in a scale, which prepare through the process of making index (Rezvani et al, 2015).

In this research, to evaluate the reliability of the questionnaire is used Cronbach's alpha hat its results are shown in the table below. Usually the alpha less than 0.6 is weak reliability, 0.6 to 0.8 acceptable and higher from 0.8 indicates high reliability. It is obvious that whatever number is closer to one, is better. As mentioned in this research, after collecting data from the prototype, the data were entered into the software of Spss2 and Cronbach's alpha coefficient calculated which the intended coefficient 95.0 was determined that is indicative of the high reliability the measurement tool. The Cronbach's alphas of each of the variables are presented in the following table separately (Rezvani et al, 2015).

In this research, in order to assess structural validity and reliability of the questionnaire after developing the questionnaire, the researcher put it in supervisor and consulting advisor; and after receiving the comments, corrective actions were taken. For evaluation the structural validity of the questionnaire and confirm of the considered factors, the confirmatory analysis method was used that values of this index is brought in the table 1.

Table 1. Results of testing the validity and reliability

variable	Cronbach's alpha	kmo	sig	Eigenvalues	variance explained
Citizenship rights	0.95	0.96	0.00	9.45	56

### 3 Data analysis method

In this research, for the research hypotheses employed a t-test, conceptual model fitting, structural equations modeling. There is different approach in relation to structural equations modeling. This means that the structural equations modeling can be used based on different statistical methods, appropriate to the type of variables and the characteristics of the statistical sample. Structural equation modeling, a particular scientific structure is invisible between a set of structures. A structural equation model consists of two components: a structural model which defines the scientific structure between the hidden variables and a measurement model that defines the relationship between the hidden and observed variables. In the path analysis is not available the model of measurement and just include the scientific structure. Path analysis can be done only on the observed variables. If it is needed, with the assumption that latent variables can be averaged from the observed variables, and we can express in a form of observed variables. One of the statistical methods in the field is Partial least squares method. The software that use structural equation based on the statistical

methods than the existence of conditions such as co-linearity of the independent variables, unmoral data and be small of the sample is compatible. In the present study has been used the Smart PLS software that in the context of structural equations modeling based on partial least squares method is useful software. The estimation method of PLS, determine the coefficients in such a way that the resulting model, have most power of interpretation of and explanation. This means that the model can predict the dependent variable with the highest accuracy (Hayes, 2013).

### 4 Research findings

Statistical information is presented in the relation to the review sample in the Table 2. As the data show the most respondents are from old texture, female and between the ages 19 to 25 years, diploma or under diploma with inhabitancy or more than 21 years in the region. More respondents know the rights of citizenship synonymous with social welfare. General information is given in Table 2.

Table 2. Demographic information

Age						kind of neighborhood			sex	
46<	41-46	36-40	31-35	26-30	19-25	18>	New	Old	Female	Man
15	13	11	13	21	24	3	26	64	54	46
Education						staying time				
Doctors	M.A	Bachelor	Associate Degree	Diploma or less	20<	16-29	11-15	6-10	1-5	
1	3	30	26	40	40	17	19	15	9	
Attitude to civil rights										
freedom	Right to Life	Urban Partnership	legal system	Welfare	Social belonging	National identity				
1	1	8	6	69	13	2				

The questionnaire was distributed in the following places: Par, Seyed alshohada (Abkhasiha), Kargah, Seyed, Godchahak, Molayan, Pahlavanan, Shajfazi, LabAb, GodKalo (Javanmardan), GodBaghal.

#### 4.1 Inferential analysis of research findings

##### Results of confirmatory factor analysis of two times (Measurement models)

Confirmatory factor analysis is one of the oldest statistical methods that use to examine the relationship between latent variables (obtained factors) and the observed variables (Questions) and represents the measurement of model. Table 4 shows the index of explained average and variance, Cronbach's alpha and combinational reliability and the average of response. The value of the index of Cronbach's alpha is from 1 to 0. The value of this index should not be less than 0.6. The combinational reliability values between 1 and 0 and is an alternative to Cronbach's alpha. In addition to the structural validity that used to check out the importance of selected markers also use to measure of constructs. Also in the present study the diagnostic validity is desired; this means that any structural markers provide an appropriate differentiation in terms of measuring

relative to other structures of model ultimately. In simple terms, any markers measure only their structures and their combination in such a way which all structures are well separated from each other. By the index of average of the variance extracted, it was found that all the studied structures, their average of the variance extracted are higher than 0.5. In this research to evaluate the authenticity structural model is used R2. According to China, R2 which only dealt with endogenous variables and is representative of the amount of variance of the endogenous latent variables; with bigger amounts of 0.67 significant, between 0.670 to 0.33 averages and less than 0.19 is considered to be Weak. Also, if in a specific model which is a combination of the endogenous latent variables with only one or two output hidden variable, the amount of R2 is an acceptable of average (Trujillo, 2009).

To check the quality or validity of the model use the cross-validation this contains index of the cv-communality and the index of cv-redundancy. The index of communality, measure the quality of measurement model of each block. The index of redundancy that is also called Q2 Stone – glyceric; considering the measurement model, measures the quality of structural model for each endogenous block. Positive amounts of this index indicate the appropriate and acceptable quality of measurement model and structure. The Indices of the model fitting are presented in Table 3.

Table 3. Indicators of measurement and structural model

Redundancy	R <sup>2</sup>	Communality	Cronbach's alpha	CR	AVE	Latent Variables
0.14	0.46	0.61	0.95	0.82	0.61	Citizenship rights
Accept= >0.16	53%	R <sup>2</sup> = 0.46		(GOF)		
		Communality= 0.61				

The overall fit index of the model (GOF), if the index be higher than 0.16 it indicates that the used model is a good fit. This means that data collected supports the conceptual model of research and given model is closer to reality and its value is 0.53 and determines that this model is a good fit.

## 5 Discussion and conclusion

We use a parametric method for the assessment of research variables. Now, we can discuss the analysis of variables in the current state average. Because mean value of a society can be compared with the number so we are used one-sample t-test. If at all tests the significance level be greater than the level of error 0.05, H0 confirms; and if the level of error be less than 0.05, H1

confirms. In the table below, we are deemed inappropriate amounts of 3 and smaller, since according to Tavakoli, Darestani and Shahbaz Moradi (2009), it is less than average. Hence:

H0 = Considering variable do not have damage

H1= Considering variable have damage

At Table 4 is given amounts of assumptions the tests to assess the damages of variables. According to the Likert 5 in each for constituent questions of the research variables should examine the resulting amount of respondents' views, until it be clear whether the mean of their responses on average with the amount of 3 (the middle number of Likert scale) has difference or not.

Table 4. The values of the variables tested

Variable	Mean	S.D	sig	T	Status
The satisfaction of citizens' rights	2.24	0.69	0.00	64.17	Damage

As can be seen in Table 5, the satisfactions of the rights of citizenship have been evaluated less than average; that is the

unfavorable situation. To understand more, we also examine the details of variables that have damage.

Table 5. The values of the index test

Index	Mean	S.D	sig	T	Status
Create streets, alleys and squares, parks and public gardens, water ducts, passages and a proposal to amend the city map ...	2.93	1.12	0.001	38.68	Damage
Cleaning and maintenance and paving of streets and public places and channels surface water and waste water level	1.88	1.21	0.001	35.07	Damage
Cooperation in health care and control of the market by the relevant organs	2.83	1.11	0.001	37.73	Damage
Avoid being forced begging and begging to work	2.73	1.21	0.001	3.32	Damage
Preservation of movable and immovable property	2.73	1.15	0.001	35.04	Damage
Create a mortuary facilities and sanitary processing plants	3.29	1.18	0.001	54.98	Good
Adjust the balance sheet and income and expenditure of the municipality	2.80	1.26	0.001	32.30	Damage
Transactions under the existing legislation Municipality	2.79	1.27	0.001	50.32	Damage
Compare the supervision of weights in the city	2.61	1.24	0.001	31.04	Damage
Statistics on births and deaths for the urban population and urban plans	2.72	1.92	0.001	33.64	Damage
Prevent common diseases of epidemic animal and human health in collaboration with institutions such as rabies in the disposal and treatment	3.89	1.24	0.001	33.93	Damage
Trade regulations, business licenses	2.84	1.33	0.001	31.62	Damage
Construction Licensing and prevent unauthorized installations	2.93	1.13	0.001	38.12	Damage
Construction harassment fix and avoid crossing barrier	1.72	1.21	0.001	35.84	Damage
Collection of duties under the provisions of Act	2.86	1.24	0.001	34.17	Damage
Specific regulations for designations urban areas	2.61	1.58	0.001	24.34	Damage
Asphalt streets and sidewalks	1.51	1.51	0.001	24.15	Damage
Avoid polluting vehicles and smoke, along with other organizations	2.35	1.40	0.001	24.71	Damage

As seen in Table 5, all of the indicators (except for the establishment of the mortuary facilities and sanitary slaughterhouse is lower than the mean value and show unfavorable situation of this variable in the city. the research aimed with Pathology of citizenship in the category of Architecture (Case Study: City of Behbahan) that conducted in 2016. According to the results of this research, Results showed that the situation is unsatisfactory and is evaluated less than the average. To improve this situation suggests that:

For example, the following description of the proposed work which can be in most human of societies considered and performing the urban management in the field of explaining, promoting and institutionalizing" culture and citizenship rights" is offered:

- Serious scientific and practical efforts of the urban management for promoting the concepts and messages of culture and the rights of citizenship derived from the Holy Quran and the Prophet's (PBUH) holy Imams.
- serious effort of urban management to identify the needs, problems and issues of citizenship and based on it, the preparation, codification and Approval of vision and work plan and prioritization of the work programs in short-term, medium-term and long-term of codified for targeted activity and lead to

tangible results and perceptible to solve the problems and provide appropriate and timely services to citizens.

- Providing facilities for the participation of citizens in the management of local affairs through revival of neighborhoods and central neighborhoods and effort to create a sense worldly belongings and a feeling of citizenship among all the citizens, with respect to the diversity of cultures and ethnicities with the approach of the increasing of the of cohesion, control, responsibility, empathy and social assistance of the citizens.
- By reminding that the Supreme Leader said in the year in which it is adorned with the "the year of economy and culture with the national determination and the management of jihadi" And about its importance has stated: the culture is an important order and economy is an important issue and now cultural and social issues are most important our urban issues, it is necessary that management of local Provincial have effort with a serious determination the management of jihadi to promote qualitative and quantitative of the performance of own the social and cultural aspects of urban management through structural measures and reform of the organizational structure of municipalities and strengthening of the section of the social and cultural municipalities and according to the new and diverse of the urban communities and to improve quality of life and the public participation in urban development, further municipalities not only as a service entity but also pay attention to issues of the

cities at a beyond approach of social and cultural institution. So it is necessary, the municipalities shifted from the hardware and physical approach to social and cultural approach and for this purpose, Islamic councils of city as the perspective document and development program of the 5-year formulate and approve for municipalities, on the issues of cultural and social must make a decision about the perspective document and short-term, medium-term and long term programs.

- To achieve a sustainable development; Islamic councils should be diligent, committed that in stage of approval, monitoring and implementation of the budget of local management, local managers bound to prepare and compile the social, cultural, security, law enforcement, judicial, environmental, cultural heritage, health attachments and in performing the civil projects; (Supreme Leader said special emphasis to the officials of city in the attachment of the cultural and artistic projects) and we accept that performing the civil projects without the mentioned attachments, something considered as useless and even contrary to the public of interests.

- serious scientific and practical effort of urban management in order to provide the infrastructure training of citizenship in the field of collecting and separating waste source, management of residue and produce wealth of this dirty gold.

- Effort and seriousness of urban management in order to provide the infrastructure training of citizenship in the areas of promoting and implement a culture of respect for the environment, reduction of the environmental pollution and promotion of environmental literacy of citizens with the goal of promoting health and social well-being of citizens and maintain and to protect the environment.

- serious scientific and practical effort of urban management to promote the living in apartment with the approach of promoting the integration, control, training, responsibility, empathy and social assistance to of the citizens.

- The urban management in order to provide the training infrastructure of citizens in the areas of promoting healthy culture of traffic and pedestrians in the pathways and the streets and a culture of respect for traffic regulations(traffic management and culture of citizenship in traffic area ) have more serious effort.

- An appropriate infrastructure and promoting a culture of life as afoot without the use of private cars, and replacement bike, walking instead of private cars in urban traffic with the approach of organizing the traffic, environmental protection, vitality and health of citizens.

- An appropriate infrastructure reforming and strengthen the structure public transport within the city in order to enable the use of easy and inexpensive of the all citizens and promoting the use of public transport by of the citizens of public transport fleet instead of using private cars in urban traffic with the approach of organizing the traffic, environmental protection, vitality and health of citizens.

- Holding workshops and scientific meetings at the local level and housing complexes with the participation of the citizens and experts in the field of social and cultural experts with the approach of face to face training of culture and citizenship rights.

- The effort to build the standard sidewalks for safe passage and risky private citizens without the intervention of cars, bikes and motorcycles. Attention to the human element in urban planning is a prerequisite for all managerial approaches.

- Serious scientific and practical effort of social, cultural urban management to reduce of areas for abusing variety of drugs with the approach improving security and public health.

- Making suitable the buildings, projects, environment and urban spaces for the enjoyment and traffic safe, convenient and easy for the elderly, the disabled, veterans, blind with the aim of promoting human dignity.

- Serious scientific and practical effort of urban management for the culture of reforming consumption patterns and energy management: electricity, gas, water particularly by of the citizens and municipalities.

- Taking steps towards increasing capita religious spaces by looking at the lawgiver in all neighborhoods and with the

approach promoting religious and social identity and as one of the essential elements for the prevention and control of social problems.

- Taking steps towards increasing capita of parks, green spaces and for sport, place for child's games by looking at the lawgiver to all localities and with the approach of health promotion and social vitality as one of the essential elements for the prevention and control of social problems.

- Organizing the suburbanization and informal settlements with the approach of the prevention of social and cultural damages and the dignity of the technical principles, health and urbanism of cities.

- Organizing and removing blockages, disturbance, seeming unbeautiful of public appearance arising from social, economic, development, construction activities and ... in urban areas.

- Organizing the urban landscape with emphasis on the observance and enforcement of noble architecture of Islamic and Iranian.

- Serious scientific and practical effort of urban management for finding the root, combating and elimination of factors affecting the incidence of beggary and colportage with a view to preventing creation of false jobs, misuse of public opinion and prevent the social harm associated with the topic.

- interaction with executive agencies and effective institutions specialized in the production and promoting the popular culture including education , broadcasting, members of the media, the bar association and ... to provide the public trainings related to culture and citizenship rights with the approach preventing and reducing the social damages and enhance the morale of commitment and responsibility of the citizens.

- Serious scientific and practical effort of urban management at interaction with executive agencies and academic centers trustee and promoting the cultural issues, the culture of health (motility, nutrition, and ...) and security for public trainings related to culture and citizenship rights with the approach of preventing and reducing the social damages, sanitary, and raise the morale of the commitment and responsibility of the citizens.

- Development and creating the components of social health (parks, hiking, suitable space of urban) with the aim of reducing and preventing the diseases such as obesity, diabetes, cancer, depression, etc., appropriate and immunization of the public spaces and parks for possibility using by women and children and ... in the field of health and exercise in order to reduce disease, depression, obesity and so on.

- Belief and serious scientific and practical effort of urban management to strengthen the element of social control for socialization of the process control and combating with the social damages through interaction with the effective of reference group, religious institutions and NGOs for utilization of capacities and communication for NGOs to provide public trainings related to the environment, culture and citizenship rights with the approach of prevention and reduction of the social damages (Theft, drug addiction, violence, divorce, etc.) and increasing the morale of commitment and responsibility of citizens.

- Organizing, guidance and management of costs of the religious ceremonies, mourning of dead, Valimeh, and the cost of the pilgrimage and ... towards the carry out of charity work and the public utility(build of schools, clinics, preparation of dowry, provide the costs of patients treatment and incurable, women without caretaker and breadwinners and heads of household, the dignity of the elderly, the disabled, helping to the destitute, entrepreneurship, Production and employment and ...) with collaboration of NGOs and through charitable institutions, social and culturally relevant.

- Serious scientific and practical effort of urban management to strengthen and improve the local community by citizens and provide the necessary fields for enjoyment of the citizens of civil rights, social, political.

- Attempt to institutionalize citizenship rights in the matter of construction in accordance with the rule and no loss through careful monitoring on the building construction.

- Belief and serious scientific and practical effort of urban management to monitor the protection of public programs and city services, avoiding the land use change and the uncontrolled

sale and law of density, non-use change and selling parking, monitor on the implementation and protection of comprehensive schemes and legislative acts of group of then article 5 on the topic of Urban Development, supervision on the allowed manufacturing and with and quality based on the triple principles of urbanism, , technical and sanitary and preventing the illegal construction and without any regard to the three above-mentioned of criteria; that all of this cases should be considered as one of the most important issues and demands of citizens' rights.

- Creating a healthy city and the creation of “active and informed citizens”. A “healthy city” is a city in which a continuous of social, physical and environmental conditions are developing and improving and with optimal use of existing resources and facilities provides the environment that because of this and also supporting each other and collaboration in all matters, are trying to get their lives to a favorable level.
- Encourage citizen to participation and social supervision aimed at reducing and preventing the social damages.
- Qualitative and quantitative development of generate of the public toilets as the urgent need with the aim improve mental health of the citizens and the general public.
- Introduce and promote of the making pattern of citizens' behavior with election of specimen citizen cultural, hygienic.
- Formation and activity-based program of committee for culture and citizenship rights in the municipalities.
- Serious scientific and practical effort of urban management in order to fulfill the general policies of principle of the resistance economy and avoidance of unnecessary costs and resources management of the limited financial.
- Discourses, resuscitation, training and promoting the Iranian Islamic culture, correct use of individual, social, organizational and combating promoting a culture of consumerism.
- The emphasis on effectiveness and efficiency of construction projects and lack impose additional costs on citizens' material and spiritual development projects and ongoing costs of local management.
- Serious scientific and practical effort of urban management for preserve the identity and historical context and providing the necessary fields of tourism development in historical cities as a generator motor of the production of wealth and added value of local communities and the protection of humans 'role in the statue of city and respect for the sanctity of cultural elements in urban living as one of the components of the social bond.

## THE INVESTIGATION OF INTERMEDIARY EFFECT OF STRATEGIC HUMAN RESOURCE MANAGEMENT ON RELATION BETWEEN KNOWLEDGE MANAGEMENT AND PERFORMANCE OF ARAS FREE TRADE ZONE COMPANIES

\*SOLEIMAN IRANZADEH

*<sup>a</sup>Department of Management, College of Management, Tabriz branch, Islamic Azad University, Tabriz, Iran*

*Email: <sup>a</sup>iran zadeh@aiut.ac.ir*

**Abstract.** The aim of this study is to investigate the intermediary effect of strategic human resource management on the relation between knowledge management and performance of companies in Aras free-trade zone. This research is applicable in terms of aim, descriptive and correlated in terms of data gathering and quantitative in terms of the type of the gathered data. Statistical population of this study were managers of 310 companies in Aras free-trade zone. As it was not possible to measure the number of managers at all levels, the statistical population of the study was considered as indefinite and the statistical sample was considered 384 managers in number. Results derived from findings of this research show that strategic human resource management influence the relation between knowledge management and performance.

**Keywords:** strategic human resource management, knowledge management, performance, Aras free-trade zone

### 1 Introduction

Nowadays all companies are working in a dynamic and competitive environment where competition is increasingly getting more serious and the traditional sources of competition can neither ensure the institutions' survival nor meet their accommodation with customers' needs. There are so many points which highlight the necessity of paying attention to strategic human resource management, especially the ability to provide companies with competitive and economic advantages (Sanchez, 2015). Barney (1991) points out that missing resources can produce a sustainable competitive advantage. This way, knowledge and human capital are considered as valuable properties for organizations, and efficient management of them makes it possible to use the employees' proficiency and knowledge to achieve the organizational objectives, to meet peripheral needs and also to improve organizational performance. While some studies have mentioned that knowledge management increases the organizational performance (Hsiao, Chen and Chang, 2001; Lopez-Nicolas and Mero'no-Cerdan, 2011; Rasola, Bosilic and Voksik), some others argue that it is only human resource management that is effective in improving that factor (Chen & Huang, 2009; Youndt, Snell, Dean and Lepak, 1996). Moreover, some studies show that knowledge management and human resource management are closely related to each other (Theriou & Chatzoglou, 2008; Wang, Chiang & Tung, 2012). Most of these studies are selected to analyze the intermediary effect of knowledge management on the relation between human resource management and the organizational performance (Jackson, Schuler and Jiang, 2014). It is interesting that few studies have mentioned the reverse relationship between these concepts. It may be expected that a probably powerful interaction between knowledge management and human resource management be taken into consideration (Liao, 2011). Therefore, the main purpose of this is to introduce a different viewpoint about the role of human resource management and to react to recent attempts to create the other causal models in order to analyze the arousing or intermediary role of human resource management regarding the relation between knowledge management and organizational performance (Jackson et al, 2014; Jiang et al, 2013). This new viewpoint is so important that it can determine whether the given human resource management systems are able to turn the organization's needs and approaches into a plan of activities related to strategic human resources or not. These activities can improve the employees' behaviors and as a result, the organization will come up with better consequences (Jiang et al, 2013). So we examine the intermediary effects of the activities related to a given strategic performance in domains including accessibility, education, participation, performance evaluation

and reward (Chen & Huang, 2009; Huslid, 1995) in order to realize the need for experimental studies to analyze human resource management systems, like exciting processes in improving the organizational approaches and objectives (Jiang et al, 2013). It is expected that these activities can serve as a medium for the relation between knowledge management which has been measured using formulation and customization approaches, and organizational performance. These relations will be examined using the structural equation modeling in a sample of 191 Spanish industrial organizations. The positive and specific effect of this study can be summarized in three parts. First it expands the limited studies which have been conducted to specify a direction towards the approaches of human resource management. Furthermore, as a mediator of knowledge management for the organization it makes a connection between its objectives and its better performance (Jiang et al, 2013; Wang et al, 2012). Second, it supports the theory which says knowledge management of employees is necessary to maximize the organizational performance through activities related to strategic human resource (Chuang et al, 2013; Liao, 2011). Finally, it contributes to provide explanations about the relation between the given approaches of knowledge management and the qualified performance in the operation systems from a point of view which leads to a better organizational performance (Chen & Haung, 2009).

### 2. Research method

#### 2.1 Research hypotheses

1. Knowledge management has a positive and meaningful effect on organizational performance.
2. Knowledge management has a positive and meaningful effect on strategic human resource management.
3. Strategic human resource management has a positive and meaningful effect on organizational performance.
4. Strategic human resource management has a positive and meaningful effect on the relation between knowledge management and organizational performance.

#### 2.2 Research design

The present study is an applicable research in terms of aim, a descriptive and survey research in terms of data gathering methods. Library survey has been done to collect data.

The statistical population is consisted of the managers of Aras free-trade zone companies. There were 310 companies in this study which were operating in different fields in Aras free-trade zone. As it was not possible to count all the managers who took part in this study, and also there was no list of their names, we had no other choice but to consider the statistical population as indefinite. According the Cochran formula for the indefinite population, 384 chief operating officers, middle managers and chief administrative officers were chosen for this research. We contacted with the managers of more than 250 companies via E-mail, phone and social networks. As the result 367 managers among them accepted to take part in the study and respond to the questions. The questionnaire used for this purpose was based on some other similar questionnaires. Its validity was approved by a team of researchers and professors in the Azad university of Tabriz.

#### 2.3 Statistical analysis

Structural equation model or the multivariate analysis with latent variables is one of the promising methods in causal relations

among variables. This statistical method refers to some general models including: confirmatory factor analysis, simultaneous equation models, path analysis, multiple regression, analysis of variance and other statistical methods. Accordingly, the structural equation model is a comprehensive statistical approach for testing hypotheses regarding the relations between manifest and latent variables. The primary focus is on the latent variables which are defined by commensurable indicators and manifest variables (Sheykh Esmā'eli, 2000).

The structural equation modelling has been used to specify the effects of knowledge management on strategic human resource management and organizational performance. This method examines the theoretical relations among the given structural

conditions and makes it possible to estimate causal relations among latent variables and also among manifest variables. The main raised question is that if this measuring model is an adequate one? To answer this question, the  $X^2$  statistics and other factors of model fitness have to be examined using the structural equation model and path analysis by applying AMOS software. Using the planned questionnaire results, the knowledge management variables, strategic human resource management and the organizational performance were applied as the latent variables. Moreover, error in variables which represents all effective factors other than latent variables were also taken into consideration. In this model, variables are called as follows (table 1):

Table 1: variables of the research

The Error variable	The variable	Its name in the model
-	Knowledge management	<b>KM</b>
e13	Strategic human resource management	<b>SM</b>
e14	Firm performance	<b>FP</b>

We also consider the variables which using them knowledge management, strategic human resource management and firm performance can be specified. We also attribute an Error

measurement variable to each variable which are as follows in our model (table 2):

Table 2: an Error measurement variable to each variable

The Error variable	The Variable	Its name in the model
e5	schooling	<b>schooling</b>
e4	Knowledge creation	<b>creation</b>
e3	Sharing knowledge	<b>sharing</b>
e2	Using knowledge	<b>using</b>
e1	Saving knowledge	<b>saving</b>
e6	Human resource provision	<b>Human resources</b>
e7	Education	<b>Education</b>
e8	Performance evaluation	<b>Performance evaluation</b>
e9	Service bonus	<b>service bonuses</b>
e10	Employee participation	<b>Employee participation</b>
e11	Efficacy	<b>Efficiency</b>
e12	Effectiveness	<b>Effectiveness</b>

### 3. Results

We first need to determine constant and free parameters to be able to estimate the model. Constant parameters in a structural equation model often include weighted regression of the Error variables. In addition, for any latent variable, one of the weighted regressions has been considered as a constant value which equals to 1. This is a reference to determine the variable and also to solve the problem that latent variables do not have any indicator.

As the investigation of structural relations among latent variables is logical and meaningful when latent structure measurement is acceptable based on practical factors, we will investigate the whole model test after making sure that the

present measurement model in the modified structural equation is acceptable.

#### 3.1 Confirming the model

In this study, we used three types of indices to ensure that the model is acceptable. Absolute fit indices (the indices which are obtained based on the differences between the manifest variance and covariance on one hand and predicted variance and covariance on the other hand), comparative fit indices (indices which are measured based on the comparison between the formulated model and a base model). Now we explain each one of the indices, which are considered for the acceptability of the model (table 3).

Table 3 Confirmation of model results

Indices	The index name	Abbreviation	The acceptable fitness	Fitness of the research model	Result
Absolute fit indices	Chi-Square distribution	Chi-Square	-	237,341	-
	Goodness of fit index	GFI	>0.9	0.902	Relatively Acceptable
	Adjusted goodness of fit index	AGFI	>0.9	0.850	Acceptable

comparative fit indices	Non-normed fit index	NNFI	>0.9	0.798	Acceptable
	Normed fit index	NFI	>0.9	0.755	Acceptable
	Comparative fit index	CFI	>0.9	0.812	Acceptable
	Relative fit index	RFI	>0.9	0.709	Acceptable
	Increasing fit index	IFI	0-1	0.814	Acceptable
Parsimony fit indices	Parsimony normed fit index	PNFI	>0.5	0.599	Relatively Acceptable
	Root mean square error of approximation	RMSEA	<0.1	0.1	Acceptable
	Normed chi-square	CMIN	1 - 5	4.654	Acceptable

Research model in this thesis according the hypothesis and proposed method, has been demonstrated in figure 1.

Figure 1: research model

When  $P < 0.05$  it means that the relation is meaningful. According to the fact that in the weighted regression table, the P is less than 0.001 for the effect of knowledge management on the strategic human resource management, and it is 0.004 for the effect of knowledge management on the firm performance, and also the effect strategic human resource management on the firm performance is 0.004, it can be concluded that all three hypotheses (1, 2 and 3) are confirmed.

Moreover, the 4<sup>th</sup> hypothesis was investigated which says strategic human resource management has a positive and

meaningful effect on the relation between knowledge management and organizational performance. The direct relation of knowledge management and firm performance is 0.34 and the indirect effect of knowledge management through strategic human resource management is  $0.48 * 0.78$ . The value of the indirect effect was estimated to be 0.37. The total effect of knowledge management on firm performance obtained from the sum of direct and indirect effects was 0.71, therefore the 4<sup>th</sup> research hypothesis was also confirmed.

Table 4 Results of research model and interaction of factors

	Impact factor	Standard deviation	C.R.	Meaningfulness level	Result
SM<---KM	0.78	0.124	7.142	***	Accepted
FP<---KM	0.34	0.199	2.058	0.040	Accepted
FP<---SM	0.48	0.173	2.885	0.004	Accepted

**4 Conclusion**

The present research was conducted to investigate the intermediary effect of strategic human resource management on the relation between knowledge management and performance of the firms in Aras free-trade zone. The first finding obtained from this study was that knowledge management has a positive

and meaningful effect on organizational performance. The outcome of this hypothesis is in line with the studies some other researchers such as Daniel & Garrigos (2006) and Rehman Asghar (2015) have done. Knowledge management also had a positive and meaningful effect on strategic human resource management. This finding is in line with the finding of Chen & Huang (2009). Furthermore, according to this research 3<sup>rd</sup>

hypothesis, strategic human resource management influences performance of the firms existed in this research population. The finding of Collins & Clark (2003) supports this. According to the 4<sup>th</sup> hypothesis, the intermediary effect of strategic human resource management on the relation between the knowledge management and performance of firms in Aras free-trade zone was confirmed based on the obtained results. Sanchez et al (2015) have found the same results.

Considering the above-mentioned results, it can be concluded that nowadays organizations need to apply knowledge to develop and make progress in their performance. In this regard knowledge management is the factor organizations need to apply. The application will turn into a system. However, there are some challenges and opportunities in this way which can support the development of knowledge management. Therefore, in the future only those organizations will be successful that are able to internalize and manage knowledge.

## IMPACT OF PARTICIPATION OF TEA FARMERS' AND MANUFACTURERS' IN THE PROFIT AND LOSS OF SELLING DRIED TEA ON THE QUALITY OF TEA

<sup>a\*</sup>HADI MOTEZARE

<sup>a</sup>PhD in commercial management, Instructor of Islamic Azad University Lahijan Branch –Iran

Email: <sup>a</sup>hadi.mphd@gmail.com

**Abstract.** In this research, the rate of involvement of tea farmer and manufacturer in the profit of selling dried tea is selected as an independent variable and quality of produced dried tea as a dependent variable. Statistical populations of this research are composed of experts and specialists in tea industry of Guilan province and Lahijan city has been selected as a statistical sample. Descriptive-analytic method and correlation research branch were used in this research. For testing hypothesis, the data has been selected based on field works and from grounding branch. Thus, in addition to performing library studies, the researcher has interviewed managers and skilled experts of tea industry and to investigate and analyses of key variables, a questionnaire has been designed and distributed.

**Key words:** Tea, Tea quality, Tea farmers, Tea factories.

### 1. Introduction

After various operations including pelas, sieve, fermentation, drying on delicate leaves, stems and buds of *Camellia sinensis* (kind of plant), the outcome is called tea (Arzpeyma, 1999).

Quality of produced dried tea depends on some special properties: smell, taste and color. Tea quality is varied according to consumers' taste in different countries (Ashpari and Mohama, 2000). Are those who produce a green leaf of a plant called *camellia sinensis* in the process of planting nursing it to maturity and harvesting which is the primary material of dried produced tea. Are factories that produced dried tea with different operation such as pelas, friction, fermentation and drying on the green leaf of a plant called *camellia* as a primary material of producing tea (Azizizadeh, 2005).

Among 3 popular soft drink in the world such as tea, coffee and cocoa which have a narcotic influence and also different effects on body, tea is considered as an old soothing drink and it has a good position as well. After drinking water, tea is the healthiest and widely-used drink in the world. It is a traditional drink in many countries and the consumption and sale of tea totally depends on the taste of consumers, while people of England and India drink their tea with milk, preferably drink dark color tea and they don't care about the smell of it. People of Austria and Bulgaria drink their tea with fresh lemon and they don't care about the taste of tea. But Iranian people totally care about smell and taste of tea (Saboori, 1996). According to this, countries such as England, India, Kenya, Sri Lanka, and China have extended marketing research on people. They tried to know about the taste of consumers of different part of the world and then produce high quality tea similar to the taste of consumers. By this, not only they could create jobs for people and fixing their own position in an internal market, but also they could create huge amount of money for their country by exporting their produced tea to different part of the world.

Iran is also one of the tea producers' countries in the world which has one century experience in planting and tea industry. But unfortunately because of lack of proper investment in research, especially marketing research and also not considering the taste of consumers, Iran's produced tea doesn't have good quality. So internal consumers use foreign good quality tea and Iran's tea loses its own place in consumer basket (Moradmand and Ashpari, 2009).

Tea is used as a main part of a daily meal (breakfast) in Iran and thousands of people are involved in the process of planting, producing, and selling it. Agricultural economy of Northern provinces depends on producing tea. So lack of proper investment in the tea research department and any recession and

depression in production and selling tea lead to collapse of agricultural economy in the part of planting and tea industry, unemployment of workers in this industry and finally it will be an economic crisis for the country (Moezi, 2009). Thus it is necessary to do something in the part of tea research and do vast marketing research to produce good quality tea match with different countries consumers' taste to develop tea production, reach to flourish in economy and bring it to its real position in consumer basket.

Effective factors in the quality of produced dried tea are: primary material, machinery, production method, exploitation management system, expert human force and the rate of involvement of tea farmer and manufacturer in the profit of selling dried tea (Freedman, et al., 1998).

In this research the researcher is investigating the effects of the rate of tea farmers' and manufacturers' involvement in the profit of selling dried tea on the quality of produced tea. The researcher is hopeful that the result of this research solves the problems of not having quality of produced tea.

In the current exploitation management system of country, tea farmers sell tea green leaf to government with guaranteed price, then they try to transfer green leaf to dried tea with paying fees to manufacturers. So there is no relationship between producers and consumption market. The quality of produced tea depends on the quality of primary material (tea green leaf), complete supervision in all stages of production, full abeyance of technical rules and related standards (Witmer, 1999). Due to lack of involvement in the profit and loss of selling dried tea between tea farmers and manufacturers, which is totally related to the quality of produced tea, they don't have any responsibility in producing good quality tea and just quantity is important for them.

Tea as an agricultural strategic commodity has a basic role in economy of country. The main purpose of this research is recognition of effective factors on the quality of produced tea, using them to enhance the quality of interior tea and provide a situation that interior tea competes with foreign tea. If the consumption of the society goes to the interior tea, not only it will enhance its market and lead to flourish in economy but also it will increase the producers' incomes and also create jobs for country.

### 2 Method of research

Descriptive-analytic method and correlation research branch were used in this research. For testing hypothesis, the data has been selected based on field works and from grounding branch. Thus, in addition to performing library studies, the researcher has interviewed managers and skilled experts of tea industry and to investigate and analyses of key variables, a questionnaire has been designed and distributed. To define and describe variables, average index, standard deviation and column diagram were used and two sided T-test was used to test hypothesis in inferential statistic.

### 3 Population and statistical sample

Statistical populations of this research who are all experts and specialist of tea industry are working in investigation center of tea factories and other units of tea organization. Lahijan is the first city that tea was planted in it, it is also the second tea producing city in the state of planting surface and production amount according to the documents. Therefore 105 skillful experts and specialists were selected in area of tea industry and well-informed on world and country's tea state and they are able to reply specialized questions of study. They are selected as statistical sample and formed study sample volume.

**4 Research hypothesis**

Participation of tea farmer and manufacturer in profit and loss of sale has no effect on quality of produced dried tea

$$H_0: \mu=3$$

Participation of tea farmer and manufacturer in profit and loss of sale effect on quality of produced dried tea

$$H_1: \mu \neq 3$$

Table 1: of Result of Testing research Hypothesis (Participation of Tea Farmer and Manufacturer in Profit and Loss of Sale)

research Hypothesis	Sample Volume	Mean	Standard Deviation	Mean of Measurement Error
Participation of Tea Farmer and Manufacturer in Profit and Loss of Sale	105	4.94	0.233	0.023

Table 2: of Result of Testing research Hypothesis (Participation of Tea Farmer and Manufacturer in Profit and Loss of Sale)

research Hypothesis	Calculated T	Freedom Degree	Significance Level	T of Table	Deviation of Mean	Confidence interval for the mean difference from the theoretical mean	
						Low level	High level
Participation of Tea Farmer and Manufacturer in Profit and Loss of Sale	85.3179	104	0.000	1.9830	1.943	1.90	1.99

$$t = \frac{\bar{x} - \mu}{\frac{s}{\sqrt{n}}} = \frac{4.94 - 3}{\frac{0.233}{\sqrt{105}}} = 85.3179$$

Table 3: of Frequency Distribution of research Hypothesis (Participation of Tea Farmer and Manufacturer in Profit and Loss of Sale)

Description	Frequency	Percentage of Frequency
Very low	0	0
Low	0	0
Average	0	0
High	6	5.7
Very high	99	94.3
Total	105	100

Considering the obtained data from the above table that is prepared by five items Likert scale, the respondents have answered the questions related to seventh hypothesis of research as below:

No answer was taken to “very low” and “low” and “average” item. 6 people have chosen the item “high” and 99 people have chosen the item “very high” which as a result, the item “very high” with 94.3 % has dedicated the highest coefficient. Results of the research are illustrated in figures 1 and 2.

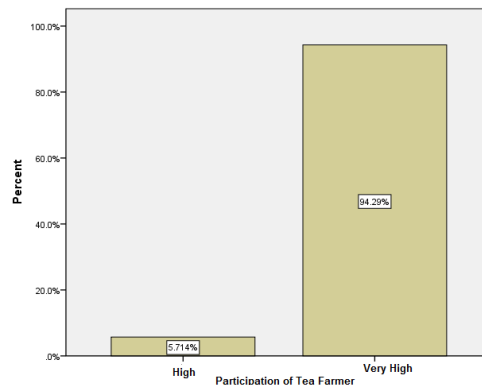

Figure 1: of Frequency Percentage of research Hypothesis (Participation of Tea Farmer and Manufacturer in Profit and Loss of Sale)

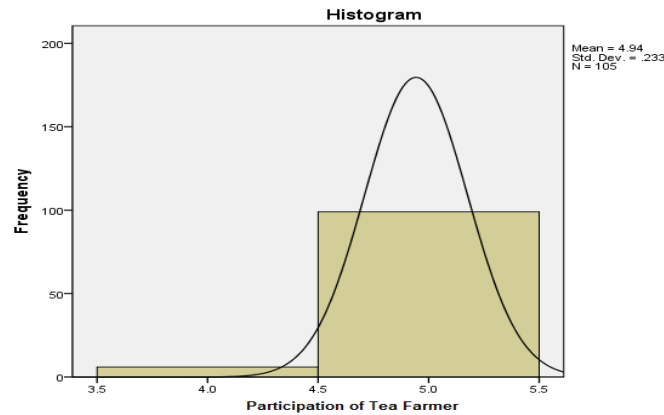

Figure 2: of Test of research Hypothesis (Participation of Tea Farmer and Manufacturer in Profit and Loss of Sale)

## 5 Conclusion

Considering the obtained results from the above table, since the amount of calculated t-test is larger than the t of the table,  $H_0$  is rejected in error level of 5% and  $H_1$  (impact of participation of tea farmer and manufacturer in profit and loss of sale on quality of produced dried tea) is accepted. Because statistics of t is in  $H_1$  area, it can be said that in confidence level of 95%, participation of tea farmer and manufacturer in profit and loss of sale effects on quality of produced dried tea.

To increase internal produced tea quality and maintenance and development of its market share, some suggestions are mentioned according to obtained results from research hypothesis as follows:

- 1- Establishing complexes and cooperative society of planting and tea industry with involvement of tea farmers and manufacturer.
- 2- Financial support of government from complexes and cooperative society of planting and tea industry to do agricultural modern methods and using modern and standard conversational industry.
- 3- Support of government for establishing sell market of dried tea in order to sell produced dried tea of complexes and cooperative society of planting and tea industry.
- 4- Omitting the guaranteed price of buying tea green leaf to encourage tea farmers to produce high quality green leaf.

## INVESTIGATING THE EFFECT OF SOCIAL STATUS OF ELEVENTH GOVERNMENT'S MINISTERS ON THE COUNTRY'S MACRO STRATEGIES

<sup>a</sup> SANAZ MOONESI SHABESTARI

*"M.A. Student of Women's Studies, Faculty of Social and Economic Sciences, Al-Zahra University, Tehran, Iran  
Email: "Moonesi.sanaz@gmail.com"*

**Abstract:** The social status of each person represents the person's position and reputation in the field of social compared to other individuals and groups. The findings indicate that, the average age of eleventh cabinet ministers is 58 years old, which represents the presence of experienced people in the cabinet and young people, are not benefited. The birthplace of the majority of ministers of large and populated provinces such as Tehran, Esfahan and Tabriz, respectively. The majority of cabinet people have PhD degree in related fields of domestic universities. State board of moderation consist mainly academics with experience of management and administrative services, those who have privileges and honors in their career.

**Keywords:** social status, the Council of Ministers, the government of prudence and hope, macro strategies.

### 1. Introduction

Social status represents each individual's social status in society that through age, gender, place of birth, education and science scores, income sources and... can be provided an analysis of it. In other words, social status refers to a position that individual archives in the group or social rank compared to other groups. One's social status determines the person's salary and benefits. (Cohen, 2008) In fact, social status is as a social container or form that in its framework, how dealing with social environment is taken place. (Javaheri, 2007)

On the other hand, the study about the origin and social status of the elites, such as the need to research and understand the class structure of society is useful not only because it achieves the key to understand and explain the governmental power system, but also it is useful in the sense that elite group is the most effective social and political agents and forces in developing countries, almost all behaviors and decisions will depend on the interests of this group. In addition, identify the political structure of Iran without the knowledge of quantitative and qualitative characteristics of the political elite is ineffective, thus, research about elites and their social origin in Iran's society as other societies is the basic research in the field of political sociology. (Azghandi, 1997)

Among the political elites, awareness of social status and origin of ministers as the powerful elites in governments has particular importance; because ultimately the ministers make decision about country's macro policy and decision-making process in government is dependent on their social status. Obviously, people who have a social status appropriate with their responsibility, in ideal conditions make suitable decisions.

By coming of the eleventh government, a new vision for the Islamic Republic of Iran was opened. Hassan Rohani, with slogans such as moderation, détente and interaction with the world, the peaceful settlement of the nuclear issue and removing sanctions, elitism and enjoying the rationality could be won the eleventh presidential elections. To realize the slogans, prudence and hope government used the ministers that investigating their social status and understanding the effect of their social status in the country's macro strategies is the purpose of this article.

### 2. The concept of status and social status

The term «Status» in word means status, prestige, dignity, base, rank, rate, position and situation is used. (Haghshenas and others, 2006: 1666) Many people use this word to describe the prestige and social value that the individual in society has it. (Ramazani and Eyvazi, 2010)

In other words, to determine the position of the individual in society, social status word is used. According to some definitions, the social status is "a value that a group is considered to a social role and value of one thing is obtained when its proportion with other things to be certain and in other words, to be ranked. Whenever members of one group in determining the value of one or another group or its roles, according to its standards, to be agreed with each other, we say, they have a social value and when a social role is valued socially, social status of that role will become evident." (Egbern and Nimkaf, 1971)

In other words, "social status refers to a position which individual in group or social rank of a group achieves compared with the other groups. One's social status determines the rights and privileges of person." (Cohen, 2008: 80) Also, "social status refers to the differences between social groups in terms of respect or social standing that others consider to them." (Giddens, 1997)

Social statuses are considered a particular type of social segregation in which social hierarchy will be important. (Haji Yusefi et al., 2012) social status has different principles: economic fundamentals, political, scientific, literary, cultural, social and family. Economic conditions will allow a person to have a better location, to be a member of the town's premier groups and to have more varied social relations. (Mohseni, 1996) Of course, to provide a detailed definition of social status, it should be considered its features derived of several social factors that all those factors appropriate to social necessities and conditions on varying degrees in the formation of status are effective or to be considered economic origin only factor in the formation of social status. (Haji Yusef et al., 2012)

#### 2.1 The identifier social status

1. The status of the individual or group in a social system with mutual expectation of holders of other status in the context of a unit structure;
2. the position of person or group according to their distribution in a social system at cases with regard to the distribution of rights of responsibilities, power and authority in that system such as terms such as up status, and down.
3. The senior official considering their distribution in a social system. (Zibakalam et al., 2010)

Sociologists have found that almost every aspect of our lifestyle, including IQ, educational attainment, family size, nutritional criteria, and political beliefs, diseases from which we suffer and even our habit in sexual relations is related to our status in our social hierarchy. (Robertson, 1993)

Meanwhile, social determinants of society status are very different from a society to other society within a society from one group to another. But since all the status by social way i.e. with the external factors to the person are determined, there are some common global standards in the assessment of good and evil, good and evil, excellent and inferior. In other words, these criteria are hidden in social values, on things that are considered important, deserve and respected. In a certain sense, these criteria are made of a series of crucial elements with internal cohesion that everywhere human lives socially, are present. These criteria are:

- Ancestors or lineage gives person a privileged or ordinary position, for that birth in a reputable or notorious family in society even in the most tolerant is considered a value. Dignity

or non-dignity of predecessor is on several factors: reputation of family, history of residence in the district, native or immigrant, belonging to the minority or the majority.

- Establishment situation, good or bad is one of the most prestigious criteria for that material assets are measurable and tangible objects. The source of wealth has a social meaning. A wealth that is accumulated generation by generation and inherited in terms of social has a higher dignity to a new wealth or wealth that is achieved from questionable ways.

- Usefulness, practical efficiency of one person: person in terms of what "performs" in the society to be ranked and its ranks depends on the value that people consider for jobs.

- The amount and type of one's education and the quality of education.

- In societies where religion and religious bodies play an important role in the social structure, high religious education, and validity of scientific fields where taken Ijtihad degree is the determining criteria of social status.

- Biological properties: gender is a global benchmark, in the sense that almost in all societies; men have a superior social status to women. Age is also a global benchmark for assessing social status, with this feature that this criterion is considered after puberty and its application is not the same everywhere, in some communities, old people have higher social status in some other young. Beauty (beautiful face and fitness) is the objective criteria of ranking social status. (Nikgozar, 1994)

## 2.2 Iranian social status

There is harmony among value system of a society and system of its classification and stratification through the assessment and classification of positions and social statuses. There is consensus in some communities about roles, personal and social characteristics and preferential assessment system that on the one hand, provide valuable status and the interests of the elites and on the other hand, the power of elites causes the public opinion in this regard. But the advantages, privileges and social rewards in certain type form of social interactions. Social statuses are legitimate and symbolic foundations for rewards and resources produced or available in the community. Selection and assignment of situations is done by a complex system of rules. The rules depend on the qualifications and personal characteristics or social backgrounds or categories and dimensions of status such as age, sex, occupation, and education.

In other words, the social statuses represent different control of individuals and groups in resources, rewards, and limitations. Similar statuses, tends to form relatively stable and hierarchical groups. Stability and order of hierarchical of various statuses has the normative characteristics, behavioral patterns and attitudes and also relations between the group and a special intergroup. Various relations of subordination and domination, authority and obedience, respect and ill-treatment are existed among the hierarchy. Privileged groups try to control and allocate more resources and material and non-material rewards for their own and have little power and influence on controlling resources, but through various status, they try to achieve increasing rewards and resources for themselves

Thus, social status indicates a hierarchical order in the social system that indicates the position of any rank in relation to other positions. Operator of any status to be had a certain amount of respect, subjugation and control in valued resources in the community. Occupation of social status represents a structure in which individuals achieve businesses, income or particular style of life appropriate to it. The formation of a variety of statuses is important that has numerous individual and collective consequences, because it explains a wide range of behaviors,

attitudes and inter-group and individual relations and therefore in sociological, less phenomenon apart of changes is investigated. (Azam, 2001)

In the meantime, many experts according to the characteristics of their communities have specified social statuses in their country. In each country, based on parameters of income, occupation, social status, etc., or even just one of these factors has separated social status. Historical records of social status in Iran shows dividing segmentation and social groups are considered the social criteria of social structure and social development and differentiation of responsibilities in Iran has a historical root. About the social status, due to the controversies on consistent definitions from the concept of status, in particular with regard to the growing groups in the community that their position is not reducible to their economic origin, it should be assumed features of social status derived from multiple social factors that all of those factors according to the social circumstances and necessities in different degrees are effective in the formation status.

Accordingly, to explain social status in Iran, in addition to the existing sociological patterns, it should be considered characteristics of Iranian society and the role of cultural and ethnic groups. Some social groups in Iran are divided on the basis of social statuses. Clerics and intellectuals are including the important social groups that in independent status have social dignity. While the economic source of their status could be different, the new middle status is present as a great force in politics, social and economic field and political and ideological nature of this status has led to social changes and determining political, social and economic positioning play a dynamics role. In introducing the new middle status, many factors should be considered such as intellectual, religious, occupational, educational trends and other factors. These factors have been formed in particular social relations and influenced by time events and developments.

In the field of political sociology of Iran, Max Weber's social status categorized pattern is useful in many ways. According to Weber, social categorization in addition to the economic aspect considers social groups and social status. According to components of economic, social and cultural, it can be considered five statuses for Iran: upper status, upper middle, status, lower middle status, low status, marginal status. (Haji Yusefi et al., 2012)

## 2.3 Social status of Council of Ministers of the Islamic Republic from the beginning of eleventh government

In the Islamic Republic of Iran, after the presidential elections and electing president by the people, President introduces an individual for each ministry as minister to the Parliament. The president's proposed ministers must obtain a vote of confidence from parliament, after achieving vote of confidence from Parliament; they constitute a council that is called Council of Ministers, the Cabinet of government. Minister is placed at the head of ministry and manages affairs related to ministry. Ministers have a number of authorities in the field of their work, including decision-making authority. Each minister according to the authorities granted to him by law has the right to decide and manage affairs related to the ministry. (Tabatabai Motmani, 1994)

At the time of formation of the Islamic Republic until August 2013, ie the time of attestation of Hassan Rohani as the eleventh president-elected in Iran, ten cabinets are constituted in Islamic Republic of Iran that their Council of Ministers included 336 minister-elected. Of a total of 336 ministers-elected, 135 ministers are in charge of one ministry, 19 ministers are in charge of two ministries and other 2 people had the responsibility of more than two ministries.

By comparing the cabinets after war i.e. the eras of Hashemi Rafsanjani, Khatami and Ahmadinejad, almost the majority of ministers have experienced the presence in ministerial posts. The most number belongs to the Council of Ministers of Cabinet of Hashemi Rafsanjani in which about 61.42 percent of cabinet ministers have experienced the membership in Council of government. Then majority belongs to cabinet of Seyed Mohammad Khatami with a ratio of 51.62 percent. The least record of membership of ministers in the cabinet belongs to the ninth cabinet; about 94 percent of ministers in the cabinet for the first time are the membership of the Cabinet in the level of Council of Ministers. (Eyvazi and Ramazani 2010)

- Most changes of cabinet with appointment and dismissal of 21 ministers belonged to the ninth and tenth state. During this period, almost half the cabinet members changed.

- At this time only one female minister was appointed to health ministry that in its kind was unprecedented. Ms. Marzieh Vahid-Dastjerdi was the first female minister in the government of Ahmadinejad that his removal from the Ministry of Health caused the criticism of MPs.

- With the passage of time, gradually the level of education of Council of Ministers was added in higher education (MSc, PhD, Medical Professor);

- In the early years of the revolution, especially in the Cabinet of Hashemi Rafsanjani, a significant percentage of ministers were educated of foreign universities, but gradually the number of ministers with education of Iran's universities is increased to the point that in the ninth Cabinet, it reaches to the most amount i.e. about 90 percent of the Council of Ministers of this state.

- Expertise of most of Ministers of cabinet of Hashemi Rafsanjani was Technical - Engineering, Khatami's cabinet was technical engineering with humanities and the Cabinet of Mahmoud Ahmadinejad was management and economics.

- The youngest Cabinet was the Cabinet of Hashemi Rafsanjani and the oldest cabinet belonged to Ahmadinejad.

- Experience of presence in important governmental positions and posts has been an important factor in the selection of council of ministers.

- Social status of ministers was belonged to the middle class (traditional and new).

- Gradually the military presence is added and in contrast, Clergymen presence in political power is reduced. (Eyvazi and Ramazani 2010)

#### 2.4 Social status of Eleventh government's council of ministers

Rohani, with slogans such as moderation, détente and interaction with the world, the peaceful settlement of the nuclear issue and the removing of sanctions, elitism and enjoying the rationality could be won the eleventh presidential election. In this context, he believes that "the Shiite Islamic thought is based on justice and moderation ... moderation is the method and way, moderation is both route and destination. Moderation without rationality is going away. Slogan without science-oriented and using the human experience, without transactional alongside peace and stability, without idealism with realism without morality, manners, tolerance and freedom is not possible." (Rohani, 2013) About macro strategies of his government, he believes that "policy and the general principles of the state program, intellectual honesty, moderation in the behavior of politicians and decision-making and implementation in government, decision-making based on collective wisdom, the centrality of national interests, trying to fulfill good governance

principles, pragmatism, respect citizen's rights, commitment to growth and comprehensive development, improve the quality of life of Iranians, fight against corruption, reform and renewal capacity of government institutions, interaction with powers based on the legal frameworks and provide the people's demand, sustaining the environment, rely on people, the support of the young generation and constructive engagement in international relations.

### 3. Results

#### 3.1 Eleventh government to realize the programs and macro strategies introduces the following ministers to parliament:

- Abdolreza Rahmani Fazli (Ministry of country) with 256 votes in favor, 9 abstentions and 19 votes against;

- Mahmoud Vaezi (Ministry of Communications) with 218 votes in favor, 20 abstentions and 45 votes against;

- Bijan Namdar Zanganeh (Ministry of Oil) with 166 votes in favor, 13 abstained and 104 votes against;

- Mostafa Pourmohammadi (Ministry of Justice) with 201 votes in favor, 19 abstentions and 64 votes against;

- Ali Jannati (Ministry of Culture) with 234 votes in favor, 12 abstentions and 36 votes against;

- Mohammad Javad Zarif (Ministry of Foreign Affairs) with 232 votes in favor, 13 abstentions and 36 votes against;

- Seyed Hassan Ghazizadeh Hashemi (Ministry of Health) with 260 votes in favor, six abstentions and 18 votes against;

- Abbas Ahmadi Akhundi (Minister of Roads and Urban Development) with 159 votes in favor, 18 abstained and 107 votes against;

- Ali Rabiei (Ministry of Labor, Cooperatives and Welfare) with 163 votes in favor, 21 abstained and 100 votes against;

- Mahmoud Hojati (Ministry of Agriculture) with 177 votes in favor, 26 abstentions and 81 votes against;

- Hossein Dehghan (Ministry of Defence) with 269 votes in favor, five abstained and 10 voted against;

- Mohammadreza Nematzadeh (Ministry of Industry, mining, trade) with 199 votes in favor, 24 abstentions and 60 votes against;

- Hamid Chitchian (Ministry of Power) with 272 votes in favor, five abstentions and 7 votes against;

- Seyed Mahmoud Alavi (Ministry of Information) with 227 votes in favor, 17 abstentions and 38 votes against;

- Ali Taiebnia (Ministry of Economy), with 274 votes in favor, 3 votes Mtn and 7 votes against;

- Mahmoud Goudarzi (Ministry of Youth and Sport) with 199 votes in favor, 24 abstentions and 44 votes against;

- Mohammad Farhadi (Ministry of Science, Research and Technology) with 197 votes in favor, 10 abstained and 28 voted against;

- Ali Asghar Fani (Ministry of Education) with 185 votes in favor, 24 abstentions and 53 votes against.

While Mr. Mahmoud Goudarzi, Ali Asghar Fani, Ali Jannati, after three years and three months withdrew from the cabinet and instead of them, Massoud Soltanyfar, Fakhruddin Denesh Ashtiyani and Seyed Reza Salehi Amiri were added to the cabinet of Hassan Rouhani.

The following table investigates people's social status indices such as age, place of birth, level of education and social status of council of ministers of the eleventh government.

Table 1. People's social status

Index	Minister	Age	Birthplace	Education level	Discipline	Place of education	Main job	Presence in cabinets	Source of income	Administrative positions	Specialty field
	Rahmani Fazli (Ministry)	54	North Khorasan	Ph.D	Geography	Iran	Professor	-	Faculty	More than 20 cases	Related
	Vaezi (Communications)	61	Tehran	Ph.D	International Relations	Iran	Research Assistant	-	Public	6 cases	Unrelated
	Namdar Zanganeh (Oil)	61	Kermanshah	MA	Civil engineering	Iran	The Expediency Council	7 cabinets	Faculty	More than 10 cases	Unrelated
	Pourmohammadi (Justice)	54	Qom	Seminarie	Law and Jurisprudence	Iran	Head of the organization	1 cabinet	Public	More than 10 cases	related
	Jannati (Culture)	64	Qom	Seminari	Islamic Science	Iran	Researcher	-	Public	7 cases	related
	Zarif (Foreign Affairs)	54	Tehran	Ph.D	Rights and International Relations	America	Iran's ambassador to the United Nations	-	Faculty	More than 10 cases	related
	Hashemi (Health)	54	Khorasan Razavi	Ph.D	Ophthalmology	Iran	Physician	-	Faculty	More than 6 cases	related
	Akhundi (Roads and Urban Development)	56	Qom	Ph.D	Political economy	England	A member of the Engineering Council	1 cabinet	Faculty	More than 10 cases	related
	Rabiei (Labor, Cooperatives and Welfare)	58	Tehran	Ph.D	Management	Iran	Professor		Faculty	More than 5 cases	related
	Hojati (Agriculture)	58	Esfahan	BA	Civil	Iran	Agriculture	2cabinets	free	More than 5 cases	related
	Dehghan (Defence)	57	Esfahan	Ph.D	Management	Iran	Military	-	Public	More than 5 cases	related
	Nematzadeh (Industry, mining, trade)	68	Tabriz	BA	environment	America	Deputy of Minister	3cabinets	Public	More than 10 cases	unrelated
	Chitchian (Power)	56	Tabriz	Ph.D	industrial engineering	Iran	Secretary	-	Public	More than 10 cases	related
	Alavi (Information)	59	Fars	Ph.D	Law and Jurisprudence	Iran	Member of the Experts	-	Public	More than 10 cases	related
	Taiebnia (Economy)	52	Esfahan	Ph.D	Economy	Iran	Faculty	-	Faculty	More than 10 cases	related
	Goudarzi (Youth and Sport)	58	Hamadan	Ph.D	Physical Education	Iran	Professor	-	Faculty	More than 10 cases	related
	Farhadi (Science, Research and Technology)	64	Semnan	Ph.D	General Practitioner	Iran	Surgeon	2cabinets	Faculty	More than 10 cases	related
	Fani (Education)	59	Tehran	Ph.D	Management	Iran	Professor	-	Faculty	More than 10 cases	related

In the table 1, it must be said:

- Age of individuals is considered one of the criteria for determining and investigating their social status. In sociology, especially political sociology, the presence of forces and young people, middle-aged and older each has a great importance in the decision making process. Youth has high motivation and potential in managing affairs and in political decision-making, including influential forces of community. In contrast, middle-aged and older elites have superior experience and knowledge to the affairs in the field of political decision-making. The presence of middle-aged and elderly people in important and political

positions causes to increase their skills in decision-making and understanding the issues and needs of the community. In investigating the age of cabinet of Rohani becomes clear that the average age of Cabinet of Ministers is 58 years that indicates the presence of qualified and experienced people in the Cabinet and young people are not benefited.

- Where a person is born and grows can play a significant role in the formation of character and individual opinions and decisions made by him in the future. By checking the birthplace of Ministers of eleventh government, it is observed that dispersion of birthplace of Ministers only contains 9 provinces that the most

frequency is related to large and populous provinces such as Tehran and the provinces of Isfahan, Qom and Tabriz respectively.

- Identification of quantitative and qualitative position of education of political elites in every country is the important issues in political sociology studies because education level of social groups directly related to the social status and interests of their class. In fact, the more the wealth of society is more and higher, it is expected that to have better level of education. In addition, the more the level of education and awareness of people and the elites is higher from domestic and international circumstances; certainly they will participate in important political decision-making process with more rationality. (Azghandi, 2006)

Check the latest education degrees of ministers of eleventh government shows that the vast majority of people of cabinet are with higher education and doctoral degree in disciplines related to their organizational positions. In addition, with the exception of three cases, Mr. Zarif, Akhondi and Ne'matzadeh, the rest received their degree from prestigious domestic universities.

- Employment and income is considered another contributing factor on people's social status. In fact, job of any person determines his income and lifestyle and class.

In addition, each individual's job affects his consciousness about the different issues and affairs of society and equally in making decisions by the political elites; so that if someone has a higher level of knowledge to affairs of society, in making decisions will act with more precision and intelligent based on the needs and necessities of the community that this issue plays an important and effective role in the preservation of the political system.

The state board of moderation consist mainly academics with a record of administrative and managerial services; people who have privileges and honors in their work filed. In this cabinet, veteran diplomat, University professor, prominent economist, qualified physician and ... have been appointed in related posts and even if minister degree is not consistent with the field of his service, his record in this post in the previous Cabinets with experience in previous management positions fill this gap.

- Another point in this context is that a third of the ministers have presence record in the previous cabinets in their repertoire and the rest before achieving the office of the Ministry have had the experience in centers, institutions and various positions which play an important role in increasing their skill and expertise in the area of political decision-making and handling of affairs.

- Ministers' social status belongs to the traditional middle and new class. In this Cabinet, in addition to academics, there are individuals from different ranges including clergyman, military and agriculture.

- Finally, in discussions of gender and social status, it must be said that, like most of the previous cabinets, moderation government not benefitted of female minister in the cabinet.

### 3.2 Eleven government ministers and the country's macro policies

Study about the origin and social status of the elites, such as the need to research and understand the class structure of society is useful not only because it achieves the key to understand and explain the governmental power system, but also it is useful in the sense that elite group is the most effective social and political agents and forces in developing countries, almost all behaviors and decisions will depend on the interests of this group. In addition, identify the political structure of Iran without the knowledge of quantitative and qualitative characteristics of the

political elite is ineffective, thus, research about elites and their social origin in Iran's society as other societies is the basic research in the field of political sociology. (Azghandi, 1997)

On the other hand, according to experts, Iran before the eleventh presidential election faced with three challenges that are connected to each other as chain and if one of them emerged as crisis and become the social movement, it could be led to political instability. Mentioned three challenges were in the field of political, social and economic.

- In the political field, fragmentation of power-sharing and multiplicity of political leadership and political power centers and the lack of political management has faced political system with challenge. Parallel managements, multiple targets and the lack of a unified political structure, along with distrust of political parties after the presidential election had challenged the political system. While in foreign policy of nuclear issue and the growth of extremism in neighboring countries was a major challenge for the country.

- In the economic field, problems were more tangible. Despite production capacity, there was little production facilities, huge liquidity was entered into the economy, without to be used for the production, there was a proper oil revenues but economic growth was very little, the country's overall income had gone up, but more poverty was observed.

- In the social field, the challenge was including the ravages of drugs and treatment, the accumulation of many records in the judiciary, the rapid growth of divorce, unemployment, drug addiction and corruption. (Mohammadi Lord, 2014)

In examining the social impact of eleventh government ministers on macro-economic policies, social and political of the country, taking into consideration the current circumstances and the interactions of politic, economy and society in each community on each other, it can be assessed performance of ministers relevant in each sector.

- In the areas of internal and external policies, despite the fact that the beginning of new round of nuclear negotiations, all things influenced by the foreign policy orientations and its measures ie, Mr Zarif, but creating relative stability in country, the widespread presence of political activists from both sides raised ie the conservative and reformist in the country, attention to ethnicity and ... shows the relative dynamics of domestic politics of Rohani state. But undoubtedly, the greatest success in Rohani state was in foreign policy that was the biggest priority of state. Solving the nuclear issue after years of conflict between Iran and world powers caused non-security of Iran's position in the international system, correct the global face of Islamic Republic of Iran, détente, reconstruction and reform of interactions with effective international powers in the national interest, normalize and improve relations with neighboring countries and strengthen constructive relations with non-hostile countries, signing the agreement of joint action plan and the continuation of nuclear negotiations, management, reduce and remove the multilateral and unilateral sanctions, constructive influence on global developments specially in the fields of combating terrorism and extremism, constructive and effective interaction with the world.

- In the social field, Rohani could make the relative openness in the field by utilizing experienced and efficient people. The most significant actions in the field is related to health sector and the most critics is for the Ministry of Education and Sports. While on cultural issues, including freedom of the press, film and music, the status of universities, freedom of organizations, the situation science, the success has net been much and the major cause of this less success can be considered in pressure of other organizations on the government as far as it was led to the resignation of three ministers.

- In the economic fields, it must be said that despite the fact that the economy is considered one of the most controversial areas of performance of any state but the economic part of Cabinet of Rohani took ahead economic policies that as to be able to have an effective role in improving the economic situation. Increasing stagnation in different fields especially housing and construction, unemployment, inflation, recession and increasing production costs and barriers to exports on the one hand and on the other hand, linking the country's economy to Barjam and America's failure to comply with its obligations and other matters, are including cases that has faced eleventh government's economic performance with stagnation.

#### 4. Conclusion

Eleventh presidential elections in Iran created a significant change in the composition of state and by superiority of coalition of pragmatists - reformists against the fundamentalists, provided the groundwork for change in the local, regional and international space. From the beginning, the eleventh state in terms of popularity for various reasons, including vote nearly twenty million and vitality that after the victory of the community showed, was placed in good condition. (Motaharnejad, 2013)

The government utilizing experienced and qualified people in its cabinet, in this context acted moderately and unlike the previous Cabinets, the criterion of ministers' selection was capabilities, abilities and their expertise. While in the periods of reconstruction and reform, responsibilities and governmental posts were divided between a few people and if displacement took place, they were these people who went from a post to other post and in the conservative government, all forces and managers at all levels of government were withdrawn and 16-year managerial experience was given to the archives and administrative affairs of the country were given at once to those who not had experience and even in some cases not had knowledge of the duties.

It is specified by examining the social status of the eleventh government ministers that the government is composed of an ideal cabinet. The average age of the ministers that is more than 58 years shows the experience and their management record. Having higher education that is in the field related to their job is the other positive case of cabinet of prudence and hope government while, the birthplace of majority of ministers is great and populated provinces such as Tehran, Isfahan and Tabriz. The majority of people of Cabinet has PhD degree in related disciplines from domestic universities and has record of management and administrative services in their repertoire.

Prudence and hope government by utilizing ministers with this social status could achieve success in the country's macro policies in the political (domestic and foreign policy), social and cultural fields but in the economy field, predetermined objectives still are not achieved. The cause of the weakness of the economic team of prudence and hope government in various economic indicators has been too much focus on the results of the nuclear negotiations. However, eleventh government despite the fact that was able to inhibit libertine inflation, but with reducing inflation, recession dominated in the country and economic growth rate sharply declined.

In the current situation that the country is facing recession, the most suitable act of eleventh government to promote economic growth is to fight against economic corruption and it is the most appropriate strategy to gain control over economic corruption, monopoly or oligarchy situations in which a group of clerks for a long time have monopolized power and economic decisions. Too much focus of power in the authority of individuals or institutions could create incentives for corruption.

**Abstract:** The research main aim is study of relationship between liquidity risk and institutional ownership in banks and accepted financial institutes in Tehran Stock Exchange. This research is implicational based on its aim, is descriptive and measurable based on its nature, is correlative based on its methodology, and has padding data and squaring Regression which have been used to analyze research data. Research statistic sample includes all banks and accepted financial institutes in Tehran Stock Exchange. Research conclusions indicate that there aren't any positive meaningful relationships between these elementary standards: liquidity risk (cash money includes foreign exchange and coins, short-term investments, partnership stocks for sale, and demand deposits in banks) and institutional ownership.

**Keywords:** Liquidity risk, Cash money, short-term deposits, demand deposits, short-term investments, institutional ownership

### 1. Introduction

One of the risk kinds in banking industry is liquidity risk which directly causes damages to banks because of unsuitable management. Liquidity risk includes risk lack of necessary liquidity for short-term commitments' coverage and outputs' money. Keeping desirable level of cashing is banks' duties, if banks don't consider it, their liquidity risk will increase. So, successful desire or indirect activity are related to banks' abilities in liquidity exhibition to customers (Saeidi and ShaebaniMotlagh, 2012).

Institutional shareholders in recent decades have been important members of asset markets in most countries of world. So, most contents of investments have been done by these institutes. In fact, institutional investors are sources to supervise corporations and are the ways to solve representation problem through institutional ownership which approximate relationship between corporations' managers and beneficiaries (Kim 1993). Based on Bush description (2000), institutional investors are major investors such as banks, insurance corporations, investment corporations, and retirement boxes. It is believed that institutional investors' presences will cause change in corporations' behaviors that will originate from supervising activities which are done by these investors (Walery and Jinkinz, 2006).

The main problem of the research is whether liquidity risk plays an effective role on institutional ownership of banks and accepted financial institutes in Tehran Stock Exchange or not? And how can the effect of effective variables on liquidity risk and institutional ownership of banks and accepted financial institutes in Tehran Stock Exchange in time duration of research investigation be?

The research is important because humans' decisions are along with limitations in information. The limitations will increase risk level and have effective roles in decisions, so risk level determination and its management are important for decision makers. (Doorlaf and Bollom, 2008). Based on experimental witnesses most investors are running away from risk and want extra returns to accept more risks. So, risk investigation in financial management is one of the main decision. Existence of big moderators such as institutional investor can solve agency problems because of his ability in economic advantage benefit originated from criterions (Diamond, 1984). Glaston and

Millgroom (1985), believed that institutional existence with information advantage will cause personnel costs for unknowledgeable investors and liquidity will decrease.

The main problem of the research is determining relationship between liquidity risk standards and institutional ownership in the accepted corporations in Tehran Stock Exchange.

### Research Background

Ahmadpoor and et al. (2011), in their research investigated corporation government effect and auditing quality on financial security cost through liability. The research conclusions showed that chief institutional shareholders' existences in investors' compositions and their activities supervisions would have meaningful decrease effect on liability cost of statistic sample corporations while auditing quality didn't have such effects.

Mehrmanesh and Jadehkenari (2014), investigated relationship between institutional ownership and share price fluctuations in the accepted corporations in Tehran Stock Exchange. The research conclusions indicated positive meaningful relationship between institutional ownership and increase fluctuations of shares' prices, while there is no confirmed bilateral and mutual relationship between ownership and pricefluctuations.

Long and Moft (2011), investigated relationship between information transparency and lack of liquidity insurance in crisis duration. Used standards to evaluate information transparency were based on accounting standards, auditor choice, profit management, observing analyst and anticipation accuracy. The research conclusions indicated negative relationship between information transparency and different standards lack of liquidity insurance such as liquidity changeability and corporation liquidity correlation with market liquidity and market return.

Zoorigat (2011), investigated ownership structure effect on auditing quality in Jordon accepted corporations. Research conclusions indicated positive meaningful relationship between institutional ownership and ownership concentration with auditing quality. While external ownership indicated negative and lack of meaning relationship with auditing quality.

Antonius (2013), investigated study of auditor choice characteristics with institutional investors. French corporations from 2006 to 2011 were the research statistic sample and research conclusions described positive relationship between external institutional investors and auditing quality.

### 2. Conceptual and Operational Definitions of Research Variables

Liquidity Risk (Independent Variable):

Liquidity risk in banks (demand coverage of cash money) is cash money for investors to indicate that:

How much do banks have ability to cover demand? Whether banks can answer investors to receive their received deposits or not? If this amount is high, bank liquidity risk will fall. The way to calculate this amount is brought in follow (Ardakani and et.al 2015):

Cash it: includes foreign exchanges and coins

Securities for sale it: short-term investments and partnership stocks for sale

Demand Deposit it: demand deposits in banks

$$[SIZE]_{(it)} = LN([Incom]_{(it)}) \quad (2)$$

Short-term Deposits it: People`s short-term deposits in banks

SIZE: corporation size, MV: corporation market value, i: investigating corporation, t: investigating year

Short-term loan it: total short-term loans of banks` acceptance

Total Assets it: total assets

Cash Money Such as Foreign Exchanges and Coins:

Based on Iran standard 2 of accounting standards, cash money is cash stock and demand deposits in banks and financial institutes in both Rials and foreign exchanges (include short-term investment deposits without any receipts).

Short-term Investments and Partnership Stocks for Sale:

Short-term investments are investments which can be sold easily or change to cash money and have been situated for one year. These investments are categorized in balance sheet as financial assets, so based on it finished cost or market price are reflected in financial statements. Partnership stocks for sale enforce corporations to establish stocks before determined contract nuisance with sale definite price.

These stocks` prices are more than nominal values which have extra amounts payments over nominal value and are called sale expenditure.

Demand Deposits in Banks: Demand (flow) deposits are deposits which banks should give back based on their money owners demands.

People`s Short-term Deposits in Banks: Deposits usually form big part of banks` liabilities. Customers` deposits indicate accepted amount of money from national money sources or foreign exchange. Amount, usance date, resistance, and foreign exchange type are topics which should be considered in the expense time of the sources.

Total Short-term loans of Banks` Acceptances: Main important asset of each corporation usually is get by short-term loans that are get by paid sources in one year or less than it and is used for temporary investment protection in used flow assets.

Institutional Ownership (Dependent variable): Based on presented definition by Azibi and et.al (2010), institutional ownership is collection of shares in banks, insurances, holdings, investments corporations, retirement salaries, assets securements corporations, investments boxes, organizations, governmental institutes, governmental corporations and corporations` shareholders. Rhimian (2012), suggested following formula:

$$S_i = (s_i^i) / s \quad (1)$$

Si: Institutional Owners` stocks, S: Total corporations` shares, Controlling Variables:

Assets Returns: Assets returns are received by net profit divisions (profit after tax deduction) over banks assets collection.

(ROA) Assets returns= net profit / banks assets collection

Bank Size (SIZE): In this research incomes collection of banks durations ends are considered as measuring criterion of banks sizes. To evaluate bank size, natural logarithm of bank value (summation of duration end incomes) is used in duration end (Dang Wazhang 2008). However, Zimerman (1983), used summation logarithm of sale incomes as corporation size factor. Corporation size is calculated by following formula:

### Research Methodology

In the research RahnavardNovin software has been used to gather data because of insufficient data in information bank, formal site of Tehran Stock Exchange (Codal Site) have been considered. At first RahnavardNovin software has been used to calculate independent variable data, liquidity risk which includes foreign exchange and coins, short-term investments and partnership stocks for sale, demand deposits in banks, people`s short-term deposits in banks, total short-term loans of banks` acceptances as assessment criterions of liquidity risk which are equal to weighting. Data extraction from RahnavardNovin enter Excel and are formulated for test hypotheses. Then to get other variable data, institutional ownership which is dependent variable in the research data extraction from RahnavardNovin enter Excel and are formulated for test hypotheses.

To get two controlling variables such as bank size and assets returns, at first natural logarithm of bank total incomes has been used to calculate corporation size variables. Then to receive assets returns variables, net profit ratio (profit after tax deduction) on total bank asset has been used.

Statistical analyses are done by computes` software`s. To test research hypotheses Regression analysis is used, models` meaningfulness are estimated by t-statistic, data measuring standard is a negative standard and relative standard shows highest and the most accurate measuring level. Research theoretical bases and backgrounds are collected analogically by library, other researches and internet, however, for research hypotheses acceptances or rejections statistical methodologies are used. Research aim is correlation relationship recognition between liquidity risk and institutional ownership, however, this research includes all researches which investigated relationship between different variables with use of correlation coefficient. So, correlation coefficient is an accurate indicator which indicate how variables changes depend on other variables.

The research can be past viewer or future viewer in term of its time duration. Totally, it can be said that if data gathering is related to the past event, research design will be past viewer, so this research is a past viewer one.

### 3. Statistic Population

Statistic population are all elements and people in a geographical criterion (world or region) that have one or several similar characteristics (Hafeznia and Sarmad 2003). The research considers all banks and accepted financial institutes in Tehran Stock Exchange that include 11 banks. Research data have been gathered by RahnavardNovin and formal site of Tehran Stock Exchange (Codal Site).

Table 1: Banks` names of research

Saman Bank
EtebaryToseah
EtebaryAskarieh
EghtesadNovin Bank
Parsian Bank
Pasargad Bank
Tejart Bank
Sina Bank
Iran Saderat Bank
Karafarin Bank
Melat Bank

#### 4. Data Gathering Methodology

In this research library method has been used to gather data, it means internal and external publication sources in books and internet that have been used. Needed data to calculated research variables have been extracted by information bank of Rahavard Novin software. To compensate insufficient data in information bank, formal site of Tehran Stock Exchange has been used. Two software's Excel and Eviews have been used to process and analyze research data. While Eviews is an appropriate software of measuring economic. So, it is better to use it to analyze data.

#### 5. Hypotheses Tests

##### 5.1 First Sub-hypothesis Test:

There is a positive meaningful relationship between foreign exchange and coins with institutional ownership.

H0: There is no positive meaningful relationship between foreign exchange and coins with institutional ownership.

H1: There is a positive meaningful relationship between foreign exchange and coins with institutional ownership.

Table2: First Sub-hypothesis Test conclusions

$SIIit = 5/69 - 4/74Cit - 1209ROAit + 8/45 SIZEit$					
Meaningful level	t amount	Standard error	coefficient	Independent variable	Dependent variable
0.327	-0.987	4.8	-4.74	Cash money	Institutional ownership
0.00	-3.86	328	-12.09	Assets returns	
0.041	2.09	4.03	8.45	Corporation size	
0.893	0.134	42.39	5.69	Fixed amount	
0.304			Determination coefficient		
7.45			Fisher test		
0.00			Fisher meaningful level		
2.27			Watson Doorbin		

While Chow test is meaningful, so modulation methodology has been used to test research hypotheses. Data have been categorized to analyze in pudding way. Above table conclusions show the test squares to estimate model and vif amount indicated lack of any linear problem between independent variables.

Conclusions indicate that Watson Doorbin amount is 2.27, this conclusions describe that variables errors are independent from each other and there is no correlation between them. In the above table, determination coefficient amount is 0.304 which shows that independent variable with 30.4 percent amount has been justified. In otherwise, anticipation ability of dependent variable is 30.4 percent. Meaningful level of Fisher test describes that model in this hypothesis is meaningful. Meaningful level of t-test for cash money variable such as foreign exchange and coins is more than 0.050 (0.327). So, dependent variable hasn't been affected by it. Finally, H0 is accepted and H1 is rejected, there is no positive meaningful relationship between foreign exchange and coins with institutional ownership.

##### 5.2 Second Sub-hypothesis Test

There is a positive meaningful relationship between short-term investments and partnership stocks for sale with institutional ownership.

H0: There is no positive meaningful relationship between short-term investments and partnership stocks for sale with institutional ownership.

H1: There is a positive meaningful relationship between short-term investments and partnership stocks for sale with institutional ownership.

Table3: Second Sub-hypothesis Test conclusions

$SIIit = -30/94 + 5/13SSit - 920ROAit + 1/047SIZEit$					
Meaningful level	t amount	Standard error	Coefficient	Independent variable	Dependent variable
0.235	1.19	4.28	5.13	Cash money	Institutional ownership
0.0017	-3.31	277	-920	Assets returns	
0.797	0.257	4.06	1.047	Corporation size	
0.449	-0.777	39.42	-30.94	Fixed amount	
0.311			Determination coefficient		
7.67			Fisher test		
0.00			Fisher meaningful level		
2.29			Watson Doorbin		

While Chow test is meaningful, so modulation methodology has been used to test research hypotheses. Data have been categorized to analyze in pudding way. Above table conclusions show the test squares to estimate model and vif amount indicated lack of any linear problem between independent variables.

Conclusions indicate that Watson Doorbin amount is 2.29, this conclusions describe that variables errors are independent from

each other and there is no correlation between them. In the above table, determination coefficient amount is 0.311 which shows that independent variable with 31.1 percent amount has been justified. In otherwise, anticipation ability of dependent variable is 31.1 percent. Meaningful level of Fisher test describes that model in this hypothesis is meaningful. Meaningful level of t-test for short-term investments and partnership stocks for sale variables is more than 0.050 (0.235). So, dependent variable

hasn't been affected by it. Finally, H0 is accepted and H1 is rejected, there is no positive meaningful relationship between short-term investments and partnership stocks for sale with institutional ownership.

**5.3 Third Sub-hypothesis Test**

There is a positive meaningful relationship between demand deposits in banks and institutional ownership.

H0: There is no positive meaningful relationship between demand deposits in banks and institutional ownership.

H1: There is a positive meaningful relationship between demand deposits in banks and institutional ownership.

Table4: Third Sub-hypothesis Test conclusions

<i>SIIit = -408 + 2.16DDit - 925ROAit + 2.22SIZEit</i>					
Meaningful level	t amount	Standard error	Coefficient	Independent variable	Dependent variable
0.357	0.928	2.23	2.16	Cash money	Institutional ownership
0.002	-3.24	284	-925	Assets returns	
0.566	0.576	3.84	2.22	Corporation size	
0.916	-0.104	38.93	-4.08	Fixed amount	
0.303			Determination coefficient		
7.4			Fisher test		
0.00			Fisher meaningful level		
2.35			Watson Doorbin		

While Chow test is meaningful, so modulation methodology has been used to test research hypotheses. Data have been categorized to analyze in pudding way. Above table conclusions show the test squares to estimate model and vif amount indicated lack of any linear problem between independent variables.

Conclusions indicate that Watson Doorbin amount is 2.35, this conclusions describe that variables errors are independent from each other and there is no correlation between them. In the above table, determination coefficient amount is 0.303 which shows that independent variable with 30.3 percent amount has been justified. In otherwise, anticipation ability of dependent variable is 30.3 percent. Meaningful level of Fisher test describes that model in this hypothesis is meaningful. Meaningful level of t-test for demand deposits variables is more than 0.050 (0.357). So, dependent variable hasn't been affected by it. Finally, H0 is

accepted and H1 is rejected, there is no positive meaningful relationship between demand deposits and institutional ownership.

**5.4 Fourth Sub-hypothesis Test**

There is a positive meaningful relationship between people's short-term deposits in banks and institutional ownership.

H0: There is no positive meaningful relationship between people's short-term deposits in banks and institutional ownership.

H1: There is a positive meaningful relationship between people's short-term deposits in banks and institutional ownership.

Table5: Fourth Sub-hypothesis Test conclusions

<i>SIIit = -59.38 - 3.28STDit - 1022ROAit + 10.83SIZEit</i>					
Meaningful level	t amount	Standard error	Coefficient	Independent variable	Dependent variable
0.050	-2.14	1.63	-3.28	Cash money	Institutional ownership
0.00	-3.94	259	-1022	Assets returns	
0.004	2.97	3.64	10.83	Corporation size	
0.175	-1.37	43.21	-59.38	Fixed amount	
0.340			Determination coefficient		
8.78			Fisher test		
0.00			Fisher meaningful level		
2.17			Watson Doorbin		

Data have been categorized to analyze in pudding way. Above table conclusions show the test squares to estimate model and vif amount indicated lack of any linear problem between independent variables.

Conclusions indicate that Watson Doorbin amount is 2.17, this conclusions describe that variables errors are independent from each other and there is no correlation between them. In the above table, determination coefficient amount is 0.340 which shows that independent variable with 34 percent amount has been justified. In otherwise, anticipation ability of dependent variable is 34 percent. Meaningful level of Fisher test describes that model in this hypothesis is meaningful. Meaningful level of t-test for people's short-term deposits in banks variables is less than

0.050 (0.357). So, dependent variable has been affected by it. Finally, H0 is rejected and H1 is accepted, there is a positive meaningful relationship between people's short-term deposits in banks and institutional ownership.

**5.5 Fifth Sub-hypothesis Test**

There is a positive meaningful relationship between total short-term loans of banks' acceptances and institutional ownership.

H0: There is no positive meaningful relationship between total short-term loans of banks' acceptances and institutional ownership. H1: There is a positive meaningful relationship between total short-term loans of banks' acceptances and institutional ownership.

Table 6: Fifth Sub-hypothesis Test conclusions

$SII_{it} = 4.14 - 6.83STLit - 1380ROA_{it} + 11.5SIZE_{it}$					
Meaningful level	t amount	Standard error	Coefficient	Independent variable	Dependent variable
0.034	-2.17	3.14	-6.83	Cash money	Institutional ownership
0.00	-4.51	305	-1380	Assets returns	
0.002	3.16	3.63	11.5	Corporation size	
0.911	0.111	37.06	4.14	Fixed amount	
0.351			Determination coefficient		
9.22			Fisher test		
0.00			Fisher meaningful level		
2.21			Watson Doorbin		

While Chow test is meaningful, so modulation methodology has been used to test research hypotheses. Data have been categorized to analyze in pudding way. Above table conclusions show the test squares to estimate model and vif amount indicated lack of any linear problem between independent variables.

Conclusions indicate that Watson Doorbin amount is 2.21, this conclusions describe that variables errors are independent from each other and there is no correlation between them. In the above table, determination coefficient amount is 0.351 which shows

that independent variable with 35.1 percent amount has been justified. In otherwise, anticipation ability of dependent variable is 35.1 percent. Meaningful level of Fisher test describes that model in this hypothesis is meaningful. Meaningful level of t-test for total short-term deposits of banks' acceptances variables is less than 0.050 (0.357). So, dependent variable has been affected by it. Finally, H<sub>0</sub> is rejected and H<sub>1</sub> is accepted, there is a positive meaningful relationship between total short-term deposits of banks' acceptances and institutional ownership.

Table 7: All Hypotheses Conclusions

conclusions	Hypotheses interpretations	Hypotheses
H <sub>0</sub> is accepted	There is a positive meaningful relationship between foreign exchange and coins with institutional ownership.	First hypothesis
H <sub>0</sub> is accepted	There is a positive meaningful relationship between short-term investments and partnership stocks for sale with institutional ownership.	Second hypothesis
H <sub>0</sub> is accepted	There is a positive meaningful relationship between demand deposits in banks and institutional ownership.	Third hypothesis
H <sub>0</sub> is rejected	There is a positive meaningful relationship between people's short-term deposits in banks and institutional ownership.	Fourth hypothesis
H <sub>0</sub> is rejected	There is a positive meaningful relationship between total short-term loans of banks' acceptances and institutional ownership.	Fifth hypothesis

## 6. Discussion

### 6.1 First sub-hypothesis conclusions

For the first hypothesis, there is a positive meaningful relationship between foreign exchange and coins with institutional ownership, modulating and least squares methods have been used. Watson Doorbin test conclusions indicate that existence of correlation hypothesis among its statements is rejected, however, Fisher test conclusions describe that the model is credible to analyze its conclusions. Determination coefficient interprets that dependent variable (institutional ownership) has been justified about 30 percent. T-statistic conclusions of this hypothesis describes that amount of meaningful level for foreign exchange and coins is more than 0.050 (0.327), so foreign exchange and coins can't effect on institutional ownership. Finally, this hypothesis is rejected, there is no positive meaningful relationship between foreign exchange and coins with institutional ownership.

This hypothesis conclusions are related to Ahmadpoor (2011) conclusions, he found that lack of existence of monetary market and effective and suitable monetary instruments are two factors in inability of liquidity extra management in Islamic countries, this research concluded that some of the standards of monetary instruments after their adaptations with Islamic doctrine should be used for liquidity extra management in Islamic banking.

### 6.2 Second sub-hypothesis conclusions

For the second hypothesis, there is a positive meaningful relationship between short-term investments and partnership stocks for sale with institutional ownership, modulating and least squares methods have been used. Watson Doorbin test conclusions indicate that existence of correlation hypothesis among its statements is rejected, however, Fisher test conclusions describe that the model is credible to analyze its conclusions. Determination coefficient interprets that dependent variable (institutional ownership) has been justified about 31percent. T-statistic conclusions of this hypothesis describes that amount of meaningful level for foreign exchange and coins is more than 0.050 (0.235), so short-term investments and partnership stocks for sale can't effect on institutional ownership. Finally, this hypothesis is rejected, there is no positive meaningful relationship between short-term investments and partnership stocks for sale with institutional ownership.

Institutional investors as main corporations' owners are responsible for effecting on corporations' managements to play effective roles on their investment effectiveness. This hypothesis can be related to Tesay and Goo (2007) conclusions, they investigated relationship between institutional ownership and corporations' operations from 1999 to 2003. They found that institutional investors in investigating corporations may help investments to decrease representative problems resulted from division management and ownership. Moreover, financial

institutes try to invest in big corporations with lower financial levers.

### 6.3 Third sub-hypothesis conclusions

For the third hypothesis, there is a positive meaningful relationship between demand deposits in banks and institutional ownership, modulating and least squares methods have been used. Watson Doorbin test conclusions indicate that existence of correlation hypothesis among its statements is rejected, however, Fisher test conclusions describe that the model is credible to analyze its conclusions. Determination coefficient interprets that dependent variable (institutional ownership) has been justified about 30percent. T-statistic conclusions of this hypothesis describes that amount of meaningful level for foreign exchange and coins is more than 0.050 (0.357), so demand deposits in banks can't effect on institutional ownership. Finally, this hypothesis is rejected, there is no positive meaningful relationship between demand deposits in banks and institutional ownership.

This hypothesis conclusions are related to Rifky (2010) conclusions, he investigated investors' liquidity behavior of Islamic banks through three motivations areas: opening account, behavior in response to deposit and decision for money removal. He found that Islamic banks should know their duties in educating banking contents based on Islamic rules because most of the liquidity problems of Islamic banks are resulted from investors' incorrect expectations.

### 6.4 Fourth sub-hypothesis conclusions

For the fourth hypothesis, there is a positive meaningful relationship between people's short-term investments in banks and institutional ownership, modulating and least squares methods have been used. Watson Doorbin test conclusions indicate that existence of correlation hypothesis among its statements is rejected, however, Fisher test conclusions describe that the model is credible to analyze its conclusions. Determination coefficient interprets that dependent variable (institutional ownership) has been justified about 34 percent. T-statistic conclusions of this hypothesis describes that amount of meaningful level for foreign exchange and coins is less than 0.050 (0.050), so people's short-term investments in bank scan effect on institutional ownership. Finally, this hypothesis is not rejected, there is a positive meaningful relationship between people's short-term investments in banks and institutional ownership. This hypothesis shows that increase in people's short-term investments in banks will lessen institutional ownership (no related research to this hypothesis has been found).

### 6.5 Fifth sub-hypothesis conclusions

For the fifth hypothesis, there is a positive meaningful relationship between total short-term loans of banks' acceptances and institutional ownership, modulating and least squares methods have been used. Watson Doorbin test conclusions

indicate that existence of correlation hypothesis among its statements is rejected, however, Fisher test conclusions describe that the model is credible to analyze its conclusions. Determination coefficient interprets that dependent variable (institutional ownership) has been justified about 35 percent. T-statistic conclusions of this hypothesis describes that amount of meaningful level for foreign exchange and coins is less than 0.050 (0.034), so total short-term loans of banks' acceptances can effect on institutional ownership. Finally, this hypothesis is not rejected, there is a positive meaningful relationship between total short-term loans of banks' acceptances and institutional ownership. This hypothesis shows that increase in total short-term loans of banks' acceptances will lessen institutional ownership (no related research to this hypothesis has been found).

## 7. Conclusions

Many researches have been done based on institutional ownership which indicated that these owners should concentrate on economical operations and avoid opportunist situations. Liquidity risk is one of the fundamental doctrine in management of financial operations, as indicated in recent credible crisis, lack of liquidity can fall biggest banks and financial institutes. Lack of assets sales possibilities with expected prices or suitable costs are very dangerous. Although, this research conclusions indicate that risk liquidity doesn't have more effect on institutional ownership kind. If it had effect, this effect would decrease institutional ownership.

**Abstract:** The aim of the present study is to assess the relationship between family communication patterns and feeling of loneliness, responsibility and prosocial behavior with visually impaired the female and male adolescents. The descriptive correlational method is used in this study. The study sample visually impaired students, ages 12 to 18 years who are selected from Narjes and Shahid Mohebi schools. Data is revised by questionnaire Family communication patterns, Loneliness Scale, Adolescent Personal-Social Responsibility Questionnaire, Prosocial behavior Scale were Collected and analyzed by using test of correlation, T test and regression method. There is negative significant relationship between dialogues with loneliness and there is positive significant relationship between dialogue with responsibility and Prosocial behavior.

**Keywords:** Family Communication Pattern, feelings of loneliness, responsibility, Prosocial behavior, visual impairment

### 1. Introduction

The importance of personality has been nowadays acknowledged the purpose of Family Communication Pattern is that Children learn how to communicate with others, interpret the behavior of others and experience emotions and communicate activities with others [1]. [2] They re-examined the communication patterns that had been studied by Mkld and Chfy and identified two important dimensions of the dialogue orientation and conformity orientation in the pattern of family relationships. The dialogue orientation refers to "the value of opportunity that families make it available to members of their families to act freely and safely in dialogues and discussions"[3].

Conformity orientation is defined as "how families emphasize on the similarity of ideas, values, and beliefs [4]. The combination of these two dimensions make four family communication styles that consists of: agreement family, pluralistic, protective and non-intervention [5]. Agreement families gain high rates of both dialogue and conformity. In these families, while individuals can express different opinions emphasize on agreement with each other on stress [6]. The pluralistic Family gain high score in dialogue orientation but do not earn a high score in conformity orientation. The characteristics of these families can note to the free conversations and comfort as well as protection of emotion [6]. Protective family orientation gains a low score in dialogue and gains a high score in conformity orientation. These families have too much emphasis on compliance and obedience to their parents [7]. In a study using census 60 impairment visual students with multi-stage sampling, 150 students of the ordinary boy were selected. Research instruments consist of Family Assessment and inventory accountability. For data analysis, Pearson correlation, independent t-test and Fisher's z test were used. And they concluded that performance of families were influential on the responsibility of blind teenagers [8]. Previous research results showed, there is no significant relationship between the use of strategies to strengthen the relationship and feel less alone among family members [9]. That alone is an unpleasant experience that includes the lack of [or lack of quality] certain relationships that lead to a reduction in health [10]. People who are lonely do not have the psychological well-being [11]. Loneliness defines as a lack of social closeness, and predictors of physical and mental health [12]. People who have close social relationships are both feeling good and behave well

and this is very useful for society [11]. People with mental and physical disabilities are more at risk of loneliness [13, 14, and 15]. Social proximity is a psychological need [16, 17], a nutrient for the body [18, 19].

The results of the study [20] showed that between Loneliness of deaf girls and boys that have Permissive parents there is a significant difference. Studies have shown that visual Impairment has profound effects on the daily lives of people with this disorder [21]. The problems of these people include psychological- social problems and constraints in everyday life such as commuting in and out of the home, social isolation [22] and loneliness [23].

Social isolation and lack of social protection of people with visual impairment lead to problems in the functioning of the mental, physical and social [24, 25]. The relationship plays an important role in the performance and function of the family. Families that are flexible as an institutional and their bases are on dialogue and autonomy than the families that obey their parents and close interaction and synergy of ideas and attitudes that cause stress in children, they cause that children have the ability to express their emotions and feeling. These children have the abilities of problem solving and decision-making [3, 26], have good self-esteem [27]. They deal with social challenges, conflicts in interpersonal relationships with peers and management ability and a strong sense of responsibility that all this leads to leading to positive communication. These people develop their social connections [28] and will not feel alone. The process of developing a sense of responsibility in social relations of children, usually occurs together with family members; In particular, in the relationship between parents, sisters and brothers, the quality of family have shown that have a big effect on responsibility and choices of daily life [30], and makes people to have ideal image of themselves [31].

Parents how has a free relationship to express positive emotions and warm relationship with their children, the interactions, communication and acceptance of excitement are at its peak. In such families, one is able to adjust the appropriate emotions and avoid negative emotions. In this communication, positive social feelings such as altruism and appreciation, facilitating social and dramatically promote and strengthen social behavior [32].

Tends to the Prosocial behavior such as altruism and gratitude is effective on having intimate relationships family members [33]. In terms of [34] Altruism is a voluntary behavior that aims to bring benefit to others without expectation of reward. Altruism parents positively associated with children's beneficial social behavior [35]. Word relationship between gender and altruism concluded that Gender does not cause differences in altruistic behavior and in this respect, there is no difference between the genders [36, 37]. People with the visual impairment may due to specific social conditions have higher than their peers to be lonely. As well as their families, by relying on a number of factors, try to not delegate many responsibilities to their children. This study aims to examine the importance of family relationships in reducing feelings of loneliness, increase and strengthen the sense of responsibility and Prosocial behavior among adolescents. Most done research in the domain of visual impairment, more personality characteristics compared with their peers and less to key factors such as the role of family and family relationships in reducing loneliness and increasing the sense of responsibility and community-oriented behavior is addressed. In the area of visual impairment either outside or inside the country, such study has been done. The purpose of this study is to investigate the relationship between family communication patterns with loneliness, responsibility, and Prosocial behavior among adolescents vision impairment.

## 2. Methodology

This research is descriptive and correlational. The study population included all 12 to 18-year-old adolescent students (first and second of high school) which as a visual impairment in Narjes and Shahid Mohebi schools in Tehran in the year 2016-2015. The number of 130 students were selected using census method [and some students due to problems such as deafness, lack of interest or lack of attendance at school do not participate in the test] of which 125 questionnaires were returned and analysis of subjects was answered based on 125 questionnaires. In order to collect data first, with confirmation of an exceptional management education and coordination with both school administrators, inventory of Family Communication Patterns, feeling of loneliness, responsibility, Prosocial behavior for each of the sample group is read verbally and they wrote their responses in Braille, then their responses was registered on answer sheets. For the analysis of test data correlation, independent t-test and regression analysis were used.

### 2.1 Revised Family Communication Patterns Inventory [RFCP]:

Inventory of Family Communication Patterns by [38] is made and has a 5-point of 26 items [strongly agree = 5, strongly disagree = 1] is in the context of family relationships. This tool forms the dialogue orientation and conformity orientation of Family respectively, 15 first propositions and 11 constitute the next proposition and the range of scores in the dialogue is between zero to 60, and the range of scores in conformity is between zero and 44. If both participants in the dialogue and conformity get a high score they are consensual Family And if they get a low score in the dialogue and get a high score in the conformity, belongs to a protective families and the participants that get a high score in dialogue and low score in conformity they are Pluralist and if get a low score in both they are promiscuous families [39].

Kvyrnr and Fitzpatrick tested reliability coefficient with test-retest method in the dialogue 0.99 and in conformity dimension reported 0.73. Coroshnia implemented the validity and reliability of these tools on 326 male and female high school student in the city of Shiraz that validity in the dialogue revealed a significant correlation 0.74 and he then acquired 0.49 conformity; and reliability of the instrument acquired in the dialogue and conformity alpha 0.87 [39].

### 2.2 Loneliness Scale:

Loneliness Scale, UCLA, first was formulated by [40]. Despite the high reliability and validity of this scale, Russell and colleagues to address some of the shortcomings revised this scale again in 1980. The scale once again in 1993 was revised by Russell. In the third edition statements and how to answer it became easier. Russell reported the alpha coefficient of this scale

0.94 [41]. Loneliness Scale has 20 questions which respondents should answer subject to any of the questions on a Likert scale of 4 degrees (never = 1, rarely = 2, often = 3, always = 4). The test scores range from [at least] 20 and the [maximum] is 80. The mean score is 50. This scale has 11 positive expressions and 9 negative expressions [42]. The scales of 1, 5, 6, 9, 10, 15, 16, 19 and 20 are scored inversely and scores on this scale indicate more loneliness. Russell and et al obtained Cronbach's alpha for this scale 0.96 and obtained the correlation of test 0.73 within two months later. Davarpanah in 1995 translated this scale into Persian, and obtain normative tables grades of loneliness on 1315 girls of 12 to 18-year-old from five districts of Tehran [42]. [41] Third Edition reliability is reported 0.88 and its validity reported 0.55.

### 2.3 Responsibility scale:

This scale has 50 items which was invented by Mr. Karami in Iran and was run in 2009 by (43) on 500 middle school students in Tehran schools and was standardized. This questionnaire is scored as follows; each phrase includes five options which are [strongly agree = 5 and strongly disagree = 1]. In this questionnaire the scoring is the reverse question contrary; means the questions, 6, 8, 10, 12, 15, 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46 are to calculate the reliability of the test. The internal consistency by Cronbach's alpha for the whole questionnaire is obtained 0.91 by Nematı (2009). Also, he reported the correlation f each question with their whole concept of responsibility between 0.48 and 0.78 and most of them is reported high.

### 2.4 Prosocial behavior scale:

The Prosocial behavior scale [44] is a 16 questions scale which reflects the behavior and feeling of others in relation to partnership with others, helping them, care of others, empathy with others and the needs and requests. Each form factor encoded on the preference of the response scale (never) to five degrees [almost always] are accordingly. Kvprara in 2005 among 1278 male and 1296 female of this questionnaire is implemented that 71% of participants were high school students. He obtained for this scale the Cronbach's alpha 0.91 for all items. He also verified the correlation between the items through the open method calculated 0.59. This questionnaire in Iran is translated by [45]. According to him among a group of students in Tehran this scale has 0.91 validity for all item, and coloration of all the factors at around is 0.59. And also its reliability is obtained 0.91.

### 2.5 Findings of the research:

In the present study sample group of tables were used for the processing of descriptive findings including mean and standard deviation obtained by the sample group in each of the variables. To test the hypotheses independent t-test, correlation and regression analysis were used (table 1).

Table1. Mean and standard deviation obtained by the two groups in communication patterns, feelings of loneliness, responsibility and Community-oriented behavior

Variable name	The statistics of group	number	mean	standard deviation
dialogue	female	52	51.85	9.46
	male	73	48.52	10.93
Conformity	female	52	31.83	6.67
	male	73	34.49	8.09
Loneliness [general]	female	52	10.85	2.78
	male	73	11.06	2.09
Responsibility [general]	female	52	26.13	3.49
	male	73	24.95	3.31
Community-oriented behavior	female	52	52.54	9.04
	male	73	12.49	8.65

Statistical methods were used to test the three hypotheses. After reviewing normality of the data, to determine the relationship between the two variables is linear or not and finally deciding to use which one the correlation methods are used. The relationship between the two variables was analyzed by ANOVA method. The results showed. The results show that between the

relationship pattern and loneliness feeling there is a negative and significant relationship  $r = -0.28$  [at 99%] and responsibility and community-oriented behavior have a significant positive relationship with  $r = 0.04$  respectively (table 2).

Table 2. Comparison groups for changing patterns of communication, loneliness, accountability and community-oriented behavior

Variable name	amount of t	degree of freedom	significant level	Mean differences
Dialogue	1.77	123	0.08	3.32
Conformity	-1.88	123	0.04	-2.67
Self-management	0.83	1	0.41	1.01
Discipline	0.43	1	0.67	0.47
Legality	1.82	1	0.05	2.79
Bailment	2.47	1	0.03	0.44
Loyalty	3.70	1	0.00	1.78
Organization	0.46	1	0.65	0.33
Progressivism	0.16	1	0.88	0.03
Isolation	0.02	123	0.98	0.42
Sociability	-0.09	123	0.37	-0.98
Lack of close friend	-0.76	123	0.51	-0.12
Lack of loneliness	1.16	123	0.25	0.21
Responsibility	1.10	123	0.04	1.32
Community-oriented behavior	2.14	123	0.04	3.42

As can be seen in the following table according with t test with -1.88 in conformity variable shows significant differences between the two groups. The test results with the 1.77 do not show significant difference between two groups. Thus, according to the difference between the two groups in the Thus, according to the difference between the two groups in conformity reject the null hypothesis and research hypothesis is confirmed. The t-test does not show a significant difference between the two groups in term of Loneliness Scale. Therefore, the research hypothesis

cannot be confirmed. According to t-test with the 1.10 show differences, in terms of accountability with insurance 0.96 statistically is significant. Thus the research hypothesis is confirmed. The t-test with 2.14 shows that difference in terms of community-oriented behavior groups is statistically significant at the confidence of 0.96. So it does not show significant differences between the two groups variance. After running the test it can be seen that only dialogue dimension entered to the model no variable is excluded from the model (table 3).

Table 3: Investigating the statistical value of the predictor variables and the criterion

Variables in the model	model	The sum of squares	Degrees of freedom	Average of squares	F	The significance level
Dialogue - feelings of loneliness	1 regression	131.30	1	131.30	27.94	0.00
	Remaining	578.12	123	4.70		
	Total	709.40	124			
Dialogue - responsibility	2 regression	120.95	1	120.95	11.15	0.00
	Remaining	50.13334	123	10.85		
	Total	1455.45	124			
Dialogue - Prosocial behavior	3 regression	126.45	1	126.95	6.15	0.01
	Remaining	6334.50	123	50.85		
	Total	6461.45	124			

According to the table above in the chi-F with the 94.27 and the degree of freedom 1 and 123, the linear relationship between dialogue and loneliness were significant in 0.00 levels. Also in test F with a 15.11 and degrees of freedom 1 and 123 linear relationship between dialogue and responsibility at the level of 0.00 was significant. The Prosocial behavior in the test variable with a value of 6.15 and a degree of freedom F 1 and 123, the linear relationship between dialogue and Prosocial behavior was significant at 0.01 level.

### 3. Discussion and Conclusion

The aim of this study is to investigate the relationship between family communication patterns with the feeling of loneliness, responsibility and Prosocial behavior among adolescents that have visual impairment. The results showed that there is negative and significant relationship between dialogue of the communication patterns and the feeling of loneliness,

responsibility and the community-oriented and positive relationship was observed behaviors and between the conformity of the overall communication patterns with any of the variables [feelings of loneliness, responsibility and community-oriented behavior] was not a significant relationship. According to the results, families in which the relationship between members is based on the dialogue can be known as people with a low level of loneliness, responsible and compassionate people, and altruism. Because these people in the family have the possibility to express feelings, having relationships and the ability to assume their roles and these families are ideal families and its members can know themselves as a useful and effective member. This study investigated the hypothesis that there is a relationship between family communication patterns with loneliness was approved. The results are consistent with other research.

The findings of the study on students and mothers of the students indicated that the more effect of degree of intimacy on the sense of isolation depends on the number of connections [46]. In

addition, there is a significant relationship between loneliness and emotional attachment [47].

The hypothesis that there is a relationship between family communication patterns and responsibility were approved. The results are consistent with other research. The results of the study [30] showed, in Pearson correlation test a significant relationship was found between the sense of responsibility and family relationship. The importance of family relationships in instilling a sense of responsibility in children in this study was quite clear among young Malaysians. These findings support the results of other studies.

[48], believes that parent families with high dialogue train children with social skills, management ability, and high leadership. The results of the study [49] showed that the more relationship between parents and adolescents warmer, the more juvenile responsibility will exist. Also, the hypothesis that there is a relationship between family communication patterns and behaviors Holistic was approved. The results are consistent with other research. When [50], interviewed with children and parents about the value of altruistic the child the altruistic behavior was evaluated, this species was observed that the socially beneficial behavior directly linked with family dialogue in the altruistic values.

In a study on the children [51], the researchers measured parenting styles with social beneficial behavior. They found that moral reasoning, Moral reasoning and social utility also useful real social behavior in families who have more education is less restricted. Another study in which the effect on the quality of family relationships and positioning siblings were 5 years old children's cognitive development, siblings are not significant impact position [52]. But studies have shown that older children adopted sibling position on socially beneficial behavior affects younger children. Studies also have suggested having a brother or sister is along with a greater understanding of other beliefs and emotions [53]. So we can say that parents that insist on obedience pay less attention to their children socially beneficial behavior.

The fourth hypothesis of the results also showed that, in terms of family communication patterns, in the next dialogue, girls achieved higher scores but this difference was not significant. In the conformity dimension, boys get a higher score than girls. In terms of responsibility and Prosocial behavior among boys and girls are different. In regard to the lonely boys got higher scores, but this difference was not significant. This may be due to the small sample group. In general, girls are more likely to mention their emotions and feelings than boys and they show that they are more sensitive to family issues; and more sympathetic. But other studies have shown, women feel lonelier than men [54]. The number of social networks effect on loneliness of people [55]. In another study based on solidarity and models, it seems that parents that in the teenage period of their children, especially in childhood, express more negative emotions in the house, they will have more compassion girls and the relationship between emotional expressions of compassion in the girls' parents and tend change over time. Perhaps the girls after puberty, their parents are less affected by negative emotional expression [56]. Other researchers have found a positive relationship between emotional expression and negative childhood outcomes [57] they found that the positive and negative expression, positively is associated with social behaviors; this relationship was positive for both girls and boys. Parents negative emotions, predicted social benefits behavior and sympathy only for women, perhaps this is due to their greater ability to control their emotions and thus more tolerable of the negative feelings [58].

Also in the fifth hypothesis results showed that family communication patterns (the dialogue dimension) can be a predictor of loneliness, responsibility, and community-oriented behavior. In line with this study [58] in their study suggested that

perhaps the best measure of the effectiveness of the parents' emotional expression and function of the relationship between parent and child. The parental emotions of father and mother aren't only reflect the quality of the relationship parent - child but also to teach children about their experiences and feelings. We can say that educational methods that rely on parents to train their children, dialogue is communication pattern makes verbal skills, communication, and social skills children be strengthened; and children feel good about themselves.

With expanding communication skills in family gradually children in social communication acquire needed skills this makes they have both quantitatively and qualitatively adequate satisfaction of their communications and they feel less lonely. In addition, parents with identifying their expectations of their children establish the personal and social responsibility in their foundations. The sense of responsibility in children and adolescents cause they became aware of needs of parents, family members, friends and other people and become able to respond to the needs of each other.

As the results of this study indicate that the dialogue can reduce feelings of loneliness

And strengthen the sense of responsibility and community-oriented behavior. Among the limitations of this study can be noted:

1. Limitation of society and lack of access to the larger society [at least a few school] due to wider generalizations results.
2. The lack of random sampling of students due to the small population size, and especially since the number of students has been limited. It is suggested that future research using positive psychology done with children and adolescents with visual impairment.

#### Acknowledgments

Thank the administrators, principals and teachers of both schools Narjes and Sahid Mohebi because of their unwavering cooperation, compassion, and gratitude and also, appreciate dear students of these schools that patiently helped us to do this research.

**Abstract:** This study aims to investigate the relationship between sport service quality perception with economic development and satisfaction of sport tourists in Isfahan province. Reliability of questionnaire was estimated and obtained by Cronbach's alpha for the whole questionnaire. Data analysis was performed in both descriptive (frequency and frequency percentage) and inferential statistics (multiple correlation coefficient, simultaneous regression analysis, Kolmogorov-Smirnov test, Pearson correlation coefficient) using SPSS software. The results showed that there is a significant relationship between sport service quality with economic development and satisfaction of sport tourists in Isfahan province.

**Keywords:** service quality, economic development, satisfaction, sport

### 1. Introduction

Iran needs to use all its potential and existing facilities and capabilities in order to create a comprehensive and sustainable development as well as making new sources of revenue instead of relying on oil supplies. One of these potential existing facilities is tourism in the country, because Iran has a special position in the world in terms of tourist attractions. Iran is one of the most spectacular countries in the world and it is among the first ten countries in the world in terms of tourist attractions and it is in the ranking of top five first countries in the world in terms of tourism diversity and among the three first countries in the world based on crafts diversity (site of Iran tourism information, 2009). Isfahan province is the most attractive regions in Iran and has the first rank in attracting tourists and the number of tourist monuments and landmarks. Isfahan has been considered an appropriate place for the onset of manifestations of Iranian culture and civilization for a long time due to favorable natural conditions, located in the geographical center of the country and the possibilities to communicate with other parts of the country (Zirakbash, 2006, p131). Having beautiful landscapes and abundant and unparalleled tourist attractions lead to ask this question whether background of economic growth and development of this province and therefore country can be provided by development of tourism industry in this region based on capacities of this province?

In recent years, tourism has become a competitive industry and countries have become more amenable to new approaches and innovation in this industry in order to earn more money. Performing sport competitions such as Olympic is one of the new ways to attract tourists and indicating culture of a country to the world. Among them, participation in the active and passive different sport movements through organization of economic-commercial factors from the origin country to the destination country and happened travels are called sport tourism which has been turned to the one of the main subsets of tourist, in recent years (Hadavi et al, 2011).

Estimations indicate that more than 70 million people, in 2004, have traveled in order to participate in sports, especially, watch these tournaments (Mojtabavi, 2008). The studies show regions where have access to the sea, beaches and mountains with a variety of climates can be an appropriate place for the development of sports tourism. Regions with steppes and extensive plains and warm climates are proper for the

development of sports such as golf, baseball and polo, etc. Regions with mountains and snow are favorable for the development of mountain and winter sports such as skiing and mountaineering, etc. There are various forms of tourism. Sports tourism is one of them and it has the highest growth among different sectors of tourism (Ehsani et al, 2010). Sports tourism, as tourism in general, has different definitions from different viewpoints of experts. These definitions have many similar and opposite aspects which make a problem for getting a special concept. Gibson offers one of the definitions in the field of sport tourism: Sports tourism is a leisure travel that people leave their settlements in order to engage in physical activities, watch physical activities and .... It must be understood that the quality of service and product play the main role in satisfaction or dissatisfaction of the clients. Therefore, leading and sublime organizations always are seeking to get ensure about their clients' satisfaction (Salehi et al, 2011). Customers' satisfaction is associated closely with the measurement of service quality. Satisfaction is feeling or attitude with which is encountered after receiving services. However, a review of existing literature on the subject suggests that understanding the relationship between customers' satisfaction and perceived service quality is still a challenging issue. The research current believes that customer satisfaction generally comes from the quality of received service. In addition, it should be noted that high clients' satisfaction and high perceived quality of service cause to return clients and customers. Mohammadpour express sports tourism as: Sports tourism is considered as a part of tourism which has been existed by combination of sport and tourism and it being turned and is growing quickly as a big and independent industry. Khatibzadeh knows quality of services and satisfaction of tourists as important issues in tourism policies, with emphasis on satisfaction and return willingness of sport tourists that addressing these issues lead to develop tourism and sport tourism. Karimi, about the challenges of tourism development, considers creating job opportunities, reduction of poverty, improvement of living standards of the population and development of infrastructures as the impacts of tourism in the cities. Because Isfahan province has a great capacity in the field of tourism attraction in general and tourism associated with sporting events in particular and effective factors on sport tourists' satisfaction and presence of sport tourists in the international sport events has not been identified in Isfahan and none of the researchers pay attention to the economic development that can be obtained by presence of sport tourists, thus, the researcher plans to investigate the relationship between perceived service quality with the economic development and satisfaction of the sport tourists of Isfahan province and investigate factors which cause to increase tourists' satisfaction and economic development of Isfahan province.

The researcher wants to answer to the following questions: Is there a significant relationship between the perception of service quality and economic development? Is there a significant relationship between the perception of service quality and sport tourists' satisfaction?

### 2. Method

The present study is applied based on its aim and it is descriptive, of correlational type, based on data collection, because the relationship between the perception of service quality and economic development and sport tourists' satisfaction in Isfahan province has been studied using questionnaire without manipulation in testees' comments. According to the aim of this study which is investigating the relationship between the perception of service quality with economic development and sport tourists' satisfaction in Isfahan province, the method is descriptive - correlational of survey branch which is collected by documentary method of the

theoretical foundations and survey method is used to collect data and information.

The study population consisted of all people as sport tourists who take part in sport-recreational events or activities in Isfahan province during considered time interval who include 50 footballers and 350 karates by inquiry of department of Isfahan Physical Education. The sampling method is holistic. Due to the limitation of the statistical population, all persons who travel to Isfahan province during considered time interval to participate in sport-recreational events or activities are considered as statistical samples who are 50 footballers and 350 karates. Researcher-made questionnaire (study instrument) was given to them. This questionnaire consists of two parts. First part includes 5 questions about demographic characteristics of respondents and second part consists of 16 items about effective factor on satisfaction about how service is provided and service quality in Isfahan.

Table 1. Distribution of questionnaire questions in triple areas

Area	Number	Question No.
Perception of quality	9	1, 2, 3, 4, 5, 6, 7, 8, 9
Economic development	4	10, 11, 12, 13
Tourists' satisfaction	3	14, 15, 16

In order to evaluate the basic components of the research, the five-point Likert scale has been used because this fact that each of the components includes a number of items. In this scale, the weights of 1 to 5 are given to answers arbitrarily. The questionnaire indexing is based on above as follows: (strongly disagree, disagree, neutral, agree, and strongly agree)

For validity, the content validity of preliminary questionnaire was approved by the respectable supervisor professor and some professors of faculty after considering their views. Its reliability was studied by Cronbach's alpha test. The results of alpha test indicate that the obtained amount for the whole questionnaire is 0.959 that shows questionnaire has high reliable items. Alpha amounts for dimensions of questionnaire are as following:

Table 2. Alpha amounts for questionnaire dimensions

Variables	Number of items	Alpha amount
Perception of quality	9	0.918
Economic development	4	0.915
Tourists' satisfaction	3	0.838
Total alpha	16	0.959

Descriptive and inferential statistical indexes have been used in SPSS software environment in order to analyze data. In descriptive statistics level, frequency, average percent and standard deviation have been used to describe collected realities. Pearson correlation coefficient and regression analysis have been used in inferential statistics.

### 3. Results

The results of demographic questionnaire showed the highest percent of respondents' age (50.8) is in the group below the twenty-year-old age and the lowest percentage of respondents' age (1.3) is in the group of forty years old and more.

The highest percentage of respondents' educational major is non-physical education (66.8) and the lowest of them is physical education (29).

The highest percentage of respondents' educational license is under-diploma (35.8) and the highest one is master degree (3.8).

The highest percentage of presence in sport events related to the group is 1 to 2 times (34.5) and the lowest one related to the group is 6 to 12 times (14).

The highest percentage of respondents is single (68.5) and others are married (28.8).

Also, variable of "quality of perception" has the mean of 31.39 and standard deviation of 9.382 which the lowest score of the answer is to this item of (responsible for performing these competitions supplies the needs of tourists) with the mean of 3.31 and the highest of them is the item of (tournaments are held at the appropriate time) with the mean of 3.65.

Variable of "economic development" has the mean of 14.46 and standard deviation equal to 4.341 which the lowest score of the answer is to this item of (these tournaments are effective in creating new jobs in the sport fields) with the mean of 3.5 and the highest of them is the item of (performing these tournaments cause to increase shopping in Isfahanheld at the appropriate time) with the mean of 3.64.

Also, variable of "tourists' satisfaction" has the mean of 11.12 and standard deviation of 3.83 which the lowest score of the answer is to this item of (in general, I am satisfied with the holding of this tournament) with the mean of 3.51 and the highest of them is the item of (I think making decision for presence in these tournaments is correct) with the mean of 3.77.

The results of Kolmogorov-Smirnov test show that data distribution of three variables is normal.

Table (3). Normality test of study variables' data

components	Perception of quality	Economic development	satisfaction
mean	31.39	14.46	11.12
standard deviation	9.382	4.341	3.836
Kolmogorov-Smirnov test	0.115	0.126	0.174
significance level	0.09	0.10	0.156

### 3.1 Study findings with separation of hypotheses

The first hypothesis is: there is a significant relationship between perception of sport service quality and economic development and sport tourists' satisfaction in Isfahan province. The results indicate that the best predictor of the perception of sport service quality has been satisfaction in the first step and the economic development in the second one among the studied variables in the regression. According to the results of stepwise regression, the relationship between perception of sport service quality and economic development and sport tourists' satisfaction in Isfahan province has been significant. Therefore, in the first step, coefficient of satisfaction component explains 61.9% of variance of sport service quality perception and, in the second step, coefficient of economic development component explains 72.9% of variance of sport service quality perception. Observed F has been significant in  $p < 0.01$  level. Thus, regression is generalizable to the statistical population.

For one unit increase in satisfaction component, beta coefficient increases the perception of sport service quality to 0.472 units and for one unit increase in economic development component, beta coefficient increases the perception of sport service quality to 0.457 units.

The equation of the main hypothesis is presented as follow:

The perception of sport service quality = (0.472) satisfaction + (0.457) economic development

The first subsidiary hypothesis is: there is a significant relationship between the perception of sport service quality and economic development in Isfahan province. The results show that the correlation coefficient between the perception of sport service quality and economic development in Isfahan province is significant. That is, there is a significant relationship between the perception of sport service quality and economic development in Isfahan province ( $r=0.782$ ,  $p<0.05$ ). According to coefficient of determination ( $r^2$ ) 1.6 percent of the variance, perception of sport service quality and economic development has been common. Therefore, the first hypothesis is that there is a relationship between the perception of sport service quality and economic development is confirmed.

The second subsidiary hypothesis is: there is a significant relationship between the perception of sport service quality and sport tourists' satisfaction in Isfahan province. The results show that the correlation coefficient between the perception of sport service quality and sport tourists' satisfaction in Isfahan province is significant. That is, there is a significant relationship between the perception of sport service quality and sport tourists' satisfaction in Isfahan province ( $r=0.786$ ,  $p<0.05$ ). According to coefficient of determination ( $r^2$ ) 1.6 percent of the variance, perception of sport service quality and sport tourists' satisfaction has been common. Therefore, the second hypothesis is that there is a relationship between the perception of sport service quality and sport tourists' satisfaction is confirmed.

#### 4. Discussion

The main hypothesis: Due to the significance level ( $p<0.05$ ) which is equal to 0.001 and the coefficient value of (0.61) and according to the results of inferential test relating to the first hypothesis, about the test of study the relationship of "perception of sport service quality with economic development and sport tourists' satisfaction in Isfahan "was confirmed.

The findings of this part were consistent with the results of Khosravi's (2005) study. The results of Khosravian's study shows that among making security, informing people, correct propaganda, coordinating organizations related to tourism affairs, expanding transportation, security has greatest impact on the growth of tourism industry development. But it was not consistent with the Taji's (2005) study. He writes: tourism play a poor role in the economic and social development of villages of this region, despite their very high capacities for tourism.

Also, the Salehi's (2005) findings are consistent with his results and indicate that economists know the tourism industry as the third dynamic and growing economic phenomenon. Also, it is consistent with Hanygan's (1994) studies. He concluded that income and employment was got by tourist were increased and areas which have position and archaism have high development.

In general, the results in the area of the relationship between the perception of sport service quality with economic development and sport tourists' satisfaction indicate that sport service quality can cause to develop economic and tourism can increase occupation and help to develop economic. Also, service quality and sport security can cause to satisfy tourists and thus attract them. The results indicate that sport service quality is an

effective dimension on economic development and satisfaction of tourists.

First hypothesis: According to the significance level ( $p<0.05$ ) which is equal to 0.001 and the coefficient value of (0.78) and according to the results of inferential test relating to the second hypothesis, about the test of study the relationship of "perception of sport service quality and economic development in Isfahan province" was confirmed.

The findings of this part were consistent with the results of Firouzj'ai's (2005) study. His results show that tourism has positive economic social effects and consequences such as creating jobs, increase of income levels and increase of awareness level of people.

But the results of the current hypothesis were not consistent with Valadi's (2008) study; Valadi's results show that 52 percent of villagers considered tourism was ineffective in their lives.

It is also consistent with Kiaipoor's (2010) findings. His results indicate that the process of creating the tourism phenomenon and tourism industry development which in fact present travelling as a commodity causes to tourism industry is defined by various components in different dimensions. Attractions and facilities are two important components in the formation of tourism industry in rural areas.

Also, it is consistent with Zeitonali et al., (2011) studies. They also concluded that there are a significant relationship between the development of sport tourism development and income and creating job.

It is consistent with Rahimian's (2011) findings. She points out that one of the most prosperous industries in the world and the main body of economy for some countries is sport tourism that is an important source of foreign exchange and financial earnings, producing economy and creating job opportunities.

The study was also consistent with Um and Crompton (1992); their results show that also it was consistent with Hanygan's (1994) results; his income and employment resulting from tourism have been increased and the growth of areas with position and archaism in tourism have become more.

In general, the results of these researches, about the relationship between the perception of sport service quality and economic development, show that sport service quality, and lower costs, life security which can be related to economic development and also better sport service can cause to improve economy.

The results of this research indicate that the perception of sport service quality is impressive on economic development.

Second hypothesis: According to the significance level ( $p<0.05$ ) which is equal to 0.001 and the coefficient value of (0.78) and according to the results of inferential test relating to the third hypothesis, about the test of study the relationship of "perception of sport service quality and tourists' satisfaction in Isfahan province" was confirmed.

The findings of this part were consistent with the results of Khatibzadeh's (2010) study. His results show that tourism has positive economic social effects and consequences such as creating jobs, increase of income levels and increase of awareness level of people. Results of his studies show that there is a significant relationship between "sport tourism service quality" and "satisfaction" and "sport tourists' desire to return". Also, "competition quality" has a significant relationship with "sport tourism service quality". Therefore, it can be said many factors which influence on sport tourism service quality, sport

tourists' satisfaction and willingness to return should be considered.

It is also consistent with Levan B.'s (2012) findings. The results of his research show that entry of sport tourists causes officials of sport tourists do something that leads to be welcomed by sport tourists such as bikers, climbers, and the riders.

## 5. Conclusion

Generally, the results of these studies in the area of the relationship between perception of service quality and the sport tourists' satisfaction indicate that possibilities, their quality, reduction of tourism costs, geographical location and so on cause to make satisfaction and thus attract sport tourists.

The results of this research indicate that the perception of sport service quality is one the dimensions which is effective on sport tourists' satisfaction.

Today, the services are mentioned as the heart of making value. Other services are not limited to banking services, health and educational services, but the most products that are purchased have some elements of services. In fact, the most goods rely on service-based activities in order to create excellence and competition. When a customer buys an item, he/she purchases not only goods but also comprehensive package of services. For example, television is along with other services like delivery, insurance and guarantees. In recent years, the services sector has been faced with great interest. Initially, economists paid little attention to service. But gradually realize the importance of services so that Marshall mentioned in the late 19th century a person who provides a service similar to a person who produces a tangible product and this service can offer utility to the recipient. In fact, in Marshall's view, what a producer of agricultural products does is valuable like what a farmer does. The west world has experienced service economy for more than two decades. Today, all manufacturers of goods offer several services to their clients.

Sport tourism is a service industry and it is mainly affected by the quality of offered services. Quality of service is considered as a key concept in organizations related to tourism. Also, quality of services is directly associated with the return of tourists and results in more profits for organizations.

Acceptance of sport centers with combination of the attraction of the destination and hierarchy has many management applications. Researchers in various countries such as Spain, Australia, India, Greece and South Africa, etc. have studied various natural-sport attractions of that country and investigated about the most important natural-sport attractions in their countries that have more diversity and extension and perhaps cause to attract more sport tourists to those countries. They have studied the effect of this kind of sport tourism, too.

Qiu mentions that some countries in North Africa such as Morocco, Tunisia, Egypt and other countries in the continent such as Kenya and South Africa have substantially increased duration, season and revenue of tourism using the opportunities for exploiting sport tourism based on natural-sport attractions.

Sport tourism is an industry that has emerged from the combination of two tourism and sport industries. In other words, sport is one of the important activities of tourists during tourism. Although the tourism industry and sport are both important issues but their interaction is not considered in the past. Travel and tourism industry is considered as the biggest and most renowned industry in the world.

Quality is not only related to private companies and organizations. According to several reasons, maintaining and increasing market share, attracting visitors, more profits, and many destinations, are up to date quality tourism policy, in particular, those that operate in competitive markets (due to price sensitivity and in the high level of replacement). In general, the characteristics of tourism as an

intangible service (intangible), heterogeneity (heterogeneity), imperishable, simultaneous production and consumption, the contradictory nature of tourism experience make significant challenges in the successful implementation of procedures and quality management policies. Human Factors in services, particularly the behavior of service providers in the field of customer's expectations, is one of the essential aspects of high quality management whose control is still hard.

Because of today human spiritual-mental need to entertainment in nature and sports which can be performed in a natural area, with scheduled planning and using the talent of the different regions and considering different conditions, we can step in development of economic aims and creating and job and make appropriate environments for tourists. Planning about these aspects and guiding sport tourists to these attractions will be very useful and prevent wasting time, resources, budget and human and material resources.

### Abstract

In this study we assessed the effectiveness of "Cognitive behavioral therapy" on stress and anxiety in children with nocturia. In this semi-structured study with pre-post assessment and analysis, 30 kids were analyzed and chosen based on inclusion criteria. Kids were assessed using "penn state worry questionnaire for children", "revised children's anxiety and anxiety scale" and "positive and negative affect schedule" on before-after sections. The resulting data were analyzed using descriptive statistics and analysis of covariance. The experiment group showed significant decrease in stress, anxiety, worry and negative feelings which proves the study's hypothesis. Therefore, according to results the cognitive behavioral therapy is effective on stress and anxiety and can be used as a harmless treatment in group training format on children.

Keywords: nocturnal enuresis, anxiety, Kendall cognitive-behavioral

### 1 Introduction

Enuresis is the involuntary repulsion of urine during sleep after the age at which bladder control should be achieved. This ability usually will obtain at three years old. This problem is divided into two types. In primary or continuous enuresis control has not been achieved at any time for a period of at least 6 months to a year and in the secondary type of bladder control the aforementioned Braymedet obtain and will be lost again (Tajri & et al, 2003). So that anxiety and anxiety in children with enuresis are among common psychiatric disorders. There is Anxiety as a part of every human life, in the extent of moderation in all people. And this extent is considered as an adapted response in such a way that we can say: "If there was no anxiety we would all go to sleep behind our desks." Lack of anxiety may face us with many problems and risks. So, anxiety as part of life of every human being constitutes one of the components of his personality structure. And from this point is that some of the anxieties of childhood and adolescence can be considered normalized and accepted their positive effect on the process of transformation. In other words, we can say that anxiety in some situations creates construction and creativity in people and vice versa, there is also a morbid anxiety. Because the extent of anxiety can be productive and useful, and most people have to experience, But this case may have a chronic and continuous aspects that in this case, not only response cannot be considered adapted, But also it should be considered as a source of failure and desperation of person that deprives a person of major part of his facilities. And create a wide range of anxiety disorders that are widespread of recognized disorders of body to unjustified fears and fearfulness (Dadsetan, 1996). (Effert & Huberty, 1990) examined Anxiety in the context of their multi-level behavioral theory. They emphasized on two main themes:

1-Underpinning of the anxiety is a central excitedly response.

2-anxiety may be learned through aversion condition and in such a symbolic way through the language.

In their point of view, the experience of hit and damage is not essential for fear, but also, the fear may easily create through negative excitement that are invoking by words. Words that are evoke with certain situations, for example, the words and the

negative thoughts may be evoked with the pictures of fearfulness.

Thus, they describe a kind of self-conditioning. The importance of their theory is that they depict a transplant and clear relationship between cognitive theory and the theory of conditioning. (Khodapanahi, 2006)

(Huberty, 2010) believes while the anxiety symptoms are different in the type of kind and severity in people and different situations, but some of symptoms are common in the all anxiety disorders and appear in cognitive, behavioral and physical responses. All of these symptoms are not seen in all people or to the same extent.

On the one hand, all people sometimes indicate some of these symptoms but this is not necessarily mean that there is anxiety and will lead to problems. Since many children are suffering from anxiety disorders, the clinical treatments are not able to cover all of them, So, the planners have to invest more in prevention part so that less children experience problematic anxiety.

(Schwartz & wadel, 2012) There are many treatment programs for improving anxiety disorders that all of them have cognitive-behavioral basic. In the field of treatment, cognitive - behavioral method has taken lead generation beyond of other approaches. It is more than twenty years that the amount of effectiveness of cognitive-behavioral therapy has been proven in the treatment of childhood disorders. Cognitive- behavioral therapy is a term to describe psychotherapist's interventions which is aimed to reducing psychological discomforts and maladaptive behavior by changing the cognitive processes. Cognitive- behavioral therapy is based on fundamental assumption that feeling and behavior are largely the products of cognition. So we can created changes in thinking with cognitive and behavioral interventions. Thus, Cognitive- behavioral therapy contains the main elements of both cognitive and behavioral theories. Cognitive psychologists are concerned the way of earning information from the world, a way of unveiling this information and turn it into knowledge, the way of store it and the way of use it in order to directing to our attention and behavior. Cognitive Psychology contains the range of psychological processes.

It covers all fields of behavior from feelings to perception, recognition of designs, attention, learning, memory, concept formation, thinking, guided imagery, remembering, language, excitements and the processes of growth to help to understand the nature of the mind of thought. The idea that the way of our thinking effects on our emotions plays an important role in the treatment of anxiety. In addition to this, the way of our action in a position depends on the consequences that are followed behavior; In other words, if an unpleasant event happens after a behavior, that behavior is more likely to reduce or even stop (Kandall et al 2006). In recent years, it has been raising the tendency toward the use of Cognitive- behavioral therapy for working with children and adolescents. The results of conducted research indicate that this method is effective and useful in the treatment of generalized anxiety disorders, depressive disorders, interpersonal problems and social phobia, morbid fears, refusing to go to school, sexual abuse and in pain management.

So in this study, we are examining the effectiveness of cognitive behavioral therapy on anxiety and anxiety in children with enuresis and attempt to answer to this question that whether cognitive behavioral therapy is effective to reduce anxiety in children with enuresis or not?

### 2 Methodology

Methodology is quasi-experimental with pre-test and post-test scheme with a control group.

The statistical population of present study includes Children with enuresis referring to outpatient clinics of Urology Specialists in 2015 and the first half of 2016 in Kermanshah city. The total number of participants in this study was 30 children admitted to the pediatric urology specialists in Kermanshah that after randomly selection, 15 individuals were placed in control group and 15 individuals were in intervention group. Sampling for children to targeted participate in the study was based on inclusion criteria. After selecting the case study sample, they randomly were placed into two groups: Control and alternative. In the pilot studies minimum samples of 15 people is appropriate. (Delavare, 2001)

Exclusion criteria including the following cases: lack of chronic diseases, lack of bladder or kidney health problems in children, lack of specific medication, no history of traumatic experiences in the past six months, the primary nocturnal enuresis

### 3 Research Tools

#### A: Penn State-form of children Worry Questionnaire (PSWQ-C) (Korpita et al. 1991).

This questionnaire includes 14 items of self-report type.

The questionnaire has used to worry measurement in the children and is useful tool for comprehensive diagnosis and assessment in children between 6 and 18 years old. Questionnaire materials is graded from zero to three as a 4-degree scale. The total test score is between zero and 42 and with the higher total score in children is a sign of greater concern. The convergent and diagnostic and reliability validity of questionnaires has been approved in the study of Mofrad, Atef and Bayanzadeh (2000) (Bakhtiari, et al., 2013).

#### 3.1 Revised child anxiety and anxiety scale (RCADS)

This scale of self-report questionnaire is for children and adolescents from 8 to 18 years old with 47 items and has six scales for measuring separation anxiety disorder, social phobia, generalized anxiety disorder, panic disorder, obsession, incontinent and major anxiety disorder. At this scale the respondent should express that whatever every item is true on him/her due to their usual feelings. In a study on clinical and non-clinical samples good psychometric properties has been reported to this questionnaire. Two specific strong point of this scale are: have several scales is related to the numerous diagnosing anxiety disorder that can be helpful in determining for treatment, the second that has the short scale for anxiety to be evaluated the possibility of anxiety (Chorpita 2011).

#### 3.2 Positive and Negative Affect Scale for Children PANAS-C

This questionnaire is a scale that is used to emotion of children in many studies that includes 24 items and measures the positive and negative emotion of children. Unlike a scale of emotion and arousal, this scale wants from children to grading some adjectives alone (such as angry, sadness) with respect to that in have felt them in recent weeks. Psychometric properties of this scale have been reported appropriate by Alornt and et al., in a

series of comparative analyzes on clinical population, Chorpita and Dalyden observed that measures of negative affection and arousal emotional scale both have correlation with anxiety scales. Meanwhile Negative Affection Scale reliability is high briefly. It was observed in the same study that positive affection Panas has higher correlation with anxiety clearly, although there is a problem due to significant correlation with other scales of negative affection, concern and confusion in its discriminant validity. Although the scale of emotional arousal due to having the high content validity to mood has better potential for prediction for the occurrence of anxiety in the future. However, any advantage or disadvantage related to it requires further researches. According to our findings use of the PANAS is recommend generally in the comprehensive assessment program (Chorpita, 2011)

#### D. assessment questionnaire of children with nocturnal enuresis

This questionnaire in parts of parents assessment, medical assessment and psychological therapist, including A. the findings of résumé B: familial history, C. physical examination findings, D. preclinical findings has been set. Each section has yes and no option and one column is to more explain about that option. Parents form includes 23 items and therapist form has been set in four different sections. This form has been prepared, set and presented by Mahmoud Gharayi in the book of bowel disorders and nocturnal enuresis of children as a practical guide for assessing and treating physicians, psychiatrists, psychologists.

#### 3.3 Implementation Method

participants after examining specialist doctor by questionnaire for nocturnal enuresis was showing that the problem is psychogenic was selected and after performing the first three questionnaires were enrolled and randomly assigned to the intervention group and control group. These sessions once a week for an hour, was conducted by the researcher. As well as during a session with parents the need to implement the treatment plan was recommended to them. And it was agreed that sessions to be implemented twice a week and for 60 minutes and parents also participate and collaborate in some sessions. Cognitive behavior therapy based on cognitive behavioral program of Kendall program in 1994 was designed by Philip Kendall to reduce the symptoms of disorders in children, this therapy method has four steps based on therapy protocol: understanding feelings of fear step, waiting for negative events, actions and attitudes that can reduce interference and results and encouraging, it has been designed. Therapy sessions were designed in a way that at first childhood be aware of your physical reactions to anxiety and physical symptoms and identify signs of anxiety. In the next incidents of negative expectations and anxiogenic accidents and their types will be discussed in therapy session meeting. In the third step the actions and behaviors of children against the events of are examined anxiogenic and problem solving skills and mental relaxation was taught to them. Finally, to the group members were given an opportunity to evaluate the new behaviors they have learned and encourage him/her to do new skills. That content of each session has been prepared and set and presented in the table based on the book of Chorpita (2011) (table 1).

Table 1: content of cognitive behavioral therapy sessions for treatment of children

Session	content
First	Its contact with the authorities, assessment, setting treatment goals, identify stressful situations, familiar with the concept of age-related behavioral problems and nocturnal enuresis
Second	Training different feelings, identify symptoms created in anxiogenic position, positive reinforcement Training, probationary contract and blackout behavior
Third	Training physical symptoms of anxiety, identify physical reactions, Training forming behavior and interaction behavior
Fourth	In person meeting of parents order to increase cooperation with them in the treatment process and responding to possible questions.

Data analysis in the descriptive part with mean and standard deviation. In the second part ANCOVA analysis of covariance was used to testing hypotheses and control of the effect of pre-

test in experimental and control groups. Data were analyzed by using 23-SPSS statistical software.

#### 4 Results

Table 2: Replacing the participants in groups

Group	Number	Percentage
Invention	15	50
Control	15	50
Total	30	100

Findings in Table 2-9 show that in this study, 30 children were present with nocturnal enuresis that were replaced in both groups

(intervention and control) and in each group 15 people has been located.

Table 3: Mean and standard deviation of scores participants in the positive and negative assessment questionnaire for children

Variable	Number	Minimum	Maximum	Mean	Sd	Skewness
Positive affection	30	25	43	32	4.938	0.186 -0.060
Negative affection	30	41	58	51.10	4.78	0.488 -0.439

As can be seen in the table mean and standard deviation positive affection among participants was equal to the  $32.200 \pm 4.938$ .

While in negative affection score of  $51.10 \pm 4.78$  had been obtained.

Table 4: Mean  $\pm$  SD of anxiety and anxiety

Variable	Number	Minimum	Maximum	Mean	Sd	Skewness
Anxiety	30	44	69	55.53	6.67	0.186

The mean of anxiety and anxiety of participants was equal to 55.53 years old with standard deviation of 6.67.

Table 5: Mean  $\pm$  SD of concern PSQW

variable	Number	Minimum	Maximum	Mean	Sd	Skewness
Concern	30	28	40	34.23	2.95	0.322

The average concern score of participants was equal to 34.23 years with a standard deviation of 2.95.

**- Research hypothesis:** there is a significant difference between anxiety scores in the intervention and control group after the intervention step

In all variables skewness and kurtosis is between -2 and +2, which represents the normal distribution samples.

Table 6: descriptive data of anxiety variable

	Group	Mean	Sd
Pre test	Intervention group	58.80	6.97
	Control group	53.60	6.60
Post test	Intervention group	50.530	5.659
	Control group	54.533	6.42

As can be seen in the total average score of anxiety participants in the control group was equal to ( $6.28 \pm 53.60$ ). This mean and standard deviation in the intervention group was equal to ( $5.65 \pm 58.80$ ). While the mean of the control group has not changed significantly ( $6.42 \pm 54.53$ ) it seems a significant change has

occurred in the intervention group ( $5.65 \pm 50.530$ ) that this difference is measured by testing significant covariance. Covariance analysis was carried out on the data normality in descriptive part and homogeneity and Levin test also has come in this part.

Table 7: Levene test a test for equality of variances

F	Degrees of freedom 1	Degrees of freedom 2	Significant
2.61	1	28	0.117

Equality of variances test shows that default of covariate analysis has been observed so the next table shows the

covariance analysis results.

Table 8: results of covariance ANCOVA effectiveness of treatment on anxiety at pre-test post-test part

Resource	Sum of squares	Degrees of freedom	Mean square	F	Significant	Eta coefficient
Modified Model	647.493	2	323.756	17.553	0.000	0.565
Anxiety	527.493	1	527.493	28.301	0.000	0.514
Groups	352.712	1	352.712	19.124	0.000	0.415
Error	497.947	27	18.443			
Total	83938.00	30				

The results indicate that after removing the effect of pre-test, the two interventions and control groups are significantly different

with F equal to 19.12 at level of 0.000. Eta coefficient is equal 0.415 which indicates the effectiveness of the intervention.

Table 9: paired Comparison of intervention and control groups in in anxiety post-test step

groups	Mean difference	standard error	Significant	The difference in the confidence level of 92%	
				Up	Down
Control	7.4	1.692	0.000	10.87	-3.928

## 5 Discussion

The research hypothesis was confirmed based on this that cognitive-behavioral therapy reduces anxiety in children with enuresis which is aligned with the results of (Volek & et al. 2015). They conducted a study to evaluate the effectiveness of psychotherapy on anxiety disorder and anxiety in children.

66 participants were participated in the cognitive behavioral therapy sessions. (Keyn & et al., 2015) Also, was conducted a study to evaluate the effectiveness of method of coping cat therapy (Cognitive therapy Kendal) on anxiety reduction in children with autism syndrome. For this purpose, there were 22 children between the ages of 8-14 years that an average of their IQ was 70. These children were placed randomly in the group and were treated with cognitive-behavioral therapy for sixteen sessions. The results indicate that cognitive-behavioral therapy has been effective on anxiety of these children in comparison with control group and this effect was remained in participants for two months.

Anxiety and anxiety were detected based on diagnostic criteria and questionnaires. The Results indicated that those who had recently thought about suicide have responded to the treatment more than others. These results finally indicated that anxiety and anxiety of children have been reduced. So, this method of treatment was detected appropriate to reduce psychological problems of children. This means that children in the intervention group significantly after the intervention were felt less anxiety and showed less anxiety symptoms compared to the control group. This finding is consistent with the results of other researches that have been conducted in this field. (Basak nejad & et al, 2011), Puleo et al., (2011), Herbert et al., (2009) Ehn et al., (2013) 30 girls of 11 to 13 years old that had been measured by using the structured diagnostic Interview and Children Anxiety Scale, divided randomly in two groups of randomized and experimental. Then, cognitive behavioral therapy group was conducted on them by method of coping with anxiety. The obtained results of analysis of single variable covariance indicated that there is a significant difference between the scores of posttest anxiety of two randomized and experimental groups that were still going on after a month of treatment effect.

In another research that conducted recently by (Zarghami and et al., 2015) aimed to treating children of 8-10 years also, had been used of cognitive therapy method based on Kendal program. In this plan a semi-experimental has been conducted with pretest-posttest and control group. 40 children of 11 to 13 years old with a diagnosis of comprehensive anxiety disorder, separation anxiety or social anxiety were replaced randomly in two groups

of 20 persons (treatment group and the group of expects) after clinical interview by child and adolescent psychiatrists, evaluating by semi-structured diagnostic Interview by placing at the clinical level based on anxiety scale that is based on the test of list of behavioral problems in children.

Intervention therapy was performed based on Individual cognitive behavioral program for ten sessions to the participants of treatment group.

Under evaluating significant clinically indicated that cognitive-behavioral therapy has been significantly reduced the symptoms of the treatment group anxiety compared with group of expects that has been continued in one and a half months and three months pursuits. Articulating this finding we can say that although this method of treatment emphasizes more on children's anxiety, But techniques that have been taught to children and their parents ,especially in 5-6 and 7 sessions can have a significant effect on reducing negative self-talking and cause increasing confidence and positive self-talking and increasing temper of students. In this orientation sessions of self-talking in anxiety or depressive situations, differentiation were performed between anxiety and harmonious self-talking, problem solving training, helping child to change self-talking and finally, the results indicated that these techniques have been effective. Therefore, addition of parents and teachers training to this context of treatment and signs and symptoms pursuit and abundance of enuresis can be useful in subsequent studies.

## Approbation and thanks

The authors know necessary to their own to thanks all people who have cooperated in this research.

**Abstract:** In this study we assessed the effectiveness of "Cognitive behavioral therapy" on stress and depression in children with nocturia. The cognitive behavioral treatment sessions were designed based on Kendall's method and then was performed on 51 kids in experimental group. Experimental and control groups were assessed using "Penn State worry questionnaire for children", "revised children's depression and depression scale" and "positive and negative affect schedule" on before-after sections. The resulting data were analyzed using descriptive statistics and analysis of covariance. The experiment group showed significant decrease in stress, depression, worry and negative feelings. According to results the cognitive behavioral therapy is effective on stress and depression and it can be used as a harmless treatment in group training on children with nocturia.

**Keywords:** nocturnal enuresis, depression, Kendall cognitive-behavioral

### 1 Introduction

The mental health-related problems in children with enuresis are 2 to 6 times the general population (Parishan et al., 2007). So that depression and depression in children with enuresis are of common psychiatric disorders. Enuresis in elementary school age children is an important and complex problem and is problematic both for parents and child, And, if untreated, cause behavioral problems in children and concerns of parents and even this problem is effective in child's communication in adult age (Sepehmanesh and Marvoogi, 2014). There are various treatment methods for treatment of. Methods that had more effective effects in the treatment of antidepressant are include using tricyclic drugs (desmopressin, conditioning therapy, cognitive therapy or a combination of both. (Yusefi & et al, 2009) Research has indicated that despite the similarity of childhood depression with adults, depression in children includes a variety range of symptoms than in adults depression, in addition to this that depression in children and adolescents has more simultaneity with other mental disorders (Charlson, 2000).

Major depressive disorder is one of the most important cases that is raised about children despite a variety of childhood and adolescent depression and is debilitating like major depressive disorder in adults (Ryan, 2003) So that, the individual operations will be injured in the short term or long term. In fact, major depressive of childhood is a recurrent mood disorder which interferes greatly with normal growth of child and increasingly associates with the risk of suicidal behaviors (Birmaher, et al., 2006). The depression of children is diagnosed when they indicate some evidence of function change according to several two-week periods. Including that depressed child may be irritable or disinterested and does not enjoy of many things or has both of them. In addition, the child should have at least four of the following symptoms nearly every day, and some of his most important functions be disturbed:

- Disorder in sleep (oversleeping or insomnia)
- Slowness or severe psychomotor agitation
- Fatigue or lack of energy

- Feelings of worthlessness or unwarranted and extreme feelings of guilt
- Loss of ability to think, concentrate or make decisions
- Repetitive thoughts about death and suicide (Firoozbakht 2006)

In addition to major depressive disorder, dysthymic disorder also is one of the unipolar and relatively stable mood disorders that appear often in childhood (Park & Goodyer, 2000) Childhood dysthymic has mild depressive symptoms for at least one year in childhood and adolescence that is associated with at least two of the following symptoms:

Poor appetite or overeating, low energy or fatigue, feelings of worthlessness, low concentration or poor decision-making and feelings of hopelessness (Khodayari fard & Abedini)

Psychotherapy and pharmacotherapy have been distinguished useful for children and adolescents with depression disorders. However, evidence indicates that psychotherapy is prior to pharmacotherapy frequently for depressed children (Park & Goodyer, 2000) in cognitive-behavioral therapy; the therapist teaches coping skills to the child and provides situations for him to practice these coping skills. These skills are protective factors in anxious disorders of children (Kenoly and Bernstein 2007.) Cognitive-behavioral therapy has different techniques, but experts using mainly from the following techniques:

- Training to child and parents about depression
- Progressive muscular relaxation exercises
- Deep breathing techniques
- Challenging the thoughts that cause depression (cognitive restructuring)
- Put the child exposed to situations cause depression (real and imagined)

Plans to avoid recurrence (such as amplifiers sessions and cooperation with parents and school) the program of coping cat fighting cat is most usable and best guide of cognitive behavior therapy (kandal, 1990).

In coping cats program children learn that how to modify their primary and secondary evaluation processes that are rooted in incorrect beliefs, In poor evaluation of their abilities and high extent of the threatening situation, By learning several skills of psychological in an atmosphere of therapy, make plans for confrontation, Thinking about available solutions, cognitive reorganizing and avoid hopeful thought and cognitive avoids. And by modifying these self-talking, coordinate their ability with the nature of stressful situations and finally with the confrontation (instead of avoiding) help to strengthen their confidence (Dadsetan & et al, 2010).

Parents learn relaxation techniques and act as therapist (Kenoli & Brinson, 2007). In this way, parents are regularly associated with the therapist. In these meetings parents raise their concerns with the therapist. They can help treatment process by informing the therapist of depression situation of their children at home and the way of their reactions. Since parents have profound feelings toward their children, they may be upset by seeing their Child's grievance, but the best thing that they can do is to help their child to confront with his fear (Dadsetan & et al, 2010). Although few studies have focused on aspects of cognitive therapy and are considered often the methods of pharmacotherapy and behavioral therapy. Therefore, due to the lack of indigenous study in this field and the importance of the outcomes of enuresis, in this study we

will evaluate the effectiveness of cognitive-behavioral therapy on depression and depression of children with enuresis. And we are attempting to answer this question whether cognitive behavioral therapy is effective to reduce depression in children with enuresis or not?

## 2 Methodology

Methodology is quasi-experimental with pre-test and post-test scheme with a control group.

The statistical population of present study includes Children with enuresis referring to outpatient clinics of Urology Specialists in 2015 and the first half of 2016 in Kermanshah city. The total number of participants in this study was 30 children admitted to the pediatric urology specialists in Kermanshah that after randomly selection, 15 individuals were placed in control group and 15 individuals were in intervention group. Sampling for children to targeted participate in the study was based on inclusion criteria. After selecting the case study sample, they randomly were placed into two groups: Control and alternative. In the pilot studies minimum samples of 15 people is appropriate. (Delavare, 2001)

Exclusion criteria including the following cases: lack of chronic diseases, lack of bladder or kidney health problems in children, lack of specific medication, no history of traumatic experiences in the past six months, the primary nocturnal enuresis

## 3 Research Tools

### A: Penn State-form of children Worry Questionnaire (PSWQ-C) (Korpita et al. 1991).

This questionnaire includes 14 items of self-report type.

The questionnaire has used to worry measurement in the children and is useful tool for comprehensive diagnosis and assessment in children between 6 and 18 years old. questionnaire materials is graded from zero to three as a 4-degree scale. The total test score is between zero and 42 and with the higher total score in children is a sign of greater concern. The convergent and diagnostic and reliability validity of questionnaires has been approved in the study of Mofrad, Atef and Bayanzadeh (2000) (Bakhtiari, et al., 2013).

### 3.1 Revised child depression and depression scale (RCADS)

This scale of self-report questionnaire is for children and adolescents from 8 to 18 years old with 47 items and has six scales for measuring separation depression disorder, social phobia, generalized depression disorder, panic disorder, obsession, incontinent and major depression disorder. At this scale the respondent should express that whatever every item is true on him/her due to their usual feelings. In a study on clinical and non-clinical samples good psychometric properties has been reported to this questionnaire. Two specific strong point of this scale are: have several scales is related to the numerous diagnosing depression disorder that can be helpful in determining for treatment, the second that has the short scale for depression to be evaluated the possibility of depression (Chorpita 2011).

### 3.2 Positive and Negative Affect Scale for Children PANAS-C

This questionnaire is a scale that is used to emotion of children in many studies that includes 24 items and measures the positive and negative emotion of children. Unlike a scale of emotion and arousal, this scale wants from children to grading some adjectives alone (such as angry, sadness) with respect to that in have felt them

in recent weeks. Psychometric properties of this scale have been reported appropriate by Alornt and et al. In a series of comparative analyzes on clinical population, Chorpita and Dalyden observed that measures of negative affection and arousal emotional scale both have correlation with depression scales. Meanwhile Negative Affection Scale reliability is high briefly. It was observed in the same study that positive affection Panas has higher correlation with depression clearly, although there is a problem due to significant correlation with other scales of negative affection, concern and confusion in its discriminant validity. Although the scale of emotional arousal due to having the high content validity to mood has better potential for prediction for the occurrence of depression in the future. However, any advantage or disadvantage related to it requires further researches. According to our findings use of the PANAS is recommend generally in the comprehensive assessment program (Chorpita, 2011)

### D. assessment questionnaire of children with nocturnal enuresis

This questionnaire in parts of parents assessment, medical assessment and psychological therapist, including A. the findings of résumé: B: familial history, C. physical examination findings, D. paraclinical findings has been set. Each section has yes and no option and one column is to more explain about that option. Parents form includes 23 items and therapist form has been set in four different sections. This form has been prepared, set and presented by Mahmoud Gharayi in the book of bowel disorders and nocturnal enuresis of children as a practical guide for assessing and treating physicians, psychiatrists, psychologists.

### 3.3 Implementation Method

participants after examining specialist doctor by questionnaire for nocturnal enuresis was showing that the problem is psychogenic was selected and after performing the first three questionnaires were enrolled and randomly assigned to the intervention group and control group. These sessions once a week for an hour, was conducted by the researcher. As well as during a session with parents the need to implement the treatment plan was recommended to them. And it was agreed that sessions to be implemented twice a week and for 60 minutes and parents also participate and collaborate in some sessions. Cognitive behavior therapy based on cognitive behavioral program of Kendall program in 1994 was designed by Philip Kendall to reduce the symptoms of disorders in children, this therapy method has four steps based on therapy protocol: understanding feelings of fear step, waiting for negative events, actions and attitudes that can reduce interference and results and encouraging, it has been designed. Therapy sessions were designed in a way that at first childhood be aware of your physical reactions to depression and physical symptoms and identify signs of depression. In the next incidents of negative expectations and anxiogenic accidents and their types will be discussed in therapy session meeting. In the third step the actions and behaviors of children against the events of are examined anxiogenic and problem solving skills and mental relaxation was taught to them. Finally, to the group members were given an opportunity to evaluate the new behaviors they have learned and encourage him/her to do new skills. That content of each session has been prepared and set and presented in the table based on the book of Chorpita (2011).

Table 1: content of cognitive behavioral therapy sessions for treatment of children

Session	content
First	Its contact with the authorities, assessment, setting treatment goals, identify stressful situations, familiar with the concept of age-related behavioral problems and nocturnal enuresis
Second	Training different feelings, identify symptoms created in anxiogenic position, positive reinforcement Training, probationary contract and blackout behavior
Third	Training physical symptoms of depression, identify physical reactions, Training forming behavior and interaction behavior
Fourth	In person meeting of parents order to increase cooperation with them in the treatment process and responding to possible questions.

of pre-test in experimental and control groups. Data were analyzed by using 23-SPSS statistical software.

Data analysis in the descriptive part with mean and standard deviation and ...In the second part ANCOVA analysis of covariance was used to testing hypotheses and control of the effect

#### 4 Results

Table 2: Replacing the participants in groups

Group	Number	Percentage
Invention	15	50
Control	15	50
Total	30	100

Findings in Table show that in this study, 30 children were present with nocturnal enuresis that were replaced in both groups

(intervention and control) and in each group 15 people has been located.

Table 3: Mean and standard deviation of scores participants in the positive and negative assessment questionnaire for children

Variable	Number	Minimum	Maximum	Mean	Sd	Skewness
Positive affection	30	25	43	32	4.938	0.186 -0.060
Negative affection	30	41	58	51.10	4.78	0.488 -0.439

As can be seen in the table mean and standard deviation positive affection among participants was equal to the  $32.200 \pm 4.938$ . While in negative affection score of  $51.10 \pm 4.78$  had been obtained.

Table 4: Mean  $\pm$  SD of depression and depression

Variable	Number	Minimum	Maximum	Mean	Sd	Skewness
Depression	30	44	69	55.53	6.67	0.186 -0.060

The mean of depression and depression of participants was equal to 55.53 years old with standard deviation of 6.67.

Table 5: Mean  $\pm$  SD of concern PSQW

variable	Number	Minimum	Maximum	Mean	Sd	Skewness
Concern	30	28	40	34.23	2.95	0.322 -0.501

The average concern score of participants was equal to 34.23 years with a standard deviation of 2.95.

- **Research hypothesis:** there is a significant difference between depression scores in the intervention and control group after the intervention step

In all variables skewness and kurtosis is between -2 and +2, which represents the normal distribution samples.

Table 6: descriptive data of depression variable

	Group	Mean	Sd
Pre test	Intervention group	58.80	6.97
	Control group	53.60	6.60

Post test	Intervention group	50.530	5.659
	Control group	54.533	6.42

As can be seen in the total average score of depression participants in the control group was equal to (6.28 ± 53.60). This mean and standard deviation in the intervention group was equal to (5.65 ± 58.80). While the mean of the control group has not changed significantly (6.42 ± 54.53) it seems a significant change has

occurred in the intervention group (5.65 ± 50.530) that this difference is measured by testing significant covariance. Covariance analysis was carried out on the data normality in descriptive part and homogeneity and Levin test also has come in this part.

Table 7: Levene test a test for equality of variances

F	Degrees of freedom 1	Degrees of freedom 2	Significant
2.61	1	28	0.117

Equality of variances test shows that default of covariate analysis has been observed so the next table shows the covariance analysis results.

Table 8: results of covariance ANCOVA effectiveness of treatment on depression at pre-test post-test part

Resource	Sum of squares	Degrees of freedom	Mean square	F	Significant	Eta coefficient
Modified Model	647.493	2	323.756	17.553	0.000	0.565
Anxiety	527.493	1	527.493	28.301	0.000	0.514
Groups	352.712	1	352.712	19.124	0.000	0.415
Error	497.947	27	18.443			
Total	83938.00	30				

The results indicate that after removing the effect of pre-test, the two interventions and control groups are significantly different

with F equal to 19.12 at level of 0.000. Eta coefficient is equal 0.415 which indicates the effectiveness of the intervention.

Table 9: paired Comparison of intervention and control groups in in depression post-test step

groups	Mean difference	standard error	Significant	The difference in the confidence level of 92%	
				Up	Down
Control	7.4	1.692	0.000	10.87	-3.928

## 5 Discussion

According to research findings, the hypothesis of research was confirmed that cognitive-behavioral program decreases the rate of depression in children with enuresis that is aligned with the findings of (Pennant & et al, 2015) that indicated the effectiveness of psychotherapy on reducing children and adolescents' depression and depression in a review study. For this purpose, 27 clinical trial studies were selected in which children with depression and depression had been treated. The overall results indicated that cognitive behavior therapy is one of the most effective treatment methods for children. This finding means that people who were in the experimental group have reported significantly fewer depressive symptoms than those in the control groups after the intervention.

In fact, this treatment program has been able to reduce the rate of depression. Wolk & et al (2015) findings that were conducted in a study aimed to evaluate the effectiveness of psychotherapy on depression and depression in children also, indicated that those who had recently thought about suicide have responded to

treatment more than others. These results eventually indicated that depression and depression in children has decreased. In another study that was conducted recently by Pennant & et al (2015) in a review study that evaluates effectiveness of psychotherapy on reducing depression and depression in children and adolescents. 27 clinical trial studies were selected in which children with depression and depression had been treated. The overall results indicated that cognitive behavior therapy is one of the most effective treatment methods for children. This finding is aligned with results obtained in this research.

Articulating this finding, we can say that although this method of treatment emphasizes more on children's anxieties but the techniques taught to the children and their parents especially in 5-6 and 7 sessions can have a significant effect on reducing negative self-talking and cause increasing confidence and positive self-talking and increasing the mood of students. In this orientation sessions of self-talking in situations of depression or depressive, differentiation were performed between depression and harmonious self-talking, problem solving training, helping child to change self-talking and the results indicated these techniques had

been effective. Results of previous researches confirm that the behavioral disorders and psychological problems have more prevalence among children with enuresis. So that Yusefi & et al., (2012) found that children with enuresis were significantly more behind in terms of evolutionary and growth than normal children in five axis of Personal social, problem solving skills, rough movements, subtle movements and communication of children with primary nocturnal enuresis. The results of Salehi & et al., 2012 study from the internalizing problems, externalizing, depression- depression, retirement-depression and emotional - behavior, there was a significant difference between the two groups of children with and without primary nocturnal enuresis.

Sepehrmanesh, 2014 reports prevalence rate of depression disorders in children with enuresis 39 percent that is significant figure. So, the necessity to attention to disorders associated with enuresis can be helpful in reducing the problems associated with this problem. Since many people linked the depression, depression and even the quality of mother's life and children with enuresis with enuresis, so, reducing on the symptoms of depression and depression can have a positive effect on children's confidence, reduce their behavioral problems. The results of this study indicate that using standard cognitive-behavioral therapy has been effective in children with enuresis and has been able to significantly reduce the rate of depression and depression. So adding parents and teachers training to this context of treatment and prevention of signs and symptoms and the prevalence of enuresis can be useful in future studies.

## THE RELATIONSHIP BETWEEN EXECUTIVE FUNCTIONS AND ACHIEVEMENT GOALS WITH ACADEMIC SELF-EFFICACY IN STUDENTS

<sup>a</sup>FARANGIS AKBARI, <sup>b</sup>MOJGAN SEPAH MANSOUR

<sup>a</sup>MA in Educational Psychology, Islamic Azad University, Central Tehran Branch

<sup>b</sup>Assistant Professor, Department of Psychology, Islamic Azad University, Central Tehran Branch

Email: <sup>a</sup>faarangiz.akbari23@gmail.com,  
<sup>b</sup>drsepahmansour@yahoo.com

**Abstract.** The purpose of this research was to specify the relationship between executive functions and achievement goals and academic self-efficacy in students. The sample studied in the research consisted of 147 female studying in high schools in Tehran using the random method. For data analysis, Pearson's correlation method and simultaneous multiple regression method were used in SPSS statistic software along with methods of descriptive statistics. The results of the research demonstrated that the number of stages component is positively correlated with academic self-efficacy, and the preservative error and specific error are negatively and significantly correlated with it. Furthermore, the regression analysis results demonstrated that the number of stages ( $\beta=0.385$ ) and the mastery style of achievement goals ( $\beta=0.371$ ) positively predict academic self-efficacy.

**Keywords:** academic self-efficacy, achievement goals, executive functions

### 1 Introduction

One of the variables effective on academic achievement is self-efficacy beliefs. Research results demonstrate that there is a significant positive relationship between self-efficacy beliefs and academic achievement, and students with high self-efficacy have had high scores in tasks and tests concerning writing (Sommerfield and Watson, 2000); actually, academic self-efficacy beliefs denotes students' perception and belief of their ability to comprehend and learn, solve school problems, and obtain academic success, which affects many aspects of life, such as goal selection, decision making, amount of effort, perseverance and persistence level, and confrontation of challenging issues (Bandura, 2006). Altunsoy and colleagues (2010) regard academic self-efficacy as a concept related to self-efficacy concerning the student's belief about the ability to achieve a specific task level.

An important variable that may be related to academic self-efficacy realized in academic achievement is executive functions; executive functions is a collection of interrelated control processes involved in selection, initiation, implementation, and supervision of the cognitive function as well as aspects of the sensory and motor function (Roth, 2005). Abilities examined as executive functions in most research include inhibition, planning, sustained attention, working memory, and abstract thinking (Wolf, 2004). Executive functions include a wide range of cognitive processes, such as reasoning, problem solving, planning, organization, active memory, discipline, sustained attention capability, confrontation with interference, utilization of feedbacks, multitasking, and behavioral abilities (Loftiz, 2014).

Barkly (2001) used the behavioral-neurological model to explain executive functions, and regarded inhibited response as a necessary condition for the effective role of self-regulation in social life and academic performance complexities based on the same model. Barkly holds that executive functions and behavioral inhibition make self-regulation possible, and enable the individual to control his behavior and predict and manage events. He also holds that behavioral inhibition causes the response to an event to be presented with delay and provide the conditions for application of other executive functions (Barkly, 2006).

Another important variable that may be related to academic self-efficacy is achievement goals; achievement goal theory is a framework for perception of motivation for achievement, motivation in academic and mastery fields in particular. The

theory, presented by Dweck (1986) and Nicholls and colleagues (1984) has been suggested in resources concerning motivation for achievement as a justifier of people's behavior, cognition, and emotions in environments related to education and mastery (Elliot and colleagues, 1999), which has mainly appeared for specific explanation of behavior. Therefore, they are the most practical target theories for perception and improvement of learning and teaching (Pitirinch and colleagues, 2003).

It is goal orientations, goals, and meanings that the individual takes into account for his achievement behavior (Rayan and Pitirinch, 1997). In separation of achievement goals, researchers first used to focus only on the two mastery and functional orientations (Dweck, 2000), but more recent evidences and theories suggest three goal orientations (Midgley and colleagues, 1998) or even four: mastery-function, mastery-avoidance, function-approach, and function-avoidance (Elliot, Fonseca, and Moller, 2006). People with mastery orientation try to obtain mastery over tasks, overcoming challenges or increasing competency levels, and people with functional orientation try to obtain good grades or satisfying others (the teacher, parents, or others) (Pitirinch, 1999). The approach or avoidance feature of orientations also concerns the individual's willingness to get away from or close to tasks to achieve goals. Therefore, achievement goals can be considered as a cognitive-social mental framework, guiding the individual in interpreting conditions, processing information, facing tasks, and confronting challenges (Kaplan and Flum, 2010). Achievement goal theory explains the approaches students have in different achievement conditions, and assumes that goals specify and guide the direction of students' behavior, cognition, and motivation, so that they get involved in academic tasks (Ames, 1992; Lee and colleagues, 2010).

Several studies have demonstrated that functional-normative goals have a stronger relationship than mastery goals with academic self-efficacy (Hulleman and colleagues, 2010). These findings as well as the advantages of functional goals in making some students interested have made some theoreticians develop a multi-goal approach that emphasizes the positive consequences of both approaches. However, there are still criticisms focused on the validity of the advantages of normative goals, particularly in regard to the relationship between normative goals and academic achievement (Senko, Hulleman, and Harackiewicz, 2011).

The findings of Calero and colleagues' (2007) study, conducted for comparison between gifted and ordinary children's characteristics, demonstrated that gifted children obtained higher scores than ordinary groups not only at intellectual level but also in the values of self-regulation and self-motivation (achievement goals has been identified as a basic motivation component in academic achievement).

Dixon, Cross, and Adams (2001) regard characteristics such as creativity, flexibility, intrinsic motivation, and self-regulation as some specific psychological aspects of people with high academic self-efficacy. Chang (1989) found that gifted students enjoy learning a subject more than ordinary students. Based on Dweck (1986, 1990), the achievement goals of children who hold that intelligence is a fixed characteristic are mostly functional, whereas the achievement goals of children who hold that intelligence is a flexible characteristic are of the mastery (learning) type. The result of her research demonstrated that task selection and process follow-up are done based on abilities in children with functional goal orientation, whereas task selection and process follow-up are focused on achievement and mastery based on efforts in children with mastery (learning) goal orientation. Schommer and Dunnell (1997) state that students with little effort hold that ability is a fixed characteristic, whereas superior students more likely hold that the learning ability can be improved. Furthermore, Dweck and Leggett

(1988) hold that students with mastery goal orientation enjoy higher feeling of competency, and do their tasks successfully. On the other hand, a number of studies have clearly demonstrated that students with mastery goal orientation demonstrate high levels of learning self-regulation skills (Schunk, 1994).

In light of what was mentioned above, this research was seeking to answer the question of whether executive functions and achievement goals are related to academic self-efficacy in students and whether executive functions and achievement goals are able to predict students' academic self-efficacy.

## 2 Method

This study was of the correlation research type. The population of the present research included all female students in the second grade of high school in the field of natural science in ordinary (state) schools in Tehran studying in the 2015-2016 academic year. Cochran's formula was used for specification of the sample size; based on the results obtained from the formula, 150 people was determined for the research. Cluster sampling method was used for sample selection. Wisconsin Card Sorting Test, Midgley and colleagues' (1998) goal orientation questionnaire, and Patrick and colleagues' (1997) academic self-efficacy scale were used for data collection.

### 1. Wisconsin Card Sorting Test<sup>1</sup>

The Wisconsin Card Sorting Test (WCST) is a neuropsychological test of "set-shifting", i.e. the ability to display flexibility in the face of changing schedules of reinforcement (Monchi, et al., 2001). The Professional Manual for the WCST was written by Robert K. Heaton, Gordon J. Chelune, Jack L. Talley, Gary G. Kay, and Glenn Curtiss. The WCST test may be used to help measure an individual's competence in abstract reasoning, and the ability to change problem-solving strategies when needed (Biederam J, et al., 2000). In this test, a number of cards are presented to the participants. The WCST consists of 4 cards with different forms (crosses, circles, triangles or stars), of various colors (red, blue, yellow or green) and numbers of objects (1, 2, 3 or 4) on them. As the task is usually administered, the 4 stimulus cards with the following characteristics are placed before the subject from left to right: 1 red triangle, 2 green stars, 3 yellow crosses and 4 blue circles. The subject is instructed to sort each response card under one of the stimulus cards, whichever she or he thinks is correct. After each sort, the subject is told whether the sort was right or wrong. No other instructions are given throughout the test. The instructor begins by responding "right" each time the subject matches for color. This continues until 10 consecutive cards have been sorted by color. The examiner then, without forewarning or comment, changes to "form" as the correct response. After 10 consecutive forms responses, the principle changes to "number" and so on. The test continues until the subject has either completed 6 categories or all 128 cards have been used.

In their research, Shahgholian, Azad Fallah, Fathi Ashtiyani, and Khodadadi (2011) designed the computerized version of Wisconsin Card Sorting, and examined its psychometric characteristics, and demonstrated that the reliability of the test using Cronbach's alpha coefficient is 0.73 for the number of stages and 0.74 for the preservative errors.

### 2. Midgley and Colleagues' (1998) Goal Orientation Questionnaire

This questionnaire was provided by Midgley and colleagues (1998). The test contains 18 questions, to be answered based on the 7-point Likert Scale. It includes three subscales: 1- goal-mastery (questions 1 to 6 of the questionnaire), 2- functional-approach (questions 7 to 12 of the questionnaire), and 3-

functional-avoidance (questions 13 to 18 of the questionnaire). In each subscale, the scores of the 6 questions are added, and constitute the individual's score in the subscale.

The reliability of the subtests of the questionnaire have been reported as 0.70 to 0.80. In their research, Kareshki, (2008) reported the reliability of the subtests as 0.87, 0.84, and 0.76, respectively; furthermore, the overall reliability of the questionnaire was reported as 0.087. The validity of the questionnaire has also been verified in Kareshki and colleagues' research using confirmatory and exploratory factor analysis. Furthermore, in Kareshki (2012), Cronbach's alpha coefficient for mastery, functional-approach, and functional-avoidance goals were obtained as 0.92, 0.87, and 0.92, respectively, and the overall reliability of the questionnaire as 0.91.

### 3. Patrick and Colleagues' (1997) Academic Self-efficacy Scale

The scale, made by Patrick, Hicks, and Ryan (1997), contains 7 items, reflecting students' perception of their competency in doing class tasks. The questions are scored between 1 and 5 from *totally agree* to *totally disagree*. Hashemi (2001) has reported the reliability of the scale with the two methods Cronbach's alpha and Spearman-Brown split-half as 0.65 and 0.59, respectively. The construct validity of the scale has been proven in many studies. Middleton and Migley (1997) reported a correlation coefficient of  $R=0.43$  between academic efficacy and mastery goal orientation. In Haji Yakhchali, (2014), Cronbach's alpha coefficient for the academic self-efficacy scale has been obtained as 0.82.

For data analysis, Pearson's correlation coefficient and simultaneous multiple regression method were used in the 21 version of SPSS statistic software.

<sup>1</sup> WCST

### 3 Results

Table 1: Correlation coefficients between executive function components and academic self-efficacy

Variable number in columns	1. Academic self-efficacy	2. Number of stages	3. Preservative error	4. Specific error
1.	1	0.504**	-0.228**	-0.184*
2.		1	-0.430**	-0.431**
3.			1	0.381**
4.				1

\*\* The correlation is significant at 0.01 level. \* The correlation is significant at 0.05 level.

The Table 1 data demonstrate that in the Wisconsin Test results, the number of stages component ( $\text{sig} \leq 0.01$ ;  $R=0.504$ ) is positively and significantly correlated with academic self-

efficacy, but preservative error ( $\text{sig} \leq 0.05$ ;  $R=-0.228$ ) and specific error ( $\text{sig} \leq 0.05$ ;  $R=-0.184$ ) are negatively and significantly correlated with academic self-efficacy.

Table 2: Correlation coefficients between goal achievement components and academic self-efficacy

Variable number in columns	1. Academic self-efficacy	2. Mastery style	3. Approach-function style	4. Approach-avoidance style
1.	1	0.482**	0.152	-0.354**
2.		1	0.484**	-0.184*
3.			1	0.148
4.				1

\*\* The correlation is significant at 0.01 level. \* The correlation is significant at 0.05 level.

The Table 2 data demonstrate that the mastery style ( $\text{sig} \leq 0.01$ ;  $R=0.482$ ) is positively and significantly correlated with academic self-efficacy, but the approach-avoidance style ( $\text{sig} \leq 0.01$ ;  $R=-0.354$ ) is negatively and significantly correlated

with academic self-efficacy. However, the approach-function style ( $\text{sig} \leq 0.066$ ;  $R=0.152$ ) is not significantly correlated with academic self-efficacy.

Table 3: Summary of regression model, variance analysis, and statistical specifications of academic self-efficacy resulting from executive functions and achievement goals

Variable	Model	SS	df	MS	F	P	R	R <sup>2</sup>
Executive functions and achievement goals	Regression	934.775	6	155.796	17.167	0.001	0.651	0.424
	Residual	1270.545	140	9.075				
	Total	2205.320	146					

Based on the data presented in the table, the correlation coefficients between the studied variables ( $R$  equal to 0.651 and  $R^2$  equal to 0.424) have been obtained. In other words, 42.4 percent of the academic self-efficacy variance can be explained in terms of achievement goals and executive functions. In this

model, ANOVA test confirms the efficiency of the utilized model in predicting the dependent variable based on the values  $F=17.167$  and  $\text{sig}=0.001$ , and it can be said that there is significant relationship between the predicting variables inputted into the model and academic self-efficacy.

Table 4: Academic self-efficacy regression based on achievement goal styles and executive function components

Model	(Unstandardized Coefficients)	standard coefficients	T	sig
	B	beta		
(Constant)	620.22	-	393.8	001.0
number of categories	155.1	385.0	869.4	001.0
Preservative error	039.0	036.0	487.0	627.0
Other errors (specific error)	012.0	015.0	203.0	839.0
Mastery goal style	180.0	371.0	617.4	001.0
Approach-function goal style	-030.0	-045.0	-588.0	557.0
Approach-avoidance goal style	-108.0	-196.0	-743.2	007.0

In Table 4, the values of change in the criterion variable (academic self-efficacy) for each unit of change in the predictor variable have been presented based on the values of  $\beta$  (standard regression coefficients); according to the values of  $t$  and its significance levels, it can be concluded that the number of stages in Wisconsin Test and mastery goal style positively predict academic self-efficacy. Based on the standard regression coefficients, it can be stated that the number of stages ( $\beta=0.385$ ) and mastery goal style ( $\beta=0.371$ ) have significant shares of academic self-efficacy prediction.

Furthermore, the approach-avoidance goal style negatively predicts academic self-efficacy. It can be stated based on standard regression coefficients that the approach-avoidance goal style ( $\beta=-0.196$ ) has a significant share of academic self-efficacy prediction.

### 4 Discussion

Based on the findings obtained from this research in female high school students, the number of stages component is positively and significantly correlated with academic self-efficacy. The preservative error and specific error are negatively and significantly correlated with academic self-efficacy; if we regard academic performance as the output of academic self-efficacy, the findings of this research are in accordance with results of research that has investigated and confirmed the relationship between executive functions and academic performance; for instance, Barkly (2001) used the behavioral-neurological model to explain executive functions, and regarded *inhibited response* as a necessary condition for the effective role of self-regulation in social life and academic performance complexities based on the same model. Barkly holds that executive functions and

behavioral inhibition make self-regulation possible, and enable the individual to control his behavior and predict and manage events. He also holds that behavioral inhibition causes the response to an event to be presented with delay and provide the conditions for application of other executive functions (Barkly, 2006).

Furthermore, the findings of the research are in accordance with the results of Wilson and colleagues (2001) due to focus on the relationship between executive functions and academic performance (as the output of academic self-efficacy); they have specified that the decision making-planning function plays a very important role in academic performance, scheduling competency, relative motor strength, and voluntary movements.

In regard to the relationship between achievement goals and academic self-efficacy, the findings obtained from this research demonstrated that the mastery style of achievement goals is positively and significantly correlated with academic self-efficacy, but the approach-avoidance style is negatively and significantly related to academic self-efficacy; if we regard academic achievement as one of the positive outputs of academic self-efficacy, the findings of the research on the relationship between the mastery style of achievement goals and academic self-efficacy are in accordance with the results of Keys and colleagues (2011). They demonstrated in their research that while all the three goal orientation methods were correlated with academic achievement, it was only mastery orientation that predicted students' academic achievement in mathematics in a stable manner. Furthermore, the findings of the research are in accordance with the results of Lee and colleagues (2010) due to focus on the relationship between intrinsic motivation (which is one of the characteristics of people with high self-efficacy) and the mastery style of achievement goals; using structural equation modeling, Lee and colleagues demonstrated that future goals with intrinsic motivation (job, social, and family orientations) have a stronger relationship with the approach-mastery orientation than with the approach-functional one, whereas future goals with extrinsic motivation (fame and wealth orientations) have a stronger relationship with the approach-functional orientation than with the approach-mastery one. Researchers suggest that teachers should encourage students to match goal orientation to intrinsic motivation and future goals to increase students' academic motivation.

Furthermore, the results of this research are in accordance with Rastegar and colleagues' (2009) findings due to focus on the relationship between intelligence beliefs and academic achievement (self-efficacy) in light of the mediating role of achievement goals. They demonstrated that the relationship between intelligence beliefs and academic achievement is affected by achievement goals and academic engagement aspects: *inherent intelligence belief* indirectly and negatively affects academic achievement through approach-function goals, avoidance-function goals, cognitive strategies, and task value, and *incremental intelligence belief* (the role of self-efficacy) indirectly and positively affects academic achievement through *mastery goals*, effort, metacognitive strategies, and task value.

Furthermore, the findings of this research are in accordance with the results of Davari, (2012); they investigated in their research the relationship between academic self-efficacy and achievement goals, and demonstrated that academic self-efficacy was positively related to approach-mastery goals, and had a significant share in predicting it, and was negatively related to avoidance-functional goals, and had a significant share in predicting this aspect of achievement goals.

In regard to the predictor role of executive functions and achievement goals in predicting academic self-efficacy, the findings obtained from this research demonstrated that executive functions (number of stages) ( $\beta=0.385$ ) and the mastery style of achievement goals ( $\beta=0.371$ ) positively predict academic self-efficacy. On the other hand, the approach-avoidance style of achievement goals ( $\beta=-0.196$ ) negatively predicts academic self-efficacy.

As mentioned above on the relationship between executive functions and academic self-efficacy, based on Barkly's (2001, 2006) theory, executive function components, such as inhibited response, play a

very significant role in self-regulation in the complexities of social life and academic performance, which is in accordance with the findings obtained from this research concerning the prediction of academic self-efficacy based on executive functions; Barkly holds that behavioral inhibition delays the response to an event, which provides the conditions for application of other executive functions (Barkly, 2006). Along the same lines, the results of this research are in accordance with those of Wilson and colleagues (2001); they specified that the decision making-planning function (executive function component) plays a very important role in academic performance, scheduling competency, relative motor strength, and voluntary movements (academic self-efficacy components).

The findings obtained from this research can also be explained in terms of the results of Malekpur (2013). They argued in their research that teaching executive functions (response inhibition) reduces attention deficit and improves academic performance, which is in line with the results of this research due to focus on the relationship between executive functions and academic self-efficacy.

Furthermore, in regard to explanation of the significant share the mastery style of achievement goals has in predicting academic self-efficacy, the findings of this research are in accordance with the results of Keys et al., (2011); they demonstrated in their research that mastery orientation predicts students' academic achievement in mathematics (academic self-efficacy) in a stable manner. Furthermore, the findings of the research are in accordance with the results of Lee and colleagues (2010) due to focus on the relationship between intrinsic motivation (which is one of the characteristics of people with high self-efficacy) and the mastery style of achievement goals; using structural equation modeling, Lee and colleagues demonstrated that future goals with intrinsic motivation (job, social, and family orientations) have a stronger relationship with the approach-mastery orientation than with the approach-functional one, whereas future goals with extrinsic motivation (fame and wealth orientations) have a stronger relationship with the approach-functional orientation than with the approach-mastery one. Researchers suggest that teachers should encourage students to match goal orientation to intrinsic motivation and future goals to increase students' academic motivation. Along the same lines, the findings obtained from this research are in accordance with Rastegar and colleagues' (2009) due to focus on the relationship between intelligence beliefs and academic achievement (self-efficacy) in light of the mediating role of achievement goals. Researchers hold that the relationship between intelligence beliefs and academic achievement is affected by achievement goals: *inherent intelligence belief* indirectly and negatively affects academic achievement through approach-function goals, avoidance-function goals, cognitive strategies, and task value, and *incremental intelligence belief* (the role of self-efficacy) indirectly and positively affects academic achievement through *mastery goals*, effort, metacognitive strategies, and task value.

Furthermore, the findings of this research are in accordance with the results of Davari, (2012). They demonstrated in their research that academic self-efficacy is positively related to approach-mastery goals, and has a significant share in predicting it; furthermore, the results of Lavasani and Ezhei demonstrated that academic self-efficacy was negatively related to avoidance-functional goals, and played a significant role in predicting this aspect of achievement goals, with which the results obtained from this research are in accordance. Doubtlessly, these findings will have important implicit consequences in regard to planning for improvement of academic self-efficacy as an important factor in enhancement of the academic achievement of the next generation of the country.

**Abstract.** This research aims to identify potentials and deficiencies of the worn out textures of Amol. It seeks to increase movement and improve the current situation by developing this area, which it leads to progress in the surroundings. So, identifying the weaknesses, strengths and potentials of the worn out textures as well as providing constructive strategies for organizing the neighborhoods not reduce inefficiency and inability of the textures, but can lead to city integration in terms of access to facilities and organizing urban sustainable development with proper supervision of executive agencies and educating culture for public participation. The results of expert and public questionnaires were used in SWOT technique and provided results based on public participation, housing and economic, environmental, and social factors.

**Keywords:** the worn out texture, stability, organizing, quality of life, SWOT

### 1. Introduction

Rehabilitation, modernization and revitalization of old urban textures are the major challenges facing urban management in developing countries, including our country (Parviz Varjavand, Internet website). The damaged urban areas are known by three features: microlithic, access problems and instability (Ghalibaf, 2007: 3). Like other old cities of the country, Amol in Mazandaran province, has a deteriorated core. According to the latest population and housing census in 2011 (Statistical Yearbook of Mazandaran, 2011), its population is 222,066. With 67831 households and household dimension of 3.3, Amol has located in Mazandaran Plain, in both sides of Haraz River with attitude of 76 m, in distance of 70 km from west of Sari, the province capital, 18 km south of the Caspian Sea, 6 km north of the Alborz Mountain range and 180 km northeast of Tehran. According to the obtained graph from Amol Bureau of meteorology –which it is a synoptic station- it can be found that on 2011, average temperature and annual atmospheric raining were 13.3 °C and 635 mm in Amol respectively; while its average relative humidity is 80%. The worn out textures have 300 years old in Amol that have been completely surrounded by the conducted renovations on the first and second Pahlavi era (Consulting Engineers of Research and Development, 2006). With an area of approximately 404 hectares, population of 20073 people, 5282 households and household size of 8.3 (Statistical Yearbook of Mazandaran, 2011), the textures locate in geometric center of the city, like other historical arteries in spatial viewpoint. They are surrounded by contemporary sectors of urban textures and main urban arteries (17 Shahrivar and Enqelab Streets in south, Taleb Amoli St. in west, Shahid Beheshti St. in east and the worn out texture area of Amol in north). It has 14 neighborhoods with the whole area of 404 hectares. A large part of buildings in the 14 districts of Amol worn out texture have no enough strength and stability, due to many reasons including age, using non-durable materials and lack of considering proper methods of construction. Totally, in terms of microlithic and impermeable items, indices of worn out textures can be identified in parameters such as lack of emergency relief network in some areas, lack of fitting width of passages, public spaces and recreational deficiency, low economic level of many families, lack of regulatory and participatory units, the ruined houses and mismatch in visual appearance. As a result, by considering the mentioned issues,

this range has been located in the burnout cycle and decay. Therefore, by considering the above-mentioned factors and central situation of the structure in the city that can have a huge impact on development or lack of development of the city, we looked to identify the potential and deficiencies of the worn out texture and provide new strategies for sustainable urban development.

### 2. Research Theoretical Foundations

Semi or completely derelict buildings, poor housing and declining socio-economic qualities can be mentioned as effects of urban worn out textures, which the processes wear out cities internally. However, following changes in lifestyle and current settlements, especially in the wake of changing needs to various services and needs resulting from changes over time, living in such urban textures will be forced with the processes, due to comply with new conditions. In general, the worn out urban textures can be defined as follows: “the worn out urban texture refers to urban legal limits that have low place, economic and environmental value due to their physical exhaustion. Several factors involve in their occurrence and formation such as physical, performance, environmental, socio-economic and cultural factors. The destructive impact of each factor will reduce quality and quantity of environmental values in areas of city. Renovation efforts will be stopped in such regions, due to decline habitual-performance values. As a result, there are increased the desire to no change and wear out and inefficiency state is predominate (Matoof & Khodai, 2008). According to the approved regulations by Supreme Council of Civilization and Architecture, indices of diagnosing the worn out textures include: 1) instability that shows lack of suitable structural system and instability of buildings; 2) impenetrability that represents lack of proper access and less passages with sufficient width to move the mounted motion (more than 6 m); 3) microlithic that indicates density of textures and multiplicity of small parts (land separation plaques); 4) urban blocks are bases to identify the worn out textures; in other words, any urban block that 50% of its parts are covered by these criteria are considered as the worn out textures; 5) unstable block is a block that at least 50% of its buildings are unstable, due to lack of suitable structural system and non-compliance with technical standards; 6) impermeable block is a block that at least 50% of its passage is less than 6 m. In addition to resolve their problems that is considered as a necessary matter, we can take steps by identifying potentials and shortcomings of the worn out textures and provide new strategies for sustainable urban development. It should also be noted that the word of “development” in sustainable urban development means a process that happens stability during it, but stability in “urban sustainability” is a collection of situations that lasts over time (Laghai & Mohammadzadeh, 1999). The final goal is that we can achieve urban sustainability, in addition to participate public, private and government sectors as well as municipalities that play a special role to in this process.

### 3. Methodology

This research is applicable-developmental objectively; while it is a combination of descriptive, documentary and solidarity methods in terms of method and nature. In this study, we will answer two questions, by attitude of changing land use and renovating the worn out textures tissues: 1) What are the main problems to settle the worn out textures in Amol, in order to achieve sustainable development? 2) What are suitable solutions to achieve optimal sustainable urban development in the worn out textures of Amol? The research objectives are the ultimate purposes of the researcher in the research process that can be divided into primary and secondary objectives in line with the research importance. In the present research, we consider the

following goals: the research main objective is to provide strategies for organizing the worn out textures in neighborhoods of Amol, in order to achieve sustainable urban development. Recognizing exhaustion aspects of the worn out textures in Amol, identifying factors contributing to burnout in the textures, providing solutions for sustainable urban development and emphasizing on public participation can be considered as the research secondary objectives. The research hypotheses are as follows: 1) lack of appropriate access in this texture is related with problems the worn out textures in Amol; 2) organizing the worn out textures in Amol by emphasizing on public participation is very effective. Library methods were used to

collect data. In the first steps of collecting data on library methods included using books, journals, the printed articles in field of the research, the related theses in universities and scientific centers and scientific resources in the Internet. Tables, maps and designs were used to assess and analyze the research results. Due to use the expert and public questionnaires, its population is divided into two categories: 1) heads of households in the area (n= 5282, according to equation 1); the related experts inn Renovation and Development Organization and Cultural Heritage Administration (n= 30).

$$\frac{\text{Total population in the worn out textures on 2011}}{\text{Family dimension}} = \frac{20073}{3.8} = 5282 \text{ (number of families in texture)} \quad (1)$$

For heads of households, n= 304 in the obtained sample rate through the Cochran Formula (Eq. 2).

$$n = \frac{z^2 pq}{d^2} \quad 304 = \frac{1.96^2 (0.7)(0.3)}{(0.005)^2} \quad (2)$$

$$1 + \frac{l}{N} \left( \frac{z^2 pq}{d^2} - 1 \right) \quad 1 + \frac{1}{5282} \left( \frac{1.96^2 (0.7)(0.3)}{(0.005)^2} - 1 \right)$$

#### 4. The Studied Area

Like other old cities of the country, Amol in Mazandaran province, has a deteriorated core. According to the latest population and housing census in 2011 (Statistical Yearbook of Mazandaran, 2011), its population is 222,066. With 67831 households and household dimension of 3.3, Amol has located in Mazandaran Plain, in both sides of Haraz River with attitude of 76 m, in distance of 70 km from west of Sari, the province capital, 18 km south of the Caspian Sea, 6 km north of the Alborz Mountain range and 180 km northeast of Tehran. The worn out textures have 300 years old in Amol that have been completely surrounded by the conducted renovations on the first and second Pahlavi era (Consulting Engineers of Research and Development, 2006). With an area of approximately 404 hectares, population of 20073 people, 5282 households and household size of 8.3 (Statistical Yearbook of Mazandaran, 2011), the textures locate in geometric center of the city, like other historical arteries in spatial viewpoint. Space of housing units is as open system that is influenced by climatic and cultural characteristics of the city's position. The houses' roofs are sloped and clay and windows and doors are wooden. In terms of building, almost half of residential area is less than 200 square meters and in terms of number of floors, 1 and 2 storey buildings constitute the highest percentage. The types of used materials include the brick and wooden supporting walls and age of most of buildings is between 30 to 45 years old. In terms of communication networks, its streets and passages are three meters wide (Takht-e-Poolad Consulting Engineers, 2010; the researcher field surveys). Some effects of worn out in old urban areas can be the exhaustion in physical, social, economic and environmental aspects of the regions, which all of them have joined hands that most of the buildings are being demolished and

they are unsecured and uninhabitable, in terms of residential viewpoint. They have a complex and tangled network of narrow alleyways, traffic problems, exhaustion and failure in installations and urban facilities. Over the years, they have not lost their indigenous population, but they have become a location for living low-income immigrants, non-native residents and rural migrants and even foreign nationals such as Afghans, who were looking for the cheapest urban areas for resident (Soltanzadeh, 2009: 3).

#### 5. Results

After distributing questionnaires, the results of expert and public questionnaires were used in SWOT technique and there was formed a SWOT matrix. The purpose of SWOT matrix and determining aggressive, competitive, conservative and defensive strategies are stated as the following:

1. How we can utilize maximum opportunities from strengths?
2. How we can eliminate or reduce effects of threats using the strengths?
3. How we can change weaknesses into strengths or reduce severity of the weaknesses using opportunities?
4. How we can reduce or remove effects of threats by reducing the weaknesses?

In fact, we can take steps to improve conditions of the worn out textures and sustainable urban development by identifying potentials and deficiencies of the worn out textures and providing strategies. There were presented results of SWOT analysis based on popular participation, housing and economic, environmental, social and physical factors (table 1).

Table 1. ST, SO, WO and WT strategies for neighborhoods of the worn out textures in Amol

SO strategy	SO <sub>1</sub> : using natural potentials of neighborhood to design and create public and cultural spaces
	SO <sub>2</sub> : holding social meetings to attract eager people to participation
	SO <sub>3</sub> : attracting private capital, due to high percentage of private property
	SO <sub>4</sub> : improving business environment by focusing on the region economic activities
	SO <sub>5</sub> : promoting and strengthening the sense of belonging to a place among residents by creating symbols and ... in different parts of neighborhoods, especially at its center
	SO <sub>6</sub> : optimal using neighborhood mosque as a cultural and information institution as well as social interactions
	SO <sub>7</sub> : full implementation of urban regulations for optimal intervention in the worn out texture and maximize proper using monuments to keep neighborhood originality
ST strategy	ST <sub>1</sub> : allocating spaces for parking by considering the land suitable price
	ST <sub>2</sub> : job creation by emphasizing economic activities in neighborhood to reduce inactive population

	ST <sub>3</sub> : recruiting eager people in renovation to improve performance of improvement councils	
	ST <sub>4</sub> : using moorlands to create green space, proper perspective and cultural and recreational spaces	
	ST <sub>5</sub> : improving communication network and narrow passages and geometric development of the texture for better access to the main street	
	ST <sub>6</sub> : considering long living history of people to conduct actions for renovating the texture	
	ST <sub>7</sub> : considering private property to restore old buildings	
	ST <sub>8</sub> : considering long-term and low interest loans for low-income residents	
	ST <sub>9</sub> : establishing the affiliated improvement and modernization branches on neighborhood centers	
	ST <sub>10</sub> : approving a comprehensive law on discount operating and engineering costs in the field of worn out texture	
	WO strategy	WO <sub>1</sub> : aligning constructions with climate and historical texture of the neighborhood
		WO <sub>2</sub> : suitable space distribution with local uses and services
WO <sub>3</sub> : determining fines and regulations to obligate owners of the abandoned and inefficient spaces for renovation		
WO <sub>4</sub> : determining appropriate conditions and facilities for allocation to owners of lands to the required uses		
WO <sub>5</sub> : attracting private capitals to create tourism spaces and job creation		
WO <sub>6</sub> : providing favorable conditions to reduce social harms by participation of the residents		
WT strategy	WT <sub>1</sub> : preventing distribution of drugs in neighborhood and reducing its social damages	
	WT <sub>2</sub> : changing and improving sport, health and cultural usage per capita	
	WT <sub>3</sub> : developing incentive programs to attract private investors in renovation and improvement affairs	
	WT <sub>4</sub> : rehabilitating the ruined and barren spaces and convert them to appropriate land uses and public open spaces to right attract people	
	WT <sub>5</sub> : using indigenous forces to participate in renovation and modernization	
	WT <sub>6</sub> : establishing supportive funds to bring order to financial situation of residents to renovate their residences and avoid more worn out	
	WT <sub>7</sub> : improving neighborhood structure according to modern applications and required for residents	
	WT <sub>8</sub> : upgrading and widening passages network to increase public safety	
	WT <sub>9</sub> : more stringent implementation of environmental laws to improve public health situation of neighborhoods	

After recognizing all weaknesses, strengths, opportunities and threats, there were prioritized internal and external factors in the

textures, which they are summarized in Table 2 for various neighborhoods.

Table 2. Summing up the results of internal and external evaluation of performance in the neighborhoods of the worn out textures in Amol

Feature	With fundamental strengths	With fundamental weakness	With fundamental opportunity	With fundamental threat
Neighborhood				
Aspehkala		*		*
Sabzeh Meidan	*			*
Ski Mahaleh		*		*
Gorji Mahaleh		*		*

Kasha Mahaleh		*		*
Chaksar Mahaleh		*	*	
Old town		*		*

**6. Conclusion**

According the output of the expert questionnaires and Table of summing up results of internal and external assessment performance on the worn out textures in Amol as well as results of public questionnaire, there were proposed strategies for organizing the worn out neighborhoods in Amol. The suggestions were proposed to organize the textures for maintaining their skeletal and body and improve level of serving. They were suggested according to the highest ratings in both internal and external assessments in each neighborhood and the identified priority areas that were at the completion of field surveys of areas. The suggested items are presented as follows:

- Widening Tabarsi Blvd. in Ghadi Mahaleh and considering a space for public green space and sport equipments as a neighborhood park between Shrine of Imamzaedh Abdullah and Taleb Amoli Blvd in south side of Tabarsi Blvd;

- Plan of creating the mixed-driven commercial, office and residential axis along the Tabarsi Blvd in Chaksar, Paein Bazar, Ghadi Mahaleh and Kashi Mahaleh neighborhoods;
- Establishing fire stations in Chaksar Mahaleh between Mir Haydar Alley and Shahid Beheshti St. with an area of approximately 350 square meters on the north side of Tabarsi Blvd because of its proper widening;
- Widening sidewalks and streets less than five meters wide, in order to facilitate standardization of services and improve the textures of neighborhoods and paved roads (it should be noted that in some areas, due to high value historical buildings, there is not possibility of widening five meters completely. For this reason, in the areas, access to pedestrian and roads is considered as priority -to preserve and restore historical identity- that includes widening 3-5 meters);
- Allocating spaces to construct parking lots, in order to reduce and ease traffic in the neighborhoods;
- Considering spaces for medical, sporting, cultural, recreational and services applications to improve well-being of residents and enhance the quality of neighborhoods;

- Allocating pause and living spaces in areas as community center;
- Considering areas in Ghadi Mahaleh, Aspehkala, Ski Mahaleh and the old town to revive the ancient gates by emulating Amol map in the Qajar period and four principal gateways into the city

In addition to the above-mentioned structure suggestions in neighborhoods, there were provided strategies to recreate the worn out textures in Amol with the approach of urban sustainable development, depending on physical characteristics and requirements of different neighborhoods as well as inclusion of social, economic, environmental and housing conditions and increasing public participation. According to Figure 2 and higher weight in evaluation matrices as well as the author surveys, top priorities are as follows:

SO<sub>3</sub>: attracting private capital, due to high percentage of private property

SO<sub>5</sub>: promoting and strengthening the sense of belonging to a place among residents by creating symbols and ... in different parts of neighborhoods, especially at its center

SO<sub>6</sub>: optimal using neighborhood mosque as a cultural and information institution as well as social interactions

ST<sub>3</sub>: recruiting eager people in renovation to improve performance of improvement councils

ST<sub>6</sub>: considering long living history of people to conduct actions for renovating the texture

ST<sub>7</sub>: considering private property to restore old buildings

ST<sub>8</sub>: considering long-term and low interest loans for low-income residents

ST<sub>9</sub>: establishing the affiliated improvement and modernization branches on neighborhood centers

WO<sub>3</sub>: determining fines and regulations to obligate owners of the abandoned and inefficient spaces for renovation

WO<sub>4</sub>: determining appropriate conditions and facilities for allocation to owners of lands to the required uses

WO<sub>5</sub>: attracting private capitals to create tourism spaces and job creation

WT<sub>3</sub>: developing incentive programs to attract private investors in renovation and improvement affairs

WT<sub>4</sub>: rehabilitating the ruined and barren spaces and convert them to appropriate land uses and public open spaces to right attract people

WT<sub>5</sub>: using indigenous forces to participate in renovation and modernization

WT<sub>6</sub>: establishing supportive funds to bring order to financial situation of residents to renovate their residences and avoid more worn out

WT<sub>7</sub>: improving neighborhood structure according to modern applications and required for residents

## 7. Suggestions for Future Studies

As the research was conducted in field of organizing the worn out textures with sustainable development approach and as there are many measurement tools for this field, the following items are proposed for the future researchers:

- Examining factors affecting to increase public participation in the neighborhoods to organize the worn out textures using structural equation modeling technique;
- Examining the role of media in organizing the worn out textures with approach of information and increase public participation;
- Examining the role and weight of self-awareness, innovation and performance limitations in organizing the worn out textures with sustainable development approach;
- Examining performance of the Improvement and Modernization Organization to organize the worn out textures in Amol, in terms of land trial

**Abstract:** The aim was to compare muscle strength, motion range and proprioception elbow joint hypermobility syndrome girl's active and passive public. People with hypermobility by Beighton test and a minimum score of 5 identified to participate in the test, and universal goniometer used to detect hypermobility. All assessments to measure the motion range detector with flexible devices Leighton and measure muscle power and proprioception elbow with isokinetic device in two angles were 45 and 60 degrees. The results showed that muscle strength of elbow between active and inactive girls have hypermobility syndrome healthy and public there is a significant difference while the elbow joint proprioception between active and inactive girls have hypermobility syndrome and healthy and public there was no significant difference.

**Keywords:** muscular power, proprioception, range of motion, elbow joint hypermobility syndrome general.

### 1 Introduction

General public hypermobility or joint laxity is defined as the absence of synovial joints that most people have a more normal range and with nonspecific musculoskeletal complaints of the factors known to include both general and localized in the peripheral joints of the spine is a component (Smith 2005). Detailed pathological mode is not joint hypermobility but rather as an increase in joint mobility comes naturally. As noted hypermobility diagnosed with musculoskeletal symptoms and people with this condition often effects of joint instability such as recurrent dislocation, subluxation and twist, muscle and joint pain, repetitive complaints vague, non-injury-related chronic and sometimes not respond to drug therapy, anti-inflammatory and pain suffered (the Kessler Rvsk 1996 and 1999). Joint pain, chronic muscle in Hayprmybayl, due to postural imbalance, in the long term motor function of disorders caused and as well as pain caused delays caused by tension in the long run (Kessler, 1996).

#### 1.1 Problem statement

Hypermobility or domain more than normal in the joint, including the factors discussed in joint instability and the resulting damage, and people who have several active joint or joint range of motion in the joints of the body are affected public Shelley (Richard 2011 Russians, 2011). This diffuse and chronic pain patients often complain without any specific reason (Richard 2011). And variables such as age, gender, ethnicity, location and variation in diagnostic criteria leading to different reports about the incidence of this complication is (Ross, 2011). So that children are inherently more mobile than adults in their joints, and this gradually decreases with age. Recent studies have shown that hypermobility syndrome in children and adolescents has harmful effects is growing. So that a decrease in physical activity, fitness and bone mass in adulthood causes of decline in children's activities of daily living (Marcoleen 2009). Among the joints, the elbow joint with muscles and ligaments of multiple surrounding mobility and strength to perform fine motor and at the same time provides strong upper lateral limb. Without a doubt, make precise movements of the forearm, hand and fingers subject to appropriate joint proprioception. Otherwise the possibility of any acute injury and damage caused by hyperthyroidism and also there will be a drop in performance.

On the other hand the role of proprioceptive feedback loops that provide information capsule and Lykamnt of the coordination function of the muscle, joint stability has been well recognized (Joel Christensen, 2008). Elbow limb proprioception is probably also the upper hand proprioception and has a great impact on the movements of the body as a chain and since the only joint is one of the most joints in the body and in most sports and motor activities required human, understand the condition and range of motion in the joints, especially in the hyper-mobility of the utmost importance. On the other hand knowledge of muscle strength of this category of people is of particular importance. This study tries to answer the question of whether the muscle strength, proprioception and girls active and passive range of motion hypermobility syndrome healthy girls there are differences.

#### 1.2 Research purposes

The overall goal: Compare muscle strength, proprioception and range of motion the elbow joint hypermobility syndrome girls active and passive public and healthy

#### 1.3 Special Purposes

1. Compare elbow muscles active and inactive girls have hypermobility syndrome public and healthy
2. Comparison of the elbow joint proprioception active and inactive girls have hypermobility syndrome public and healthy
3. Compare the range of motion of the elbow joint hypermobility syndrome girls active and passive public has healthy

#### 1.4 Hypotheses

The main hypothesis: Between muscle strength, proprioception and range of motion of the elbow joint hypermobility syndrome girls active and passive public and healthy are differences.

#### 1.5 Specific hypotheses

1. Between the muscular strength of elbow joint hypermobility syndrome girls active and passive public and healthy are differences.
2. Between the elbow joint Proprioception hypermobility syndrome girls active and passive public and healthy are differences.
3. Between the range of motion girls active and passive elbow joint has Hypermobility syndrome public and healthy are differences.

#### 1.6 Defaults

A) Range or scope of the research:

The scope of this study encompasses both space and time. The research sample consisted of girls 16-14 years old territory that hypermobility syndrome in Karaj city schools. And the period of study, which is spring 2016.B)

B) Restrictions on out-of-control researcher:

- Psychological conditions of the subjects cannot be controlled.
- Living conditions and daily activity during the study subjects was rampant.

- Possibly damage the upper limb on the hypermobility of each person is different.

#### C) Limitations on self-control:

1. The subjects, all 16-14 year old girls ages hypermobility syndrome were selected.
2. None of the subjects have not a history of surgery of the elbow or elbow dislocation.
3. All subjects were selected from among active and inactive.
4. None of the subjects had at Championship level and all levels of physical activity were at the same level.

## 2. Background research

Certainly in every field in the first fundamental studies are needed to determine its basic principles and mechanisms. In recent years, a range of studies and research in the field of proprioception and hypermobility has been studied various issues associated with them. Investigate the causes of sports injuries prevention, treatment and recovery them crucial for researchers. Proprioception has been considered as one of the factors related to injuries. Also in the past decades has conducted a study to assess the public joint Shelley. In this section we will refer to some of these investigations.

Perany et al (2016) study compares the isometric strength of elbow and knee in adult men and women suffering have hypermobility syndrome with healthy people. The study, which included 106 adult men and women with hypermobility syndrome using isokinetic dynamometer to compare the isometric strength of elbow and knee patients and healthy people were studied. The results showed that isometric strength in men with hypermobility syndrome and healthy individuals is a significant difference. The results showed significant difference between healthy women and women with hypermobility syndrome does not exist.

Ranalta et al (2012) study examined the association between joint hypermobility public and increased risk of muscle disorders - skeletal paid from the general hypermobility. This study investigated the relationship between traumatic shoulder instability with joint hypermobility public. In this study, 100 patients with anterior shoulder dislocation general hypermobility that were treated with the arthroscopic method, in terms of Beighton criteria, in terms of general hypermobility of the joints were examined. The mean age of these patients was estimated at around 25 years. The patients with 100 healthy people matched for age and gender were similar to the first group, were compared. People in the control group, there is no history in terms of joint instability in the shoulder joints, did not Lygmany injury knee and lateral ankle sprain. This study showed no significant difference between the rate public joint hypermobility aren't two groups of patients and controls.

Chahal et al (2011) General hypermobility as a predictive factor for contralateral anterior shoulder dislocation were studied. 57 people with an average age of 30 years between 2006-2003 had suffered a shoulder instability were examined in this study. The control group in this study were 72 undergraduate students with no history of shoulder dislocation or damage were anterior cruciate ligament. Two study groups in terms of age and gender matched. The results showed that the prevalence of general hypermobility study groups (5.32 percent), compared with the control group (10.4 percent) was higher. In addition, the increase in external rotation in the opposite shoulder, compared with the control group was approximately 2-fold.

Vaktr Robinson (2011) study on public hypermobility in people who shoulder stability, are carried out under review. In this study, 21 patients and 46 patients with shoulder stabilization under review collarbone fracture were studied as a control group. All of these individuals were obtained from a series of treatment centers. In addition first obvious stability and cause of injury in these patients was studied. Clinical assessments were also

carried out to assess the general hypermobility by Beighton criteria were investigated. People who have a score of 4 or higher in Beighton criteria, as people were considered Hayprmbayl. Most methods used to stabilize the joint open surgical technique and the most common cause of fractures in the control group was traumatic fracture type. 61% of people have Beighton score of 4 or higher. The result of this study showed that the prevalence of general hypermobility shoulder stabilization in people who have been under review, are common. The main cause of fractures, traumatic causes. People with general hypermobility increased fracture rate after the initial surgery and then had shoulder stability and rehabilitation should be followed.

Westling et al (2010) study the relationship between general hypermobility and TMJ joint destruction. In this study, 96 girls and 97 boys 17 years old through Baton methods were evaluated. TMJ joint evaluation was carried out through auscultation by stethoscope. The relationship between visible signs of clinical auscultation and self-reported symptoms were shaken, were studied. The prevalence of symptoms in adolescents with general hypermobility of joint destruction temporomandibular, the Beighton score above 9.5 was more. People with more hypermobility, Oral parafunction higher score indicating a direct relationship between general hypermobility signs and symptoms of dysfunction was Cranio- mandibular.

Vahdat et al (2016), Assessment of biomechanical structure of the passive resistance torque on the elbow joint and its application in training facilities and their rehabilitation. Eight healthy men without problems and a history of previous impairment in neuromuscular system based on height and weight coefficient participated in this study. Five elbow flexion passive range of motion at speeds of 15 and 45 degrees per second in zero to 130 degree per second isokinetics box was conducted by the dynamometer at the same time, muscle EMG activity was recorded. The results include optimized to achieve the motion, reducing joint damage and as well as reducing energy waste by natural resistance mechanisms involved moving tissue to create a mechanism of resistance in the equipment on the motion was carried.

Arab and colleagues (2013), during a study examined the association's general hyper mobility and arch feet in the healthy girls. 50 people participated in this study. Determining the degree of hyper-mobility of people using the Beighton criteria and measuring arch using the footprint was conducted. The results showed that people with more hypermobility have less arch feet. This relationship may be due to ligament laxity and loss of their consistency.

Nodehi et al (2013), a study designed to compare the static situation the shoulder in women with general hypermobility discussed with healthy individuals. In this study, 30 women with general hypermobility with 30 healthy subjects matched for the side slip shoulder of the vertebrae of the spine in three different modes were compared. Involves Status: shell hands beside the body, Situation abduction of 45 degrees and Situation abduction of 90 degrees with maximum internal rotation. This study showed that only in a situation that is on the side of the body, the distance between the shoulder and thoracic spine between the two groups was significant and in other situations difference is meaningless.

Khalkhali et al (2013) study to examine the knee proprioception in patients with public joint hypermobility and discussed comparison with healthy individuals. Subjects included 20 patients with general hypermobility in the knee and 20 healthy subjects with age ranging 18 to 30 years. Error sense of the situation in the three angles of 15-45 and 60 degrees of active knee extension in sitting position by using a goniometer, digital images, measured by AutoCAD software and the two groups were compared at different angles. The results showed important that young people suffering knee joint position sense joint mobility less than healthy individuals. The knee joint position

sense in the end both sides were more accurate than the more internal angles.

### 3. Research Methodology

The study is quasi-experimental comparison. The sample consisted of 40 students of Karaj city schools with an average age of 14 to 16 years who are enrolled in the academic year 2016. In four groups, 10 active students with hypermobility, 10 disabled students with hyper-mobility, 10 healthy active students and 10 disabled healthy students, is divided. Students with and without hypermobility in organized sports on a daily basis or weekly basis during the last two years have participated and healthy children as well as with Disable hyper-mobility the past 2 years have not had any regular exercise. Non-random sampling method is selective, where researchers muscle strength, proprioception and range of motion of the elbow joint cross compare the groups.

#### 3.1 Research variables:

Criterion variable: the elbow joint hypermobility

The predictor variables: 1. Elbow muscle strength 2. The range of motion of the elbow joint 3. The elbow joint proprioception

#### 3.2 Measuring tool:

- Consent forms and collect data
- Casio digital scale model made in Japan to measure the Weight
- Height gauge to measure the wall height
- Beighton Beighton test for the diagnosis of the syndrome with Hyper-Mobility
- Universal goniometer to determine the range of motion in helping with diagnosis of hyper-mobility syndrome
- (Biodex isokinetic dynamometer system build-America) to measure isometric strength and proprioception elbow
- Flexible Leighton gauge to measure the range of motion
- Bed laboratory measurement to measure the range of motion of the elbow joint

#### 3.3 Statistical Methods:

In order to study and statistical analysis of raw data obtained from research, descriptive and inferential statistics were used. The descriptive statistics of mean and standard deviation were used to describe the data and determine the differences between the groups. The Kolmogorov-Smirnov test was used for data normalization. The descriptive statistics to test the equality of variances Lone statistic was used and in case of heterogeneity of variance, the test analysis of variance (ANOVA) (inter and between group) (at 95%) was used to assess differences between means. If the difference between the mean in relation with groups was significant, post hoc test (post hoc (Tukey)) was used to determine significant differences between the groups. This hypothesis was tested using SPSS version 22.

#### 4. Analysis of the findings:

1. Compare elbow muscles active and inactive girls have healthy and public hypermobility syndrome (H1):

The results of the study (H1) showed that between active and passive muscle strength of elbow general hypermobility syndrome and healthy active and inactive girls have significant differences. Results of this study with the results of studies Perani et al (2016) and Fatou et al (2008) in this field were consistent. According to the study of perani et al muscles in women with hyper-mobility in the development of more power compared to healthy women. Resources Development is an important factor for joint stability and since people with public joint hypermobility due to shell passive structures, they may have less joint stability neuromuscular mechanisms such as the development of joint forces to rely more stable. This study did

not measure the amount of force development so we can determine that if we use this hyper-mobility of the affected elbow flexors power or not. Fatou and colleagues showed that muscle torque in the hyper-mobility is high. And with the results of studies of Sahin et al (2008) was inconsistent because of this difference can be traced to several factors: In the Perani and colleagues were the main cause of the age difference could be that included adults were and hypermobility syndrome intensity decreases because age increases and As well as muscle strength decreases with increasing age, while in this study subjects were girls ages 14-17 years and because of the disparity in study Sahin et al isokinetic strength of knee flexor muscles was evaluated while in this study isometric strength of elbow flexor muscles were examined. And it should be noted that the type of muscle contraction in the torque (power) is very important. Hypermobility was one of the precipitating factors, and can even lead to premature osteoarthritis is pyrophosphate deposition.

2. Compare elbow joint proprioception girls active and inactive with general hypermobility syndrome and healthy (hypothesis 2):

Below contains the first hypothesis: the results of this study (hypothesis 2) showed, proprioception 45-degree angle at the elbow joint hypermobility syndrome less than healthy group inactive proprioception, but this difference was not significant.

Below contains the second hypothesis: the results of this study (hypothesis 2) showed, proprioception 45-degree angle at the elbow joint hypermobility syndrome active girls, less than healthy group active proprioception, but this difference was not significant.

Below contains the third hypothesis: The results of this study (hypothesis 2) showed, Proprioception 60-degree angle at the elbow joint hypermobility syndrome inactive girls, less than healthy group inactive proprioception, but this difference was not significant.

Below contains fourth premise: The results of this study (hypothesis 2) showed,

Proprioception 60-degree angle at the elbow joint hypermobility syndrome active girls, less than healthy group active proprioception), but this difference was not significant.

Results of this study in the field with the results of the study Fatou et al (2008), Sahin and colleagues (2008), Rosie (1999), BasvIntl (1995), Zemek et al (1996) outside the country, khalkhali and et al. (2013), Jadidian (2009) in the interior consistent with the results of the study Wolfgang et al. (2004) and Stillman (2002) was inconsistent.

The reason for this disparity in Wolfgang et al study that examines the proprioception of shoulder joint after surgery in patients with joint instability paid in kind could be examined in detail. The research Wolfgang et al. (shoulder joint), while in the elbow joint study in study subjects with joint instability Wolfgang, who previously had been operated hypermobility word is quite different from instability. Hypermobility demonstration of excessive laxity or increasing the length of the tissue, while increasing instability of motion, Steve kinematics and is Artrokinmatik and muscle and muscle control not possess any protective role, whereas people with hypermobility no signs of instability, but in the current study subjects not undergone any surgery and only with joint hypermobility syndrome were elbow and due to differences in study Stillman and colleagues varied the type of joint involved and the investigation was done on the knee joint, the age range of the subjects was 29 to 18 years, while in this study participants comprised students 14 to 17 years, gender is also a contributing factor in failure to comply in Stillman and colleagues study participants were men and women, while the present study subjects were only women.

3. Compare the range of motion of the elbow joint girls active and inactive with general hypermobility syndrome and healthy (hypothesis3):

Results of this study (H3) showed, between range of motion of the elbow joint active and inactive girls with hypermobility syndrome general and healthy there is a significant difference. Results of the present research in this field with the results of the study Chahal et al. (2011) and Gedaliah et al (1993) abroad and the Arab and cooperation within the consonants, According to the Arab and colleagues studied people who are more general hypermobility, because ligaments largely have lost their consistency, was not able to maintain the overall structure of joints, in fact, by increasing general hypermobility criteria such as consistency ligaments decreases cause range of motion is too joint and with results of the study Ranalta et al (2012) was inconsistent. The cause of this discrepancy can be in several factors, in the study Ranalta et al, subjects that people with a history of anterior shoulder dislocation were treated with the arthroscopic method, however, in present study people any history of dislocation

Or elbow joint had no previous injury and as well as the type of joint involved in the study Ranalta and colleagues who shoulder joint was different with present study and Average age in the study Ranalta et al 25 years. But in the present study was an average age of 15 years. According to the study, Graham and colleagues (1990) age is also a contributing factor in an article entitled hypermobility syndrome, to express the history of general hypermobility have paid and its severity in children are most commonly mentioned. It also stated that from the rate of hypermobility decreases with age. In addition, hypermobility is more prevalent in women than men mentioned in your article and general hypermobility more joints than the more common single-joint hypermobility have stated. Also general hypermobility abundance variation in different races stated.

**4.1 First hypothesis**

Between the muscle strength of elbow active and inactive girls with general hypermobility syndrome and healthy there are differences.

Table 1 results of Tukey post hoc test in comparison isometric strength of the groups.

Groups	Mean difference	P
Inactive healthy - Active healthy	7.85	0.032
Active healthy - Active hypermobility	1.93	0.893
Active healthy - Inactive hypermobility	4.69	0.329
Inactive healthy - Active hypermobility	9.78	0.005
Inactive healthy – Inactive hypermobility	3.16	0.656
Active Hypermobility - Inactive hypermobility	6.62	0.090

At the level of  $p < 0.05$  was significant

According to Tukey test results are shown in Table1:

- Between the elbow muscle strength in healthy inactive girls with active healthy group ( $p = 0.032$ ) and active hypermobility ( $p = 0.005$ ), there was a significant difference.

- The muscle strength of elbow joint hypermobility group inactive more than three groups, but this difference was not statistically significant.

In Figure 1, means and standard deviations muscle strength of elbow active and inactive girls with general hypermobility syndrome and healthy viewing.

Figure (1) Average isometric strength

**4.2 Second hypothesis**

Between elbow joint proprioception active and inactive girls with general hypermobility syndrome and healthy there are differences.

Table 2 Results of Tukey post hoc test in comparison Proprioception angle of 45 degrees in the groups

Groups	Mean difference	P
Inactive healthy - Active healthy	2.43	0.746
Active healthy - Active hypermobility	0.71	0.991
Active healthy - Inactive hypermobility	3.07	0.586
Inactive healthy - Active hypermobility	3.14	0.568
Inactive healthy – Inactive hypermobility	5.50	0.122
Active Hypermobility - Inactive hypermobility	2.63	0.763

Table 3 Results of Tukey post hoc test in comparison proprioception angle of 60 degrees in the groups

Groups	Mean difference	P
Inactive healthy - Active healthy	3.90	0.73
Active healthy - Active hypermobility	3.83	0.579
Active healthy - Inactive hypermobility	0.24	1
Inactive healthy - Active hypermobility	6.92	30.11
Inactive healthy – Inactive hypermobility	3.33	0.682
Active Hypermobility - Inactive hypermobility	3.59	0.629

According to Tukey test results are shown in the table above:

- Proprioception angle of 45 degrees elbow inactive girls with hypermobility syndrome less than proprioception inactive healthy group but this difference was not significant (p = 0.12).
- Proprioception angle of 45 degrees elbow joint in active girls with hypermobility syndrome less than proprioception active healthy group, but this difference was not significant (p = 0.99).
- Proprioception angle of 60 degrees inactive the elbow joint in girls with hypermobility syndrome less than

proprioception inactive healthy group, but this difference was not significant (p = 0.68).

- Proprioception angle of 60 degrees elbow joint in active girls with hypermobility syndrome less than proprioception active healthy group, but this difference was not significant (p = 0.57).
- Figures 4-2 and 4-3 Proprioception means and standard deviations angles of 45 and 60 degrees elbow active and inactive girls with general hypermobility syndrome and healthy is showing.

Figure (2) Average 45-degree angle elbow joint proprioception

Figure (3) Average 60-degree angle elbow joint proprioception

4.3 The third hypothesis:

Between range of motion elbow active and inactive girls with general hypermobility syndrome and healthy there are differences (table 4).

Table 4 Results of Turkey test the range of motion in comparison the elbow joint in the groups

Groups	Mean difference	P
Inactive healthy - Active healthy	2	0.714
Active healthy - Active hypermobility	10.3	0.001
Active healthy - Inactive hypermobility	6.30	0.010
Inactive healthy - Active hypermobility	8.30	0.001
Inactive healthy – Inactive hypermobility	4.30	0.120
Active Hypermobility - Inactive hypermobility	4	0.164

According to Tukey test results are shown in the table above:

- Between range of motion of the elbow joint inactive healthy girls with active hypermobility group ( $p = 0.001$ ), there was a significant difference.
- Between range of motion of the elbow joint active healthy girls with active hypermobility group ( $p = 0.001$ ), there was a significant difference.
- The range of motion elbow joint hypermobility groups active was more compared to deactivate hypermobility but this difference was not significant ( $p = 0.16$ ).

- The range of motion the elbow joint disable healthy group was more compared to active healthy group but this difference was not significant ( $p = 0.714$ ).

Figure (4) Show the mean and standard deviation range of motion of the elbow joint active and passive girls with general hypermobility syndrome and healthy.

Figure (4).The average range of motion of the elbow joint

## 5. Conclusion:

In this study, three variables of muscle strength, proprioception at angles of 45 and 60 degrees and range of motion of elbow joint, active and inactive girls healthy and with general hypermobility syndrome was evaluated and the results showed that muscle strength elbow joint between the active and inactive girls with general hypermobility syndrome and healthy, there is a significant difference, While between the elbow joint Proprioception active and inactive girls with general hypermobility syndrome and healthy, there was no significant difference. Also amount Proprioception in hypermobility active and inactive angles 45 and 60 degrees relative to the control group decreased, but the decrease is not significant. Also between range of motion active and inactive girls elbow joint with general hypermobility syndrome and healthy significant difference was observed.

## 6. Suggestions:

### Suggestions arose from study:

- The results showed that muscle strength elbow joint between the active and inactive girls with general hypermobility syndrome and healthy, are difference. Therefore, measuring the power in this people in order to choose sports teams and also to prevent the possibility of injury is suggested.
- According to lower elbow joint Proprioception active and inactive girls with hypermobility syndrome compared to active and inactive healthy to trainers recommended that special exercises to improve proprioception in people with hypermobility syndrome in school athletic programs should be used.

Due to significant differences in range of motion in the elbow joint active and inactive girls with general hypermobility syndrome and healthy, assessment of range of motion girl students In order to detect and prevention of problems associated with this syndrome and avoid forbidden actions in sport for detected offered to trainers.

**Abstract.** This research is applied in terms of purpose and is descriptive and correlation type in terms of data collection method. The study population consisted of all active investors of Aras Free Zone Organization that is a limited community including 460 investors. Statistical sample of research is a part of this population that 210 samples were selected based on Krejcie and Morgan table according to the 460-person sample size for community using available sampling method. Researcher made questionnaire was used to collect data that its validity is confirmed by 10 experts, including supervisors and specialists and reliability coefficient is estimated 0.86 through Cronbach's alpha. The research results show that investigated factors of research are effective on investors risk taking in Aras Free Zone.

**Keywords:** Educational-psychological factors, social factors, cultural factors, political factors, economic factors, managerial-administrative factors, geographic and risk taking

### 1. Introduction

Investment is of important economic variables that have always allocated major issues to itself and different schools of thought, have presented different definitions of investment. Theoretically, about the role of capital, economists believe that capital is a necessary condition for economic growth and development. Private sector investment has characteristics that gives it special importance in economy of that country (Ghanbari et al. 2007). According to occurred changes in today's world, especially in developing countries that are faced with numerous threats, these countries to solve their economic problems need proper planning to make better use of their facilities and God-given riches. In this regard, one of the main strategies, is expansion and developing investment (Modarres and Hesarzadeh, 2008) which investment is always associated with various for investors, so researcher in present study tries to investigate factors affecting risk taking of investors in Aras Free Zone.

### 2. Research Hypothesis

- Psycho-educational factors are effective on risk taking of investors in Aras Free Zone.
- Social factors are effective on risk taking of investors in Aras Free Zone.
- Cultural factors are effective on risk taking of investors in Aras Free Zone.
- Political factors are effective on risk taking of investors in Aras Free Zone.
- Economic factors are effective on risk taking of investors in Aras Free Zone.
- Management-administrative factors are effective on risk taking of investors in Aras Free Zone.
- Geographical factors are effective on risk taking of investors in Aras Free Zone.

### 3. Research method

Present study is applied in terms of purpose and is descriptive and correlation type in terms of data collection. It is applied because it follows new knowledge that has certain applications on product or process in fact. It is descriptive because it describes and interprets whatever is and focuses on conditions or existing relations, common beliefs, ongoing processes, clear effects or expanding trends. Statistical population of research, based on official figures of Aras Free Zone, includes all active investors of this organization that is a limited community including 460 investors. And also for 460-person community sample of 210 persons is selected. To collect research data both library and field studies have been used and finally collected

data are entered into SPSS after sorting, and statistical analysis have been done on them.

### 4. Research background

Douglas (2010) in his study concluded that venture investors play a major role in creating added value in investee entrepreneurial firms by providing advice in the areas of financial, administrative, marketing and strategic issues. Also accessing network of accounting consultants, lawyers, banks and financiers, and other professional firms in the subject provide Investee Company's activity.

Barokomora (2010) in the joint research have examined major obstacles of investment in developing countries. They divided obstacles into 2 formal and informal categories. According their findings the most important formal obstacles of investment in the studied countries include capital account restrictions, legal obstacles, problems of taxation system and informal obstacles included political risks, institutions, lack of rule of law, administrative corruption, economic instability and currency risks. In total, two types of formal and informal obstacles represent investment risk levels in different countries.

Jyaraman (2001) study examined investment status in less developed countries with special attention paid to Fiji. Her research results that are applicable to many countries with similar economic structure, Represents a significant and negative effect of private sector investment of these countries on inhibiting factors such as regulation weakness, poor economic infrastructure, corruption and bribery and other factors that causes an increase in the cost of risk in the studied countries.

Abzari et al. (2014) have done a study entitled "Factors Affecting the risk and return on investment in financial products" the results of which is as follows: Macro-economic factors affecting the systematic risk of investment in financial products, microeconomic factors affecting unsystematic risk of investment in financial products and non-economic factors affecting overall risk of investment in financial products. On the other hand, non-economic factors of risk perception with willingness to investment risk has negative correlation, historical return rate positively correlated with willingness to risk, perceived risk is negatively correlated with the rate of expected return, Information on past performance is positively correlated with the expected rate of return.

Bahraini and Malek Alsadaty (2012) in a study entitled "Institutional obstacles to investment and doing business in Iran" reviewed business environment in Iran and compared it with other countries and according to results, insecurity and concerns of investors and business people in Iran regarding unpredictability of changes in laws and policies, the government is not committed to the policy announced, not into play investors and business people in the process of legislation and new policies, suddenly cancel current rules and regulations by the government, the incidence of major changes in rules and policies after the election (in case of changing government) and introduced several other factors as the main factors increasing the risk of investing in the country.

### 5. Data analysis

#### 5.1. Demographics

##### 5.1.1. Distribution of respondents' age

Table 1 is related to the age of the respondents to research questionnaires. As can be seen in table 11.4% of whole sample aged 21 to 30 years, 29.5% are in the age group of 31 to 40 years, 43.8 percent aged 41 to 50 years and 15.2 percent are 51 years and older.

Table 1: Frequency distribution and percentage of respondents by age

age group	Frequency	Percentage
21 to 30 years	24	11.4
31 to 40 years	62	29.5
41 to 50 years	92	43.8
51 years and older	32	15.2
Total	210	100

### 5.1.2. Distribution of respondents' gender

Table 2 is allocated to gender of respondents. As the table shows of a total of 210 persons of investors that were evaluated in this study, 98.1 percent are men and 1.9% are women.

Table 2: Distribution of respondents' gender

gender	Frequency	Percentage
Men	206	98.1
women	4	1.9
total	210	100

### 5.1.3. Distribution of respondent's degree of education

Table 3 is related to the education degree of the respondents to the questionnaire of research. As can be seen in Table of the total review sample 3.3 percent have educational Degree lower diploma, 11.9 percent have a secondary diploma, 18.6 percent have Associate Degree, 8 percent have Bachelor's degree and 11.4 percent have Master's degree or higher.

Table 3: Frequency distribution and percentage of respondents according to degree

Educational	Frequency	Percentage
Lower	7	3.3
Diploma	25	11.9
Associate	39	18.6
Bachelor's	115	54.8
Master's	24	11.4
total	210	100

### 5.1.4. The distribution of participants by type of investment

Table 6: Descriptive Table research components

research components	size	average	median	mode	variance	minimum	maximum
Educational-psychological factors	210	3.621	3.600	3.60	0.482	1.40	5.00
social factors	210	4.108	4.200	4.00	0.199	3.00	5.00
cultural factors	210	3.692	3.800	3.80	0.299	2.20	5.00
Political factors	210	3.895	4.000	4.40	0.475	1.00	5.00
Economic factors	210	4.105	4.200	4.20	0.183	2.80	5.00
Managerial-administrative factors	210	4.081	4.000	4.00	0.187	2.80	5.00
Geographical factors	210	3.917	4.000	4.00	0.238	2.80	5.00
risk taking	210	3.455	3.400	3.40	0.232	2.40	4.80

### 5.3. Examining normality of variables distribution

Table 4 is related to the type of investment of respondents to the questionnaire of research. As can be seen in Table 1.4% of whole sample are active in primary industries, 45.7 percent in manufacturing companies, 16.2 percent in service section and 36.7 percent in other types of investment.

Table 4: Frequency distribution and percentage of participants according to the type of investment

type of investment	Frequency	Percentage
primary industries	3	1.4
Manufacturing industries	96	45.7
service section	34	16.2
Other activities	77	36.7
total	210	100

### 5.1.5. Distribution of respondents based on the time spent in Aras Free Zone

Table 5 is concerning the duration of presence of reviewed investors of this study in Aras Free Zone. As seen in the table of the total review sample 28.1% is less than 2 years, 35.7 percent of 2 to 4 years, 21.0 percent 4 to 6 years and 15.2 percent 6 years and above that have invested in Aras Free Zone.

Table 5: Frequency and percentage of respondents based on time spent in Aras Free Zone

Time Spent	Frequency	Percentage
Less than 2 years	59	28.1
2 to 4 years	75	35.7
4 to 6 years	44	21.0
6 years and higher	32	15.2
Total	210	100

### 5.2. Central characteristics and dispersion of research variables

For factors affecting the risk taking of investors in Aras Free Zone and also for risk-taking, the sample size, average, median, mode, variance, minimum and maximum are calculated in detail which are given in Table (4-6).

Kolmogorov - Smirnov've test is used in order to evaluate the normality of variable distribution. In this normality test of

variable distribution the null hypothesis is variable and opposite hypothesis refers to the abnormal distribution. If the significance

level of test is less than 0.05 the null hypothesis is rejected and it is conclude that the target variable distribution is not normal.

Table 7: The results of Kolmogorov - Smirnov test to study the normality of variable distribution

Dimensions	size	Z-statistic of Kolmogorov-Smirnov	significance level
psycho-educational factors	210	1.351	0.052
social factors	210	1.314	0.063
cultural factors	210	1.354	0.051
Political factors	210	1.329	0.058
Economic factors	210	1.344	0.054
Managerial-administrative factors	210	1.351	0.052
Geographical factors	210	1.322	0.061
risk taking	210	1.354	0.051

#### 5.4. Testing hypotheses of the study

Regression analysis was used to test the hypotheses that the results are as follows:

##### 5.4.1. The first hypothesis: the psycho-educational factors are effective on risk taking of investors in Aras Free Zone

Initially linearity of the relationship between variables is confirmed using ANOVA test that the results are in Table 8:

Table 8: The results of ANOVA test

Model	freedom degree	Mean Square	F	significance level
Regression	1	0.348	1.500	0.022
Residual	208	0.232		
Total	209			

As specified in the table, amount of significance level is 0.022 which it is smaller than the 0.05, so linearity assumption of model can be approved. Now, the impact of psycho-educational

factors on risk taking of investors in Aras Free Zone can be predicted using Table regression analysis that the results are given in Table 9:

Table 9: The results of regression analysis test to examine the effect of psycho-educational factors on risk taking of investors in Aras Free Zone

model	Standardized coefficients	t	significance level
(Constant)	Beta	18.333	0.000
psycho-educational factors	0.850	12.291	0.022

Given that the sigma test is smaller than 0.05, it can be stated that Psycho-educational factors affect amounted to 0.85 on risk taking of investors in Aras Free Zone and with increasing of one unit on the amount of the psycho-educational factors, the risk taking of investors in Aras Free Zone will be changed as much as 0.85 units.

##### 5.4.2. The second hypothesis of the research: social factors are effective on the risk taking of investors in Aras Free Zone

Table 10: The results of ANOVA test

Model	freedom degree	Mean Square	F	significance level
Regression	1	0.487	2.107	0.048
Residual	208	0.237		
Total	209			

Table 11: regression test results to examine the impact on social factors on risk taking of investors in Aras Free Zone

model	Standardized coefficients	t	significance level
(Constant)	Beta	9.775	0.000
social factors	0.100	1.451	0.048

### 5.4.3. The third hypothesis of research: cultural factors are effective on the risk taking of investors in Aras Free Zone

Table 12: The results of ANOVA test

Model	freedom degree	Mean Square	F	significance level
Regression	1	0.040	0.174	0.007
Residual	208	0.233		
Total	209			

Table 13: regression test results to examine the impact of cultural factors on the risk taking of investors in Aras Free Zone

model	Standardized coefficients	t	significance level
	Beta		
(Constant)		15.573	0.000
cultural factors	0.290	0.409	0.007

### 5.4.4. Fourth research hypothesis: Political factors are effective on the risk taking of investors in Aras Free Zone

Table 14: The results of ANOVA test

Model	freedom degree	Mean Square	F	significance level
Regression	1	0.602	2.611	0.008
Residual	208	0.231		
Total	209			

Table 15: regression test results to examine the impact of political factors on the risk taking of investors in Aras Free Zone

model	Standardized coefficients	t	significance level
	Beta		
(Constant)		16.544	0.000
political factors	0.480	8.333	0.008

### 5.4.5. Fifth hypothesis of research: economic factors are effective on risk taking of investors in Aras Free Zone

Table 16: The results of ANOVA test

Model	freedom degree	Mean Square	F	significance level
Regression	1	0.000	0.000	0.006
Residual	208	0.231		
Total	209			

Table 17: Results of regression tests to examine the impact of economic factors on risk taking of investors in Aras Free Zone

model	Standardized coefficients	t	significance level
	Beta		
(Constant)		10.721	0.996
political factors	0.001	0.005	0.006

### 5.4.6. Research sixth hypothesis: management-administrative factors are effective on the risk taking of investors in Aras Free Zone

Table 18: The results of ANOVA test

Model	freedom degree	Mean Square	F	significance level
Regression	1	0.109	0.470	0.004
Residual	208	0.233		
Total	209			

Table 19: Results of regression analysis to evaluate the effect of management-administrative factors on risk taking of investors in Aras Free Zone

model	Standardized coefficients	t	significance level
	Beta		
(Constant)		11.595	0.000
management-administrative factors	0.470	5.233	0.004

### 5.4.7. Research seventh hypothesis: geographical factors are effective on the risk taking of investors in Aras Free Zone

Table 20: The results of ANOVA test

Model	freedom degree	Mean Square	F	significance level
Regression	1	0.418	1.808	0.000
Residual	208	0.231		
Total	209			

Table 21: Results of regression tests to assess the impact of geographical factors on the risk taking of investors in Aras Free Zone

model	Standardized coefficients	t	significance level
	Beta		
(Constant)		11.495	0.000
geographical factors	0.093	1.345	0.000

### 5.5. Multiple regression test

Multiple regression test results is as follows:

First, linearity of relationship between variables is confirmed using ANOVA test that the results are given in Table (4-22).

Table 22: The results of ANOVA test

Model	freedom degree	Mean Square	F	significance level
Regression	7	0.324	1.413	0.002
Residual	202	0.229		
Total	209			

As specified in the table the amount of significance level is 0.002 that because it is smaller than the 0.05, So linearity assumption of model can be approved. Now, using multiple

regression analysis table, the effect of each of research variables on the risk taking of investors in Aras Free Zone are given in Table (4-23).

Table 23: Results of regression testing to examine the impact of research variables on the risk taking of investors in Aras Free Zone

Model	Standardized coefficients	t	significance level
	Beta		
psycho-educational factors	0.205	3.368	0.032
Social factors	0.111	1.511	0.015
Cultural factors	0.101	1.583	0.005
Political factors	0.128	0.260	0.009
Economic factors	0.021	1.831	0.001
management-administrative factors	0.120	0.305	0.006
geographical factors	0.101	0.747	0.049

Results in Table 23 shows linear multiple regression test of the effect of each of the factors affecting risk taking of investors in Aras Free Zone.

### 6. Conclusion

The first research hypothesis is confirmed, linear regression test was used to assess this hypothesis, since the test sigma is smaller than 0.05, it can be stated that psycho-educational factors affect risk-taking of investors in Aras Free Zone in amount of 0.85 that the amount of this impact is high.

The second research hypothesis is confirmed, linear regression test was used to assess this hypothesis, since the test sigma is smaller than 0.05, it can be stated that social factors affect risk-taking of investors in Aras Free Zone amounted to 0.10, results of this study is consistent with Rahbari, (2008) studies that in a joint study have examined obstacles of investment and its impact on economic growth in Iran and in this study, the positive impact of social factors on the risk taking of investors has been approved. Also the results of the present study is consistent with studies of Karimzadeh (2010) that in a study examined the obstacles of production in Iran and called them "factors that increase the risks of investment" in the country and assess the impact of social factors on these risks as positive.

The third research hypothesis is confirmed, linear regression test was used to assess this hypothesis, since the test sigma is smaller than 0.05, it can be stated that cultural factors affect risk-taking of investors in Aras Free Zone amounted to 0.29. Results of this study is consistent with studies of Rahbari, (2008). Also the results of the present study is consistent with studies of Goladestone et al. (2004) that and showed in their research that in Canadian companies backed by venture capital, trading sales have been doubled common than initial public offering of take stock.

The fourth research hypothesis is confirmed, linear regression test was used to assess this hypothesis, since the test sigma is smaller than 0.05, it can be stated that political factors affect risk-taking of investors in Aras Free Zone amounted to 0.48. Results of this study is consistent with studies of Rahbari, (2008).

The fifth research hypothesis is confirmed, linear regression test was used to assess this hypothesis, since the test sigma is smaller than 0.05, it can be stated that economic factors affect risk-taking of investors in Aras Free Zone that the extent of this impact is very minor. Results of this study is consistent with studies of Rahbari, (2008).

The sixth research hypothesis is confirmed, linear regression test was used to assess this hypothesis, since the test sigma is smaller than 0.05, it can be stated that management-administrative factors affect risk-taking of investors in Aras Free Zone amounted to 0.47. Results of this study is consistent with studies of Karimzadeh (2010).

The seventh research hypothesis is confirmed, linear regression test was used to assess this hypothesis, since the test sigma is smaller than 0.05, it can be stated that the geographic factors affect risk-taking of investors in Aras Free Zone amounted to 0.093. The results of the present study is consistent with studies of Gladestone et al. (2004).

## THE COMPARATIVE INVESTIGATION OF ACADEMIC ACHIEVEMENT THROUGH COLLABORATIVE LEARNING WITH INDIVIDUAL LEARNING SYNTAX LESSON OF THE ARABIC LITERATURE STUDENTS AT THE UNIVERSITY OF ZABOL

\*ELHAM GHORBANI

*\*Instructor, Department of Arabic Language and Literature,  
University Of Zabol*

*Email: eghorbani@uoz.ac.ir*

**Abstract.** The academic achievement was investigated comparatively through collaborative learning with individual learning syntax lesson of the Arabic literature students at the University of Zabol. This test involves a test of 20 questions that measure the different levels of knowledge. In this case that after the same training to both groups, students studied individually in the individual group and learned collaboratively in the collaborative group. The results show that: teaching with individual method is effective on learning and leads to increase post-test scores of them. But participatory techniques had more effective compared to individual learning in terms of understanding and comprehension and analysis power. But in terms of remembering, remembering and judgment, participatory method had not difference with individual method.

### 1. Introduction

The education is one of the most effective means that training provides it. So, the method of teaching is significant and important. And teachers of our time have great emphasis on teaching methods are based on thought. Because there is evidence that collaborative learning groups achieved higher levels of thinking and keep out information and findings longer than learners who act solo. Learning through cooperation was introduced at the beginning of the last century by John Dewey, and is one of the permanent topics in education. Research shows that this type of learning put responsibility on students and involve them in the learning process. And the foundation of this method is the formation of a learning team. In the past it was believed that only silence and lack of exercise classes, were real learning classes. At the time, the training managers walk in the blackout corridors and waiting to hear the slightest sound, to control their classes. Today, it is recommended that teachers and educators used programs and methods that invite students to express their opinions and participate in learning. The reaction of some to this proposal is that they in fact acted as a group and set down collaborative learning in their classroom. So what is new in-between? In fact, a few teachers and lecturers can provide collaborative learning situations. Because institutions teach students to accept adult roles, and because participation will form a major part of adult life, it is expected that educational institutions, underscored the cooperative activities.

### 2. The expression of the problem

The role of new education is that it flourished people's talents and abilities and prepared them to participate in society activities. Achieving these goals requires a favorable change in learner's behavior. due to the rapid changes that occur in sciences, our learners need ways through which learners achieved learning skills so that they can learn sciences better and faster and along with the advancements. There are many ways to learn. Some of these methods is based on the memories and memory. And learners merely to keep the matters provided by the teacher, but some learning methods force person to think. In these ways, not only individuals haven't passive state, but also learns quite actively, among these methods, it is cooperative learning method that person works in the group and learns in the group. Collaborative learning is not limited to a particular method, but also including a wide range of methods through which classroom was organized and run flexibly and yet efficiently, and each of teacher can use a form of that according to the conditions, situations and his philosophy (Hashemi et al., 2015). collaborative learning doesn't mean the grouping students based on the same talents, on the contrary, any size

heterogeneity of team members be more in terms of culture, intelligence and academic achievement and ... participatory approach will be more effective (Shabani, 2009). In other words, collaborative learning is proposed the truth as a solution to deal with hordes of education problems. This learning is remembered mostly as means for strengthening thinking skills and enhance systematic learning level, compensatory educations or special educations and improve communication between students of different races together and prepare them to take part in group and participatory activities (Sepehrian and Azar, 2016). but individual learning methods in this study, is learning that each of the students alone without help or helping others and without formation of a classroom or home learning groups study and learn subject taught by teacher (Canaani, 2000). that individual learning levels is to be noted that knowledge (remembering) is in the its first level knowledge is that learner can provide evidence by the recalling or recognition stating that he has remembered the experienced phenomenon or thinking during training. Understanding (perception) of learning at this level is the ability to understand the meaning of a story, and explain it with statements that the person makes his own, without the content with other content communicate. Analysis, in the analysis, breaking down matter to its constitutive components and finding relationships between components and how organizing they are stressed. Evaluation (judgment) of this phase includes judging about the affairs, information and even methods of dealing with the issues. The evaluation is result of the recognition. At this point, learner inevitably, make the decision. In other words, judgment is judging about the value of matters and subjects for specific purposes. (Mousavi, 2011).

But one of the most important lesson materials in any language learning is language rules (syntax) that fluency in it can lead to progress in other lingual skills. For this purpose, studying different teaching methods for scientific upgrade of the students and the possibility of efficiency in processing their scientific information indeed will make significant progress in their position in higher education and the labor market. since in teaching Arabic language of country, for many reasons, including : low content of textbooks in Arabic language , lack of access learners to language audio tools or appropriate educational networks, failure to allocate sufficient time for specialized lessons in educational planning, lack of awareness of teachers from the importance of modern teaching methods and their impact of it on learning overshadowed Arabic language and literature in the country and created relative weakness in learning the language (Heidari and Hakim , 2015).

It can be said with regard to mentioned issues that in this study, researchers sought to determine the effect amount of cooperative learning in comparing to individual learning (remembering information, understanding, analysis and judgment power. so, this the present research project tries to study academic achievement through collaborative learning with individual learning of syntax lesson of the Arabic literature students at the University of Zabol.

### 3. Research Objectives and hypotheses

The overall goal: of the study is comparison of the effect of cooperative learning with individual learning at lesson syntax clause of the Arabic literature students at the University of Zabol.

The research Hypothesis

1. the cooperative learning than individual learning has more effect on remembering and remembering scientific information of lesson syntax clause of the Arabic literature students at the University of Zabol.

2. the cooperative learning than individual learning has more effect on perception and understanding amount of learned matters of lesson syntax clause of the Arabic literature students at the University of Zabol.

3. the cooperative learning than individual learning has more effect on the strength amount of of scientific data analysis of lesson syntax clause of the Arabic literature students at the University of Zabol.

4. the cooperative learning than individual learning has more effect on the strength of of scientific judgment of lesson syntax clause of the Arabic literature students at the University of Zabol.

5. the cooperative learning than individual learning has more effect on the learning amount of lesson syntax clause of the Arabic literature students at the University of Zabol.

#### 4. The research History

The following investigative records is brought briefly from two aspects of education and the use of cooperative and individual learning and comparison of two variables of the newest available resources in terms of researching purpose and assumptions. Spherion Azar (2016) studied the effect of Jigsaw classroom to meet the psychological needs of students (need for autonomy, competence and relatedness) that the study findings showed that Jigsaw method has a positive effect on the need for autonomy and competence and communication. Overall, the study findings protected from Self-determination theory and showed that the self-determination protective environments such as teaching Jigsaw method has positive effect on basic psychological needs are met.

Safar Ali Zadeh and adyb (2015) in a conducted study analysis with aim of examining the effect of cooperative learning in interaction with the learning styles (field dependent and field independence) on mathematics academic achievement of first grade female students in Urmia city showed that academic achievement in the experimental group than the control group was significantly higher. The participatory method had a positive effect on on mathematics academic achievement scores with regard to the learning styles, also in conditions that subjects learning style is dependent to field, the participatory method had more effect on the academic achievement amount of subjects.

Hashemi et al. (2015) meanwhile emphasizing on participatory methods stated that including active attended methods of education experts is participatory learning. they with aim of examining the effectiveness of cooperative learning of Jigsaw kind on the self-regulation and academic motivation of primary school children showed that the cooperative learning of Jigsaw increase significantly self-regulation and academic motivation in students and has a positive effect on the development component of these two variables in the students. Overall, study findings showed that the cooperative learning method of Jigsaw compared to traditional methods of teaching is more effective in the development of self-regulation skills and increase students' academic motivation.

Mohammadi et al. (2015) in conducted study the effectiveness of education with cooperative learning method and individual conceptual map on the motivation and academic achievement of students with quasi-experimental method with pre-test and post-test design of control group showed that teaching with cooperative learning method and individual conceptual map is effective on improving the motivation and academic achievement of students. The application of research findings for teachers is that the role of motivational factors of education through collaborative learning and education with individual conceptual map method should be put under consideration in order to increase motivation and academic achievement.

Mesrabadi and Fazy (2015) in a study with combination aim of conducted studies in field of the effectiveness of cooperative learning methods had positive effect on special children's education yields. Ahmadi et al. (2015) in study the effect of

cooperative learning on student composition achievement and comparing it with the traditional method in second grade of junior high school in Saveh city, showed that cooperative learning method than the traditional method leads to error reduction (improvement) in the composition of students. Progress composition of male and female students in cooperative learning method was the same.

Khadive, (2009) studied the comparison of participatory teaching method and traditional teaching methods in the development of sciences lesson and the creativity amount of the third grade middle school students and the results have shown that the quality of learning is more favorable in ways that are along with student more activities and their cooperation with each other. In these methods on how to learn and skills of how learning is emphasized more than our facts and knowledge transfer. And the learner achieves a set of skills and attitudes and knowledge through engaging in various learning activities and experiences that he was contributed to the formation and production of them.

Tajrobeh Kar, (2001) conducted a study as "the Impact of individual and collaborative strengthen in the collaborative learning on academic achievement in English language lesson of third grade female students in Kerman region 1 of education," that educational progress of students who were involved with cooperative learning method to learning, was more than the students who were involved with individual learning method to learning, in the individual groups, the progress of students who received bonuses was more than students who didn't receive bonuses in cooperative groups, groups that are engaged in collaborative learning and received reward individually and cooperatively was better than cooperative learning group who acted without reward. No significant difference was seen between the two collaborative groups with individual reward and collaborative groups with cooperative reward.

Canaan, (2000) studied the impact of participatory teaching methods compared with traditional teaching (lectures) on the academic achievement of first high school female and male students in Rasht city that the results showed that the participatory learning more than the traditional learning leads to increase student academic achievement. Also, the participatory learning has the same effect on the academic achievement of male and female students. In addition to some poor ethnic students the benefit equally from cooperative learning. Johnson et al. (1981) analyzed in an overview 122 conducted studies in regarding to the effect of cooperative, solitary, competitive learning on academic progress. In cooperative learning, in this case that students learned in different groups collaboratively. And in collaborative learning along with competition between groups, means students in different groups paid learning collaboratively. But, the groups compete in reaching goal and receiving reward together. And competitive learning so that students learn individually and competed together to reach the goal and receiving reward. And in individual learning, those without competing with each other learn individually to achieve a certain goal and receiving reward.

#### 5. Methodology

The semi-experimental study method with pretest and posttest design with the control group has been used in this study. In this case that collaborative and individual learning methods were applied as independent variables so that their impact is determined on the amount of remembering, understanding, analysis and practical judgment of the students as the dependent variable. Two Arabic grammar classrooms was used to do this study that number of participants to 50 semester coordinate students were selected with participatory teaching and learning with group partnership and other education by the same lecturer and professor that they participated in one of the specialized classes of the syntax lesson at bachelor course of Arabic literature at the University of Zabol in the 96-95 school year and were studying but in individually learning, the people were

selected with available sampling and simple random method as the studied sample. At the end of the period through doing a test of exam with 20 questions such as routine tests, different syntactic knowledge levels were measured. Then, the pre-test results were collected and were analyzed by statistical tests such as t test for independent groups.

## 6. The data analysis

The analysis of findings in the descriptive statistics section represents that after applying instruction at the level of learning score in syntax lesson of the Arabic literature students at the University of Zabol, a progress was obtained under both

Table 1: independent t tests the first hypothesis before training

The group	The number	The mean	t	The degree of freedom	The probability amount	The test error
participatory	25	0.04	0.12	48	0.905	0.05
Individual	25	0.02				

In the table (1) independent t test results before training between participation groups and individual groups in the "remembering and recalling" score have been brought. Based on the results in the table, before didactic course was applied on the students of cooperative group and the average score of remembering and reminding in the individual group and in the cooperative group was obtained respectively 0.02 and 0.04 and the amount of obtained t ( $t=0.12$ ) in degrees of freedom 48 and confidence

educational practices which shows the effectiveness of teaching both ways but the score level in the collaborative group was higher from individual groups.

### 6.1 The first hypothesis

The cooperative learning than individual learning has more effect on remembering and remembering scientific information at lesson syntax clause of the Arabic literature students at the University of Zabol.

#### A. pre-trainin

level 95%, is smaller from the value t of table ( $t=2.00$ ). So, there is no significant difference between the two individual and participation groups in the "remembering and recalling score" pre- didactic course in the lesson syntax clause of the Arabic literature students at the University of Zabol.

#### B. post -training

Table 2: independent t test in the first hypothesis after training

The group	The number	The mean	t	The degree of freedom	The probability amount	The test error
participatory	25	3.76	0.27	48	0.788	0.05
Individual	25	3.69				

In the table (2) independent t test results after training between participation groups and individual groups in the "remembering and recalling" score of the lesson syntax clause of the Arabic literature students at the University of Zabol have been brought. based on the results in the table, after didactic course was applied on the students of cooperative group and the average score of knowledge in the individual group and in the cooperative group was obtained respectively 3.69 and 3.76 and the amount of obtained t ( $t=0.27$ ) in degrees of freedom 48 and confidence level 95%, is smaller from the t value of table ( $t=2.00$ ). So, there is no significant difference between the two and individual and participation groups in the "remembering and recalling score "after didactic course. As a result, the research hypothesis is rejected and cooperative learning than individual learning at lesson syntax clause of the Arabic literature students

at the University of Zabol hasn't more effect on remembering and remembering scientific information at lesson syntax clause of the Arabic literature students at the University of Zabol. Ofcourse, with comparing two groups before and after training were observed that both types of training are effective ways because it leads to increase remembering and reminding levels.

### 6.2 The second hypothesis

The cooperative learning than individual learning has more effect on understanding of the learned matters at lesson syntax clause of the Arabic literature students at the University of Zabol.

#### A. Pre-training

Table 3: independent t test in the second hypothesis before training

The group	The number	The mean	t	The degree of freedom	The probability amount	The test error
participatory	25	0.06	- 0.23	48	0.819	0.05
Individual	25	0.09				

In the table (3) independent t test results before training between participation groups and individual groups in the " perception and understanding " score of the lesson syntax clause of the Arabic literature students at the University of Zabol have been brought. based on the results in the table, before didactic course was applied on the students of cooperative group and the average score of perception and understanding in the individual group and in the cooperative group was obtained respectively 0.09 and 0.06 and the amount of obtained t ( $t= - 0.23$ ) in degrees of

freedom 48 and confidence level 95%, is smaller from the value t of table ( $t=2.00$ ). So, there is no significant difference between the two individual and participation groups in the "perception and understanding "score "before didactic course in the lesson syntax clause of the Arabic literature students at the University of Zabol.

#### B. post -training

Table 4: independent t test in the second hypothesis after training

The group	The number	The mean	t	The degree of freedom	The probability amount	The test error
participatory	25	3.45	2.52	48	0.015	0.05
Individual	25	3.02				

In the table (4) independent t test results after training between participation groups and individual groups in the "perception and understanding" score of the lesson syntax clause of the Arabic literature students at the University of Zabol have been brought. Based on the results in the table, after didactic course was applied on the students of cooperative group and the average score of perception and understanding in the individual group and in the cooperative group was obtained respectively 3.45 and 3.02 and the amount of obtained t ( $t=2.52$ ) in degrees of freedom 48 and confidence level 95%, is larger from the t value of table ( $t=2.00$ ). So, there is significant difference between the two and individual and participation groups in the "perception and understanding" score "after didactic course. As a result, the research hypothesis is rejected. According to obtained the

average related to cooperative learning is more than individual learning, it can be said that the cooperative learning than individual learning has more effect on understanding of the learned matters at lesson syntax clause of the Arabic literature students at the University of Zabol.

### 6.3 The third hypothesis

The cooperative learning than individual learning has more effect on the amount of ability to analyze scientific information of the lesson syntax clause of the Arabic literature students at the University of Zabol.

#### A. Pre-training

Table 5: independent t test in the third hypothesis before training

The group	The number	The mean	t	The degree of freedom	The probability amount	The test error
participatory	25	0.8	- 0.74	48	0.463	0.05
Individual	25	0.9				

In the table (5) independent t test results before training between participation groups and individual groups in the "analysis" score of the lesson syntax clause of the Arabic literature students at the University of Zabol have been brought. Based on the results in the table, before didactic course was applied on the students of cooperative group and the average score of analysis in the individual group and in the cooperative group was obtained respectively 0.9 and 0.8 and the amount of obtained t

( $t= - 0.74$ ) in degrees of freedom 48 and confidence level 95%, is smaller from the value t of table ( $t=2.00$ ). So, there is no significant difference between the two individual and participation groups in the "analysis ability" score "before didactic course in the lesson syntax clause of the Arabic literature students at the University of Zabol.

#### B. post -training

Table 6: independent t test in the third hypothesis after training

The group	The number	The mean	t	The degree of freedom	The probability amount	The test error
participatory	25	4.43	6.92	48	0.000	0.05
Individual	25	3.2				

In the table (6) independent t test results after training between participation groups and individual groups in the "analysis ability" score of the lesson syntax clause of the Arabic literature students at the University of Zabol have been brought. Based on the results in the table, after didactic course was applied on the students of cooperative group and the average score of analysis ability in the individual group and in the cooperative group was obtained respectively 3.2 and 4.43 and the amount of obtained t ( $t=6.92$ ) in degrees of freedom 48 and confidence level 95%, is larger from the value t of table ( $t=2.00$ ). So, there is significant difference between the two and individual and participation groups in the "analysis ability" score "after didactic course. As a result, the research hypothesis is rejected. According to obtained

the average related to cooperative learning is more than individual learning, it can be said that the cooperative learning than individual learning has more effect on the amount of analysis ability of scientific information at lesson syntax clause of the Arabic literature students at the University of Zabol.

### 6.4 The fourth hypothesis

The cooperative learning than individual learning has more effect on the ability amount of scientific judgment of the lesson syntax clause of the Arabic literature students at the University of Zabol.

#### Pre-training

Table 7: independent t test in the fourth hypothesis before training

The group	The number	The mean	t	The degree of freedom	The probability amount	The test error
participatory	25	0.07	0.17	48	0.866	0.05
Individual	25	0.04				

In the table (7) independent t test results before training between participation groups and individual groups in the "scientific judgment" score of the lesson syntax clause of the Arabic literature students at the University of Zabol have been brought. Based on the results in the table, before didactic course was applied on the students of cooperative group and the average score of scientific judgment ability in the individual group and in the cooperative group was obtained respectively 0.04 and 0.07

and the amount of obtained t ( $t= 0.17$ ) in degrees of freedom 48 and confidence level 95%, is smaller from the value t of table ( $t=2.00$ ). So, there is no significant difference between the two individual and participation groups in the "scientific judgment ability" score "before didactic course in the lesson syntax clause of the Arabic literature students at the University of Zabol.

#### B. post -training

Table 8: independent t test in the fourth hypothesis after training

The group	The number	The mean	t	The degree of freedom	The probability amount	The test error
participatory	25	2.81	1.62	48	0.112	0.05
Individual	25	2.44				

In the table (8) independent t test results after training between participation groups and individual groups in the " scientific judgment ability "score of the lesson syntax clause of the Arabic literature students at the University of Zabol have been brought. Based on the results in the table, after didactic course was applied on the students of cooperative group and the average score of scientific judgment in the individual group and in the cooperative group was obtained respectively 2.44 and 2.81 and the amount of obtained t (t=1.62) in degrees of freedom 48 and confidence level 95%, is smaller from the t value of table (t=2.00). So, there is no significant difference between the two and individual and participation groups in the "scientific judgment score "after didactic course. As a result, the research

hypothesis is rejected and cooperative learning than individual learning at lesson syntax clause of the Arabic literature students at the University of Zabol hasn't more effect on amount of scientific judgment ability at lesson syntax clause of the Arabic literature students at the University of Zabol.

### 6.5 The fifth hypothesis

The cooperative learning than individual learning has more effect on learning amount of the lesson syntax clause of the Arabic literature students at the University of Zabol.

#### A. Pre-training

Table 9: independent t test in the fifth hypothesis before training

The group	The number	The mean	t	The degree of freedom	The probability amount	The test error
participatory	25	0.26	0.569	48	0.572	0.05
Individual	25	0.21				

In the table (9) independent t test results before participating between participation groups and individual groups in the " learning amount "of the lesson syntax clause of the Arabic literature students at the University of Zabol have been brought. Based on the results in the table, before didactic course was applied on the students of cooperative group and the average score of the learning amount in the individual group and in the cooperative group was obtained respectively 0.21 and 0.26 and

the amount of obtained t (t= 0.569) in degrees of freedom 48 and confidence level 95%, is smaller from the t value of table (t=2.00). So, there is no significant difference between the two individual and participation groups in the "learning amount "before didactic course in the lesson syntax clause of the Arabic literature students at the University of Zabol.

#### B. post -training

Table 10: independent t test in the fifth hypothesis after training

The group	The number	The mean	t	The degree of freedom	The probability amount	The test error
participatory	25	14.45	2.46	48	0.018	0.05
Individual	25	12.35				

In the table (10) independent t test results after participating between participation groups and individual groups in the " learning amount "of the lesson syntax clause of the Arabic literature students at the University of Zabol have been brought. Based on the results in the table, after didactic course was applied on the students of cooperative group and the average score of the learning amount in the individual group and in the cooperative group was obtained respectively 12.35 and 14.45 and the amount of obtained t (t=2.46) in degrees of freedom 48 and confidence level 95%, is larger from the t value of table (t=2.00). So, there is significant difference between the two individual and participation groups in the "learning amount "after didactic course. As a result, the research hypothesis is accepted and according to obtained average related to cooperative learning is more than individual learning. It can be said that the cooperative learning than individual learning has more effect on the learning amount of leaned matters at lesson syntax clause of the Arabic literature students at the University of Zabol.

## 7. Discussion

In this section, the results of this study are presented and are analyzed, the results of this research are:

1. The first hypothesis: according to the first hypothesis, there is no significant difference between the remembering and recalling amount of scientific information in the participation learning method than individual learning method in the lesson syntax clause of the Arabic literature students at the University of Zabol. This result hasn't inconsistent with the findings of the Taliby research findings of Talibly in 2005 and Mobini in 1998. The results of researches of these researchers have shown that the subjects of participant group compared to two other groups showed a significant increase in recalling in the lesson syntax clause of the Arabic literature students at the University of Zabol. This result with studies results of Slavin (1990) and

Stanley and Camp Bell research (1966) approve the findings of this hypothesis. These researchers investigated application effect of cooperative learning strategies versus the traditional method of teaching in the Geological Sciences lesson of high school students with emphasis on knowledge, understanding and application of cognitive domain levels in conducted study on 770 ninth graders. the results showed that the cooperative learning in the low levels of cognitive domain such as knowledge and understanding, and perception, hasn't superiority than traditional method but in achieving high levels of this field, it is more effective than traditional methods.

2. According to the second hypothesis, the cooperative learning than individual learning has more effect on the perception and understanding amount of the learned matters at lesson syntax clause of the Arabic literature students at the University of Zabol. The result of this hypothesis has consistent with the researches results of these researchers, such as Robert Slavin 1990, Astosen 1995, Hosseini 2010, and Taliby 2005 and hasn't consistent with the study results of Stanley and Camp Bell in 1966. As it is noted above, these researchers denied cooperative learning excellence in knowledge and understanding and perception levels.

3. According to the third hypothesis, the cooperative learning than individual learning has more effect on the analysis ability of scientific information of the lesson syntax clause of the Arabic literature students at the University of Zabol. the findings of this hypothesis has consistent with the researches results of Johnson 1981, Seirafi 1996, the researches results of these researchers imply on that when students in all three groups (high, medium, low) work together, reach a higher level of reasoning about the course objectives and learning strategies than their counterpart on teaching competitive methods.

4. According to the fourth hypothesis, there is a significant difference between the cooperative learning methods than

individual learning at the judgment levels of the lesson syntax clause of the Arabic literature students at the University of Zabol. This result has consistent with researches results of Mobini 1999, Pakize, 1998, Seirafi 1997 and hasn't consistent with researches results of Stanley and Camp Paul 1966, the researchers in a study that they conducted on 770 ninth grade students, they found that collaborative learning in low levels of cognitive domain is not superior to individual method but in achieving high levels of this area such judgment is more effective than individual method. Researcher in his researches didn't face with studies that directly examined the effect of cooperative learning on the judgment level. The finding of this study couldn't find significant difference between the cooperative- individual learning amount at the judgment and knowledge levels of the lesson syntax clause of the Arabic literature students at the University of Zabol. Probably because the level of knowledge is related to information recall and recognition and in entire memory, participation cannot influence more on raising this kind of information and improving memory. It should be said about judgment levels that given that, this level constitutes the highest level of cognitive domain and the time is required to reach this level and it isn't possible in limited time and on the other hand, because Mike intended test is considered as limitation and it was obtained in Nyjeh, it wasn't been effect less.

5. According to the first hypothesis, the cooperative learning method compared with individual learning method leads to students' learning more. This result has consistent with researches results of Slavin, 1990, 1991, 1992, 1995 Johnson et al, 1982, 1989, 1992, Byrod, 1994, Akbyvkola 1985, 1990 Kennedy in 1982, Camp Bell and Stanley, 1966, Lazaro Vetyz and Hertzlazar Do tyz 1995, Ston 1995, Balaie et al, ..., Hosseini 2010, Khadive 2009, Keramaty 2006, Seirafi, 1996, Aoubi 1999, Canaani 2000, Mini 1998 Safar Alizade and adyb, 2015, Mohammadi et al. 2015, Mesrabadi and Fayzi, 2015, Ahmadi et al. 2015, Ashouri et al. 2015.

According to the results of research based on the effectiveness of cooperative learning on some educational, emotional, behavioral aspects, perhaps it can be said that the collaborative learning excellence password are the following factors: forming groups, encouraging students to cooperate, social skills training, the use of group goals, individual responsibility and collective rewards. With regard to the proposed issues about the effects of different methods of cooperative learning on different aspects of behavior, emotions, attitudes and students academic achievement and considering this fact that many students try greatly to understand and learn their lessons, but they don't benefit efficiently from their activities, failure learning and competitive system of schools, leads to their frustration and anxiety and in the result, academic downfall matters at lesson syntax clause of the students, therefore, we must seek new methods in education. the cooperative learning method is one of the ways in which, first teacher gives comments on the goals, skills, patterns and new concepts and after it, the students work together in learning groups of 4 to 5 people on determined assignments for them. So, the members of the group evaluated each other to ensure the success of each group member in the individual evaluation. Then amount of learning the skills and training matters and issues and assignments each student individually is tested by the teacher. After summing up scores of members of the group, the group that received higher ratings will be encouraged. In this way, the opportunity is established so that students communicated with each other, and are encouraged to work together to achieve a common goal. As various studies have shown, participation led to accept more attention and trust between members of the group means that the group members in the cooperative position than competitive position give more value to each other.

## 8. Conclusion

1. According to surveys taken on the first hypothesis recommended so that they classified students in higher education

into regular bands, and encouraged them to cooperate, necessary training in social skills, and the use of group goals, individual responsibility should be presented to students and useful rewards are considered to participate more students in group activities.

2. according to surveys taken on the second hypothesis, it is suggested that while teaching philosophy and cooperative learning theory and practices applying them to the teachers, training spaces is created so that the students can learn matters deeply and exactly in small groups. The intelligence of the students is paid attention seriously. And applied different tests of intelligence among students and students are classified according to the level of intelligence and learning and they fostered students with principal and logical actions so that they increase the amount of scientific information reminding and remembering in them.

3. According to surveys taken on the third hypothesis, it is proposed that cooperative learning method is used at all levels of education, even in the case of all lessons. as well as college textbook authors is suggested that according to determined goals and monitoring their cognitive levels and the impact of participatory or individual methods on each of these levels proper methods of learning in lessons guide books were recommending.

4. According to surveys taken on the fourth hypothesis, it is proposed that school officials mean teachers and managers and training teachers tried to promote the culture of participation among students and tried to provide space and context that students are more motivated to lead their group activities because encouraging students to solve problems with the help of classmates leads to increase the power of analysis in students.

5. According to surveys taken on the fifth hypothesis, it is proposed that the teachers use new practices and ways to increase the level of analysis and recognition and judgment power in the students. because individual and team or participation activities alone does not recognition and judgment ability on students, so, teachers and school authorities should try to raise analysis power and their cognitive level than the issues surrounding and educational and scientific issues.

Email:<sup>a</sup>fatem.vojdaniteh@gmail.com,<sup>b</sup>mohamad\_taghi\_1986@gmail.com

**Abstract.** The study population was consisted of all students and graduates and to determine the sample size, 100 students were selected by using Morgan table. The results were analyzed by using descriptive statistics and inferential statistical methods: one-sample t test. The results from questionnaires indicated that based on the ten Akker elements assessment model (logic and reason, purpose, content, learning activities, teaching methods, materials and resources, grouping, location, time, evaluation) respectively the highest level of utility was related to courses of (Methodology 1, statistics 1, philosophy of education, computer applications, computer applications, statistical methods 1, Statistical Methods 1 and 2, Statistical Methods 2, Statistical Methods 1, evaluation methods).

**Key words:** higher education, curriculum, assessment models, quality

### 1. Introduction

In the twenty-first century universities and higher education institutions continue to be one of the main forms of investment in human resources in different societies have a special place, and the importance. Today, along with the rapid development of education and training has become increasingly important topic of research in the field of education, the need for educational evaluation and revision of curricula is important (khandaghi et al. 2012) Educational evaluation of educational systems usually arises in relation to the quality of the assessments and that is to measure the quality of a system. But the question that arises in this context is; what is the role of assessment in improving the quality of educational systems?

The concept of improvement of the quality is improvement in various fields, including design methods and operations, reduce waste, employee satisfaction, increased profitability and consumer satisfaction, etc. (Fathi Vajargah et al. 2014). Stakeholders and decision makers in relation to everything in their community including higher education and specific inputs such as curricula should constantly examine and evaluate them, insufficient attention to the ongoing renewal of the curriculum is one of the main reasons for failure of quality; therefore, to create a platform from the stakeholders to assess and investigate the programs, and turning them into more appropriate curricula and relevant to the needs are of the major tasks that can be used to help sustain the position of universities in the world as the original base of knowledge, research and development (Burk et al. 2014). One of the most important and most basic activities in the planning cycle is finding the value of previous activities in the form of evaluation, in terms of education can also consider assessment the most basic step in conjunction with the evaluation of educational activities in order to improve the quality of education, performing educational evaluation process at different intervals, in order to measure the effectiveness and program quality is of utmost importance (Bazargan, 1997).

Curriculum evaluation process is used in judgment of decisions about appropriate curriculum (Bartlett and Burton, 2012). In this study evaluation and assessment means the steps that teachers do during the semester to assess students' ability. Some scholars believe that the target of evaluation is to recognize "results of the curriculum". According to this department of Educational Evaluation should notify the appropriate authorities of the affected curriculum. Through comparative study program or comparison of a program with other programs, it can be concluded that how is a program (Kelly, 2009). Akker while the identification of these elements raises questions to clear the status of these elements in the quality of the curriculum review process (Table 1).

Table 1: ten elements of the curriculum from the perspective of "Akker"

Directing Questions	Elements of the curriculum
Why should learners learn?	Rationale
What are learners' goals to achieve?	Goals and objectives
What do Learners learn?	Content
How do learners learn?	Learning activities
How teachers facilitate teaching and learning process?	The role of teacher
What does help learners in this process?	Materials and Resources
Who would they engage to learn?	Grouping
When and how long do they need to learn?	Time
Where do they learn?	Location
How much progress has they been made in learning?	Assessment and evaluation

Curriculums are of the main elements or sub-systems of higher education and have undeniably crucial role in achieving the goals and missions of higher education in terms of quantity and quality (Wang, 1994). A feature of the curriculum in universities and higher education institutions is that first of all judgments and decisions in relation to the existing curriculum, is to identify systematically impact of the flow of technological, economic, political, social and cultural on higher education and its elements, and be aware of the type and extent of impacts, issues, and challenges arising from them in each respective components. In the past decade, the concept of quality in higher education has been emphasized with more attention and its assessment has been proposed in the university systems (Asadpour, 2008). In other words educational evaluation in the educational system usually arises in relation to quality and in fact, the assessment is to measure the quality of a system. Many scientists such as Robertson believe that, paying too much attention to concept of

qualification in education has led to a crisis called quality and educational systems should strive to improve the quality of their inputs, processes and outputs. One of the ways to improve the quality of educational is assessment. Educational and research quality are of concerns that the university always strive to achieve it. Considerable efforts has been carried out on continuous quality improvement in higher education and achieve academic goals in the last decade in many countries (Asadpour, 2008). In today's world, the necessity of quality of education and its efficiency is very important. Nowadays, continuity and dynamics commensurate with social changes in quality of education has become an important issue for organizations involved in education and curriculum specialists so that they can improve their performance and curriculum, and they should consider the quality of education in the process (New Ton, 2007).

For internal quality assessment of curriculums there are significant challenges which among them determining the elements of the curriculum as well as creating balance and cohesion among them is of the most importance. For determinations of curriculum elements different views has been offered. However, perhaps the most famous withdraw of the proposed elements of the curriculum is, Francis Klein pattern classification study of the pattern of school education (SOS) which has done in 9 elements of goals, instructional materials, content, learning activities, learning strategies, grouping, time, place and evaluation of proposed curriculum. According to the proposed model, "Akker" in terms of the elements of the curriculum is focused on 10 elements other than the element of "Rationale and reason" of curriculum, other elements are in common with Klein model (Pazargadi, 2004)

Curriculum evaluation is presented in different patterns among the models, Akker model elements are more inclusive and considered all of the factors (Cai, 2010). In this study, we investigated this model and described the elements of it. This study tries to answer this fundamental question "The inner-quality of the curriculum of Educational research field in master's degree in Islamic Azad University Branch of Rudehen by considering how ten elements of Akker are. In order to achieve the research objectives in this regard, the question is raised:

How is the internal quality of academic curriculum of educational research field of Islamic Azad University Branch of Rudehen by considering ten elements of Akker?

## 2. A review of the literature

Arrefi (2005) in a research titled ((Evaluation of field of Educational Sciences curriculum with educational management orientation and providing ways to improve it)) considered the current situation and optimal curriculum on this field. Results represents that the status quo of curricula in all three undergraduate, master's, and Ph.D. do not meet the conditions and the needs but the revision of the undergraduate curriculum is more demanding.

Hatami et al. (2009) in his study entitled "the study of effect of internal quality assessment of the quality of higher education from the perspective of faculty members of Shahid Beheshti University" achieved these results, internal evaluation affects all the variables also by the independent t test turned out the term of membership in the group and gender doesn't affect variables.

Klein (1990) in his research entitled "curriculum in higher education according to individual needs" with a case study has provided a model for Curriculum Development in Higher Education in certain circumstances, due to the immediate needs. In this review he has concluded that the lesson planner as researcher have to pay up and has particular skills in this domains. Also the relationship between curriculum planners and researchers in an organization and time management are requirements of a successful plan.

Andre (1998) in his research entitled "Curriculum for the year two thousand: a case study of vocational schools curriculum" Several factors such as organizational culture, values, relationships, and policies. . . Studied by using ethnographic methods and ultimately concluded that the important factors in planning are, active participation of faculty and all relevant groups, including students, managers and employers, as well as having management support and systematic approach in planning. A research by Goreck Baybars and kocakulah has been conducted (2009) entitled "The assessment of basic physics curriculum not on teachers opinions" that according to the results of this research teacher thought the activities included in the curriculum are suitable, but they cannot be applicable in a classroom setting. In addition, the findings of this study indicated that the activities were not compatible with the environment and environmental supplies, don't support activities

and, when they were necessary, weren't sufficient to teach a unit or teachers doesn't share common comments on them. So the role of teachers in achieving success in the implementation of the curriculum should not be ignored. Kirkgoz (2009) in a study entitled "development challenges and maintain innovation in the curriculum in higher education in Turkey" is concluded that static and dynamic curriculum reform process can be effective if they are founded on the needs of teachers and students as well as multi-dimensional analysis of the needs of the community.

## 3. Objectives and Methodology

This study is a cross-sectional survey that was done in 2015. In this study a researcher- made questionnaire was used to examine the quality of the curriculum. The objectives of this study are as follows:

- investigation of the quality of logic and reason elements on curriculum of Postgraduate Course of Educational Research field Faculty of Education of Islamic Azad University of Rudehen
- investigation of the quality of goal and objective element on curriculum of Postgraduate Course of Educational Research field Faculty of Education of Islamic Azad University of Rudehen
- investigation of the quality of content element on curriculum of Postgraduate Course of Educational Research field Faculty of Education of Islamic Azad University of Rudehen
- investigation of the quality of learning activities elements on curriculum of Postgraduate Course of Educational Research field Faculty of Education of Islamic Azad University of Rudehen
- investigation of the quality of teaching methods element on curriculum of Postgraduate Course of Educational Research field Faculty of Education of Islamic Azad University of Rudehen
- investigation of the quality of material and facilities element on curriculum of Postgraduate Course of Educational Research field Faculty of Education of Islamic Azad University of Rudehen
- investigation of the quality of grouping element on curriculum of Postgraduate Course of Educational Research field Faculty of Education of Islamic Azad University of Rudehen
- investigation of the quality of location element on curriculum of Postgraduate Course of Educational Research field Faculty of Education of Islamic Azad University of Rudehen
- investigation of the quality of time element on curriculum of Postgraduate Course of Educational Research field Faculty of Education of Islamic Azad University of Rudehen
- investigation of the quality of evaluation element on curriculum of Postgraduate Course of Educational Research field Faculty of Education of Islamic Azad University of Rudehen

The questionnaire consisted of two parts of demographic characteristics and questions of the questionnaire. For measuring the validity of the content validity and reliability and the final assessment, the Cronbach's alpha was used, the using Cronbach's alpha reliability of the questionnaires was 85%. The study population consisted of all students and graduates of Islamic Azad University Branch of Rudehen that in this study to characterize the sample of 100 students was selected by using Morgan table. To analyze the data we used software SPSS, also by descriptive statistics (mean, tables and frequency) and inferential statistics (one-sample t test) of research data were analyzed.

### 3.1 Validity and reliability

To determine the validity, several copies of the questionnaire were put out among teachers of curriculum and based on their suggestions, it was corrected. To determine reliability, before the final run of questionnaire, "pilot implementation" of questionnaire was conducted. In the pilot implementation the questionnaire was filled out by 35 subjects. In this study, to achieve the reliability, Cronbach's alpha coefficient has been used which the Cronbach's alpha coefficient was calculated by using the software spss as 85%. Since the alpha is in the interval of (1-0) the obtained value in terms of reliability is at a high level (Moen, 1990).

**4. Research Findings**

Statistical methods used to analyze the information in question were developed based on the intended goals, including descriptive and inferential statistics. In descriptive statistics the frequency, percentage and density percentage were used to summarize information and the mean and standard deviation in statistics were used to summarize questionnaire data that was used to test the research questions, which was included one-sample T test, chi-square test and Friedman test.

**4.1 Quality of logic and reason elements**

Table 2 indicates the t test results on the Rationale element in each of the courses. As can be seen, the value of t is calculated for all courses (except the philosophy of education and educational psychology) t is larger than a critical value. Therefore the situation of logic and reason element in the curriculum of graduate studies of Educational research field (except for the two mentioned course), in the rest of the courses is higher than average (3). And we can conclude that from the perspective of graduate students of educational research of Islamic Azad University Branch of Rudehen, the quality of logic and reason element of all courses (except philosophy of education and educational psychology) has been assessed somewhat properly with respect to the ten elements of the curriculum of Akker.

Table 2: one- sample t-test to examine the internal quality of the curriculum in terms of Rationale of logic and reason

95% confidence interval for the difference		Differences between the means	The significance level	Degrees of freedom	the amount of t	Elements	Element
Upper line	Lower line						
1.2400	.8600	1.05000	.000	99	10.967	Research Methodology 1	Rationale and reason
1.0222	.6578	.84000	.000	99	9.150	Research Methodology 2

.7790	.4610	.62000	.000	99	7.738	Teaching methods	
.6521	.2479	.45000	.000	99	4.417	Computer Applications	

**4.2 the quality of objective element**

Table 3 indicates the t-test results in the context of the target element in each of the courses. As it can be seen, the value of t calculated for all courses is greater than the critical value. The status of the target element in the curriculum of graduate studies

is higher than average (3). Therefore it can be concluded that from the perspective of Education graduate students' of educational research of Islamic Azad University Branch of Rudehen, the quality of target element of all courses according to the ten elements of curriculum of Akker has been assessed somewhat appropriately.

Table 3: one sample t-tests to examine the quality of the curriculum in terms of target

95% confidence interval for the difference		Differences between the means	The significance level	Degrees of freedom	the amount of t	Elements	Element
upper line	Lower line						
.5828	.2172	.40000	.000	99	4.342	Research Methodology 1	The objective element
.4154	.0846	.25000	.003	99	3.000	Research Methodology 2	
1.0954	.7446	.92000	.000	99	10.408	Statistics 1	
1.0542	.7258	.89000	.000	99	10.755	Statistics 2	
.7163	.3037	.51000	.000	99	4.906	Philosophy of Education	
.7640	.3560	.56000	.000	99	5.447	Educational Psychology	
.9482	.5518	.75000	.000	99	7.509	Evaluation methods	
.9094	.5306	.72000	.000	99	7.545	Teaching methods	
.7283	.3317	.53000	.000	99	5.302	Computer Applications	

**4.3 Quality of content element**

Table 4 indicates t test results in the field of content element in each of the curriculum courses. As can be seen, the value of t calculated for all courses is greater than the critical t value. Therefore the state of content element at graduate students'

educational research curriculum is higher than average (3). Thus, we can conclude that from the perspective of graduate students of educational research of Islamic Azad University Branch of Rudehen, quality of element content of all courses according to the ten elements of the Akker curriculum is assessed somewhat appropriately.

Table 4: one sample t-tests to examine the quality of the curriculum in terms of content

95% confidence interval for the difference		Differences between the means	The significance level	Degrees of freedom	the amount of t	Elements	Element
upper line	Lower line						
0.9745	0.5855	0.78000	0.000	99	7.956	Research Methodology 1	Content element
0.9043	0.4957	0.70000	0.000	99	6.797	Research Methodology 2

#### 4.4 Quality of learning activities Element

Table 5 indicates t test results in the context of learning activities in each of the courses. As can be seen, the value of t calculated for all courses (except evaluation methods and teaching methods) is larger than a critical t value. Therefore the status of learning activities element of across the curriculum for

postgraduate educational research student's curriculum (except in two mentioned lessons) is higher than average (3). Thus, we can conclude that from the perspective of educational research of graduate students of Islamic Azad University Branch of Rudehen, quality of learning activities in all courses (except evaluation and teaching methods) with respect to the ten elements of Akker curriculum is assessed somewhat appropriate.

Table 5 one-sample t-tests to examine the inner-quality of the curriculum in terms of learning activities

95% confidence interval for the difference		Differences between the means	The significance level	Degrees of freedom	the amount of t	Element	Element
upper line	Lower line						
0.9970	0.6430	0.82000	0.000	99	9.193	Research Methodology 1	Learning activities element

1.4270	1.0730	1.25000	0.000	99	14.015	Computer Applications	

#### 4.5 Quality of teaching methods element

Table 6 indicates t test results in the field of teaching methods element in each of the courses. As it can be seen, the value of t calculated for all courses (except evaluation methods) is larger than a critical t value. Therefore the state of element of teaching methods in educational research graduate students is (except for

the above mentioned course) higher than average (3). Thus, we can conclude that from the perspective of graduate students of educational research Branch of Islamic Azad University of Rudehen, Faculty of Education, quality of teaching methods element in courses (except evaluation methods) with respect to the ten elements of Akker curriculum is assessed somewhat appropriately.

Table 6 one-sample t-tests to examine the inner-quality of the curriculum in terms of teaching methods

95% confidence interval for the difference		Differences between the means	The significance level	Degrees of freedom	the amount of t	Elements	Element
upper line	Lower line						
0.6626	0.2174	0.44000	0.000	99	3.921	Research Methodology 1	Teaching methods
0.6064	0.1736	0.39000	0.001	99	3.575	Research Methodology 2	
1.1127	0.7273	0.92000	0.000	99	9.474	Statistics 1

1.1521	0.7479	0.95000	0.000	99	9.325	Computer Applications	

#### 4.6 Quality of material and resources element

Table 7 indicates t test results on material and resources element in each of the courses. As it can be seen, the value of t calculated for all courses is greater than the critical t value. Therefore the status of materials and resources element in courses of graduate

students of educational research is above the average (3). Thus, we can conclude that from the perspective of graduate students of educational research Branch of Islamic Azad University of Rodehen, Faculty of Education, quality of materials and resources elements according to ten elements of Akker curriculum is assessed somewhat appropriately.

Table 7: one sample t-tests to examine the inner-quality of the curriculum in terms of materials and resources

95% confidence interval for the difference		Differences between the means	The significance level	Degrees of freedom	the amount of t	Elements	Element
upper line	Lower line						
1.0201	0.6799	0.85000	0.000	99	9.916	Research Methodology 1	Materials and resources
1.0017	0.6583	0.83000	0.000	99	9.593	Research Methodology 2	
1.1892	0.8508	1.02000	0.000	99	11.964	Statistics 1

1.1910	0.7690	0.98000	0.000	99	9.215	Computer Applications	

**4.7 Quality of grouping element**

Table 8 indicates t test results in the context of grouping element in each of the courses. As it can be seen, the value of t calculated for all courses is greater than the critical t value. Therefore the status of the grouping element in the curriculum of educational

research graduate students is higher than average (3). Thus, we can conclude that from the perspective of graduate students of educational research Branch of Islamic Azad University of Rudehen, Faculty of Education, quality of grouping elements in all courses according to the ten elements of Akker curriculum is assessed somewhat appropriately.

Table 8: one-sample t-tests to examine the inner-quality of the curriculum in terms of grouping

95% confidence interval for the difference		Differences between the means	The significance level	Degrees of freedom	the amount of t	Elements	Element
upper line	Lower line						
0.7320	0.3080	0.52000	0.000	99	4.868	Research Methodology 1	grouping
0.7020	0.2780	0.49000	0.000	99	4.587	Research Methodology 2	
0.9284	0.5516	0.74000	0.000	99	7.794	Statistics 1	
0.9367	0.5433	0.74000	0.000	99	7.467	Statistics 2

**4.8 Quality of location element**

Table 9 indicates t test results in each of the courses in the location element. As it can be seen, the value of t calculated for all courses (except evaluation and teaching methods) is larger than a critical t value. Therefore the Location element in the curriculum of the graduate students of educational research

(except for the two mentioned courses) is higher than average (3). Thus, we can conclude that from the perspective of graduate students of educational research Branch of Islamic Azad University of Rudehen, Faculty of Education, quality of location element in all courses (except evaluation and teaching methods) with respect to the ten elements of Akker curriculum is assessed somewhat appropriately.

Table 9: one-sample t-tests to examine the inner-quality of the curriculum in terms of location

95% confidence interval for the difference		Differences between the means	The significance level	Degrees of freedom	the amount of t	Elements	Element

**4.9 Quality of time element**

Table 10 indicates t test results in the context of the time element in each of the courses. As it can be seen, the value of t calculated for all courses (except for Research Methods 1 and 2) is larger than the critical t value. The time element status in the curriculum for postgraduate educational research students

(except in two mentioned lessons) is higher than average (3). Thus, we can conclude that from the perspective of graduate students of educational research Branch of Islamic Azad University of Rudehen, Faculty of Education, Quality of time element for all courses (except for Research Methods 1 and 2) with respect to the ten elements of Akker curriculum is assessed somewhat appropriately.

Table 10: one-sample t test to examine the inner-quality of the curriculum in terms of time

95% confidence interval for the difference		Differences between the means	The significance level	Degrees of freedom	the amount of t	Elements	Element

#### 4.10 Quality of evaluation element

Table 11 indicates t-test results of the evaluation element in each of the courses. As it can be seen, the value of t calculated for all courses is greater than the critical t value. Thus the evaluation element in the curriculum of the graduate students of educational

research is higher than average (3). Therefore, we can conclude that from the perspective of graduate students of educational research Branch of Islamic Azad University of Rudehen, Faculty of Education, quality of evaluation element of courses according to all ten elements of Akker curriculum is assessed somewhat appropriately.

Table 11: one-sample t-test to examine the inner- quality of the curriculum in terms of evaluation.

#### 5. Discussion and Conclusion

Evaluation is a Systematic activity in which the criteria is determined for the valuation, to provide information about the status of the subject or phenomenon and by comparing these two (the status quo with pre-designed criteria), is obtained information from the value and usefulness of the subject or phenomenon. In order to find the reason and necessity of evaluation in Higher Education it is said that it causes faculty and students within each institution / program and outside the scientific community be aware of the quality of scientific and educational activities and academic norms and friends of the institution / program with self-evaluation and external evaluation by volunteering with scientific and technical peers, enhance their constantly improvement chances and make more rational use of the feedback on improving their assessment and planning for future actions and to provide a competitive situation out of existing resources. This section includes a summary of research, discussion and conclusions based on statistical analysis of data of research. The present study evaluated the quality of the curriculum of graduate studies at the Faculty of Educational Sciences, Islamic Azad University Branch of Rudehen that in this study, ten questions has been proposed about the evaluation of inner-quality of the curriculum of graduate courses of educational research field.

Research results indicate that students who graduate from the perspective of Educational Research Branch of Islamic Azad University of Rudehen, Faculty of Education, the quality of logic and reason elements of all courses (except philosophy of education and educational psychology) according to the ten elements of Akker curriculum is assessed somehow appropriately. Also from the perspective of the students, the quality of the target element, the element of evaluation, content element and material element, Element of grouping and resources of all courses according to the ten elements of Akker curriculum is assessed somewhat appropriately.

Moreover, the results represented that the quality of learning activities element in all courses (except evaluation and teaching methods), the quality of teaching methods elements of all courses (with the exception of the evaluation methods), quality of the location element in all courses (except evaluation and teaching methods), quality of the time element in all courses (except for Research Methods 1 and 2) with respect to the ten elements of Akker curriculum is assessed somehow appropriately.

The empirical data of present study is conducted on the impact of internal quality assessment scale of the students' curriculum, so if the research was performed on the faculty members, the

results would be more reliable. There is no doubt that many variables impact on the quality of the curriculum of graduate courses of educational research but the difficulty in quantifying some of these variables caused in this study to examine the issue only through ten Akker elements.

According to the statistical results of the study, it is suggested that briefings about the need to change the curriculum, benefits and positive outcomes within the curriculum of colleges and universities to be held at different levels of decision-making. It is also recommended that to give more emphasis on group working in the classroom and teaching methods, student participation, participating in the operations and training environments and practical lessons according to the needs of the organization and the community.

## EFFECT OF SATIATE MESSAGES ON TREATMENT AIMS IN SOCIAL NETWORK MARKETING CONSIDERING THEORY AND USERS PROFICIENCY IN ROSHTAK ELECTRONIC PRODUCT PAGE IN FACEBOOK (CASE STUDY: ELECTRONIC PRODUCTS OF COMMUNICATION ZONE)

<sup>a\*</sup>HOMA DOROUDI, <sup>b</sup>MEHDI GIVEIE

<sup>a</sup> Assistant professor, Marketing Management Course, Faculty of Social and Humanities, Islamic Azad University, Zanjan Unit

<sup>b</sup> MSc student, Marketing Management Course, Faculty of Social and Humanities, Islamic Azad University, Zanjan Unit

Email: <sup>a</sup>homa.dor.oud@yahoo.com, <sup>b</sup>mehdi.giv.19m@gmail.com

**Abstract.** This study is carried out with point of checking of satiate message effect in social network marketing considering perception and user's proficiency in roshtak electronic product page in Facebook especially on electronic products of communication zone. Using data standard questionnaire of statistical society is collected. In descriptive statistical analysis, SPSS software is used and for assumption testing, structural formulas based on LISREL software is used that outcomes shows logic quality variables, send popularity, attractiveness on beneficial variables and has positive and meaningful prefer. Last but not the least, it is proposed that by sending subjects in sites learning words and accompanied by meaning should be used in order to plunge visitor's taught in advertisement.

**Keywords:** Marketing, social networks, satiate messages, logic quality, sending popularity, sending attractiveness

### 1. Introduction

Social relationships is considered as society main core and is caused activists to simplify their action in society with extension of their relations and reach their aims through this. All members of society are in an attempt to make a relation with others somehow to accelerate their exchanges in different fields (Bianchi and Andrews, 2015).

In addition to society in huge level that is composed of extend exchanges in it, smaller society as "network society" is presented that is a network of person informal relationships (Constantin ides, 2014).

In media era, talking about newfangled does not mean talking about organizations, rather the word is about an organization which is based on regular control of social relationships in time-space intervals. Modern era organizations are unheard and original from many aspects and are not any way continue of the cultures and lifestyles of before modern. Form this point of view, kind of disintegration and historical separation confronts (Rizan and Esfandiary Moghadam, 2015). One of these obvious differences of newfangled universe rather than previous eras of social life is its irregular dynamism and mobility (Abdolvand and Alipour, 2011).

Virtual social networks emanate second life. This situation know under topic like online life, virtual life and electronic life, too. So, virtual social networks can confront people taste, people lifestyle, organizational inclinations and organizational paradigms with special changes (Cheung and Lee, 2010). Today social media are emanate of people in online space, media which people are its axis (user axis) and most of visitor's amount and allocated production content to itself. So it seems that these media become very beneficial and attractive for works and trades. Because these works and trades always was follow gaining attention and addressee's interest (users or customers). This is when marketing knowledge is introduced. By increasing in user numbers and their attending time in social media, these media can turn into stronger tools for marketing that companies make profits for selling their products and in other word for attracting customer and other treating aims in this field. Satiation messages can be caused view change of users and producing reciprocal exchanges between users and organization (Camarero and San José, 2011). One of the notable methods in customer attraction area and guidance of treating aims in media marketing area can messages which transfer from these media. Nowadays social network marketing that use networks and social media

toward sharing content, publishing data, making connections are of the most effective advertisement methods (Dahnil et al. 2014).

With help of communication due to social network marketing, messages can be received and sent simply and fast. Social media with effect of synergy in marketing theories has become to one powerful and efficient tool in this area. So marketing managements of organizations can persuade social network users to publish satiation and advertising messages. So publishing process and sharing data is a vital factor in social network marketing success in treating aims in this area (Chang et al. 2015).

Satiation process is an active effort that cause changes in person's beliefs and proceedings by logical and reasonable speeches.

In satiation process, argument quality and strong arguments will cause receiving appropriate cognitional responses rather than posts. If advertising posts consist of incorrect content, inactive links, irrelevant subjects etc. Addressees may find negative vision to the organization and thereafter organization even lost his customer. Addressees should be aware of accurate subject of post messages to be able to analyze argument quality and find out the profits of it (De Vries et al. 2012). Argument quality trace back to persuasive power of discussion in post content. Send popularity trace back to number of likes and comments and sharing times and responding answers that is in social network page. Send attraction points that how far receiver's post treat as admirable and lovely writings (Karnik et al. 2013).

Satiation messages are handwritings or speeches that a person express for reaching his aim to addressee or addressees until they act or think in a distinct way. Satiation messages itself consist of components which can be successful by combining and aggregating them in addressee's satiation process. These components consist of argument quality, post popularity and post attraction. Argument quality as mental penetration in addressee's mind is of importance. Every attempt to use stronger arguments to send satiation messages, it can have more penetration on addressees. Also more attractive post absorb more addressees and is caused more popularity in posts (McGrath and O'Connor, 2015).

Nowadays, one of the commodities which organizations pursuing to find customer for this is electronic product area, communication area specially phone, tablet, laptop and modern application software that have its specific customers in population different groups. These products according to variables like age, sex and inclinations of customers can have different requirements. In fact, the requirement amount and selling of these products can be known as a function of age, sex, work etc. (Wellman et al. 2001).

In today universe of adolescents, youth and even middle aged persons succeed identification and use of newest and the most efficient models of phone, tablet, laptop and their application software. Most of the people according to their vocation or education are required to have sufficient and correct information in field of newest daily changes of digital universe and electronic vehicles and related software. Also, people who have attempt to purchasing these products are interested in newest brands of producers of these products as Samsung, Sony, Apple, etc. And are interested in to acquaint from newest facilities which are in products of these brands have been presented (Hudson et al. 2016).

If shopper of these products have complete and update information, can choose the best choice between existing and identified brands in each product and achieve the most

appropriate than cost. So, customers will welcome to news sources which can prepare them these information correctly and in least time and least cost (Zhou, 2012). In proposed model of this study as case study, electronic accessory industry is considered. In this study evaluating of production like phone, tablet, laptop and applicable and skilled software will be proceeded. Because of this model will study the effect of satiation messages on beliefs and point of view of the users, it can present a vision to optimum design of satiation messages to organizations. So, satiation messages in advertising area can help customer attraction for the organization with impacting on beliefs and user's point of view and thereafter impacting on their treating aims. Although extended literature in advertising area and social media marketing is exist, but commonly conducted investigations are limited to special variables like age, sex or vocation of users or some variables like belief and user's point of view does not entered in model and it make study model without complete, comprehensive and universal.

In this study a comprehensive model based on effective variables on customer attraction like kind of satiation messages and their properties as argument quality, popularity and post attraction, beliefs and user's point of view like proficiency and post prefers is designed and proposed. So, the importance of present study can be at achieving appropriate result and make an effective step for impacting on treating aims of organization's customers.

## 2. Study Literature

Study of past of investigation is important thence that can make bases and main theories of investigation area clear and make investigator familiar with conducted similar works in related area. Also, with studying literature subject and conducted investigations can find a vision toward present study subject and occur some ideas for conducting new studies. So, in this part of study, we proceed to study conducted investigations in social network marketing area inside and outside of the country and become more familiar to literature subject.

Tavallae et al. (2016) in an investigation proceed to study the modern capabilities of social networks in extension of marketing investigations using mapping identification method.

In this study using deep seated interview method with experts to find credit of identified components in field of social network capabilities in extension of marketing investigations and identifying dimensions and conceptual model components was in this area. His study shows that social networks through four dimension of relation with beneficiaries, gathering information and contents, investigation planning, determining measurement criterion of investigation function can draw on marketing investigation extension.

Coulter and Punj, (2004) in thesis entitled studying mass communication based on social networks conducted on credit and loyalty of Branda. Investigation method in this study in order to evaluate variables of study, free and applicable study is used. Equipment of gathering data is questionnaire and statistical society is Facebook network which volume of statistical sample is 384 person. The most important results are as follows:

- Brand mass communication based on social networks have positive impact on awareness from shared emotion and beliefs and customs and moral responsibility.
- Awareness of shared emotion has positive impact on social network building activities.
- Awareness of shared emotion has negative impact on emotion management activities and brand application activities.
- Abolahian and Kermani in the year of 2013 conducted an investigation entitled the study and evaluation social investment of Iranian users of Facebook social network. In this paper, social investment theory of Rabert Potnam and methodology attitude of Frank is used for social investment evaluating building equipment and Facebook site also is

considered as study field for performing this plan. Incidentally, He attempted to gather required data for testing paper's claims by using triangulation technic and online surveying and participatory observation methods. Data analysis and study outcomes at last is used to create 10 index of social investment measurement in Facebook site.

Gulbahar & Yildirim in the year of 2015 conducted an investigation entitled studying related marketing activities with social networks and phone application in tourism. His investigation was based on obtained qualitative information from hotel's managers. In this investigation, hotels of the Istanbul city were analyzed and studied. Regarding investigation method is a qualitative investigation method and data are gathered from 19 managers of hotel. In the questionnaire of this study, 11 question is asked from participants. Aim of this study is to identify and study the impact of social networks and phone applications on marketing aims in tourism industry. He was presented in his investigation a frame for designing marketing strategies in tourism area in Turkey using social networks. Tourism organizations can apply appropriate strategies for their organization using the results of this investigation and use them toward operation of competition profits. Based on the results of this study, using customer attraction potentials and marketing by using social networks and phone software will have positive impact on customer attraction whether in international hotels and whether in local hotels.

Yadav et al. in the year of 2012 investigated the effect of using social networks for improvement of social study education in far regions. The results represent that using educational media and other learning procedures from far distance have different proficiency for both students and teachers. Among clears study process and also is an excitation and also enhance the competence and principle of students in information technology. Because technology role is increasing in daily life, learning how use the social media as an educational equipment is necessary.

## 3. Investigation Method

In this chapter studying of used investigation method is proceeded which are consist of the definition of aims and assumptions, investigation method explanation, data gathering methods- measurement equipment, testing of stability and justifiability of study, sampling method and sample volume determining and data analysis method.

Present investigation type is based on application aim. Because application investigations are studies which apply theories, lawfulness, principles and technics which is codified in basic studies for solving performance problems. Present investigation is a descriptive investigation, because proceed to describe conditions with under studying phenomena. And also based on nature and method of work performance and relation evaluation between variables are excellent. For as much as at this study evaluating of beliefs, visions and treating aims of purpose society is proceeded, this is accounted a survey that in this kind of investigation, investigators gives the questionnaire to a society to obtain scattering amount, properties, visions and beliefs of that informational society. Statistical society of this study are users of Roshtak Iranian page in Facebook social network.

### 3.1. Aims and Assumptions

Aims which are defined in this study are as follows. In the following, the study's assumption is presented.

- Determination of argument quality impact amount on efficacy
- Determination of post popularity impact amount on efficacy
- Determination of post popularity impact amount on prefer
- Determination of post attraction impact amount on prefer

- Determination of efficacy impact amount on prefer
- Investigation Assumptions
- Argument quality has positive and meaningful impact on efficacy.
- Post popularity has positive and meaningful impact on efficacy.
- Posts popularity has positive and meaningful impact on prefer.
- Posts attraction has positive and meaningful impact on prefer.
- Efficacy has positive and meaningful impact on prefer.
- Efficacy has positive and meaningful impact on like intention.
- Efficacy has positive and meaningful impact on sharing intention.
- Prefers has positive and meaningful impact on like intention.
- Prefers has positive and meaningful impact on sharing intention.

**3.2. Stability and justifiability of investigation equipment**

The method which is used in this study for stability testing is Kronbakh Alpha method. According to distribution of considered questionnaire with 29 asked question, we calculate Kronbakh Alpha for the sample number of 384 persons. Kronbakh Alpha amount of questionnaire for 384 person sample is 0.923. According to obtained amount for Kronbakh Alpha, it can be said that all in all, questionnaire enjoys an acceptable stability. At last with referring to these results, it can be use from gathered data with safety.

For accounting Kronbakh Alpha, 30 questionnaire among viewers of Roshtak Facebook page of electronic products are distributed and gathered and results were analyzed using SPSS software 21 version. Table 1 shows the Kronbakh Alpha amount of present investigation variables.

Table 1: Kronbakh Alpha amount of investigation variables

Kronbakh Alpha	Variable	
0.816	Argument quality	Satiation messages (Independent variable)
0.858	Post popularity	
0.756	Post attraction	
0.811	Efficacy	Beliefs and Visions(Intermediate variable)
0.807	Prefer	
0.923	Total Statements	

Provided measurement equipment modification (items omitting that cause increasing of alpha amount in considered component), Alpha amounts can tend to more and more to its previous amount.

So any question of questionnaire and internal similarity of question was studied but the results showed that by omitting each question the safety factor reduces, so these questions are of high precious and in none of question omission cases does not cause increase safety factor. Therefore, this subject shows internal similarity of questions. At last according to calculated safety factor and other results, it is specified that used questionnaire that Alpha amount of it is 0.923 has required value and safety (stability).

**3.3. Study conceptual model**

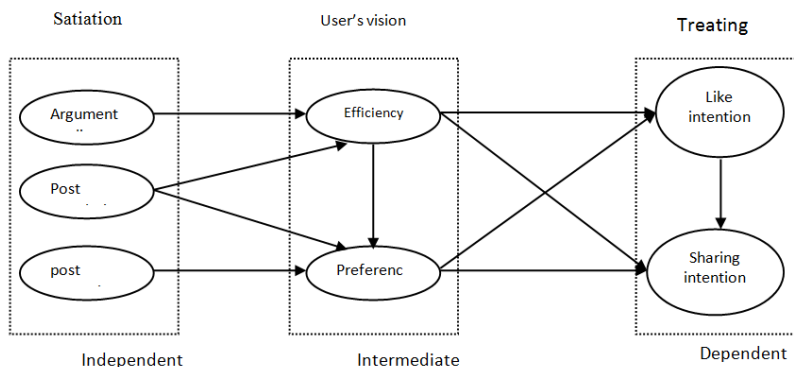

Figure 1: investigation conceptual model, adaption from

Figure (1) shows the schematic view of investigation conceptual model. In this figure, all investigation variables and their relations with each other is expressed conceptual and structural. As it is seen in this figure, effectiveness of satiatio messages that is divided into three variables of argument quality, post popularity and post attraction, is studied on beliefs and user's visions. Also in another study by investigator, effectiveness of beliefs and visions is studied on 2 subset variables of treating aims. These two variables are as like intention and sharing intention.

Conceptual model of present investigation is obtained from model of source 8 that is applied some changes in it. In this study, a model was extended for advertising formularized program organization in social media area. In considering model of this study, three factor of argument quality, post popularity and post attraction is used and effectiveness of satiatio messages study on beliefs and visions of users as intermediate role in model.

**4. Results**

In this section, findings and research results is presented as descriptive and illative statistic.

**4.1. Descriptive analysis of sex variable**

Results shows the sex relative frequency distribution. Based on existing findings in this table, 20.8 percent of responders were women and 79.2 percent were men. This results shows that women use less than men from network marketing and Roshtak page in Facebook.

**4.2. Descriptive analysis of age variable**

Findings shows the age variable relative frequency distribution. Based on the findings of this table; Responders average age is equal to 29.68, 19 year old with maximum mode frequency, 27 age of average variable, variable variance is equal to 121468 and standard deviation is equal to 11.01 and minimum age of

responders is equal to 16 year and maximum age of responder is equal to 80 years and variable amplitude is equal to 64 year.

**4.3. Descriptive analysis of time period variable of internet utilization**

Table 2 shows the time period variable relative frequency distribution of internet utilization between responders. Based on

findings of this table, 24.2 percent between 1 to 2 year, 46.9 percent between 3 to 4 year, 15.5 percent between 5 to 6 year and 13.4 percent more than 7 year uses internet. This shows the amount of internet utilization between responders is high. Average of 3.87 and mode of 4 shows somehow averagely near to 4 year of responders used from Internet global network.

Table 2: Responder's distribution at time period using Internet

Total	More than 8 year	7 to 8 year	5 to 6 year	3 to 4 year	Less than 2 year	Time period of using internet
322	10	33	50	151	78	Frequency
100	3.1	10.3	15.5	46.9	24.2	Percent
	Maximum:10 year	Minimum: 1 year	Variance:4.1	Standard deviation: 2.02	Mode: 4	Average:3.87

**4.4. Descriptive analysis of independent variable of post popularity**

Table 3 results shows the descriptive analysis of independent variable of post popularity in sample that shows the frequency of people numbers that have chosen the related items to each question in related questions to forgoing variable. In this table, question 5 to 7 of questionnaire that is related to this variable have been described. As you see, observed average of all

question and also the average of all questions of this variable (3.83) is more than theory average which means amount 3. This shows that the independence of post popularity is more than average. Findings of figure number (4-10) is also approve this results which have been known 72.1 percent with high post popularity, 21.4 percent with medium post popularity independence and 6.5 percent with less post popularity independence.

Table 3: post popularity independence variable relative frequency distribution

Observed standard deviation	Observed variance	Observed average	Total frequency	Post popularity					Question choice
				Frequency of responses					
				Completely Agree	Agree	No opinion	Disagree	Completely disagree	
0.907	0.82	4.15	322	135	122	51	8	6	1
0.878	0.77	4	322	101	140	64	14	3	2
0.906	0.82	4.012	322	101	151	49	15	6	3
0.830	0.69	3.83	322	62	140	69	18	3	average

**4.5. Descriptive analysis of independent variable of post attraction**

Table 4 shows the descriptive information related to independent variable of post attraction in sample that shows the frequency of people numbers that have chosen related choices of each question in related questions to forgoing variable. In this table, questions 8 to 11 of questionnaire have been described that are

related to this variable. As you can see, observed average of all questions and also average of all questions of this variable (3.93) is very more than theory average 3 and these results shows that post attraction for users of Roshtak page were high. Findings of figure number (4-11) approve these results, too, which have been known 77.8 percent with high post attraction, 20.5 percent with medium post attraction and 2.5 percent with less post attraction.

Table 4: Post attraction independent variable relative frequency distribution

Observed standard deviation	Observed variance	Observed average	Total frequency	Post attraction					Question choice
				Frequency of responses					
				Completely Agree	Agree	No opinion	Disagree	Completely Disagree	
0.85	0.73	4.24	322	147	123	39	10	3	1
0.69	0.48	4.47	322	185	109	23	5	-	2
0.74	0.56	4.17	322	116	151	49	6	-	3
0.77	0.59	4.15	322	116	149	48	9	-	4
0.7	0.49	3.93	322	62	186	66	8	-	Total average

**4.6. Checking of normalization of sample distribution of case study**

Normalization testing results of study variables is visible table 5. According to obtained P-Value amounts in table 5 that all of them are larger than 0.05, zero assumption which means normalization assumption of sample's distribution is approved in error level of 5 percent, namely there is no meaningful difference between sample's distribution and normal distribution. So, according to normalization of case study samples for testing of

study assumptions, parametric methods will be used. In next for testing of assumptions path analyze method and structural equations (SEM) will be used.

Table 5: Variables normalization distribution test

Test result	decision	p-value	Z Kolmogrof- Esmirnof statistic number	Number	Variable
Distribution is normal.	Accept zero assumption	0.342	0.863	322	Argument quality
Distribution is normal.	Accept zero assumption	0.231	0.542	322	Post popularity
Distribution is normal.	Accept zero assumption	0.324	0.452	322	Post attraction
Distribution is normal.	Accept zero assumption	0.645	0.547	322	Prefer
Distribution is normal.	Accept zero assumption	0.202	0.913	322	Efficacy

#### 4.7. Factor analysis related to independent variables

Model of independent variables using 11 index is measured. As it can be seen from table 6, these indexes consist of (k1- j4). Standardized parameter assessments shows that all indexes are

meaningful statistically ( $p < 0.05$ ) and their factor loads are in high level (more than 0.5). Also studying the results of fitting indexes signify model appropriate fitting and all fitting indexes are placed in acceptable area. So, independent measurement model is acceptable without any change.

Table 6: Accepted indexes of independent variables

Index situation	Meaning level	t-value	Factor load	Index label	Main index	Dimension
Accepted	0.000	8.99	0.60	K1	Conducted advertising in Roshtak page posts increased my information about cellphones, tablets, laptops, electronic vehicles and media area software.	Argument quality
Accepted	0.000	13.28	0.57	K2	Conducted advertising in Roshtak page posts about cellphones, tablets, laptops, electronic vehicles and media area software was useable and beneficial for me.	
Accepted	0.000	10.8	0.55	K3	Conducted advertising in Roshtak page posts about cellphones, tablets, laptops, electronic vehicles and media area software is instructive for me and increase my awareness and cognition level.	
Accepted	0.000	7.33	0.54	K4	Conducted advertising in Roshtak page posts about cellphones, tablets, laptops, electronic vehicles and media area software was sufficient and convincing for me.	
Accepted	0.000	13.97	0.66	Mah1	I think posts which is shared about cellphones, tablets, laptops, electronic vehicles and media area software are more reliable and trustworthy.	Post popularity
Accepted	0.000	18.86	0.80	Mah2	I think posts which are shared or are more admirable about cellphones, tablets, laptops, electronic vehicles and media area software are more reliable.	
Accepted	0.000	13.34	0.63	Mah3	I think posts which are shared or are more admirable about cellphones, tablets, laptops, electronic vehicles and media area software are more believable.	
Accepted	0.000	9.87	0.67	J1	Short film viewing type about cellphones, tablets, laptops, electronic vehicles and media area software in Roshtak page posts are admirable to me.	Post attraction
Accepted	0.000	10.77	0.62	J2	Photo of cellphones, tablets, laptops, electronic vehicles and media area software from Aesthetics vision are admirable to me.	
Accepted	0.000	15.66	0.60	J3	I like apparent figure of Roshtak page posts about cellphones, tablets, laptops, electronic vehicles and media area software.	
Accepted	0.000	13.05	0.54	J4	All in all, design of Roshtak page posts about cellphones, tablets, laptops, electronic vehicles and media area software are admirable to me.	

#### 4.8. Investigation final model (Investigation structural equation)

Table 7: Selection of important fitting indexes of graphic model

T	Standardized B coefficient	Graphic signal	route(Formative-Reflective)		
11.23	0.47	kifeyat	efficacy	F	Argument quality
13.96	0.53	mahbobyat	efficacy	F	Post popularity
21.52	0.80	mahbobyat	Prefer	F	post popularity
12.51	0.77	jazabeyat	Prefer	F	Post attraction
16.92	0.76	sodmandi	Prefer	F	Efficacy

## 5. Conclusion

One of the notable methods in customer attraction area and lead treating aims in media marketing area can be the messages which transfer from these media. Nowadays, social network marketing which use networks and social media toward content sharing, information publish and information connection, are of the most effective advertising methods. In this section of investigation, findings and investigation results analyze by statistical data according to investigation aim.

According to route analysis pattern and table 7 amounts of route standard coefficient, argument quality dimension are about 0.47 and (t-11.23) amount. So according to T in this route (t-|11.23| > 2.56), it can be concluded with 99 percent probability, H0 assumption is passed and H1 hypothesis is accepted. In other word, argument quality has a positive impact on efficacy of uses from Roshtak page and so, the relation is positive and assumption is accepted. With increasing 1 unit in argument quality variable, user's efficacy variable in Roshtak page increases 0.47. As result, with argument quality of Facebook Roshtak increasing, efficacy amount of Roshtak page users is invigorated.

According to route analysis pattern and table 7 amounts of route standard coefficient, post popularity dimension are about 0.53 and (t-13.96) amount. So according to T in this route (t-|13.96| > 2.56), it can be concluded with 99 percent probability, H0 assumption is passed and H1 hypothesis is accepted. In other word, post popularity has a positive impact on efficacy of users from Roshtak page and so the relation is positive and assumption is accepted. With increasing 1 unit in post popularity variable, user's efficacy variable in Roshtak page increases 0.53. As result, with post popularity of Facebook Roshtak increasing, efficacy amount of Roshtak page users is invigorated.

According to route analysis pattern and table 7 amounts of route standard coefficient, post popularity dimension are about 0.80 and (t-21.52) amount. So according to T in this route (t-|21.52| > 2.56), it can be concluded with 99 percent probability, H0 assumption is passed and H1 hypothesis is accepted. In other word, post popularity has a positive impact on user's preference from Roshtak page and so the relation is positive and assumption is accepted. With increasing 1 unit in post popularity variable, user's efficacy variable in Roshtak page increases 0.80. As result, with post popularity of Facebook Roshtak increasing, prefer amount of Roshtak page users is invigorated.

According to route analysis pattern and table 7 amounts of route standard coefficient, post attraction dimension are about 0.77 and (t-12.51) amount. So according to T in this route (t-|12.51| > 2.56), it can be concluded with 99 percent probability, H0 assumption is passed and H1 hypothesis is accepted. In other word, post attraction has a positive impact on user's preference from Roshtak page and so the relation is positive and assumption is accepted. With increasing 1 unit in post attraction variable, user's efficacy variable in Roshtak page increases 0.77. As result, with post attraction of Facebook Roshtak increasing, prefer amount of Roshtak page users is invigorated.

According to route analysis pattern and table 7 amounts of route standard coefficient, efficacy dimension are about 0.76 and (t-16.92) amount. So according to T in this route (t-|16.92| > 2.56), it can be concluded with 99 percent probability, H0 assumption is passed and H1 hypothesis is accepted. In other word, efficacy has a positive impact on user's preference from Roshtak page and so the relation is positive and assumption is accepted. With increasing 1 unit in efficacy variable, user's efficacy variable in Roshtak page increases 0.76. As result, with efficacy of Facebook Roshtak increasing, prefer amount of Roshtak page users is invigorated.

According to route analysis pattern and table 7 amounts of route standard coefficient, efficacy dimension are about 0.57 and (t-11.23) amount. So according to T in this route (t-|11.23| > 2.56),

it can be concluded with 99 percent probability, H0 assumption is passed and H1 hypothesis is accepted. In other word, efficacy has a positive impact on like intention from Roshtak page and so the relation is positive and assumption is accepted. With increasing 1 unit in efficacy variable, user's like intention variable in Roshtak page increases 0.57. As result, with efficacy of Facebook Roshtak increasing, like intention amount of Roshtak page users is invigorated.

According to route analysis pattern and table 7 amounts of route standard coefficient, efficacy dimension are about 0.73 and (t-11.23) amount. So according to T in this route (t-|15.38| > 2.56), it can be concluded with 99 percent probability, H0 assumption is passed and H1 hypothesis is accepted. In other word, efficacy has a positive impact on sharing intention from Roshtak page and so the relation is positive and assumption is accepted. With increasing 1 unit in efficacy variable, user's sharing intention variable in Roshtak page increases 0.73. As result, with efficacy of Facebook Roshtak increasing, sharing intention amount of Roshtak page users is invigorated.

According to route analysis pattern and table 7 amounts of route standard coefficient, prefer dimension are about 0.42 and (t-10.05) amount. So according to T in this route (t-|10.05| > 2.56), it can be concluded with 99 percent probability, H0 assumption is passed and H1 hypothesis is accepted. In other word, prefer has a positive impact on like intention from Roshtak page and so the relation is positive and assumption is accepted. With increasing 1 unit in prefer variable, like intention variable of users in Roshtak page increases 0.42. As result, with prefer of Facebook Roshtak increasing, sharing intention amount of Roshtak page users is increased.

According to route analysis pattern and table 7 amounts of route standard coefficient, prefer dimension are about 0.60 and (t-11.32) amount. So according to T in this route (t-|11.32| > 2.56), it can be concluded with 99 percent probability, H0 assumption is passed and H1 hypothesis is accepted. In other word, prefer has a positive impact on sharing intention from Roshtak page and so the relation is positive and assumption is accepted. With increasing 1 unit in prefer variable, like intention variable of users in Roshtak page increases 0.60. As result, with prefer of Facebook Roshtak increasing, sharing intention amount of Roshtak page users is invigorated.

**Abstract.** Financial reports is available sources of information on capital markets which is expected to play an effective role in improving the efficiency of investment and beneficial, the aim of this study was to investigate the effect of audit reports on the timeliness of accounting information, accounting and stock returns' impact on the reliability of the information. The period consisted of 5 consecutive years from 2010 to 2014 and samples are 114 companies listed in the Tehran Stock Exchange. Test the hypothesis of the present study is based on panel data regression analysis and using EViews software, the significance relationship between variables investigated. The results of the research showed that the accounting report has no significant impact on the timeliness of information but has a significant effect on reliability.

**Keywords:** audit report, the reliability, timeliness, stock returns.

### 1 Introduction

Research and analysis of all aspects of securities markets and draw correct conclusions can speed up the development of these markets. Valid world exchanges have shown successfulness in maintaining and raise capital, and it is resulted of the confidence of investors to capital markets and market efficiency, so that they know do not waste investments and brings reasonable profits. Research on various issues affecting the stock market can help to shareholder to make correct decisions and the efficient allocation of economic resources to be the efficient allocation of economic resources to make more favorable investment situation (Ghaemi et al. 2003). In the present competitive world that reducing the cost and time efficiency are so important, competition in the auditing profession in the world and particularly in developed countries has been significantly intensified. Audit firms to remain competitive and increase their share in the global market, have to implement the principles and techniques of planning and management in their institutions. To achieve these two important points must consider: increasing the quality and reduce the price of goods and services (Firth, 1993).

Today, due to the expansion of economic activities, financial markets and investment boom in the capital markets, especially the stock exchange by natural and legal persons, access to accurate information, timely and realistic analysis of them are the most important tools to make the right decisions, achieve the expected benefits, financial facilities, efficient and optimal use. Information in today's society play a significant role in human life and whatever more advanced society of more and better uses. One of the reasons progress in developed societies is optimal and effective use of information. The end product of accounting, is providing information for different users ranging from internal users and outside users of the company, in the form of accounting reports. The group of accounting reports prepared and presented, with aims to meet the information needs of users of outside the company, placed in the area of financial accounting (Vaghfi, 2009). The main philosophy of the audit is to validate the data reflected in the financial statements; because mentioned information is the base of the decision-making groups such as shareholders, potential investors, agents, managers, financial consultants, analysts, creditors and the government. Therefore the audit of the users' perspective is especially useful when shareholders during their proceedings to investigate and

evaluate the continuity of the establishment, freedom from false financial statements, pay to significant fraud and illegal acts affecting the entity's activities and agreed to abide by the above declare (Amini et al., 2011).

Transparent and reliable financial information are produced by a comprehensive reporting system and it counts also a key element of assessing the financial condition and performance of a company and make decisions about exchange of securities issued. In today's professional communities from the perspective of users, the information is deemed reliable that an independent agency on the company's reporting process and at the center of this process means monitor the financial statements. The examples of these organizations are audit firms which mainly are monitored and evaluated in the internal control structure of the reporting unit the final product of the financial statements and internal control. The most important and valuable service the auditing profession are, independent and expert opinion about the desirability of the financial statements. (Publication 105 Corporate Audit). Auditors with the reliability to the financial statements, financial reporting and transparency of financial markets play a crucial role to play in the process. Audit report as the end product of the audit, the nature of the goods (services) are public, which the use of which do not prohibit the use of other public services and its use is not restricted to any one user. Public goods like other goods and services must have appropriate quality to be continuing demand for it. If the audit is a means of monitoring the multiple roles to undertake these, assuming the other conditions permanently, forms of STI policies have audited financial high quality, will be reliable and more confident to consumers of goods (services) (Hassas Yeganeh and Jafari, 2010). The effect of an audit opinion on stock returns in alignment depend on the auditor's theory, shareholders and investors. If the audits' idea is different with the shareholders and investors according to official auditor access to information within the enterprise, his theory has the response of shareholders. The existence of reliable financial information, one of the requirements for the development and production of human science. The investor's decision to buy or sell stocks, a banker who decides on the approval of a loan application, the state to collect taxes based on the tax returns, they rely on information that is provided by others. Auditors did not comment on correcting intentional or unintentional mistakes in financial statements, and the quality of accounting information as a basis for decision makers raise investors. As mentioned in problem statement, the purpose of this study, is investment the effect of the audit report on the quality of accounting information and stock returns of companies listed on the Stock Exchange. In fact, the purpose is the answer to this question: whether or not the information content of the auditor's report for the users? Is there a significant relation among the kind of audit report, timeless information, reliability, financial statement and stock returns? With the intensification of competition in different fields such as accounting, auditing institutions they are looking for ways to increase the efficiency of their efficiency that to achieve this goal, they must identify important factors of efficiency and strive to eliminate or minimize its inhibitors, for this cause, auditors need a tool to warn himself to the risk of distortion, one of these tools is the use of analytical methods. Analysis of financial and non-financial variables can also be the means for the implementation of analytical methods reasonable assurance level that is associated with the issuance of the audit opinion. In this study seeks to provide useful information to users of our accounting and auditing practice, infect in this research tries to follow (main purpose of accounting is to provide useful information for decision-making).

We try in this research to answer the following question is there a significant relation between the auditor's report and the timeliness of accounting information?

Is there significant relation between audit report and stock returns?

To answer these question, formulated the following hypotheses:

- 1) There is a significant relation between the auditor's report timeliness of accounting information.
- 2) There is a significant relation between the auditor's report and the reliability of accounting information.
- 3) There is a significant relation between audit report and stock returns.

## 2 Audit report, stock return and quality of disclosure

### 2.1 Financial reporting

According to theoretical concepts of financial reporting, the financial statements purposes are included summarize and classify the information provided about the financial position, financial performance and financial flexibility of commercial unit which for a wide range of users in making economic decisions is directly applicable to financial statements. Achieving this goal requires the information has primarily been relevant and reliable and secondly, be understandable and comparable. Financial reports is available sources of information on capital markets which is expected to play an effective role in improving the efficiency of investment and beneficial (Modares and Hesar Zade, 2008) the purpose of financial reports require some specific traits that called quality of accounting information. Qualitative information characteristics make useful information and when dealing with accounting choices (choice of accounting methods, reporting forms and information that must be disclosed) to be searched; these are the criteria that determine what information is relevant for purposes of decision-making (Babajani and Azimi Yancheshmeh, 2012).

### 2.2 Disclosure Quality

According to Brown and Hillegeist (2006) disclosure quality shows the general awareness ability of disclosed information and depend on the volume of disclosed information, timeliness and accuracy of it. Some researches consider disclosure quality related to continuous release timely information and awareness. According to them, the companies with disclosure quality the probability to refuse unfavorable and valuable is lower. Disclosure quality refers to the ease of studying and interpreting financial reports. When the volume of information, timelessness and the accuracy of disclosure be aware of the obvious cause and investors about the value of securities after receiving the data reach rightly believed, disclosed information has high quality. Therefore, disclosure quality affects the value of the securities. It is expected after increasing disclosure quality, the information content of earnings increase and reported earnings effect on behavior of investors. Information disclosure quality is reported one of the most important factors for evaluation information. If the quality of disclosure increase, information provided are greater and reduce credibility, confidential information and information asymmetry. Full disclosure and transparency of financial reporting can make certain circumstances as increases investor confidence. Transparency have a positive impact on shareholders performance and can protect their interests. Increasing investor confidence, reduced expected returns and value of company increases (Kurdistani and Hosseini, 2013). The results show that between independent variables of profit error forecast and the adjustments annual earnings with variable delay in the issuance of the audit report negative significance was established and there is no relation between the independent variable of disclosure quality rating companies the delay in the issuance of the audit report. Among the control variables, firm size, size of audit firm, having good or bad news and the company's debt, only the size of the company with variable delay in the issuance of the audit report has been negative

significance and other variables are not any significant relationship (Mollaymeny and Marfou, 2015).

### 2.3 Stock returns

In theoretical foundations of financial reporting has been pointed the role of financial investors' decision-making. One of the criteria for the usefulness of financial information and explanatory power of prediction is this information. Hence investors with financial information to evaluate and predict stock returns (Hashemi and Motalebian, 2013). Francis et al (2013) suggest that investment is a money transfer that is expected to followed additional money. Every investment involves a degree of risk which entails the loss of the money in time to get its benefits. In fact, the main variable efficiency in the decision to invest. Return is a factor to compare the real benefit that create by investors to returns to offset investment risk. Although, researches in other countries, similar research has not been done in Iran; however, corporate governance and other structures have been studied alone such as corporate governance and firm performance (Mashayekh and Ismaeli (2006), Ghaemi (2009)), corporate governance and profit divided (Fakhari and Yusuf Ali Tabar (2010), corporate governance and audit quality (Ahmadpur and Kashanipoor (2010), corporate governance and agency expenses (Noroush and Karami (2009) but less study has been done in this field.

Nikoumaram (2011) evaluate the relationship between the cost of equity and six aspect of earnings quality. Six aspect of earnings quality are based on accounting information contained accrual quality, earnings variability, discretionary accruals, the common factor, the predictability of the earnings and profits are being paved. Hypotheses test showed that generally companies with a minimum acceptable value for each benefit quality (any quality was considered separately) compared to firms with maximum optimal value, are higher than the cost of equity. The common factor in the cost of capital was not confirmed and discretionary accruals relationship is contrary to the cost of capital. Among the other four indicators of earnings quality, "AQ" is the highest impact on the cost of equity. In addition, the explanatory power of the model includes six indicators for earnings quality is more than explanatory power models which used only one of the indicators of the profits as independent variables. Therefore it can be said that earnings quality has a significant negative correlation with the cost of equity. The results of this study could remind the importance of earnings quality, from investors and other stakeholders' points of view.

Setayesh and Zolfaghari (2011) were examined the impact of the quality of disclosure on liquidity and current and future cost of equity capital firms listed in the Tehran Stock Exchange.

In this regard, the criteria for assessing the liquidity of the stock turnover rate, the number of shares traded and the volume of quantification exchanges were used. Survey 105 companies during the period 2004 to 2008 findings, show that there is a significant and positive relationship between firm size and its current and future liquidity, but there is not a significant relationship between disclosure quality and current and future liquidity of the companies. Moreover, there is a significant negative relationship between disclosure quality and cost of equity in current and future capital of company. However, no evidence observed a significant relationship between firm size and the current and future cost of equity capital. Pereira (2009) evaluate the relationship between corporate governance, the quality of accounting information and the independent auditor's report for the 419 companies listed on the stock Sao Paulo, Brazil. In addition to content analysis was conducted on data governance and financial year 2006 of these companies, Logit model is used by independent auditors to examine the relationship between governance mechanisms such as the presence of members with financial expertise on the board, the audit committee and the audit 4 large institution, to provide an unqualified opinion. The results of this investigation showed that the dominant characteristic of auditors qualified opinion to

express appeal for companies that had used their financial statements, included, they were no board members with financial expertise, they were independent auditors services other than four large auditing firm, they were reportedly will have negative net worth and generally privately controlled and have non-institutional investors and most of them were involved in legal disputes. In the following stated that the probability of error of 5% there is a significant communication between a board of directors with financial expertise, and the four largest audit services with unqualified opinion by the auditors. But no evidence of a relationship was found between the presences of the Audit Committee of the Company control structure, with an unqualified opinion by the auditors.

Pereira (2009) has stated that internal auditors have a close relationship with managers, therefore they can monitor the issuance of reports and management decisions. Institutional owners have effective monitoring to corporate managers and can increase the efficiency of capital market information.

Ali Shah and colleagues (2009) have reported negative relationship between active participation of institutional owners and earnings management.

### 3 Methodology

Table 1: variables and definitions

Variable symbol	Variable type	Variable name
Report	Independent	Audit report
Time	Independent	Timelessness of information
Reliability	Independent	The ratability of accounting information
Ret	Dependent	Stock return
Size	Control	Size of the company

The statistic society in this study included all active companies in the Tehran Stock Exchange which mentioned limits the number of 570-year- companies are selected Due to the availability of information throughout the company, all data to test hypotheses have been selected. In this study, to test each hypothesis only panel data is used. The reason is that using cross-sectional data econometric estimation models may be associated with problems of inefficiency and inconsistency. As a result of all mentioned, to analyze test hypotheses on the results of the estimation model is based on the combined data.

In this study, the comparative method is used for understanding literature and inductive method is used to collect data and test hypotheses. The research territory to determine population, are the sample, collect data and test research hypotheses, in Tehran Stock Exchange.

The time period is 2010 to 2014 to collect data and test hypotheses that is a 5-year period.

#### 3.1 Test hypothesis model

1. The auditor's report is not a significant relationship timeliness to accounting information.

$$\text{Time} = \alpha_0 + \alpha_1 \text{ report} + \alpha_2 \text{size} + e$$

2. The auditor's report is a significant relationship to reliability of accounting information.

$$\text{Reliability} = \alpha_0 + \alpha_1 \text{ report} + \alpha_2 \text{size} + e$$

3. Audit report is significant relationship with stock returns.

$$\text{Ret} = \alpha_0 + \alpha_1 \text{ report} + \alpha_2 \text{size} + e$$

The study variables is presented in table 1.

### 4 Data analysis

#### 4.1 Descriptive statistics of variables

Since the data is usually summarized by calculating statistics such as mean, standard deviation, minimum, maximum, range, and coefficient of variation takes place, therefore, to examine and analyze primary data, at first information concerning the descriptive statistics and explanatory variables studied in this research is presented in the table to overview of the data analyzed in this study were obtained. The descriptive statistics of variables used in the study is presented in table 2.

Table 2. Descriptive statistics of variables used in the study

Size	Lever	Quick ratio	Current ratio	Reliability	Timelessness	Stock return	Variable characteristic
5.96	0.62	0.10	1.38	54.31	78.43	0.21	Average
5.89	0.62	0.06	1.22	62.31	82.79	0.14	Middle
8.26	1.57	1.41	10.95	99.87	100	8.06	Maximum
4.56	0.09	0	0.22	0	0.84	-6.22	Minimum
0.61	0.20	0.13	0.91	33.88	19.28	0.66	Standard division
3.69	1.48	1.41	10.72	99.87	99.16	14.28	Variation range
0.10	0.33	1.34	0.66	0.62	0.25	3.13	Coefficient of variation

Adjustment and classification of data are draw and calculate values such as mean, median, etc. which shows the profile of every member of society. Descriptive statistics data from a group, described that group and obtained information cannot be generalized to the same category. The mean and median are the most common measures of central tendency. In this study, the average stock return 0.21, timeliness 78.43, reliability 54.31, current ratio 1.38, quick ratio 0.10, leverages 0.62 and liquidity is 5.69; and median, respectively, 0.14, 82.79, 62.31, 1.22, 0.06, 0.62, 5.89, which shows the numeric value located in the middle

of a data set. The standard deviation as a dispersion index shows how much the data average distance from average value. The current ratio is the lowest dispersion.

#### 4.2 This model estimation and hypothesis testing

The null hypothesis: there is not a significant relationship between the type of auditor's report and timeliness of information.

First assumption there is a significant relationship between the type of auditor's report and timeliness of information.

Control variables of current ratio, leverage and audit ratings have a significant impact on reliability of the information. The first model results are presented in table 3.

Table 3. The first model results

Time <sub>it</sub> = α + β1Report <sub>it</sub> + β2size <sub>it</sub> + β3Lev <sub>it</sub> + β4Rank <sub>it</sub> + β5Current <sub>it</sub> + β6Ani <sub>it</sub> + ε <sub>it</sub>			
The significance level	T statistics	Variable ratio	Variable
0.27	1.09	0.68	Reports
0.000	4.71	18.78	size
0.09	1.67	2.39	Current ratio
0.000	-4.04	-18.001	Lever
0.04	-1.98	-0.49	Auditor rank
0.81	0.23	0.93	Quick ratio
0.79	-0.25	-5.73	Intercept
	0.84		R2
	0.79		Adjusted R2
	18.31		F
	0.00		Probe
	2.00		Durbin-Watson statistic

#### 4.3 The first hypothesis result

According to significant level of variable the auditor's report 0.27 (more than 5 hundredths of error is considered) the null hypothesis is accepted. The auditor's report is not a significant relationship timeliness to accounting information. The size of controlling variables, leverage and audit ratings have a significant impact on the timeliness of information.

Statistics F show the Overall significance of regression coefficients, Durbin-Watson statistic with 2.00 reflects the lack of correlation between the disturbing elements. The coefficient of determination and adjusted coefficient of determination

models are 84 percent and 79 percent respectively; thus, we can conclude that the regression equation, only about 79 percent of the dependent variable changes explained by the independent variables.

#### 4.4 The second model result

The null hypothesis: there is not a significant relationship between the type of auditor's report and reliability.

First assumption: there is a significant relationship between the type of auditor's report and reliability. Its results are presented in table 4.

Table 4. The second model results

Reliability <sub>it</sub> = α + β1Report <sub>it</sub> + β2size <sub>it</sub> + β3Lev <sub>it</sub> + β4Rank <sub>it</sub> + β5Current <sub>it</sub> + β6Ani <sub>it</sub> + ε <sub>it</sub>			
The significance level	T statistics	Variable ratio	Variable
0.00	4.30	1.63	Reports
0.99	-0.00	-0.002	size
0.00	5.94	2.42	Current ratio
0.000	-6.27	-7.04	Lever
0.000	-3.52	-1.27	Auditor rank
0.81	0.23	-44.72	Quick ratio
0.000	-20.79	-5.73	Intercept
	0.98		R2
	0.98		Adjusted R2
	244.08		F
	0.00		Probe
	2.17		Durbin-Watson statistic

#### 4.5 The first hypothesis result

According to significant level of variable 0.00 (more than 5 hundredths of error is considered) the null hypothesis is not accepted; there is a significant relationship between the type of auditor's report and reliability. Statistics F show the Overall significance of models' coefficients, Durbin-Watson statistic with 2.17 reflects its lack of correlation between the disturbing elements. The coefficient of determination and adjusted coefficient of determination models are 98 percent and 98 percent respectively; thus, we can conclude that the regression

equation, only about 98 percent of the dependent variable changes explained by the independent variables.

#### 4.6 The third model result

The null hypothesis: there is not a significant relationship between the type of auditor's report and stock return.

First assumption: there is a significant relationship between the type of auditor's report and stock return. The third model result is presented in table 5.

Table 5. The third model results

Ret <sub>it</sub> = α + β1Report <sub>it</sub> + β2size <sub>it</sub> + β3Lev <sub>it</sub> + β4Rank <sub>it</sub> + β5Current <sub>it</sub> + β6Ani <sub>it</sub> + ε <sub>it</sub>			
The significance level	T statistics	Variable ratio	Variable
0.54	0.61	0.02	Reports
0.67	-0.42	-0.20	size
0.10	-1.62	-0.04	Current ratio
0.06	-1.86	-0.33	Lever
0.93	0.07	0.002	Auditor rank

0.000	3.80	0.43	Quick ratio
0.56	0.57	1.61	Intercept
	0.28		R2
	0.07		Adjusted R2
	1.37		F
	0.01		Probe
	2.5		Durbin-Watson statistic

#### 4.7 The third hypothesis result

According to significant level of audit report 0.54 (more than 5 hundredths of error is considered) the null hypothesis is not accepted; there is not a significant relationship between the type of auditor's report and stock return.

Quick variable also has a significant effect on the control variable returns. Statistics F show the Overall significance of models' coefficients, Durbin-Watson statistic with 2.5 reflects its lack of correlation between the disturbing elements. The coefficient of determination and adjusted coefficient of determination models are 27 percent and 7 percent respectively; thus, we can conclude that the regression equation, only about 7 percent of the dependent variable changes explained by the independent variables.

#### 5 Discussion and Conclusion

In this study, has been paid to the effects of auditing report on the timeliness of accounting information, the impact on the reliability of accounting information and stock returns. The results of the first and second test hypotheses shows accounting report has no significant impact on the timeliness of information, but has a significant effect on reliability.

It can be resulted when investors and other users of financial reports do not have the same equal time access to information, this issue potentially reduces the content of information accounting reports and affect the performance of the audit and subsequently of reliability financial statements. These results disagree with the results of Karhashmy Bahreman and Banimahd (2015) that show the audit report showed a negative relationship with the timeliness of information. This result also against are Pourhoseini (2010). In a study entitled "The Relationship between financial and non-financial aspects and time of completion of audit firms listed in the Tehran Stock Exchange" he states that given that timeliness is one of the most important characteristics of financial information. The interval between the publication dates of the financial statements of the fiscal year of business units are shorter, benefit from the annual financial statements of entities increases. The controlling size variables, leverage, and current and the audit rated impact on the timeliness of the information and the reliability of information. This result is in line with Smile and Chandler (2004) is in line to check the timeliness of financial reports Malaysia's midterm companies. They studied regarding the timeliness of financial reporting and the characteristics of the size of profitability, growth and capital structure of the company studied in their research. The results showed that despite the fact that companies are more tend to provide timely financial reports. But they found that the timeliness of financial reporting period by size, profitability, growth and leverage the company will be affected. The results also showed that larger companies and companies with profitability, growth and leverage provide midterm financial reports faster. The results of the test show that the third hypothesis audit report has no significant effect on stock returns. These results are consistent with studies mentioned in the following. Chen Vezayv (2000) paid in the Shanghai Stock Exchange in the period 1997-1995 to assess the impact of contingent and non-contingent with section description audit report on their stock prices and returns. They used market model to calculate abnormal returns. The results showed that the

market reaction to any of these reports there is no significant difference. Puchenta et al (2004) in Spain, using event study method to examine the capital market's reaction to the qualified audit reports. They concluded that qualified audit reports has no value for users of the information. Alsa Nybyt et al (2008) to assess the information content of audit reports of Stock Exchange Jordan, examined the impact of qualified audit reports on stock prices. Their research results indicate the reported condition had no impact on stock prices. Also, the quick control variable also has a significant effect on returns.

**Abstract.** Last decade can be called as economic and industrial development decade. Development process of economic processes has been accelerated in recent years. With the onset of the industrial revolution and forming machine industry, energy became as one of the primary and most important factors of manufacturing in industry. This research studies the relationship between energy consumption and GDP, imports and exports of OPEC countries over the period of 1990-2014 were analyzed using panel data. The results showed that the growth of GDP, exports and imports has positive and significant effect on energy consumption in countries that were studied. Finally, the researcher suggests to reduce energy consumption and increase the efficiency of production, an increase in productivity of production technology and modernization of production equipment is essential.

**Key words:** GDP, imports, exports, energy consumption, selected countries of OPEC, panel data

### 1. Introduction

Evolution of the economy in the last century, has been associated with variety of energy applications but in the seventies oil shocks and economic recession in the West, caused role of energy to have a special place in economic developments and in the eighties the relationship between energy consumption and economic growth to be the focus of economic analysts (Sadorsky, 2011). During the last thirty years, many emerging and developing economies, have experienced rapid growth in trade, production and energy consumption and many studies have been done on the relationship between energy consumption and GDP (Dedeoglu and Kaya, 2013).

Studying relationship between energy and trade from different directions is important. If energy consumption is cause of export or import, any reduction in energy consumption such as energy-saving policies, will reduce export or import and trade benefits and will neutralize trade liberalization policies that are designed to boost economic growth. In fact, in these conditions, energy conservation policy is in contrast with the policies of trade liberalization. But if there is one-way causality from export or import to energy, energy saving policies won't have mentioned negative effects (Sadorsky, 2011).

Countries studied in this research which included selected OPEC member countries are the world's major oil exporters and OPEC members. The importance of energy consumption in these countries arises since that, firstly, since the country's income is mainly from oil, loses a lot of financial resources by inefficient use of energy inside; secondly as time goes on fossil energy sources or the oil and gas reduces in exporting countries. So if these countries won't make their energy consumption more efficient or not reform their infrastructures, will face serious problems in next few years (Mukherjee and Chakraborty, 2010).

The aim of this study is to investigate the relationship between energy consumption and economic growth in selected countries of OPEC during the period 1990-2014 using panel data.

### 2. Review of empirical literature

Sadorsky (2011) also introduces and estimates an empirical model of renewable energy consumption for countries in the

group7 for the period of 1980-2005. Co-integration Panel estimates in this study shows an increase in real per capita GDP and Carbon dioxide emissions per capita is as the main drivers for renewable energy consumption per capita in the long term. On the other hand, rising oil prices have had small and negative effect on renewable energy consumption. According to the research findings, long-term elasticity estimated by the cointegration panel of FMOLS model show that 10% increase in real per capita GDP, 8.44 percent increases renewable energy consumption. While 1 percent increase in per capita carbon dioxide will increase 5.23% per capita consumption of renewable energy.

Apergis et al. (2010), test the causal relationship between carbon dioxide emissions, nuclear energy, renewable energy and economic growth for a group of 19 developed and developing countries for the period of 1984 to 2007 using error correction panel model. They have expressed bidirectional relationship between renewable energy and economic growth means that Expansion of renewable energies will not only can reduce dependence on external energy sources for import-dependent economies, but also this factor can reduce the risk resulting from fluctuations in the supply of natural gas, oil and prices.

Deedgula and Kaya (2013) in a study evaluated the relationship between energy consumption, export, import and GDP for OECD countries over the period of 1998 to 2010 using integration panel method and use of Granger causality test. The model was estimated for this purpose have been as follows:

$$\text{Energy} = F(\text{GDP}, \text{Import}, \text{Export})$$

In top model the Energy is energy consumption, Import is import and GDP is based on 2005 fixed price and the Export is export.

At first existence of long-term relationship is evaluated using co-integration regression in model and after securing the long-term relationship between the research variables investigated the causal relationship between energy consumption with import, export and GDP (Armen and Zare, 2010). The results showed that export, import and GDP have significant and positive relationship with energy consumption. Other results of the research showed that there is bidirectional Granger causality relationship between energy consumption-GDP, energy consumption-export and energy consumption-import and mark of long-term stretch between variables is positive so that one percent increase in GDP, exports and imports respectively causes an increase of 0.32, 0.21 and 0.16 percent in energy consumption (Zellner, 1962).

Behboodi et al. (2010) in an article entitled "Study of the relationship between energy consumption and GDP in developing and developed countries" studied use of Johansen cointegration test. The results showed that in the long run there is two cointegrating vector between variables in selected developing and developed countries. Although these two vectors are different, during the studied period developed countries are in higher level of energy consumption than developing countries and amount of long-term impact of energy consumption on GDP in these countries is less than developing countries.

Maleki (2015) in a study investigated the causal relationship between energy consumption and economic growth over the period of 1360-1380. The results of estimated model showed that any changes in energy consumption both in the short and in the long run could affect economic growth, so that any limitation in its use can reduce economic growth.

### 3. Model and analysis of data

The model used in this study is as follows that is adapted from Ting-Huan et al. (2010) research:

$$\text{Energy} = F(\text{GDP}, \text{Import}, \text{Export})$$

In the above model the Energy is energy consumption, import, and GDP is based on 2005 fixed price and the export.

This research is based on combined data methods. When the panel data is used different tests should be done for diagnosing the proper estimation method. The most common test in this field is Chow test and Hausman test. Chow test is used to test between ordinary least squares method and the fixed effects model. In this test, the null hypothesis expresses the equality of coefficients and intercept in studied data. Thus, rejection of the null hypothesis indicates using panel data and not rejecting the null hypothesis indicates using merged ordinary least squares method. If it is determined in Chow test that separate intercepts can be considered for all sections or times In this study, then

should attempt to test choose between estimates with group or time random-effects. The main assumption in fixed effects model is that error term could be correlated with the explanatory variables, while in random effects model it is assumed that there is no correlation between error term and explanatory variables. Hausman test also uses chi-square criteria. If the probability of the test statistic is more than 5%, at the significant level of 0.95 % random effects can be preferred to fixed effects; otherwise fixed effects are chosen.

### 4 Model estimation

According to what was said desired model is estimated using panel data. The results of estimated model are in following.

If time series variables are non-stationary, the coefficients will lead to a spurious regression. In the first stage unit root and co-integration test of panel takes place on model variables in order to prevent spurious regression. In this study, the Levin, Lin and Chow tests are used. The null hypothesis of test indicates non-stationary of variables.

Table 1: unit root test on the level and the difference of variables

Variables	Levin, Lin & Chu (First difference of variables)		Levin, Lin & Chu (level of variables)		collective degree
	Statistic	Probability	Statistic	Probability	
GDP	-11.22	0.000	1.96	0.97	I(1)
Energy	-	-	-7.70	0.000	I(0)
Export	-	-	-17.84	0.000	I(0)
Import	-	-	2.76	-3.76	I(0)

Source: Researchers findings

As Table 1 shows that all research variables are static except GDP, but first difference of GDP is static. In other words, GDP are I(1).

Cao co-integration test is used to prove non-falseness of regression in this study. T statistic value in Cao's test is obtained as (3.25-) and the P-Value equals (0.003) which confirms the existence of co-integration so it can be said that there is a long-run balance relationship between independent and dependent variables. After securing co-integration relationship, it is

necessary to determine the type of panel data estimation method in order to estimate the model. So, initially to determine the presence or absence of a separate intercept for each of these countries the F-statistic is used. Then, the Hausman test is used to test if the model is estimated by fixed effects method or random effects. The results of the F test, confirm estimation of model using fixed effects. Hausman test also indicates approval of fixed effects model against the random effects. Table 2 shows the results of Chow and Hausman test.

Table 2: Results of Chow and Hausman tests

Type of test	Significant level	Test statistic	Type of test	test results
Chow test	0.000	151.54	Chow test	Approval of fixed effects model against the pooling data model
Hausman test	0.000	22.26	Hausman test	Approval of fixed effects model against random effects

Source: Research results

The results of model estimation with fixed effects is shown in table (3).

Table 3: Model estimation with fixed effects

Explanatory variable	Dependent variable : Energy		
	compound data test		
	Prob	T-statistic	Coefficient
GDP	0.05	1.890	0.630
Import	0.021	2.25	0.180
Export	0.000	5.69	0.277
Constant	0.0000	-24.48	-11285.9
F statistic	265.96		
P-value	0.0000		
R <sup>2</sup>	0.87		
Adjusted R <sup>2</sup>	0.88		
DW	1.96		

Source: research results

Based on the results of table (3), F test represents significant of the regression. Based on other results, the variable GDP, has positive and significant effect on energy consumption in the studied countries. expressly, the increase of production, has

increased the energy consumption in this countries. In some new theories, although the energy factor together with other factors is considered in the model, but its importance in various models, is not the same. Thus, according to existing theoretical

foundations, about justification of the relationship between energy consumption and GDP, existence of such relationship can be rationally logical and considered theoretically. Also the import factor has significant and positive effect on energy consumption. In fact, the increase in imports has increased the energy consumption in studied countries. Import and export variable, have had significant and positive effect on energy. Also the increase in exports and imports and has increased the energy consumption in these countries (Angeliki, 2011). Specifically trade includes exports and imports of goods and theoretically there are several reasons for why exports could affect energy consumption. To make growth happen in exports, machinery and equipment for loading and transportation of exported goods should be sent to ports, airports or unloading stations. Machinery and equipment in the manufacturing process and transportation of goods for export, are in need of primary energy and any increase in exports, represents growth of economic activity and this growth will increase energy demand. So the export of manufactured goods require energy for transportation, means without enough energy to transport, the export expansion will be weakened. Imports can also affect energy consumption. If importing include machinery, equipment and new technology will cause an increase in production and increased use of energy. In addition, imports of goods are done through the transport network which causes the fuel consumption by the transport system (Stern and Cleveland, 2004).

## 5 Conclusions

Nowadays issues related to energy consumption and amount of its consumption in different sectors, is one of the most important issues in policy and planning of countries. In this study, the relationship between energy consumption and GDP, importing and exports of selected countries in the Islamic Middle East during the period of 2014-1990 were analyzed using panel data. The results showed that GDP, importing and export have had significant and positive effect on energy consumption in studied countries (Akarca and Long, 1979). Suggestions of this research is presented in two parts for studied countries in general and Iran in particular:

According to results of this study and export and import's direct effect on energy consumption, in the absence of a systematic program, increased demand for energy, could have adverse effects on the environment. So it is recommended to run strategies to reduce energy consumption in the transport sector, especially in the export and importing of goods so that we can reduce the amount of pollution emitted by vehicles. Based on previous studies, the use of rail freight is one of the best ways of transporting in terms of pollution. In Iran, one of the goals and visions of economic development, is to achieve first place in economic, science and technology in the South West Asia with an emphasis on software movement and science production, rapid and continuous economic growth, and the relative improvement per capita income in reaching full employment. According to conjunction of oil and gas markets in the world, in the shadow of economic globalization and nonrenewable energy and resource scarcity, oil embargo against Iran, will reduce pace of development of energy resources in Iran. Therefore increase in productivity of production technology and modernization of production equipment is essential in order to reduce energy consumption and increase the efficiency of production.

**Abstract.** Statistical population of the research included the employees of Qazvin Glass Factory. Due to the high number of the members of studied population, it was used simple random sampling. Samples were obtained from 292 people, based on Cochran formula. For testing hypotheses, it has been used univariate regression and independent two-sample t-test to study in-group and out-group word of mouth advertising due to normal variables and independent errors. Results showed that newness and usefulness of the products has positive and significant effect on the creation and the amount of in-group and out-group word of mouth advertising. In addition, results from two-sample t-test showed that successful function of in-group word of mouth advertising is higher than out-group word of mouth advertising.

**Keywords:** Newness of the Product, Usefulness of the Product, In-group and Out-group Word of Mouth Advertising

### 1. Introduction

Researches conducted by researchers have continuously showed the importance of word of mouth advertising in shaping attitudes, purchase decisions, and decreased risk related to customer purchase decision. Today, positive word of mouth advertising is considered as a very powerful tool to promote product sales so that it quickly place unknown and obscure products into the path of fame and unbridled trade reputation. Many marketers have also considered positive word of mouth advertising as one of the oldest forms of marketing communication. In many situations, it is possible that word of mouth advertising is one of the most powerful forms of communication, especially by a person whom we know and believe him.

Today, word of mouth marketing is growing very fast. According to Clarify research group, word of mouth advertising has become the Holy Grail of marketing. Word of mouth marketing is a type of marketing that motivates people to iterate your marketing message to others. It gives people motivation and reason in order to speak with each other about your company products/services. Multi Level Marketing Company (MLM) has first used the word "word of mouth marketing" in 1980 in Australia. MLM Company who was one of producers of diary products, could increase its sales amount several times using promotion method. Word of mouth advertising has long been considered as a factor affecting on consumer behavior (Moldovan et al. 2011). Word of mouth advertising points out to informal communications about products that could be in the form of product or service (Moldovan, 2011). As word of mouth advertising is a communication between a receiver and a connector, it is often reported as a non-commercial communication, which is understand (Lam et al. 2009).

Word of mouth advertising can have positive and/or negative capacity. According to the researched conducted by Lam et al. (2009), when word of mouth advertising is positive, it will considerably affect on consumer decision making to get a product. When there is negative, information or rumors related to word of mouth advertising, it will cause to separate the customer from that product or trademark (Lam et al. 2009). People often share important opinions, information, and word of mouth advertising, which will effect on product to be successful (Berger et al. 2010). To buy a new product, consumers often rely on word of mouth advertising to obtain information and consultation (Moldovan et al. 2011).

Various factors effect on the creation of word of mouth advertising including product attributes, cultural factors, the power of relationship between the sender and receiver of a message, specialty of message source, and the characteristics of individuals. According to the research conducted by Moldovan, product attributes can be included product complexity and price, which can be led to the success of new product (Moldovan et al. 2011). Other product attributes include the newness and usefulness of the product, product objectives and services, performance, complexity, and risk level.

In the research, it has been tried to study the effect of product attributes included newness and usefulness on word of mouth advertising. According to the results of researches conducted by Moldovan et al. (2011), the newness of the product increases consumer tendency to word of mouth advertising. The usefulness of the product also leads to word of mouth advertising. Various factors can affect on the effectiveness of advertising, which can be referred to consumer involvement. Consumer involvement is defined as perceived personal importance or interest related to product/service/ idea acquisition, usage, or withdrawal. As consumer involvement increases, consumers gain more motivation to pay attention, understand, and open a gap on the information that is important to purchase a product (Mowen et al. 2007). Therefore, products could be classified in two categories: low product involvement and high product involvement. In the research, our aim of products is low product involvement.

On the other hand, various factors affect on involvement, one of which is product attributes. Obviously, community members are the memberships of various groups. Members of these groups can have a close relationship with each other or be unfamiliar to each other. People who have a close relationship with each other and who are family members or close friends are called in-group people; other people outside this definition are called out-group people. Since, people tend to share their purchasing and consumption experience with others, they can affect on word of mouth advertising, introducing the product to others, encourage them to purchase, and/or avoid them to purchase. The research has also been trying to study whether people would prefer to share their information with in-group or out-group people.

Lam et al. (2009) conducted the research in this area. He studied cultural values according to the dimensions Hofstede (1980) pointed out. That research showed that individualism is effective on spreading word of mouth advertising. This observed in out-group people more than in-group people. People also placed more value on matriarchy and power distance. It is expected that they would spread positive word of mouth advertising within their group. Finally, they found that avoiding uncertainty has a negative correlation with in-group word of mouth advertising.

Therefore, the purpose of current research is to study the effective factors of product attributes on in-group and out-group word of mouth advertising among employees of Qazvin Glass Factory.

### 2. Literature review

Khabiri et al. (2013) studied the affect of four variables of trust, commitment, communication, and expertise on the relationship quality and the affect of the relationship quality on word of mouth communication among customers of private body building clubs. Results showed that four variables of trust, commitment, communication, and expertise had positive and significant impact on word of mouth communication among customers of the clubs. Fit indices also suggest that data were well fitted with the model.

Hasangholipour et al. (2013) theoretically and practically studied the factors predicting customer word of mouth in Airlines Corporation (case study: Iran Air Airline Corporation). Findings showed that satisfaction, trust, quality of the service, perceived value and loyalty were effective factors on the creation of positive word of mouth in Airline Corporations.

Zargham and Alaei (2010) studied to choose a proper form of internet advertising in the air transportation sector using an applied model (case study: Iran Air Airline Company (Homa)). Results showed that there is a significant relationship between internet advertising such as banner, pop-up, interstitial, skyscraper, super-text, email, and video advertising and customer purchase in Homa Airline Corporations. After application of exploratory data analysis based on one-sample ratio test according to results from sections 2 and 4 of the questionnaire), skyscraper internet advertising was known as the most desirable form of internet advertising in the Air Transportation Service.

Ranjbaran and Jalilvand (2010) studied E-word of mouth advertising in tourism management. They concluded that word of mouth advertising and interpersonal influences are as the main source of information when make decision about the purchase. Sources of internet word of mouth advertising play an important role in consumer decision-making process. When word of mouth advertising becomes digital, the large and transient nature of internet requires new was of capturing, analysis, interpretation, and management of online word of mouth advertising. Anonymous visitors who add their opinions in web pages quickly become opinion leaders of electronic age.

Mortazavi (2010) conducted a research concerning focus of control and word of mouth communication among consumers. They stated that word of mouth communication is one of the most important means of informal communication in the marketing among consumers about products, services, and organizations. Internal focus individual are more likely to involve in word of mouth communication and to share their information and experiences about products/services with others. However, external focus individual are less likely to involve in word of mouth advertising and they refuse to do so.

Martin and Lueg (2011) showed that the effect of face-to-face word of mouth advertising is stronger than the effect of electronic word of mouth advertising. Findings showed that using word of mouth advertising is heavily influenced by audience attitude toward the product. Once, individual have little knowledge about the product, information understood through the source have a large impact on individual attitude toward the product especially when the audience trust to a source of word of mouth is stronger. However, if the audience feels that he/she has substantial information about the product, the source of word of mouth communication will be of less value. He also said that positive word of mouth advertising directly affects on the audience attitude toward the product and their purchase intention.

Berger et al. (2010) researched the positive effects of using negative advertising. For negative and unknown product, giving people more knowledge about the product leads to increased possibility of purchasing such products.

Mohammadi (2002) studied a kind of network structure, which is created in the online environment. It was assumed that network structure in online environment is different from network structure in non-online network and real life. It was also stated that network structure is influenced by the time of innovation acceptance in electronic communication environment.

Goytte et al. (2010) stated that dissatisfied customer expresses his displeasure to nine people while satisfaction has just expressed to five people. Results showed that positive capacity

is the main factor creating word of mouth communication. She also stated that creating word of mouth advertising includes four dimensions: intensity, positive capacity, negative capacity, and the content of word of mouth advertising. Electronic word of mouth advertising can be used as a strategic tool for business managers.

Lam et al. (2009) studied the effects of cultural value on the formation of common communications in in-group and out-group word of mouth advertising. They used four dimensions of Hofstede to study cultural values. They knew individualism in spreading word of mouth advertising. They stated that this has been observed in out-group people more than in-group people have. Respondents also placed more value on matriarchy and power distance. It is expected that they would spread positive word of mouth advertising within their group. They found that avoiding uncertainty has a negative correlation with in-group word of mouth advertising.

East et al. (2008) conducted a research about measuring the impact of positive and negative word of mouth on brand purchase probability. They believed that positive word of mouth advertising has more effect than negative word of mouth advertising. Prior to this, they had studied the relatively incident of positive and negative word of mouth.

Matos and Rossi (2008) found that satisfied customers are not necessarily loyal customer. Damage caused by negative word of mouth advertising can lead customers to separate from the providers in the short-term experience of dissatisfied customers. Appropriate recommendations can lead to increased customer commitment to the organization. Managers can increase customer commitment by improvement and identifying common values, which exist between customers and companies. This can be as an incentive for supporting customers.

Grun et al. (2006) in the research found that exchange of knowledge and information, which occur between customers with customer, has a direct relationship with loyalty intentions. Electronic word of mouth advertising considerably affects on customer perceived overall value.

Kempf (2006) stated that women have more positive attitude toward word of mouth advertising than men have. However, both men and women can equally determine information after receiving the information of word of mouth advertising.

Maxham (2001) stated that improved services could affect on consumer perceptions. They measured satisfaction, purchase intention, and positive word of mouth in their research. They found that the improvement of various services affect on consumer attitude and behavior. Improvement of effective services can cause customer retention and customer loyalty. When improved services is considerably higher than medium level, it will be caused to positive word of mouth advertising.

According to the importance of in-group and out-group word of moth advertising and its effects on the amount of product sale in Qazvin Glass Factory. The research has studied the effect of newness of the product and the usefulness of the product on the creation of in-group and out-group word of mouth advertising and the amount of word of mouth advertising.

### 3. Methodology

In the research, product attributes such as the newness and the usefulness are independent variable; characteristics of group members such as being in-group and out-group as well as the amount of word of mouth advertising are considered as dependent variables.

According to stated variables and above mentioned the conceptual framework of the research is shown in figure 1.

Figure 1. Conceptual framework of the research

### 3.1. Research method

Type of current study is applied research in terms of objective and descriptive-survey in terms of subject attributes and the time of data gathering. It has been used field method to gather data. One tool for data collection was questionnaire, which was personally distributed to the respondents. To reach necessary validity to use standard questionnaire, mentioned questionnaire was submitted to the supervisor professor and experts to obtain content-related and face validity after developing the questionnaire. After involving their opinions, the final questionnaire was developed and submitted to the customers. In the study, it has also been used Cronbach's Alpha to measure the reliability of the questionnaire. Given that, the amount of Cronbach's Alpha of all variables has been obtained higher than 0.7 so the questionnaire was of high and acceptable reliability. Statistical population of the research included all employees of Qazvin Glass Factory whom were 1210 people on that year. To

determine the sample size, Cochran formula is one of the most common and simplest methods. The sample size of the research included 292 people among employees of Qazvin Glass Factory using Cochran formula limited population). In the research, sampling method was simple random sampling.

## 4. Findings

### 4.1. Determine normality of population

To use statistical techniques, one must first determine the type of distribution of collected data. If distribution of collected data is normal, parametric tests can be used to test hypotheses. If distribution of collected data is non-normal, nonparametric tests can be used to test hypotheses. At this stage, we have been reviewed the results of Kolmogorov-Smirnov test conducted n each of the variables.

**Table 1.** Results of Kolmogorov-Smirnov test

Variable	Kolmogorov-Smirnov	Sig.
The newness of the product	1.045	0.211
The usefulness of the product	0.816	0.383
In-group word of mouth advertising	0.916	0.276
Out-group word of mouth advertising	0.885	0.312
The amount of word of mouth advertising	1.064	0.205

Ref: findings form SPSS output

As shown in table 1, since the significance level of Kolmogorov-Smirnov test is higher than 0.05 for all variables, the data can assumedly be normal. Therefore, null hypothesis of the research based on data normality is confirmed. For testing hypotheses, it can use parametric tests in spss<sub>16</sub> software. Therefore, it was used linear regression to test each hypothesis in the research.

### 4.2. Testing hypotheses

For testing hypotheses of the research, it was used linear regression according to normal distribution of data. According to the conceptual framework, six hypotheses have been tested in the study. The affects of the newness of the product and the usefulness of the product has been studied on in-group word of mouth advertising, out-group word of mouth advertising, and the amount of word of mouth advertising in the first three hypotheses and the next three hypotheses, respectively.

**Table 2.** Results of regression model fitness for hypotheses of the research

Hypothesis	Regression model	Sum of squares	df.	F	Sig.	Durbin Watson
1st	The newness of the product- in-group word of mouth advertising	140.791	290	390.358	0.000	1.937
2nd	The newness of the product- out-group word of mouth advertising	195.082	290	135.432	0.000	1.839
3rd	The newness of the product- the amount of word of mouth advertising	133.350	290	173.834	0.000	1.843
4th	The usefulness of the product- in-group word of mouth advertising	139.863	290	394.872	0.000	1.728
5th	The usefulness of the product- out-group word of mouth advertising	186.427	290	155.183	0.000	1.900
6th	The usefulness of the product- the amount of word of mouth advertising	119.772	290	226.415	0.000	1.816

As shown in table 2, the significance level is less than 0.05 for all hypotheses so regression model fitness for all hypotheses is confirmed. Given that the amount of F is significant, the

accuracy of using regression model is confirmed for all hypotheses.

**Table 3.** Summery results of linear regression test for testing hypotheses

Hypothesis		R <sup>2</sup>	Beta coefficient	Sig.	Conclusion
1st	The newness of the product- in-group word of mouth advertising	0.574	0.757	0.000	Confirmed
2nd	The newness of the product- out-group word of mouth advertising	0.318	0.564	0.000	Confirmed
3rd	The newness of the product- the amount of word of mouth advertising	0.375	0.612	0.000	Confirmed
4th	The usefulness of the product- in-group word of mouth advertising	0.577	0.759	0.000	Confirmed
5th	The usefulness of the product- out-group word of mouth advertising	0.349	0.590	0.000	Confirmed
6th	The usefulness of the product- the amount of word of mouth advertising	0.438	0.662	0.000	Confirmed

As shown in table 4, the significance level is less than 0.01 for all hypotheses. Therefore, null hypothesis is rejected and all hypotheses of the research are accepted at %99 confidence level. According to the results of the research, the newness of the product on in-group word of mouth advertising, the newness of the product on out-group word of mouth advertising, the newness of the product on the amount of word of mouth advertising. The usefulness of the product on in-group word of mouth advertising, the usefulness of the product on out-group word of mouth advertising, and the usefulness of the product on the amount of word of mouth advertising are confirmed with 0.757, 0.564, 0.612, 0.759, 0.590, 0.662 beta coefficient,

respectively.

#### 4.3. Study in-group and out-group word of mouth advertising

In this stage, we are trying to answer the question: is there a significant difference between in-group and out-group word of mouth advertising? According to the normality of variables of in-group and out-group word of mouth advertising (based on results of Kolmogorov-Smirnov test), it has been used two-sample t-test to answer the question, of which results are as follows:

**Table 4.** T-test for in-group and out-group word of mouth advertising

Variables	Number	Mean	Standard deviation	T statistics	df.	Sig.
In	292	3.60	1.05			
Out	292	3.37	0.99	-2.784	582	0.006

As shown in table 4, the amount of significance level of two-sample t-test was obtained for in-group and out-group word of mouth advertising. Since, the significance level of t-test is up to 0.006 and is less than the amount of acceptable error ( $\alpha = 0.05$ ), there is a significant difference between the mean of in-group and out-group word of mouth advertising. As shown in table 4, the mean difference was significant, the mean of in-group and out-group word of mouth advertising is 3.60 and 3.37, respectively, and the mean of in-group word of mouth advertising is higher than the mean of out-group word of mouth advertising. Therefore, it can be said that there is a significant difference between in-group and out-group word of mouth advertising; and the performance of in-group word of mouth advertising is higher than the mean of out-group word of mouth advertising.

## 5. Conclusion

The objective of the research was to study the effective factors of product attributes on in-group and out-group word of mouth advertising, in order which six hypotheses has been designed. Statistical population of the research included employees of Qazvin Glass Factory. It has been used simple random sampling method due to the high number of members of the studied population. The sample size has been obtained from 292 people based on Cochran formula. It has been used the questionnaire of Moldovan et al. (2011) and Lam et al. (2009). According to the normality of variables and independency of errors, it has been used univariate regression for testing hypotheses; and it has been used independent two-sample t-test to study in-group and out-group word of mouth advertising in Spss22 software. Results showed that both the newness and usefulness of the product variables have positive and significant effect on the creation of in-group and out-group word of mouth advertising and the amount of word of mouth advertising. In addition, results of two-sample t-test showed that the performance of in-group word of mouth advertising is higher than out-group word of mouth advertising.

Companies should look to identify strategies that will stimulate positive word of mouth advertising among the customers. Companies should also identify factors, which lead to negative word of mouth advertising and try to decrease their affects. In this way, it can increase the possibility of forming positive word of mouth advertising among the customers and encourage them more to speak about company services with their friends, relatives, and colleagues. In addition to the main services and improvement of equipments and facilities, creating superior value or more benefits for the customers by offering customized services; increasing working hours for responding to the customers; informing and accurately expressing the facilities, possibilities, and limitations; and providing various and ancillary services will lead to customer loyalty and differentiate the company from its competitors.

According to the results of the last three hypotheses of the research, it was showed that the usefulness of the product has positive and significant affect on the creation of in-group and out-group word of mouth advertising and the amount of word of mouth. Given that, the buyer is always looking to buy a product that can create an interest and benefit for him, meet his need, or give him benefit by its usage. Therefore, it is not possible except by providing a memorable experience through providing better and higher quality service. In addition, the more the speed of offering products, the variety of products, paying attention to the customer needs, and transaction security; surely the more affects on the creation of in-group and out-group word of mouth advertising and the amount of word of mouth. Furthermore, it is recommended to set up websites by the sellers for promoting the brand and to provide the possibility of word of mouth advertising for the consumers in ways such as giving comments or opinions in websites, providing awareness campaign through internet catalogs and banners. Spreading electronic word of mouth advertising via e-mail and message, and providing word of mouth advertising messages in which show the customer perceived high quality of the company products.

Therefore, according to the research results:

**Abstract.** Ethics includes Islamic transcendental teachings, which has had a profound and imperative role in the development and expansion of Islamic civilization. Professional ethics requires issues, with which can provide and maintain its realization context. In this case, professional ethics will appear and continue in a way that it should be. This research is a descriptive-survey research. The validity of the questionnaire has been obtained by the formal method. The reliability of the questionnaire has been obtained by the Cronbach's Alpha test. It has been made five hypothesis to examine variables (social responsibility, justice, trust, loyalty, sociability) of which four hypothesis has been confirmed and one hypothesis has been not supported. Results show that there is a significant relationship between sociability, justice, trust, and employee loyalty in Zanjan Water and Wastewater Corporation.

**Key words:** Professional Ethics, Social Responsibility, Trust, Justice, Sociability

### 1. Introduction

Ethics is the plural of mood and it has two meanings, in words. Some consider ethics as an inner force and nature that may have been only understandable by the foresight and non-appearance, compared to creation that is considered as a tangible form and is understandable by an eye-popping. Others know mood as a firm sensual characteristics which human promptly acts according to it (Sharifi, 2010).

The purpose of professional ethics reflects on the ethical dimension of issues and subjects that are related to specific jobs such as medical ethics, business ethics, etc. (Hosseini, 2011). Professional ethics, which has the meaning within strategic approach as ethical responsibilities of organization and enterprise toward direct and indirect environment, has taken many attentions of Iranian organizations in the recent decades. The dominance of professional ethics has many benefits for the organizations such as internal dimension and aspects of improving relations, increasing understanding atmosphere, reducing conflicts, increasing more commitment and responsibilities for employees, and reducing the costs of control. In addition, the dominance of professional ethics influences the organization from social responsibility aspect by increasing the legitimacy of organization and its actions, moral obligations given the importance of stakeholders, increasing revenue, profitability, and improving competitive advantage of organizational success (Beykzad et al. 2010). Professional ethics has organizational contexts as well as brings cross-organizational results and effects. Promote ethics in the enterprise and moral excellence of organizational culture not only creates a lively environment exposed to increased productivity, but also it plays an effective role in the society beyond the organization. Health and, beyond it, moral excellence of the society are influenced by the enterprises and its organizations (Qaramaleki, 2008). Ethics in all human societies get its base from school, ideology, and applicable value system of the society. Islam is among the schools in which ethics is treated as important and left memorial valuable assets of verse

and traditions, and historical examples.

Reviewing management literature in 19980-1990 indicates the influence of ethical issues and rules, social responsibilities, social thinking on the management of which scope is still under developing and expressing (Nadimi, 1998). Every person is responsible for the environment in which he live (work environment) in addition of his life. One should set his relationship with the environment according to his job so that he does well his main responsibility and duty toward others, at the same time, creating moral conscience. Applying right job ethics in the working environment attracts trust of others and causes more social and economical opportunities to be developed. Access to all these factors requires to respect the right of others and to perform job tasks as best as possible along with the use of moral conscience. Other importance of ethics review is that if moral values do not internalize in a society and its organizations, neither the law nor efforts and government policies nor other tools and mechanism will not have function and be efficient (Qorbazadeh and Kariman, 2009). Today, the most important variable in organization success is professional ethics. Professional ethics is of strong values and charges that comply with them play a role in the organizations and social norms. Professional ethics provides self-control and self-improve power for the person or for the organization. However, comply with professional ethics increases the ability of organizations in business and reduces the costs of society and organizations (Mohammadi and Golverdi, 2013).

### 2. Problem Statement

Professional ethics, which has the meaning within strategic approach as ethical responsibilities of organization and enterprise toward direct and indirect environment, has taken many attentions of Iranian organizations in the recent decades. One of the main concerns of efficient managers at different levels is how to provide appropriate opportunities for human factors working in all profession so that they can deal their tasks in their society and business with responsibility and commitment and comply with ethics principals governing their profession. Professional ethics is as a double-edge sword whose one-edge is threat. Weakness in the system of morality leads to reduce communications and increase damages in the organization; and management will rely more on retrospective control because people do not convey information to the management. In this case, the energy of organization is converted to the negative energy. In other words, organization power will be spend on rumor, gossip, and layoff instead of organizational goals. The other edge of the sword is opportunity. Professional ethics dramatically influences on activity and results of the organization. Professional ethics increases productivity, improves communications, and reduces risk degree because information flow easily facilitates and the manager can be informed before the event when professional ethics dominates in the organization. Therefore, the dominance of professional ethics in the organization is significantly able to assist the organization in order to reduce tensions, achieve successfully the efficiency goals, and make it responsive (Beykzad et al. 2010).

### 3. Importance Of Subject

As Islamic perspective, importance and necessity of professional ethics is the moral decay and breakdown of moral boundaries, in which case nothing will be left to be health and humanity collapses. This is of critical and special situation in the administration affairs. Because when a person moves out of individual privacy, he/she is linked to other human beings, and this link forms administrative, if good ethics not govern on human relationships, the tragedy will be multiplied. Therefore, the highest criterion in any administrative organization is to belong to human ethics.

Working is sweet and with job satisfaction and feeling of satisfied and self-actualization, on the one hand, and people consent and the work prosperity, on the other hand. Consequently, working leads to satisfaction of the creator, precipitation of blessings, development of human talents toward absolute perfection in the working field and acting based on the fundamentals of professional ethics. Lack of professional ethics is to eliminate the context and bed of human and society flourishing toward absolute perfection. Moral decays is to rise a sense of self-dissatisfaction, a sense of vanity, a sense of decline and destruction, the rise of which appears as anger, intolerance, abuse, boredom, disloyal, absenteeism, and psychosomatic disease. Professional ethics removes repetitive, boring, and tedious aspects of working and gives people a sense of excellence. The sense of excellence seriously affects on work-esteem and human relationships with others. By ethics to be broken, all privacies are breached. When privacies are breached, any evil can penetrate in the inside, outside, and relations. Imam Ali (AS) has said, "lest break the excellent moral, change it, and convert to bad moral" (Qaramaleki, 2009).

Today, many countries in the industrialized world have reached the maturity that disregard ethical issues and evade from responsibilities and social commitments leads to the loss of entity. Therefore, many successful countries feel the needs to develop ethical strategies. They have reached the belief that and ethics-based culture should penetrate in the organization. Thus, they have tried to give a special position to the researches about professional ethics (Amiri et al. 2010). Understanding our rich heritage in professional ethics can help us to encourage the development of this knowledge and show its way. Islamic ethics teachings are one of rich sources to understand professional ethics. Due to current poverty in the field of professional ethics in our country, we try to design a framework model of professional ethics with Iranian-Islamic approach in the research, which is one of the most important sources of ethics in Islam (Farahani, 2011).

#### 4. Literature Review

Ethics is included in sublime teachings of Islam that has had a dramatic and imperative role in the creation and development of Islamic civilization. To show the importance of ethics, it is enough to say that the Seal of Prophethood (Mohammad) communicated his mission statement to the world after his designation to the prophet position that was "to perfect moral standards." Since he says, "I have been designated as a prophet to perfect moral standards."

Of course, the prophetic ethics is the most effective means of Islam development after the Quran in Peninsula Arabia and the geography of the world. God says in the Quran about Prophet, "and most surely you conform (yourself) to sublime morality."

In other verse, God addresses the Seal of Prophethood as the prophet of mercy: "and we have not sent you but as a mercy to the worlds."

The important key of the progress and development of Islamic civilization after the miracle of Quran is prophetic ethics, which brings Islamic civilization to the glory as far as Muslims were placed at the height of cultural and civilization achievements in the fourth century. Prophet moral is sacred and divine ethics. Ethics philosophies have differentiated between sacred ethics and secular ethics. Sacred ethics is God-centered and perfectionist but secular ethics is human-centered and pragmatic. It can be noted the following items from the features of Islamic and prophetic ethics, of which increasing creation and development of Islamic civilization has resulted: protection of human dignity, justice-centered, meritocracy, the spirit of mercy and compassion, forgiveness, tolerance for oppositions, compliance with human right, and having moderation policy in manners and methods (Hedayati et al. 2011).

#### 5. Professional ethics

Professional ethics is to find an executive mechanism to change general ethical principles and theories to administrative and organizational environment that is highly monitor the existence needs and damages in the working and society environment. Professional ethics is a set of accepted ethical actions and reactions that are established for professional community by the organizations (Salamati, 2004).

Professional ethics can be considered as the application of ethical principles in life and professional relations. The main question of professional ethics can be stated in the manner that how do we behave in our professional and working relations to be adhered to professional ethics (Deilami, 2008)?

Professional ethics is a branch of applied ethics. There are both traditional and new approaches in professional ethics. The traditional approach is to turn the human resources management to professional ethics, which focuses on ethical responsibility of individuals in jobs, businesses, and occupations. The new approach, which has become common in recent decays, is the approach of strategic management toward professional ethics. In this approach, it is focused on the organization responsibility with system approach (Beykzad et al. 2010). As authors view, professional ethics is generally to apply normative ethical principles of a specific school and system to prevent and control an organization or enterprise based on existing and advanced damages, needs, and requirements (Mohammadi and Golverdi, 2013).

##### 5.1. The concept of professional ethics

Professional ethics is a branch of applied ethics that deals with ethical issues in business. Business owners have two expectations from ethics knowledge: systematically expressing ethical responsibilities in the business and accurately determining and effectively solving ethical problems in the business. Primarily, the concept of professional ethics was applied as working and jobs ethics. Today, some authors of professional ethics use its primary meaning to define it. Terms such as "professional ethics" or "work ethics" are used for professional ethics in Persian language. It has various definitions for professional ethics as following (Qaramaleki, 2008):

- a. Work ethics is mental and physical energy of individual or group to be committed to collective idea in order to obtain power and talent within the group and the individual to develop in any form;
- b. Professional ethics is a new branch of ethics that seeks to answer ethical issues of various professions; it is considered certain principles.
- c. Professional ethics deal with ethical issues, questions, principles, and values of a professional system; it monitor ethics in a professional environment;
- d. The purpose of professional ethics is a set of rules that individual must voluntarily observe based on their voice of conscience and nature to perform professional work without having any external obligations or be subjected to legal penalties in case of violation;
- e. Personal ethics is a person's responsibility against his/her own behavior just as a human being. Job ethics is a person's responsibility against his/ her own professional and working behavior as the owner of professional or organizational position;
- f. The ethics includes a set of worth laws, behavior and treatment obligations, and instructions to implement them;
- g. Professional ethics studies ethical obligations in a profession and its ethical issue as a branch of ethics science. As a definition of profession, it is known as a certain activity that leads a person to be directed to a determined situation along with special ethics.

The definition of professional ethics is as follows:

1. Professional ethics is a common behavior among people of a

- profession;
2. Professional ethics is the management of human behavior and treatment when doing professional work;
  3. Professional ethics is a field of ethics science that studies job relations;
  4. Professional ethics is a set of rules that is primarily obtained from the nature of profession and job (Amiri et al. 2010).

### 5.2. Governing professional ethics

Governing professional ethics benefits more for the organization in terms of internal aspects such as improved relationships, increased atmosphere of understanding, reduced conflict, increased employee commitment and responsibility, and reduced costs of control. It can influence the organization in terms of social responsibility by the legitimacy of organization and its actions, ethics necessity given the importance of stakeholders, increased revenue and profitability, competitive advantage, and organizational success. Today, having professional ethics is introduced as a competitive advantage in the organization. Fred David believes that good ethics principles are preconditions of a good strategic management. Good ethics principles mean a good company. He believes that the growing belief toward adherence to ethics will lead to strategic advantage and will become more common among managers (Beykzadeh et al. 2010). Therefore, professional ethics has its own features and properties in every culture. For example, the privacy of individual is different between an east society and western society (Taqizadeh, 2009). Since Islamic Republic of Iran is an Islamic society, it is so important to recognize principles of professional ethics. According to the principles of professional ethics in Nahj al-Balagha as the second important Shiite books, one of the advantages of which is comprehensive and universality, it has been always given attention to morality and ethics that is worthy. In every research, it is necessary to review already done researches to achieve objectives of the research so we can use their scientific experience. Therefore, several researches are presented in this section.

Mahini (2007) in the research entitled "basics and patterns of professional ethics in Nahj al-Balagha" states:

The effect of Nahj al-Balagha on the development and evolution of Islamic civilization and culture as well as its importance in the promotion of professional ethics based on Islam makes necessary to study professional ethics and communicative behavior pattern introduced in the Nahj al-Balagha. Ultimate criterion of ethics in the Nahj al-Balagha is divine satisfaction; and respect for individual rights is operational basis of professional ethics in the Nahj al-Balagha.

Moarefi (2009) in the research entitled "study the ethos in Shiite thought based on verses of Quran and traditions of Nahj al-Balagha using content analysis method" studied the ethos in Quran and Nahj al-Balagha. Results indicate that Islam religion and Shi'ism focus on ethics and professional ethics. Substantial difference of the ethos between Islamic/Shiite thoughts and other perspectives is on attitudes and ideology. Ethics in Islamic and Shiite thoughts is founded based on unity principle, responsibility, human authority, and the effect of human moral thoughts and behavior on his life after death (visualize action).

### 5.3. Professional ethics in Islam

Behavioral patterns at the level of institutes and social organizations are unifying religious community. A general definition of ethics and communicative behavior patterns is responsibility for individual rights. Religious society involves many issues in terms of interaction of organizations and social institutes in them as well as individual communicative behavior. The issues arise from religious determination of such societies and they should be answered by religious determination. Ethics is organizing communicative behavior in terms of individual, organization, society, and international relations. Interpersonal and intra-personal communicative behavior in private life and

professional life is integrated and organized through ethics. However, communicative behavior of organization with the environment and the interaction of social institutes with each other consolidate based on ethics in both national and international level. To determine the functional components of professional ethics (Islamic), one can use strategic principles of professional ethics in Islam. The main strategic principles of Islam include genuine and unconditional respect for people, respect for human freedom, justice for humans, trusteeship in behavior and personal insight (Ameli, 2009).

Professional ethics in administrative system of the Islamic Republic of Iran should have Islamic identity. It should be formed based on Islamic ethics. Having Islamic identity of professional ethics in our country, it can be point out four reasons (Jaznee, 2003):

- a. In terms of cultural, due to dependence of the mass of our people to the belief system;
- b. In terms of religious, due to the inherent of ethics and religion in Islam context;
- c. Need dynamics in Islamic culture according to its exposure to the challenges of globalization;
- d. In terms of the system of government, oblige to religion-centered theocracy; in terms of law, adoption of Islamic law emphasized by the constitution in the Article VIII.

Islamic ethical system is so that it combines with professional ethics and is inseparable. Because, final criterion and ultimate human happiness is God in this system; and man is the center of ethical attention as a caliph and successor of God on earth. This means that human pleasure and serves him leads to God satisfaction and nearness to him (Qaramaleki, 2005).

It should be said about the latter that the ultimate criterion of ethics is omnibenevolent God's will. The most important strategic principles that can be the origins of forming functional components of professional ethics (Islamic) include: a) human dignity; b) individual liberty; c) social justice: put each thing in its proper place in terms of general concept; d) trusteeship in both bailment and trust-oriented insights. Amongst all, the fourth principle is the most important principle (Amiri et al. 2010).

### 5.4. Framework of professional ethics from the perspective of Islamic teachings

Professional ethics requires and ethical system. There are different ethical systems in the world. Some ethical systems are free of the religion and completely secular. Some other ethical systems are based on revelation and religious teachings. Islam is the religion, one of whose mission is ethics. Professional ethics obtain its ultimate criterion of ethics and strategic principles form the Quran and traditions due to Islamic identity (Qaramaleki, 2009). Therefore, professional ethics should be Islamic in addition of being professional. The purpose of being Islamic is to utilize very important sources of the Quran and traditions. Of course, this means that there is no need of other sources.

### 5.5. Responsibility

Human perfection relies on the perfection of his responsibility. Imam Ali (AS) determined the areas of responsibility much broader. He asked his agents and employees to be responsible for all works and actions as well as their relations (Seyed Razi, 2008).

Responsibility is the basis principle on professional ethics in such way that any kind of irresponsibility is to get out of the right direction and to walk in unrighteousness and obliquity. Human perfection relies on the perfection of his responsibility. Everyone who fails to take responsibility, deterioration will be more in his job. However, everyone who takes more responsibility, he will be perfect in terms of individual behavior and professional ethics (Delshad Tehrani, 2000). Imam Ali (AS)

emphasized more on responsibility and determined the areas of responsibility for his agents much broader. As illustrated in the sentence "Fear Allah in the matter of His creatures and His cities because you will be questioned even about lands and beasts" (Nahj al-Balagha, sermon 167), the scope of agent responsibility not only include people but also cities and beasts. As illustrated, Imam Ali (AS) asked his agents to be responsible for all actions and relations.

### 5.6. Justice

Justice means endurance and consistent in word. The concept calls for justice whatever is a source of moderation, balance, and endurance. Imam Ali (AS) define justice: justice puts everything in its place (Seyed Razi, 2008). This means that the right of everyone and everything will be given to him. Some schools of ethics philosophy consider justice as the ultimate criterion of ethics; some consider justice not as the ultimate criterion but strategic principles of professional ethics (Izadifard, 2007).

Justice attracts peoples' trust and the person can correctly do his task (Delshad Tehrani, 2000). Respect for justice and fairness in administrative relations and serving to people is a principle that administrative system goes out of human form without it; and it will be suffered of any corruption and depravity. The rule of justice on administrative system, honoring justice, protect the rights of others as our own right in arbitration position, respect for the equal right of the parties. In addition, give rights to others equal to our own rights are the most important issue that is to protect the health and strength of administrative system and the cause of heart transplant. Imam Ali (AS) said, "treat people with fairness to trust you" (Tuhaf al-Uqul, 49).

### 5.7. Loyalty

Loyalty is one of social values. It is of great importance in our life and relationship with people. Loyalty has been defined as honesty, trueness, integrity, sincerity, and being faithful in life and relations. In fact, loyalty can be defined as stability and stableness in relations, honesty in interactions, and act upon obligations. The purpose of loyalty to the organization is to employ all the employees' ability to achieve organizational targets, responsibility, eagerly do the work, doubled effort, coordination with changes, etc. There are various definitions for the loyalty (Mohammadi and Golverdi, 2013). H. Becker believes that:

"If a person refuses a job in order to maintain his/her current job having known better situation, higher wages, and more appropriate conditions of that job; it will considered as his/her loyalty to the organization."

Spiritual and emotional sense of belonging to the organization and be sensitive to it is what represents the organization and it is intended as belonging to it (Amiran, 2005). Interested and loyal employees have a higher job performance; they tend to remain in the organization more; they have less absenteeism; they have higher work motivation; and they are more accompanied by changes in the organization. Imam Ali (AS) says about the importance of loyalty "honor covenant particularly with loyal ones" (Seyed Razi, Nahj al-Balagha, sermon 155).

Covenant amongst all nations (Muslim and non-Muslim) is revered and scared. In Islam, it has been too much attention given to fulfill the covenant (Farahani, 2011).

Loyal employee to the organization and their long-term staying in the organization strengthens the human resources department of the organization and brings resources of experiences for the organization. Employees who are loyal to the organization; work for the organization over the years; are well familiar with strategies and mission of the organization; know how they should take step toward the interest of organization, they do not need training, justification and such issues. In contrast, continuous changes of the employees and lack of loyalty to the

organization causes high costs to the organization. In fact, some kind of duplication occurs in the organization and resources of the organization will be wasted.

Loyal employee to the organization is responsible towards organization goals. They work toward these goals and implement managers' decisions. A person, who is loyal to the organization, accepts faster and more pleasing changes in the organization, adapts himself with them because he knows himself as a part of the organization, and understands policies of the organization (Farahani and Ahrafi, 2014).

### 5.8. Sociability

Individual socialization is the process through which employees identify organizational values and learn organization expectations about behaviors related to their jobs and required knowledge to play their role as an effective member. In fact, development and increased level of abilities and organizing human resources of any organization to achieve organizational goals has outlined in vision and intellectual level of human resources management. This level of management significantly contributes to the organization victory and defeat. Human resources management is subject to policies, procedures, and systems that influence on employee behavior, thoughts, and performance (Noe, 2000). There has been provided different classification for tasks of human resources management but in general we can say that the main tasks and activities of human resources management are achievable in five processes (Dolan and Scheler, 2010; Dessler, 2010; Seyed Javadin, 2006). If patterns, practices, policies, and procedures relating to employees of the organization are aligned with each other, they will significantly contribute in achieving organizational goals and strategic plans and it will be more likely to achieve organizational success. Two main tasks of human resources management are the knowledge of employees with the organization as a part of recruitment process and their deployment as well as self-assessment as a part of performance evaluation. At arrival at the organization, individual may have little knowledge and understanding to the organization, what they might do in the organization, and various processes to which are given importance in the organization. In the process of personnel recruitment and selection, it is very rare to select candidates who are aware of values, norms, behavioral patterns of the organization, goals, methods of working, and current rules and regulations of the organization (Dolan and Scheler, 2010). Employees little knowledge about the organization causes various problems in the type of and how the assessment of organization (Saks, 2006). Therefore, employees will experience conflict in terms of criteria, based on which they must be assessed, and expectations which they are functionally expected. Inevitably, they may use their personal impressions and/or false information, which others may be provided them with, to fill the vacuum resulting from lack of information in the organization. Therefore, organization should familiarize staffs with new social and working environment. In addition, understanding and support from the managers and supervisor in the organization can seriously reduce employee errors and mistakes within the organization. This causes employee satisfaction and higher self-efficacy in a progressive cycle.

### 6 Trust

Trust is a positive expectation which individuals are expected to not act as an opportunistic during their speech and behavior. In the study of Islamic sources, it has been used terms such as reliable, trustworthy, reliance, inclination, and their derivatives with some differences in the concept of trust. However, reliable, secure, and inclination indicate a certain concept of trust. That is, reliable and secure are used when it is subjected to rely on someone or something with calm and quiet heart (Skandari and Mousavi, 2011). While in a position of trust, it may be to rely on another person combined with a degree of uncertainty and risk taking (Tavakoli, 2000). Generally, we can consider trust as relying on God, ourselves, others, and nature.

Trust creating is an important and heavy duty for managers and leadership of the society so it needs comprehensive knowledge to have a sustainable and durable result. The concept of trust has a management application, which includes the right application of responsibility, independence, strength in the treaties and social contracting, post and position to serve the community, and matching words with actions (Motahari, 2010).

### 6.1 The role of religious beliefs in professional ethics

In the monotheistic thoughts of Imam Ali (AS), faith in the reality of existence and religious beliefs plays a fundamental role in the term of professional ethics. Hence, Imam Ali (AS) emphasizes on to remember God and resurrection in his governmental orders and administrative guidelines. He calls agents and staffs of his administration system to adhere to professional ethics given up real ubiquitous and observer and remembering a detailed audit of God. Those who faith in almighty God and see himself in the presence of God, they undoubtedly adhere to ethical customs and human behavior. Those who believes in the resurrection and knows precise calculations of God governing on his actions and behavior, they undoubtedly pay careful attention to what God offers because they know the audit of that world far more difficult than the audit of universe (Delshad Tehrani, 2000).

Religious beliefs affect on the enhancement of professional ethics in two ways. On one hand, when people have faith in the resurrection and the rest of the world, they do not need to gain a position and opportunity for themselves in this mortal world with deception, betrayal, cruelty, arrogance, etc.; then they leave the world and go to the other world. On the other hand, those who believe in God and consider the presence and supervision of God on their actions and behavior, they do not commit a sin before the presence of God; they are humble, patient, good-natured, etc. in their responsibilities; these are the foundations for the creation of professional ethics (Hosseini, 2011).

### 6.2. The importance of ethics in Islamic tradition

Professional ethics is not an abstract and celestial phenomenon but a real issue. Naturally, a real good infrastructure and provided backgrounds and necessary conditions can form it. Professional ethics requires actions which provide and maintain the context of its realization. Undoubtedly, professional ethics does not mean without necessary arrangements. These arrangements are both material and spiritual; these are both individual and social; these should be considered both form the top and form the bottom; these require both structural changes and cultural changes. In the other words, it should be provided structure and relationships in which all administrative forces are placed in proper position based on meritocracy. Therefore, their talent will be properly flourished, their abilities will be well appeared, they will serve in an environment full of job security and peace, they will fully secured, and everything will proceed in the legal-oriented relationships. In this case, professional ethics will appear and sustain in a way that it should be.

Professional ethics has been pursued with extraordinary importance in the traditions which have been quoted as behalf of the Prophet as well as other infallible leaders. In the following, some examples of meaningful traditions are mentioned. In a famous tradition of the Prophet (PBUH), we read:

"I have been designated as a prophet to perfect moral standards."

The purpose of "I" which is for restriction shows that all objectives of Prophet Mission are summarized in the perfection of human moral.

In other tradition of Imam Ali (AS), we read:

"Even if we don not have hope of Paradise, fear of Fire, and waiting for reward or punishment, it is proper to follow the moral characters, for these are of things that show the way of success."

It is sufficient to say that Quran said about the expression of the dignity of the Prophet (SAW):

"And indeed, you are of a great moral character" (Al-Qalam, 4).

### 6.3. The ultimate criterion of professional ethics in Islam

The ultimate criterion of professional ethics is a matter that will be taken as argument perfection in order to justify and prove all ethical recommendations and it does not need to justify and prove, as it will also be taken as the last goal and ideal of ethical behavior. Philosophers of ethics are much debated about the ultimate criterion of ethics. According to Islamic ethical system, the ultimate criterion of ethics is God and any behavior that is proximate to him is a virtue. The ultimate goal is proximate to him; such criterion provides goodness of action as well as ensures goodness of the subject (Qaramaleki, 2009).

### 6.4. Neglect the factors affecting professional ethics

In the knowledge of management, it is clear that environmental factors outside the organization particularly the factors of global environment are less accessible for the organization and the possibility of influencing or controlling these factors are almost impossible. However, they are not missed in the analysis of the internal affairs of the organization. The least benefit of understanding these factors are that they will be made us more realistic and thus more successful inn obtaining organizational strategy and policy. In the field of professional ethics and at least in the explanation and analysis of ethical dilemmas of the organization, it should not be ignored organizational and environmental factors. The negligence of these factors in the analysis and explanation of ethical dilemmas causes are suffered us from reductionism and non-realism that will not have result but failure.

Pennino (2004) divide the factors affecting on professional ethics into three aspects:

1. Individual aspect: means that individual features and properties, religious values, personal criteria, family factors, beliefs and character are the factors affecting professional ethics. Absolutely, a person who lacks good individual moral competency, he/she will also not benefit from appropriate standards of professional ethics.
2. Organizational aspect: factors such as leadership, management, relationship with coworkers, relationship with subordinates and elites, reward and punishment system, coworker expectations, regulations and procedures, organizational atmosphere and environment are included in this area. Obviously, undesirability of such factors will threaten professional ethics and vice versa.
3. Environmental aspect: economical, social, cultural, and political factors as well as other organizations and competitive factors among them are the factors affecting professional ethics. Furthermore, lack of facilities and working tools, inappropriate tools, poor working environment, workload in excess of the employee ability, busy office environment, and legal breaches can provoke moral dilemma. Economical instability, political instability, cultural-historical chronic pains such as despotism, which is seriously incompatible with the culture of collaboration and teamwork. Social false teachings such as escape responsibility and knowing laziness at work as a type of sleight, unequal status of global competition, which is threatening business ethics. In addition, other such factors are undoubtedly affect on ethical status of the organization (Amiri et al. 2010).

## 7. Hypothesis

1. Social responsibility has a positive and significant effect on employee performance.
2. Trust has a positive and significant effect on employee performance.

3. Sociability has a positive and significant effect on employee performance.
4. Justice has a positive and significant effect on employee performance.
5. Loyalty has a positive and significant effect on employee performance.

### 8. Conceptual Framework of The Research

Conceptual framework is a fundamental on which all research is

Figure-1: Conceptual framework of the research

### 9. Methodology

Generally, it can be said that this study is a field research which has been conducted by the questionnaire. The study is descriptive-survey research because the tool of data gathering has been distributed and gathered among the population. In the research, it has been studied the relationships between variables through regression analysis so descriptive-survey research is of correlation type. However, the study is applied research in terms of research goal.

#### 9.1. Statistical population, sampling, and method of sampling

Statistical population includes managers and employees in Zanjan Water and Wastewater Corporation. Statistical sample has been selected among managers and employees through random sampling method.

#### 9.2. Research tool

In the research, it has been used standard questionnaire to set the questions which has been included 32 items and designed in two parts for the respondents to understand more. First part includes individual features of the respondents such as gender, age, history, and education. Second part has been provided in order to study other hypothesis.

Questions of the questionnaire have been designed as closed questions. It has been used five-point Likert scale for variables. It was used items 1-4 to study the variable of social responsibility from standard research of Bruno et al. (2009), items 5-9 to study the variable of trust from standard research of Ferda (2003), items 10-13 to study the variable of justice from standard research of Chong (2015), items 14-17 to study the variable if loyalty from standard research of Susan (2015), items

18-28 to study the variable of sociability from standard research of Beykzad (2005), and items 29-32 to study the variable of employee performance from standard research of Ferda (2003).

#### 9.3. Validity and reliability of the research

After a preliminary study on the subject, it has been studied to review research conducted in this fields and their results in order to achieve required validity and credibility in the design and use of questionnaire. Then, the questionnaire was prepared and proposed questionnaire has submitted to the relevant professors and experts. After involvement of their corrective comments, the final questionnaire was developed and it has distributed among managers and employees in Zanjan Water and Wastewater Corporation. Cronbach's Alpha of all variables and overall Cronbach's Alpha was higher than 0.7 that indicates high reliability of the questionnaire.

#### 9.4. Data analysis

It was used SPSS software, descriptive statistics, and inferential statistics to analyze collected data.

### 10. Results

In this part of research, answers provided by the population were analyzed using linear regression test to design the framework of employee professional ethics with Iranian-Islamic approach in Zanjan Water and Wastewater Corporation given the normal distribution of population according to Kolmogorov-Smirnov test. Table 1 shows the results of Kolmogorov-Smirnov test. As shown in Table 1, significance level of all variables is higher than 0.05 so null hypotheses (normal distribution of data) is confirmed.

Table 1: Results of Kolmogorov-Smirnov test

	Social responsibility	Trust	Justice	Loyalty	Sociability	Employee performance
Number	80	80	80	80	80	80
Kolmogorov-Smirnov	0.890	1.187	0.772	1.294	0.909	0.902
Sig.	0.404	0.120	0.675	0.070	0.380	0.390

Therefore, linear regression was used for hypothesis test given the normal distribution of data. For using regression model, it is necessary to test preconditions of using it. In this regard, Durbin-

Watson, co-linearity, and normality of errors tests was done. Results show that all preconditions of using regression are established.

Table 2: Results of regression model fitness for hypotheses

Hypothesis	Regression model	R <sup>2</sup>	Sum of squares	df.	F	Sig.
1st	Effect of social responsibilities on employee performance	0.024	62.968	79	1.933	0.168
2nd	Effect of trust on employee performance	0.207	62.968	79	20.372	0.000
3rd	Effect of sociability on employee performance	0.517	62.968	79	83.568	0.000
4th	Effect of justice on employee performance	0.312	62.968	79	35.360	0.000
5th	Effect of trust on employee performance	0.362	62.968	79	44.199	0.000

As shown in table 2, significance level of all hypotheses is less than 0.5 but the first hypothesis so regression model fitness is confirmed for them. Since, the amount of F is significant, the correctness of using regression model is confirmed for all

hypotheses but the first hypothesis. Thus, effect of social responsibility on employee performance is not supported given the confirmation of null hypothesis.

Table3: Results of linear regression test for hypotheses test

Hypothesis	Regression model	Beta coefficient	Sig.	Result
1st	Effect of social responsibilities on employee performance	0.140	0.168	Not supported
2nd	Effect of trust on employee performance	0.455	0.000	Confirmed
3rd	Effect of sociability on employee performance	0.719	0.000	Confirmed
4th	Effect of justice on employee performance	0.559	0.000	Confirmed
5th	Effect of trust on employee performance	0.601	0.000	Confirmed

As shown in table 3, significance level of all hypotheses is less than 0.05 but the first hypothesis. Thus, null hypothesis is not supported and all hypotheses of the research are accepted with %99 confidence level but the first hypothesis. According to the results, the effect of social responsibility on employee performance was not accepted. The effect of trust on employee performance is confirmed with 0.455 impact factor (Beta). Therefore, trust can predict and explain %20.7 of employee performance. The effect of sociability on employee performance is confirmed with 0.719 impact factor (Beta). Therefore, sociability can predict and explain %51.7 of employee performance. However, the effect of justice and loyalty on employee performance is confirmed with 0.559 and 0.601 impact factor (Beta), respectively. Therefore, justice and loyalty can predict and explain %31.2 and %36.2 of employee performance, respectively.

## 11. Discussion and Conclusion

Islam is a great source of teachings with help of which the organization can provide a context for individual moral growth because ethics is an internal and infrastructure matter. The aim must be develop people who can face problems and solve them with creative thoughts. As people can communicate well with each other and remove problems through using collective knowledge and generating new ideas. One of the necessary conditions for the emergence of new ideas is the existence of peace within the environment of organization. By increasing ethical deposit, it can provide conditions for the formation of a relaxed environment accompanied with ethics in the organization and community and become closer to determined goals. Components of professional ethics such as responsibility, justice, sociability, and trust can help organization to achieve required dynamic and growth in the field of ethics and organizational internal cooperation. However, they can help organization to do assigned duties toward predetermined goals of the organization with a sense of belonging, loyalty, and participation in decision-making and to act as an important arm of higher level of the organization.

Professional ethics is necessary in the organization so that the organization does not violate society, on the one hand, and guarantee its long-term interest with its logical and wise

decision-making, on the other hand. In confronting with the concept of professional ethics, something must be considered that professional ethics includes personal ethics and job ethics but it goes beyond and it is as a legal collection supervisor in the organization.

According to the results of testing hypotheses, components of professional ethics including trust, loyalty, sociability, and justice affect on employee performance in Zanzan Water and Wastewater Corporation. To promote professional ethics in order to improve employee performance in Zanzan Water and Wastewater Corporation, following recommendations are provided:

- Pay attention to sociability as an advantage of professional ethics in business environment
- Strengthen ethical atmosphere of the organization based on trust in the workplace and foster a sense of belonging, commitment, and loyalty to the organization
- Respect for ethical principles in payments, fairness, and consistency in performance evaluation and reward/punishment system by modifying remuneration with providing explicit and clear criteria
- Employee loyalty in the organization, which leads to customer satisfaction, and loyalty to the organization that leads to profitability and improvement in organizational performance.
- Pay attention to the needs of employees, organizational justice, interactions between managers and employees, creating a spiritual environment in the organization, providing job security, job assignment based on responsibility in the organization, which causes the organization to be welcomed, by the customers and effects on the improvement of employee performance.

<sup>b</sup>ostadmis@yahoo.com

**Abstract.** The present study has paid to investigate the role of culture in the field of increasing the international marketing share. The culture has an influential and changeable impact on each of the national and international market environments. The global marketing managers must recognize the impact of culture and be prepared to respond to it and otherwise by its change to coordinate with it and coordinates their cultural products based on characteristics of the target population. The cultural international marketing managers plays an important role and even leadership in affecting cultural changes around the world. The statistical population of the present study consists of Qazvin province manufacturing firms that among these companies, about 220 samples were selected by random sampling.

**Keywords:** Culture, International marketing, Manufacturing companies.

### 1 Introduction

The sale market globalization and how this process is effective in forming the global people cultural characteristics, is considered as the most important critical issues facing the international marketing managers. The powerful forces such as capitalism, global shipping, communications, sales and promotions and internationalize of countries is very effective in the removing of borders limit among the culture and economy of countries and in the view of some people, it also has significant impact to speed up the identical culture create in the global consumer (Babaei Zakliki, 2008, 67).

By considering that the most of the world countries are almost multicultural and growing rapidly, but even in the relatively homogeneous countries, the individuals are thinking differently some extent about understanding, respect and practical to cultural norms. Thus, a correct understanding of culture is recognized as an essential element in the development of effective marketing strategies and marketing superior functions (Cutler, 2000, 50).

In this study, we introduce the culture and then have examined the theories of globalization and the culture impact on international marketing and thus to investigate the role of culture in international marketing and international marketing characteristics.

### 2 Problem statement

Today's world is found the same as village, which its integrity market has spread across the continent. The deliberate and scientific knowledge with the various markets and capabilities and shortcomings of each firm is required to self-knowledge. It must start to move from its knowledge point and reach to knowledge and understanding of customers' obvious and hidden needs. It should be understand that we are in what situation and how to move towards the excellence path.

One of the products that can be entered through of it in addition to protect of the identity at the global level, is the marketing culture which has transformed their culture and national identity to others and promotes the target population cultural needs, so that this marketing has different aspects of domestic and international marketing and it is exchanged a huge part of the material and spiritual cultural products.

This exchange is internal and for cultural enrichment and respond to domestic needs is made and to be exchange, because

the television programs, music and movies and domestic cultural products is exchanged at the international level, since that handicrafts, tourism and visual and audio products that are produced with interdisciplinary look.

In marketing, we must be obtain an accurate recognition of the product to delivery place in order to achieve the more success in marketing issue.

In an article, the export processing region performance of North Asia can be compared in three country of India, Sri Lanka and Bangladesh, which in this study the factors such as: Location of areas, quality of infrastructure, quality of governance, concessions policy and the area special characteristics has a direct emphasis on the success of these areas in three countries.

The mentioned factors analysis in the form of econometric models using descriptive-hybrid statistics of three countries were conducted at two national and regional level.

In an article, the impact of trade liberalization on the export growth can be reviewed for the examples of developing countries. In an article, the impact of export processing can be evaluated in unemployment structure of Harris's model. His purpose in this article is to mitigate the destructive effects of the export processing region in the host country.

Khadijeh Karimi Amiri (2016), in her thesis in a research entitled of "Evaluation of the potential and actual capacities of Iran's free trade zones to fulfill the strategy and export promotion" has been conducted at Tehran University (2015).

Kazem Vafadari (2015) in his thesis in a research entitled of "Evaluation of the role of free trade-industrial zones in the field of non-oil export promotion has been conducted at Imam Sadiq University. Seyyed Mehdi Hosseini (2015) in his thesis in a research entitled of "Evaluation of Iran's free trade zones performance on the basis of cost-benefit analysis in case study of Chabahar at Tarbiat Modares University.

### 2.1 Concepts

Market is referred to a set of potential and actual buyers for a product or service (Cutler, 2000: 42). From the history perspective, market implies to a place that buyers and sellers to exchange goods or services refer to it. But economists are referred the market as a set of buyers and sellers who to buy and sell a particular product or service. From the marketing perspective, the market is formed a set of buyers. At the same time, the word of market sometimes refers to set except of the customers or buyers, such as labor market (Cutler, 2006: 50).

The market consists of all potential customers who have common needs and desires and to meet their needs and demands have tendency towards of the transaction and have the ability to do this work (Cutler, 2007: 50).

Kind of the market:

- Perfect competition: A status of the market with many number of seller or service provider that each one can influence on the prices.
- Perfect monopoly: A status of the market that provide only a manufacturer or service provider a product or service.
- Competitive monopoly: (Multilateral): In this status, several sellers or provider of goods and services may be exist (Babaei Zakliki, 2008: 58).

The word of market is reminded a busy street full of buyers and sellers. But accurately, the market defines as a place where a group of actual and potential buyers of a product to be exist. The market size depends on the number of those who said they need

and their need amount and buyers ability for the transaction. The marketing means to manage and expand of the market in order to meet the needs of buyers and identify of potential needs. America Marketing Association also is known the marketing as a process involves planning and realization of an idea, advertising and the distribution of goods, services and thinking to exchange, so that using of it can be satisfy individual and organizational objectives (Esmailipoor, 2015)

Marketing activities can be regarded respectively as product manufacture, market research, communication, distribution, pricing and services provide. But the main philosophy of marketing management is based on four underlying factors that are known as four *p* (Product, price, promotion, place). Product specifications, determined price for it, time and place appropriate site for product supply and the encouraging factors such as the advertising and informing are constituent of marketing mix. But about technology marketing, these factors are somewhat limited.

The distribution network and encouraging factors for informing and infrastructure are summarized. The price determination has different base and technology specifications is not completely in the buyer hand. The market technology by creating appropriate space for informing and completing information bank, makes the market virtual environment and by facilitating to create the relationship between supply and demand to make easier the marketing. Philip Kotler says that the marketing is an art and science to identify, creation and value provide in order to satisfy the needs of the target market, for achieve to profit. The marketing identifies unfulfilled desires and needs. Moreover, defining and estimating the size of a defined market, its profitability level is also measured. In other words, the marketing identifies the market segments as the most appropriate market segment for the company and specifies that the company has the ability and possibility of services provide to them and also it introduces the most suitable of products and services required of its segment (Babaei Zakliki, 2008: 75).

The international marketing is implementing one or more cases of the marketing activities from one side to the other side of national borders of a country. In other words, it is regarded as the planning and execution all of marketing activities in many countries (Esmailipoor, 2015: 14).

**Domestic Marketing Management:** It is the controllable factors management in the external environment of uncontrollable which is limited by geographical and political boundaries of a country.

**International Marketing management:** It is included the activity in several foreign market and in these markets not only the uncontrollable factors are vary from country to another country but also there is a strong possibility that controllable factors are also vary from market to another market (Esmailipoor, 2015: 15).

International marketing is also included the production operations and sale of goods and services in more than one country, without any goods to pass from the main borders of a country. For example, Ford Company which its original location is in the US is also exported the produced cars in Germany to other countries. For this reason, sometimes international marketing is also regarded to multinational marketing. It should be explained that the concept, stages and principles of marketing has standard aspect and in all markets and countries is applicable. Thus, the distinction between international marketing and domestic marketing is related to their activities (Babaei Zakliki, 2008: 4-3).

## 2.2 Internationalization

Internationalization or in other words, internationalize the activities has studied from the various aspects. This word refers to the different components in the organization as strategy,

organizational structure, products, such and like this, as well as internationalize implies as the process engaging in international operations. Internationalization or in other words, internationalize the activities.

Kalof and Beamish are stated that internationalization process means to coincide process of the companies' operations (such as strategy, structure, resources ...) with the international environment, in other words, in fact, internationalize of activities is considered as a dynamic process.

The benefits entering to the global market: 1. Technology progress; 2. Trade liberalization; 3. Institutions and structures changes; 4. Ideology agreement and global consensus and cultural developments; 5. Investment; 6. Industry; 7. Information technology; 8. Consumers seeking to cheaper and better goods; 9. Specialization of tasks; 10. Profitability; 11. Productivity increase, efficiency and rationalization of production.

## 2.3 The importance of international marketing

Today, no nation cannot live in complete separation from other countries. Economic resources, technology and individual living standards of a country depends relative on the economy of other countries which by the complex flow of goods, services, capital and technology, are related together. The countries through the international exchanges, increase their production levels and acquire more profit.

The price difference or because of the difference in terms of supply or production facilities or difference in terms of demand or consumption patterns or a combination of them. Differences in supply conditions, may be due to differences in natural resources, performance, skill, levels of production technology, and a lot of factors of production and so on. However, the difference in cost or supply conditions, the price difference, but the difference in terms of demand factor alone mainly by the level of income and consumption pattern of different countries of the Ygyrd, make a difference in prices as the difference supply has an effect.

So, through the import they can earn the goods that they are not able to produce and through the export, they send the surplus manufacturing goods in terms of their consumption to other countries. Although a country may has different production factors and can produce a variety of goods, but it will not be able to produce them with the same price. The primary cause of international exchanges, is in the price differences of countries' goods and services. The price difference is because of the difference in terms of supply or production facilities or difference in terms of demand or consumption patterns or a combination of them. Differences in supply conditions, may be due to differences in natural resources, efficiency, work skill, levels of production technology, and frequency of production factors and so on. However, the difference in cost or supply conditions, is not only considered as the factor of price difference, but also the difference in demand conditions which is formed mainly by income level and consumption pattern of different countries, that in creating of the price difference impacts on the supply difference size.

Every country by beginning of international exchange can apply their production factors to produce the products that have more efficient and exchange them with the products of other countries. International exchanges is underlying of international expertise development. Financial institutions with access to foreign markets through exports, has greater growth and thereby to offer their products with better quality to domestic and foreign markets and obtain the higher profits. The tendency to follow towards of the industrial investments, the necessity of economic growth, excellence motivation, and reputation in the business arena, the emphasis on improving efficiency and profitability, domestic markets saturation, mass production policy and the need for foreign exchange, are including the

factors that more reveal the necessity and importance of international marketing.

## 2.4 Marketing Principles

1. Create value for the customer: It means high value for the customer compared to other competitors, which its common methods are as follow: A) Product improve, B) Price reduction.
2. Create competitive advantage: The amount of organization offers compared to competitors in view of customers that can include 4p
3. Focus: Focus and attention to the needs, wants and tastes of the customers.

## 2.5 Culture

Culture is a set of beliefs and behaviors of human groups. Moen Persian dictionary defines culture composed of two words of *Far* and *Hang* which means the literature, education, knowledge, science, wisdom and customs. Culture is derived from biological factors, environmental, psychological and human history.

With regard to set of traditions and complexities of human relationships, even simple things that human like animal needs to them, is formed in the form of cultural patterns. The culture is different ways of life or life plan a group of people. For example, a Japanese is representative of a nation or a society. A Japanese person can be observed directly, but Japanese culture is an abstract of observed rules or regular trends which exists in the ways of life of these people. Culture is as follow: As what the people as members of a society think, acts. In the other words, thoughts, deeds and moral and material assets of a people or community (Esmaeilpoor, 2015: 81).

Cultural exchange is voluntarily transferring cultural meanings and sometimes with cultural programming, as each cultural system takes elements from other cultures. This exchange is done in areas that each cultural system permits it. This cultural transmission is bilateral; it means that values and norms are exchanged.

### 2.5.1 Cultural Marketing

Now with regard to the offered concepts of marketing and culture, we have paid to extract cultural marketing definition

- To set of human activities, cultural, planned, directed to meet the community cultural needs which is conducted by providing cultural goods or services, is called cultural marketing.
- Cultural marketing is a process in line with predict the community cultural needs and meet the needs through cultural exchanges.
- Set of activities that will be lead to customer's attention to the provision of services or cultural goods.
- Organized effort to predict the community cultural needs and meet those needs.

### 2.5.2 Cultural Marketing Management

The process of planning, organizing, leading of human force and resources to coordinate and the favorable control of supply flow and goods and cultural service demand is called " Cultural marketing management".

In fact, cultural marketing management refers to analysis, planning, implementation and monitoring of programs that are aimed creating a desirable level of cultural exchanges. The cultural marketing management predicts a managerial process which determines the customer satisfaction continually and effectively during a given time.

## 2.5.3 International Marketing Culture

International marketing, in its simplest level, is a process in which a business firm must make decisions about their marketing mix beyond the borders of its country. The sophisticated level, is including create of production unit and coordinate the company marketing strategy around the world (Doole and Lowe, 2004).

According to another definition, international marketing is as follow to perform of business activities to send of goods and services of a company to customers or consumers in more than one country, in order to make a profit (Pervez, 2005: 6).

The stages and principles of marketing have the standard and public aspects and in all markets and countries are applicable. The only distinguish of domestic marketing and international marketing is in their activity field.

This important difference creates new discussion of international marketing which among the considerable issues related to it, can be implied to awareness of the other nation (s), the adoption of appropriate strategies to enter the countries and different markets and perform specific actions in markets that for foreigners somewhat is associated with lower confidence and higher risks (Babaei Zakliki, 2008: 4).

## 2.6 The kinds of organizational culture:

The relationship pattern of culture with environment and the organization strategy: Daniel Denison has provided a model which on one hand, the relationship between environmental needs and emphasize of the organization strategic and on the other hand shows the type of organizational culture consistent with them.

Dennis pattern has formed of a two-dimensional matrix that one dimension of it shows the change degree or environmental sustainability and another one dimension of it indicates the type of strategic emphasis (Internal or external). From the impact of environmental needs and the organization strategic emphasis is formed the four types of organizational culture that each one can be associated with the type of strategic emphasis and degree of environmental sustainability compatible with it.

**A) Compatibility culture:** This type of culture that has many flexibility, while it is formed that the organization strategic emphasis is on the external environment. The organization has a lot of requirement which by applying of the flexibility and change move towards of the customer needs. The compatibility culture is a kind of beliefs and behavioral norms that the organization can be support in the discovery, interpret and translate the environmental symbols in the form of new behaviors. This type of organization should be fast response to the environmental needs, to adjust their structure and to apply the new requirements easily.

**B) Apostolic culture:** In this type of organizations, is paid attention to the external environment. But the accelerating change is not face to face. Apostolic culture has focused its fundamental emphasis on a common vision towards of the organizations goals. The expectation of this culture from the organizational humans, is a deep understanding of the organization's mission that goes beyond explaining of the job roles. The main focus on the organization strategic orientation is the future and achieve to distant ideal goals.

**C) Participatory culture:** The first emphasis of this culture is involving and participating of the employee in tasks with regard to changing accelerating of the intra- organizational environment, so the organization purpose in this case is the fast response to the environment and increase efficiency. From the perspective of participate culture, involving and participating of the employee in organization tasks is the sense of responsibility and belonging in the organizational individual which in line

with the people commitment amount towards of aims and organization activities that considerably increases.

**D) Adaptability culture (Continuity):** The emphasis of this culture on inter- organizational environment in relation to the relative stability of the environment. Continuity culture supports from the regular and expected trends in business management. Symbols, rituals, myths and other cultural elements are acted in the field of the situation stabilization, coordination, preserve of traditions and comply with the policies and established procedures.

### 3. Research method

This research in terms of purpose is based on applied method and in terms of data gather is based on survey method. The statistical population of the present study consists of Qazvin province manufacturing firms that among these companies, about 220 samples were selected by random sampling. To data gather, a questionnaire of Denison culture is used which it consist of 60 questions.

In this study, Cronbach's alpha coefficient for the dependent variable and for each independent variable has been calculated. The alpha method reliability all of them is higher than 0/85 and the calculated alpha average for these variables is 0/89.

It should be noted that if Cronbach's alpha coefficient to be calculated more than 0.7 the questionnaire reliability is

evaluated desirable and assessment questionnaire of international markets which determines the amount of importance factors in decision - making for export to a foreign market, has been composed. The questions of this questionnaire were designed with 5 items and how to score and interpret the results has been described. For data analysis, Pearson correlation coefficient with SPSS18 software has been used.

## 4. Findings

### 4.1 Research Hypotheses

1. There has been a significance relationship between participatory culture in the work and international marketing of Qazvin province manufacturing companies.
2. There has been a significance relationship between compatibility culture and international marketing of Qazvin province manufacturing companies.
3. There has been a significance relationship between adaptability culture and international marketing of Qazvin province manufacturing companies.
4. There has been a significance relationship between mission culture and international marketing of Qazvin province manufacturing companies.

**First Hypothesis:** There has been a significance relationship between participatory culture in the work and international marketing of Qazvin province manufacturing companies.

Table (1): The relationship between participatory culture in the work and international marketing of Qazvin province manufacturing companies.

Subject	Used statistic	Value	Significance level
Participatory culture in the work international marketing	Pearson	0.518	0.000

Since that the significance level (0.000) is less than 0.05; so, there has been a significance relationship between participatory culture in the work and international marketing of Qazvin province manufacturing companies. So that by increasing the participatory organizational culture in the work because of the proximity of the Pearson correlation coefficient (0.518) to

number '1' increases. Then, the research first hypothesis is accepted.

**Second Hypothesis:** There has been a significance relationship between compatibility culture and international marketing of Qazvin province manufacturing companies.

Table (2): The relationship between compatibility culture and international marketing

Subject	Used statistic	Value	Significance level
Compatibility culture and international marketing	Pearson	0.593	0.000

Since that the significance level of Pearson coefficient (0.000) is less than 0.05; so, there has been a significance relationship between compatibility culture in the work and international marketing. So that by increasing the compatibility culture in the work because of the proximity of the Pearson correlation

coefficient (0.593) to number '1', international marketing increases. Then, the research second hypothesis is accepted.

**Third Hypothesis:** There has been a significance relationship between adaptability culture and international marketing

Table (3): The relationship between adaptability culture and international marketing

Subject	Used statistic	Value	Significance level
Adaptability culture and international marketing	Pearson	0.447	0.000

Since that the significance level of Pearson coefficient (0.000) is less than 0.05; so, there has been a significance relationship between adaptability culture and international marketing. So that by increasing the adaptability culture because of the proximity of the Pearson correlation coefficient (0.447) to number '1',

international marketing increases. Then, the research third hypothesis is accepted.

**Fourth Hypothesis:** There has been a significance relationship between mission culture and international marketing of Qazvin province manufacturing companies.

Table (4): The relationship between mission culture and international marketing

Subject	Used statistic	Value	Significance level
Mission culture and international marketing	Pearson (gamma)	0.422	0.049

Since that the significance level of Pearson coefficient (0.422) is less than 0.05; so, there has been a significance relationship between mission culture and international marketing. So that by increasing the mission culture because of the proximity of the Pearson correlation coefficient (0.000) to number '1', international marketing increases. Then, the research fourth hypothesis is accepted.

## 5. Conclusion

There has been a significance relationship between participatory culture in the work and international marketing of Qazvin province manufacturing companies. Since that the significance level (0.000) is less than 0.05; so, there has been a significance relationship between participatory culture in the work and international marketing of Qazvin province manufacturing companies. So that by increasing the participatory organizational culture in the work because of the proximity of the Pearson correlation coefficient (0.518) to number '1', international marketing increases. Then, the research first hypothesis is accepted.

There has been a significance relationship between compatibility culture in the work and international marketing. Since that the significance level of Pearson coefficient (0.000) is less than 0.05; so there has been a significance relationship between compatibility culture and international marketing. So that by increasing the compatibility culture in the work because of the proximity of the Pearson correlation coefficient (0.593) to number '1', international marketing increases. Then, the research third hypothesis is accepted. There has been a significance relationship between mission culture and international marketing of Qazvin provinces manufacturing companies. Since that the significance level of Pearson coefficient (0.000) is less than 0.05; so, there has been a significance relationship between mission culture and international marketing. So that by increasing the mission culture because of the proximity of the Pearson correlation coefficient (0.422) to number '1', international marketing increases. Then, the research fourth hypothesis is accepted.

## 5.1 Suggestions

**1-Internationalization:** For the business company which is include the interaction between environmental forces and management behavior, as the effect of each of them is evident also in the global market. When the company thinks about internationalize, it should be within the framework of contingency. In fact, the companies in different environments to do different tasks must be actin different ways.

**2-Confidence building:** Since that the confidence in the domestic markets helps to the partners' exchanges, coordinate their activities and reducing transaction costs, is very important, so that this importance is more evident in the abroad participation, because the cultural distances at the beginning of transaction often leads to poor coordination between partners and in order to create the value for foreign customer, we need to coordinate. The foreign partners' confidence to each other can create the necessary flexibility to them for adapting unfamiliar international markets.

**3-International Commitments:** It describes that which resources, including human and financial, are available to marketers, to work in international markets. International commitment can be used as a tool control of marketing activities in foreign markets. High level of control is considered as a strategic point. An international manager who wants a high level of control, requires to allocate resources to control work tasks. Consequently, the international commitment is very wide, but the control can be considered as a positive determinant.

**Abstract.** Power system stability is necessary to guaranty its right operation. In early years using FACTS devices as a one of effective methods for improving the performance of system controllability and power transmission limitations is presented. Considering the non linear characteristic of power system the linear methods are not convenient for designing the stabilizers. In this paper, the non linear method of power system is considered for simultaneous designing of power system stabilizer (PSS) and static synchronous compensator (STATCOM). Moreover, simultaneous designing of power system stabilizer (PSS) and static synchronous compensator (STATCOM) is represented by PSO algorithm. Comparing this algorithm with other intelligent algorithms existing in Condor four-machine system, Indicates the more efficiency of this algorithm.

**Key words:** static synchronous compensator (STATCOM), power system stabilizer (PSS), PSS and STATCOM coordination, PSO algorithm

### 1. Introduction

One the most important issues in truly applying power system, is power system stability. Considering this issue that load of grid is variable, it is necessary to system keep its stability and synchronism in facing with this variations which are known as disturbance. Therefore, in recent decades different methods for designing the stabilizer were center of attention. According to increasing use of FACTS devices and their effect in improving damping of power system oscillations, operation synchronization of these controllers by power system stabilizer is necessary (Hingorani, 2000). As a power system is a non linear system, the stabilizer and FACTS device controller parameters should be designed for non linear models. In this way, in recent years, using evolutionary algorithm for solving optimizing problems is considered. Intelligent algorithms such as genetic algorithm (Kundur, 1994), (PSO) particle swarm optimization (Bomfim and Taranto, 2000), simulated annealing, are used for designing and adjusting the PSS parameters. Moreover, in PSS designing is done by Particle swarm optimization PSO and bacterial foraging algorithm BFA and results are compared with each other.

Coordinated designing of PSS and TCSC is studied in (Shayeghi et al. 2010; Abido, 2000). In simultaneous design of PSS and SSSC is investigated by Multi-Objective Evolutionary Programming. Coordinated design of SVC and PSS by Probabilistic theory is suggested in (Das et al. 2008). In this research stabilizer coordinated designing of power system and STATCOM considering non linear power system model is considered in four-machine system. For adjusting the coordination of PSS and STATCOM parameters the mentioned algorithm is used and the result of simulation shows the power of PSO algorithm for coordinating the PSS and STATCOM for improving the stability of system.

### 2. STATCOM modeling

In figure (1) the single machine power system with STATCOM is shown.

Figure 1: single machine power system connected to an infinite bus with STATCOM connection

In STATCOM, for controlling the injected reactive power, an inverter of voltage source with voltage of  $V_p$  is used. In steady condition, the DC bus voltage is constant and in the condition of  $V_s > V_p$  then STATCOM absorbs reactive power from AC bus and vice versa. Cai and Erlich (2005) first the STATCOM equations are provided in the reference frame of q and d, but considering this issue that the reference of reactive current is determined by AC bus voltage. The q'd' frame is chosen in a way that d' axis is tangent with AC bus voltage. The vector diagram of q and d reference frame and q' and d' frame is shown in figure 2 (Aziz et al. 2013).

Figure 2: vector diagram of q and d reference frame and q' and d' frame

The dynamic equations of current of STATCOM q and d' components are as following:

$$\frac{di_{pd'}}{dt} = -\frac{R_p}{L_p} i_{pd'} + \omega i_{pd'} + \frac{1}{L_p} (V_s - V_{pd'}) \quad (1)$$

$$\frac{di_{pq'}}{dt} = -\frac{R_p}{L_p} i_{pq'} - \omega i_{pd'} + \frac{1}{L_p} (-V_{pq'}) \quad (2)$$

In which  $V_{pq'}$  and  $V_{pd'}$  are the voltage of q' and d' components of voltage source. The  $V_{pq'}$  and  $V_{pd'}$  voltages are defined as following:

$$V_{pq'} = V_{pq} \cos \delta_t - V_{pd} \sin \delta_t \quad (3)$$

$$V_{pd'} = V_{pd} \cos \delta_t - V_{pq} \sin \delta_t \quad (4)$$

By replacing equation 3 in equation 1 the differential equation of STATCOM can be obtained as following:

$$\omega = \omega_0 + \frac{d\delta_t}{dt} \quad (5)$$

In which the  $\omega$  is the frequency of STATCOM voltages angles. The  $V_{pq'}$  and  $V_{pd'}$  can be obtained from following equations:

$$V_{pq'} = -(\omega L_p i_{pq'} + L_p u_q') \quad (6)$$

$$V_{pd'} = \omega L_p i_{pq'} + V_s - L_p u_q' \quad (7)$$

$$\frac{di_{pd'}}{dt} = -\frac{R_p}{L_p} i_{pd'} + u_d' \quad (8)$$

$$\frac{di_{pq'}}{dt} = -\frac{R_p}{L_p} i_{pq'} + u_q' \quad (9)$$

In which  $u_d'$  and  $u_q'$  are controlling signals that are obtained by PI controller.

Moreover, the dynamic equation of DC bus voltage is as following:

$$\frac{dV_{dc}}{dt} = \frac{3}{2CV_{dc}} [V_s i_{pq'} - (i_{pd'}^2 + i_{pq'}^2) R_p] - \frac{V_{dc}}{CR_{dc}} \quad (10)$$

In which  $V_{dc}$  is capacitor voltage,  $C$  is the value of dc capacitor, and  $R_{dc}$  is resistance parallel with dc capacitor which is equal to STATCOM switching losses. The above equations are three dynamic STATCOM equations. Figure 3 illustrates the STATCOM controller structure (Hashemi et al. 2013).

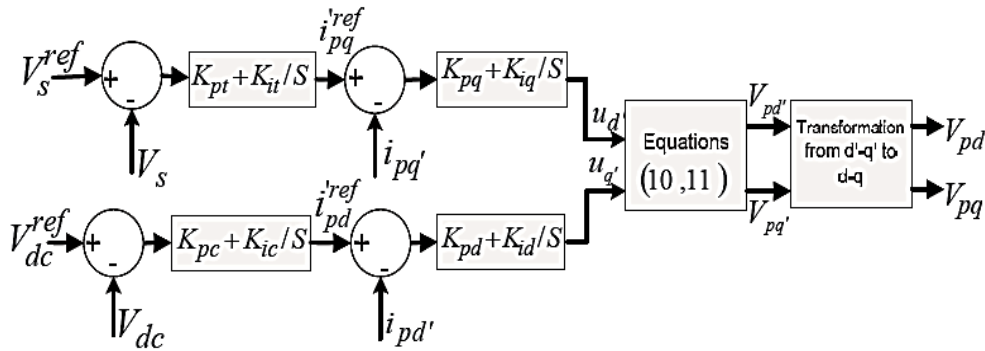

Figure 3: STATCOM controller structure

### 3. Synchronous machine model

A synchronous machine with an appropriate approximation is modeled by three stator coil and three coils over rotor (one field coil and damper coil). The dynamic equations which define the machine behavior are consisting of electromagnetic equation between coils and electromechanical equation of dynamic of rotor.

Electrical equations: natural linear electrical differential equations (regardless of magnetic saturation) and time variable. By definition of new variables and using a transformation named Park's transformation not only these equations will be very simpler than before, but they loss the characteristic of being time variable (Afzalan and joorabian, 2013). These simplified equations are very applicable in different power system studies.

For obtaining a model with least order, unimportant phenomenon in low frequency oscillations are neglected.

The most considerable phenomenon is:

1) by the time of low frequency oscillation the converted current in damper coils is low therefore; these coils are neglected in modeling.

2) since the special stable rates corresponding to q and d coils (stator coils) are adequately far from imaginary axis; these equations are considered in algebraic form. Only the remaining electric differential equation is related to synchronous machine field which is kept because of importance of its dynamic and applying control by excitation system.

Mechanical equations (oscillation):

This equation indicates the dynamic of circular motion of rotor and in a descriptive way is: The resultant of electrical and mechanical torque on rotor is equal to moment of inertia multiplied by the angular acceleration. The above equation is a non linear second order differential equation. Considering the desired topic meaning the answer of power system to small changes, the differential equations are defined around an operating point, linear, and with  $K_1$  to  $K_6$  coefficients. Using these equations not only leads to a physical view, but simplifies the appearance of equation. The above coefficients depend on machine, transmission grid, and operating point. The figure 4 shows the synchronous machine connected to Infinite bus in form of block diagram. In this block diagram the machine excitation system is modeled in the form of a first order transmission function. Two main mechanical and electrical loops can be seen in up and down of figure.

Figure 4: the block diagram of transmission function for studying low frequency oscillation phenomenon

The characteristic equation of mechanical loop is:

$$(Ms^2 + Ds + K_1\omega_b)\Delta\delta = 0 \quad (11)$$

Roots of above equation are the oscillation modes of system and are very important. Difference of electrical and mechanical torque is input of this loop and velocity, and rotor angle are output of this loop.

Transmission functions corresponding to excitation and circuit of synchronous machine field are placed in electrical loop. This block diagram is beautifully analyzed in reference (Singh and Kadagala, 2012) and the effect of different dynamics on K1 and K6 coefficients and following that on stability of synchronous machine is explained. The system state equations can be obtained easily from this block. By choosing state vector in a following way:

$$X = [\Delta\omega \quad \Delta\delta \quad \Delta e'_q \quad \Delta E_{fd}]^T \quad (12)$$

It can be written that:

$$\dot{X} = AX + B_{UE} \quad (13)$$

In which A and B matrixes are:

$$A = \begin{bmatrix} 0 & -K_1/M & -K_2/M & 0 \\ \omega_b & 0 & 0 & 0 \\ 0 & -K_4/T_{do} & -1/T_{do}K_3 & 1/T_{do} \\ 0 & K_A K_5/T_A & -K_A K_6/T_A & -1/T_A \end{bmatrix} \quad B = \begin{bmatrix} 0 \\ 0 \\ 0 \\ K_A/T_A \end{bmatrix}$$

#### 4. PSS designing stages

The phase lead circuit and PSS gain is down like following respectively:

##### 4.1. Calculating $\omega_n$ frequency of electromechanical mode

Regardless of natural damping, the mechanical characteristic equation is obtained in following form that by solving it the natural immortal frequency can be obtained.

$$Ms^2 + K_1\omega_b = 0 \quad (14)$$

$$s = \pm j\omega_n \quad \omega_n = \sqrt{\frac{K_1\omega_b}{M}}$$

##### 4.2. Designing phase compensator

First the transmission function between  $\Delta e'_q$  and  $u_E$  in electrical loop is calculated ( $G_E(s)$ ). The value of phase delay of this transmission function in exchange for  $\omega_n$  should be compensated by a phase lead circuit. A normal form for phase compensator is:

$$G_c(s) = \left( \frac{1+sT_1}{1+sT_2} \right)^K \quad K=1 \text{ or } 2 \quad T_1 > T_2 \quad (15)$$

In which the K is the number of first rank blocks and for compensating large angles two blocks are used. For  $T_2$  usually a characteristic value is selected. The only remaining parameter is the T1 compensator circuit which is determined by equation (16).

$$\angle G_E(s) \Big|_{s=j\omega_n} + \angle G_c(s) \Big|_{s=j\omega_n} = 0 \quad (16)$$

#### 4.3. Gain designing

The value of  $D_E$  in equation (17) can be controlled by PSS.

$$X = [\Delta\omega \quad \Delta\delta \quad \Delta e'_q \quad \Delta E_{fd}]^T \quad (17)$$

The PSS gain called  $K_C$  is equal to:

$$D_E = K_2 K_C |G_c(s) \Big|_{s=j\omega_n} |G_E(s) \Big|_{s=j\omega_n} \quad (18)$$

On the other hand regardless of D and considering standard form of characteristic equation:

$$s^2 + 2\xi\omega_n s + \omega_n^2 = 0 \quad (19)$$

$$D_E = 2\xi\omega_n M \quad (20)$$

By removing  $D_E$  between (18) and (20) equation the value of gain of PSS can be obtained based on damping coefficient.

$$K_C = 2\xi\omega_n M / (K_2 |G_c(j\omega_n)| |G_E(j\omega_n)|) \quad (21)$$

Figure 5 shows the block diagram of a PSS.

Figure 5: PSS block diagram

#### 5. Simulation results

Figure 6 shows the general simulation structure in Simulink environment. Simulation is done in two levels, first parameters is found by PSO algorithm without optimization then the effect of optimization on value of studying parameters is investigated by PSO algorithm. In studying process and finding the results six parameters are investigated and compared which are: the velocity of generator G1, the velocity of generator G2, the velocity of generator G4, STATCOM injected voltage, generator velocity difference of G4 and G1, and generator velocity difference of G4 and G3.

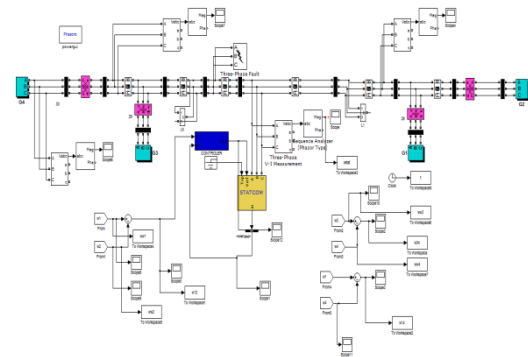

Figure 6: general structure of simulation in simulink environment

Overall, simulation is done in two levels, first the optimum value is obtained by PSO algorithm by coding in mfile environment of

MATLAB then the output of this section is linked to simulink of MATLAB software.

Table 1: the values of STATCOM block parameters

parameter	Unit	value
Maximum reference vltatage changing rate ( $V_{ref}$ ) drop	perunit	0
regulator gains $V_{ac}$ ( $K_p, K_i$ )	-	12,100
regulator gains $V_{dc}$ ( $K_p, K_i$ )	-	50,1000
Current regulator gains ( $K_p, K_i, K_f$ )	-	3,1,4

Figure 7: the velocity of generator G1 without optimization by PSO

Figure 8: the velocity of generator G2 without optimization by PSO

Figure 9: the velocity of generator G3 without optimization by PSO

Figure 10: the velocity of generator G4 without optimization by PSO

By a close look at the figures it can be said that the most and least change domain occurs in G3 and G4 generators respectively. Behavior pattern of G1 and G2 are very similar. The G3 generator gets damped in least possible time. Figure 11 shows the injected voltage by STATCOM.

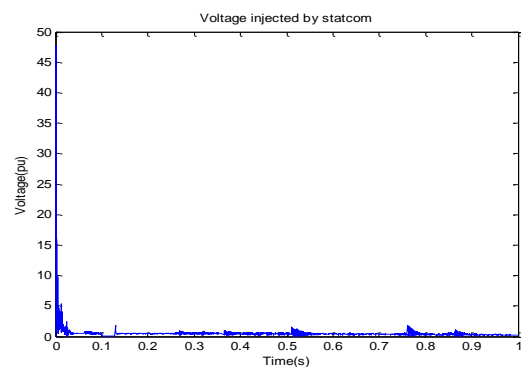

Figure 11: the injected voltage by STATCOM without optimizing by PSO

By a close look at the figure 11 it can be claimed that in some initial cycles of voltage domain decreases from 50 to less than 1 per unit quickly. The behavior of this voltage after passing the transient was not so linear and has distortion and domain changes.

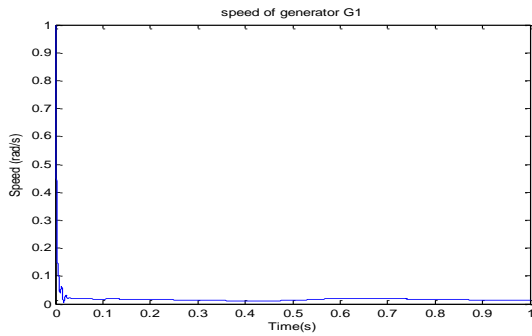

Figure 12: the velocity of G1 generator with PSO

Figure 13: the velocity of G2 generator with PSO

Figure 14: the velocity of G3 generator with PSO

Figure 15: the velocity of G4 generator with PSO

By attention to above figures, the G1 and G2 generators have least and most velocity domain change respectively. the G1 and G3 generators have similar behavior and G2 and G4 generators have similar behavior. Except G1 generator in other conditions in stable condition the distortion is low and neglect able. The injected voltage by STATCOM can be seen in figure 15.

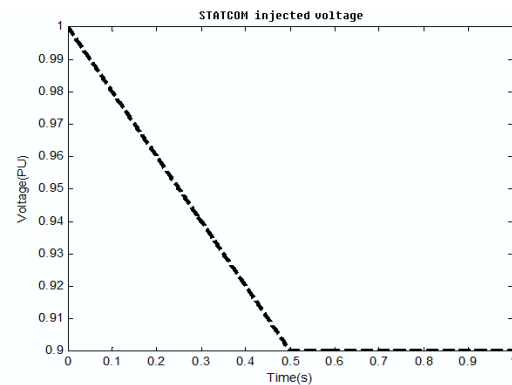

Figure 16: STATCOM injected voltage with PSO

Considering the figure 16 curve, this curve can be divided in two independent parts. Up to 0.5 second the curve is completely descending and after 0.5 second it is direct and linear.

**6. Conclusion**

In this paper, coordinated designing of power system stabilizer and STATCOM for increasing damping is done by PSO. The results of simulations by PSO algorithm are indicative of positive effect of this algorithm on velocity of generators for error state. Moreover, by attention to desirable performance of designed controller against system changes the improvement of accuracy and velocity of process of investigating determining optimum parameters of system is proven.

**Abstract.** The purpose of the present study is to check social health status and predict the effects of social capital, social protection and religiosity of University of Medical Sciences. The results showed that the social health has a relationship between social capital (Sig = 0.000), piety (Sig = 0.014) and social support (Sig = 0.000). Analysis of the theoretical model of social capital research directly 0.232 explain the changes in public health. And also trust dimension with the rate of 0.319 the capacity of the network to the next 0.311 is directly and others support with the rate of 0.147, the family support with the rate of -0.112 explain the changes in public health. Strengthening the social capital and other predictive variables in the research seems necessary.

**Keywords:** Social Health, Social Capital, Piety, Social Support, Iran University Students.

### 1. Introduction

Young generation has an important role in the sustainable development of community of any society as human capital. Today this generation in terms of technical capability in the dynamics of youth and energy, can have a decisive influence on the future of their community; such vitality and dynamism thus benefit from health and social capital parameters can be achievable; because social health somehow is individual performance and it depends on people investing in social relations and taking the available resources at the community level in these relations and helps to earn returns. "(Nickvarz, 2012)

Physical and mental health is not just freedom from disease, but it is how human social relations and how he thinks of the community health assessment criteria in the society at large (Samaram, 2010). Keyes (2004) knows social health as the monitoring and evaluation of how people operate in the community and the quality of relationships with other people, relatives and members of their social groups. For he and Shapiro it does more to life its richness and meaning relatives, relationships, and shared experiences. (Keyes and Shapiro, 2004). In Hendry et al (2006) Social Health is not absence of mental illness, or even the absence of negative emotions in certain contexts that can be considered a constructive response, but it is the ability to perform effective and efficient social roles without harming others (Raymond, 2004; quoted in Babapour et al., 2010). Social health manifested as the relationship status with others in the community of individuals in the society (in terms of social prosperity, social adaptation, social cohesion, social acceptance and community involvement manifested (Alizadeh et al., 2015)

The social capital in the field of stable public health has specific characteristics that refer to the social empowerment, community organizing, group or public voluntary participation to solve the problems in the majority. Accordingly, "in the absence of social capital, the ability to work collectively with the resources do not exist for general purpose, it is unlikely that only financial capital and increasing human capital can cause positive results" (Tajbakhsh, 2006). Social capital that has a sociological aspect, is also located as a lever to raise and accepted by many successful entrepreneurs. In the absence of social capital, other capitals lose their effectiveness and without social capital,

cultural and economic path of development, are rugged and difficult (Rarani Amini et al., 2012).

Since the individual characters are influenced by the quality and quantity of interpersonal relationships, lack of social support from family, friends and others may reduce individual resources to cope with challenges, and probably lead to disorders; because the supports that person receives from family, friends or community directly affect the social health (Bastani, et al., 2009).

Haddon (1983) argues that piety is the main cause of social, religious and intellectual-practical integrity and orientation in problems of phenomena and social issues (Nazkbar and others, 2007: 234 quoted by Firouz Rad, 2016) The piety means a religious obligation and having it in a way that affects attitude, tendency and individual actions. Religion is often a powerful factor determining social phenomena, to shape the institutions, to effect the values and influence the relationships (Zakerman, 2016). In general, religious practices and beliefs associated with health of personal or social community (Dei, 2010).

By the presence of numerous factors, such as being away from family, living in student accommodation, entry to a larger collection and stressful, compatible with culture and different people, economic problems and lack of sufficient income, type of activity and the role that they are doing also numerous expectations that others have of them and the responsibility they hold for themselves (Alizadeh et al., 2014) make it necessary to investigate the social factors affecting health status among Iran university students. Purpose of this study is to evaluate the social Health University of Medical Sciences and predict the effect of social capital, social protection and piety on it.

### 2. Materials and methods

This research is descriptive - explanatory that it is done in precise way in the fall of 2016 to identify factors that affect the social health of students in Iran University of Medical Sciences. The study sample included all the students in Tehran University of Medical Sciences that they were in university in 2016 the number of 7436 students to study. The sample size was calculated using the formula Cochran 365 people that due to the possibility of data loss of the number of questionnaires collected increased 10% and considered 400 subjects. The selection of the sample, table and the number of students prepared and was determined using a stratified random sampling. In this study a standard questionnaire was used to collect information such as Keyes Social Health (1998), Social capital Stone (2001) Social protection for sunflowers (1976), Piety Aston and Clark (according to the Taleban, 1999). To test the hypothesis Pearson's correlation coefficient and to explain the contribution of each independent variable regression and path analysis using software (spss) version 20 was used.

#### 2.1 Validity and Reliability of the questionnaire

In this study, to evaluate the reliability of structures the confirmatory factor analysis technique is used. Confirmatory factor analysis indicated that based on confirmatory factor analysis KMO value among all variables was estimated to be more than 70%. The relationships among the items are suitable for factor analysis to measure the relevant variables in the study are fit enough and faithful credit. As well as to establish the reliability of Cronbach's alpha was used. Thus, by conducting a preliminary study with a sample size of about 30 students of Iran who were selected randomly, Cronbach's alpha was calculated for variables of 0.70 that is acceptable in the humanities alpha (Edrisi, 2008).

Table 1: the achievements caused by goodness- of- methods theoretical model fitting Test item analysis and factor analysis

Indexes / Indices	Alpha	Kaiser-Meyer-Olkin Measure of Sampling Adequacy (KMO)	Bartlett's Test of Sphericity Approx. Chi- Square (BTS)	Degree Freedom (df)	Significance Level (Sig)
All items in the questionnaire	9.87	0.832	934.15782	3570	0.000
The social health rate	1.75	0.747	229.1654	190	0.000
The social capital rate	8.76	0.743	437.1806	231	0.000
The social support rate	74	0.725	769.1051	36	0.000
The piety rate	6.89	0.906	080.4341	276	0.000

**2.2 Theoretical and operational definition of the research variables**

Conceptual and operational definition of independent variables: Social Health

Keynesian (1998) defines the social health as the individual's performance assessment in the community (Sam Aram, 2011). The means of social prosperity is the people's perception of the issue that they will benefit from social development. Social Solidarity means that people feel integration with other person that must be the results of experience is shared with others. Social cohesion is people who have a positive attitude to their character and accept good and bad aspects of the life both with each other, examples of mental and social health are social acceptance, confidence in the innate goodness of others and

positive view of human nature that cause people feel comfortable with other members of the society. In order to determine the individual requirements for the role of community participation in society (Hatami, 2001) The purpose of the social participation means to determine the individual requirements for the role of society (Hatami, 2001)

Conceptual and operational definition of independent variables:

Social capital Social capital relationship options related to social position, constitute a potential source of increased social Ice tray (Chalbi, 1997), Stone (2001) the indicators used in studies of social capital are divided into two categories. In Stone's classification the structure of social relations and quality of social relations are the keys of dimensions of social capital. (Rahmani, 2015)

Table 2: Operational definition of social capital

Concept	Dimension	Petty dimensions	Components	
Social capital	The structure of social relations: networks	Network structure	Official	
		The size and capacity of networks	Unofficial	
	the quality of the relations	trust	Limited / extensive	Homogeneous / inhomogeneous
			Home / World	
		trust	Dense / sparse	the trust between people
			Generalized trust	
Trust in institutions				
	Reciprocal treatment	Objective / Alternative		

**2.3 Conceptual and operational definition of independent variables: social support**

Koub (1976) defines social support as a set of data which leads one to believe that in a communication network that are in other's interest (Rastegar, 2006). Variable measuring of social support takes place in three groups: family, friends and others. The objective of this study is to support or means of indicating the availability of physical protection. In this type of support, the help is from people who are close. Information support includes help in understanding a problem that is hard to understand. This type of support indicates the information that one can make use of the personal and environmental issues. Emotional support resources related to having those implies that for comfort and confidence, one can refer to them. People who have enough emotional resources, typically, feel they have others that can refer to them when dealing with the problems (wax Fleming, 1986 to the Varmazyar, 2009)

**2.4 Conceptual and operational definition of independent variables: Piety**

Glock and Stark believed that despite of the world's religions differ in many details, but they have general areas that piety appears in that area or dimension (Ahmad, 2010). Clark and Stark standard in different countries, America, Africa and Asia and the religions of Christianity, Judaism and Islam has been implemented (Quoted Mohammad Reza Talebi, 1999) Validity of the questionnaire is confirmed Sharifi (2004). Based on model of Clark and Stark piety includes belief, emotional, consequences and ceremonial.

**3.The research results**

According to Table 3 Average observed social Health 44.30 is lower than expected average (50). The observed mean social capital 47.13 is lower than expected average (55) and the observed mean of piety 2473 is less than the average expected (22.5). The observed mean piety includes 58.90 is lower than expected average (60).

Table 3: Distribution of frequency and percentage of dependent and independent variable

Social Health	very little		little		Very much		Much		The observed average	The expected average
	frequency	percentage	frequency	percentage	frequency	percentage	frequency	percentage		
Social capital	2	0.5	132	34	242	62.4	12	3.1	44.30	50
social support	5	1.3	150	38.7	224	57.7	9	2.3	47.13	55
Piety	2	0.5	35	9	237	61.1	114	29.4	24.73	22.5
Social Health	9	2.4	87	22.4	210	54.1	82	21.1	58.90	60

According to table 4, there is a significant relationship between social capital and social health its dimensions. Also, there is a significant relationship between the dimensions of reciprocal treatment with social acceptance, trust the size of prosperity,

cohesion, social acceptance and participation, the capacity dimensions of cohesion, participation and social network with acceptance of the resort.

Table 4: the relationship between social health and its dimensions and social capital and its dimension

Pearson correlation		Social capital	Reciprocal treatment	Trust	Capacity	Network
Social Health	The Pearson	.232**	.045	.343**	.163**	.087
	Significant	.000	.375	.000	.001	.088

According to the results in Table 6, the determination coefficient of social health in terms of different dimensions of social capital variables, social support and Piety was measured on this basis is R2=0.157. Of the three independent variables, trust, network capacity

and social capital variables, respectively 0.131 and 0.319 have effect on the social capital of the students. The family and other of social support variables by rates 0.112 and 0.147 Iran university students have a direct effect on of social health.

Table7: Regression coefficients of dependent variable: social health

The amount and Significant F			The standard Pearson correlation		The standard Pearson correlation	T	Significant
	B	The standard deviation	Beta				
F=6/354 Sig=0/000	stable amount	36.438	2.805			12.991	0.000
	social capital	0.202	0.045	0.232		4.683	0.000
157/0 = R2	social capacity	0.326	0.159	0.1310		2.047	0.041

	social family	0.691	0.194	0.171		3.566	0.000
	social others	0.373	0.085	0.231		4.393	0.000

According to the research model 15.7 percent social health of variance explained by the independent variable composition 84.3 changes be explained by factors outside of the model.

#### 4.Results

The issue of student's health is a critical issues that today cause to many challenges (Kadysvn Vdygrnvmv, 2004; Snyder, 2004). Block and Breslow for first time in a year1972 considered social health with community members as synonymous and make social health index. The importance of issue increase in time that some studies show the problems of this category are increasing. For example, the results of a 13-year longitudinal study showed that students today go to university counseling centers to a greater extent than before; in addition, their problems also become more complex (Benton et al, 2003). Raymond et al (2004) that refers to some of the social challenges, social acceptance, social participation, social prosperity and social cohesion. Keynesian social health involves components that together indicate the quantity and quality of enjoyment of life is the right person, he said, mental health, quality of life and individual performance cannot be assessed without regard to social criteria, Rafie et al., 2011). Results of this research show that the social health of university students in Iran were observed below the average that is sobering.

The results show Yazdanpanah Nei Kurz (2016) as well as social health of students Bahonar university of Kerman was average. Larsen defines social health of individual assessment of the quality of relationships with family, people and community groups. He believes that scale of social health measures that reflect the health of individual satisfaction or dissatisfaction with life and her social environment and in fact (including responses such as the person's inner feeling, thinking and behavior) Akbarian et al., 2011). Health studies using biological models, further emphasize on the privatization of health way; but people are in social structures and communication with and face countless challenges and social duties) Akbarian et al., 2011) Healthy individual socially knows the community with a

significant collection, understanding and the potential for growth and prosperity; there is a sense of belonging to the community, the community will be accepted and is involved in its development. Healthy people, socially as well as have a sense of belonging to social groups in society and its development partner. The content of social health scale, the whole positive assessment of the experiences of the individual in society. The new scale public health measures at the level of the individual (such as aggression and social support) and social level (such as poverty and social status) is different (Akbarian et al., 2011) There was a sense of social integration at the highest level leads to suicide (Durkheim, 1951). Healthy people feel they are part of society, so the social integration is between the persons common sense with others that make his social reality. They belong to your community. Social integration based on concepts such as social cohesion "Durkheim" cultural alienation and social isolation "Semen" and Class Consciousness "Marks". In term of Durkheim's social harmony and social well-being is a reflection of people to connect with each other through the criteria. Seeman believes that cultural alienation is to break the individual and the community, society or rejection of the view that society cannot be a reflection of cultural values and styles. On the other hand, social capital that known is as the missing link in the development of its results it is also less than average important variable in sustainable development should pay more attention to it. High levels of social capital can expand the powers and responsibilities. In recent years it has been shown that social capital by creating and providing an effective source of support for confidence and mutual respect, increase access to local health services, facilitating the process of crime prevention, promote the rapid transfer of medical information, raising the possibility of modeling the behavioral norms related to health and improving the opportunities of social control deviant behavior related to health, is of prime importance in public health (Linda Strvm and et al, 2006)

Although in this study piety does not have direct effect on the social health of university students in Iran but according to the research Kafashi (2015) explains the most direct effect will be

as a direct result of religious conviction the variable component of piety on social cohesion and social health factors. The results show of piety, health-oriented lifestyle variables. The results Rad et al., (2015) regression analysis suggests explanatory power of religion on the health of the community. Therefore, religion can often be a powerful factor determining social phenomena, to shape the institutions, to effect on the values and their relationships under their influence (Zaker, 2006: 175) Haddon (1983) believes that the main cause of social, religious and intellectual coherence, practical direction in solving problems of social issues and phenomena (Nazktbar and others, 2007: 234 quoted by Firouz Rad, 2016) totally, personal health practices and religious beliefs of a society is related to social and individual health (Dei, 2009)

The results show that there is a significant relationship between social capital and social health and its dimensions also there is a significant relationship between the reciprocity with social acceptance, self-actualization dimensions, cohesion, social acceptance and participation, the capacity of cohesion, participation and social network with acceptance of the resort. The results Afshani, Shir Mohammed Ayad and Safiri (2016) and Mansourian (2015) showed a significant relationship between social trust and social health. Based on the results of Sharbatian (2013), Rarani Amini et al. (2012) all dimensions of social capital have a significant relationship with social health. Results of Grozny (2011), Gilbert (2008) and Yip et al., (2007) suggest a significant positive relationship between social capital and social health.

Various links provide a wide range social support for network members. Social support enables students to have the ability to deal with everyday problems and crises of life and serve them well. According to Wellman (1992), the source of support and what kind of links, provides what kind of support, has of great importance (Bastani and Salehi Hikohi, 2006). The results of this study suggest that there is a significant relationship between the support of friends and social capital and its dimensions. There is a significant relationship between the family dimension with the social capital and the capacity dimensions, trust dimension and reciprocity, friend dimensions and others with variable social capital and social support. Hence this sense induces popularity and belonging to a network of bilateral linkages with others and feel useful to the students and with this their public health increases.

The results of present study suggest that there is a significant relationship between piety variable with social capital and trust dimension and reciprocity. As well as there is a significant relationship between faithfulness with social capital and trust dimension with and reciprocity, Between the outcomes and social capital and trust and reciprocity and the emotional dimension of social capital and the dimension of capacity, trust dimension and reciprocity. Sharbatyan (2013), in their study points out that gathering people in religious ceremonies, also strengthens the religious beliefs And creates sensational and extreme emotions that Strengthens the bond between people (Rahman, 2015). Durkheim believes that the religion makes a continuous collection and recreates and it conducts this by tightening the links that connect the individual (Jalali Moghadam, 2001).

## 5. Conclusion

In general, it can be concluded that Lack of social participation activities and distrust prevents the absorption of the individual in the social context, In this case the person feels that There is nothing in common between his personal and social values and become indifferent to social values and norms and mistrust (reducing social integration), therefore feels that Social destiny is related to force foreign structures. When above attitudes were created in person. The individual loses his performance and feels that cannot have a role in the development and future of the society. So public health have an important factor in the acceptance of social norms that through the Strengthening the

social capital, a person can face with the challenges of social life and deal with them and have superior performance in society. Since social capital and trust dimension and networking capacity is effective on social health it is necessary to increase the amount of trust of the students than other members of society and social institutions that one way of that is providing clear information from the institutions responsible for and attention to the wishes and needs of young people. Providing appropriate conditions for students to participate in different levels, providing recreational facilities, Student sports at the university level, especially the home environment, provide the Jolly fields and mobility for students, to young people with gathering in these places in addition to the benefit of physical health, social psychological and social interactions, and their sense of oneness with each other.

## ARCHITECTURE FOR WELL LIVING NOT WELL BEING (FEASIBILITY OF ACCEPTANCE RATE OF COMMON LIVING ENVIRONMENT OF OLD PEOPLE AND YOUNG ORPHANS)

<sup>a</sup>MOBINA ROUHI, <sup>b</sup>TOHIDEH HAMED, <sup>c</sup>ALIREZA MEMARIAN

<sup>a</sup>Assistant Professor, Department of Architecture, Islamic Azad University, Mahmudabad branch, Iran.

<sup>b</sup>Student of Sariyan Higher Education Institute, Architectural Engineering, Sari, Iran.

<sup>c</sup>PhD in architecture education, West branch, Islamic Azad University, Tehran, Iran.

Email: <sup>a</sup>M.Rouhi@srbiau.ac.ir, <sup>b</sup>Tohidhamed90@gmail.com, <sup>c</sup>Alirezamemarian2000@yahoo.com<sup>3</sup>

**Abstract.** In this research, methods such as studying related papers, field observations and SWOT were used and after receiving 30 questionnaires with opinions of experts in architecture and psychology and jobs related to teenagers and old people in wellbeing organization and other organizations in Astara and Sari cities, the final results have been achieved. After conducting studies and obtained results of strategic evaluation matrix, it was observed that creating common living environment of old people and young orphans provides high capabilities and developmental attempts dominate over non developmental attempts and this indicates the approach (SO). With strategy (SO) it is possible to design centers for old people and young children to live in a safe environment, away from the disturbing.

**Key words:** old people, young orphan, wellbeing, architecture, common living environment

### 1 Introduction

The family is the first environment in which human can be trained and educated to cope with life's problems. (Mosalae et al., 2000) along with the family, life will be meaningful. The meaning of life is achieved through morality that leads to meet the needs and talents of human nature. (Ali Zamani and Ghafourian, 2010) certainly different generations in the family, is one of the reasons for this evolution. Unfortunately, in our own lives today, generally we cause the collapse of this valuable environment rather than environmental factors. In recent years, sending old people to nursing homes has increased. It is important that why such a place is considered as a "final sign of failure" for old people. (Salarvand et al., 2007), some old people, because taking care or getting ride of family problems and some are forced to find accommodation with family care giver in nursing homes. (Salarvand and Abedi, 2008). It should be kept in mind that old age is a sensitive period of life and considering the problems and needs of this stage is a social necessity. (Shokrollahi and Tabassi, 2012).

Part of the future force of society wanted and unwanted are fostered away from the family. For example, fostered children do not experience families emotionally. Although the behavior of orphanage and responsible in terms of discipline, proper exposure and logical constraints, responsibility, cooperation and goal setting look like family environment; (Khodabakhshi Koolae, et al., 2014), but still differ from the family (Khodabakhshi Koolae, et al., 2014). A normal teenager can suggest his opinion to buy shoes but a fostered one should obey rules of orphanage (Khodabakhshi Koolae, et al., 2014). This is only a small corner of the wants and needs of fostered and orphaned teenagers at the age of puberty. They grow up in a predictable environment full of "characters", gain personal identity, local identity and emotional security of their environment. (Hannachi and Azad Armaki, 2012). No doubt, failure to achieve social skills can provide significant damages on their emotional, psychological and personality balance. (Yeganeh, 2014).

For old people, home and past, are everything, but if living in a nursing home is the best choice, it is required to take actions to improve the quality of service. (Mokhtari and Ghasemi, 2010). So behaviors appear to satisfy the needs, hence understanding

human needs for environmental design is considered important. Architects in their design need a model of "human needs". (Matlabi, 2001). Sense of place is a sophisticated concept of emotions and attachment of human in adapting to the environment caused by human use of place. On the other hand, manner of people's needs, their expectations of place are considered important factors. In meaning group, identity and beauty and at the level of activities, social interaction, sense of community and satisfaction are obvious. (Falahat, 2006)

Undoubting, the environment is an influential factor. Man placed in everywhere that feels live with it, because the man is alive with residence. (Barati, 2003) This comes from two-way communication between human and the environment. Outstanding influential factors of environment on human are symbols, icons, sound and voice, light and their origins which these are material dimension and their effects can be considered and examined in identity, personality, sense of belonging to the place, comfortable feel, safe feel, humiliation and spiritual note and spiritual meanings. The most outstanding aspect which can introduce apparent and the effects of these factors them simultaneously, is the quality of space. (Taghizadeh:66,2002) for example, providing proper conditions aspect of lighting inside the place through the windows indicate other aspects such as rate of view from inside to outside for people inside the place during the day, as well as from outside to inside to control the view and the privacy of place. Also conditioning and heating in warm and cold seasons are considered perfectly. (Pourdeihimi and Haji SeyedJavadi, 2008)

Architecture appropriate for teens should meet their emotions. They kept their world of imagination and reality and enjoy their moves and elegance in color, light, sound, smell, touch, texture, volume, movement, form and rhythm of surroundings (Hanachi and Azad Armaki, 2012). They love playing and game and pastime and being in fun grounds, but their mental and physical health is resulted when their relationship with nature and themselves as part of nature is supervised perfectly. (Mehdi Nejad et al., 2012)

In recent years, the need for more communication between children and the old people is emphasized. Holding programs such as visiting nursing home for old people, painting about old people, eating food beside them can promote relation between old people and children and also social behaviors of children and make old people honor and respectful and value and respect old people and obtain a better understanding of the process cycle. (Adib Haj Bagheri and Amin Alroyae Yamini, 2011). These activities in the upper grades and more mature also are applied to adolescents. Growth of potential talents of person based on the physical and social world of which he is its member is formed certainly. (Azad, 1995)

According to studies, when young people see the wooden door of a traditional building with its old staircases, describe it positively. This is a sign of the ability of traditional Iranian architecture (Hanachi and Azad Armaki-95-2012). It is important because old people in unique and unusual environments suffer from nervous spasm and intense shaking (Pourjafar et al., 2010). Evidently, necessary architecture of both generations connected closely. So, maybe it can meet the similar needs. Beliefs and issues like this can generate common sense between them. (Kamel Nia, 2010)

The goal of this study is showing the importance of human and its emotions and for example it studies two generations such as old people and teens who live away from families for several reasons. Teens in critical and challenging period in their lives follow learning and real love. On the other hand, old people remain health who continue their daily activities (ShebaniTaziji and Pakdaman, 2010). Feeling useful member

in family and community is important for the old people (Mickaeili, et.al., 2012). In general, every society needs young people with the experience to survive and to have such young people; we need experiences of old people. As long to say "wisdom from the old people, fight for the young people".

Well-being is the same as well living, but with different approaches over time in common sense. An attitude that compassion is important than trying to make a beautiful and ideal life. We know that living environment, particularly its architecture has effective role in conveying a feeling of security, importance and acceptance significant which it is a reason to being, whether for neonates, children and adolescents, the old people and those who need to care compassionately. Certainly, it is better they be the initiators of a positive change.

In this exclusive study, it is intended to focus on old people (experiences) and adolescents (at the age of puberty and the formation of characters and personality), from the architectural and psychology points of view, steps be taken to improve their lives and the way to welfare becomes real. In this order, feasibility of acceptance rate of common living environment of old people and young orphans is considered to achieve following results:

- 1) How much it is possible to have capabilities in common living environment for old people and orphaned young?
- 2) How much you consider limitation in having common living environment for old people and orphaned young?

## 2 Theoretical principles

### 2.1 Welfare Organization

After studies and researches of great martyr dr. Mohammad Ali Fayazbakhsh, Welfare Organization under the law dated 14 July 1980 and in order to fulfill the provisions of Articles three, twenty-first and twenty nine of constitution of the Islamic Republic of Iran, from merger of 16 organizations, institutions, foundations and associations was established to provide services and non-insurance support measures and preserving the values and dignity of human, and rely on public participation and close cooperation with relevant organizations, to expand rehabilitation services, support, rehabilitation and prevention of disability and social damage and help to provide at least the basic needs of low-income groups. In July 2011, based on the integration of the three Ministries of Cooperatives, Labor and Welfare and Social Security, Welfare Organization joined under the Ministry of Cooperatives, Labor and Social Welfare. (Www.behzisti.ir)

### 2.2 Outlook Document

Based on text of outlook document in the visions of the country in 2025, having a healthy, productive and acceptable quality living, free of disease and disability, liability is a public right that the governments have responsibility about it and is pre-condition for achieving sustainable development. To achieve sustainable development, certainly health people plays a central role and obviously protecting and improving human health, requires an efficient health system. (Alviri, 2003)

### 2.3 Old people

he or she has more than 60 years old and needs to care due to side effects of aging and physiologic changes. There are three groups aspect of age such as old man (60-70) and middle (71-80) and old (81 years and over). As well as, aspect of dependency rate, there are three independent, semi-independent and dependent old people.

### 2.4 Types of care centers for the old people

Four types of centers in welfare organization are dedicated to old people (in private):

**1) Day and night old people rehabilitation, care centers:** providing health care services, rehabilitation services, including medical, physiotherapy, occupational therapy, speech therapy at all hours of day and night to old people.

**2) Daily rehabilitation and training centers for old people:** providing professional and social and medical training and rehabilitation services in some times of the day.

**3) the rehabilitation and care services centers of old people at home:** providing care and rehabilitation services, including medical services, physiotherapy, occupational therapy, speech therapy and counseling psychologists and social workers to old people at home on a daily basis or boarding.

**4) Old people rehabilitation services centre:** presenting and providing rehabilitation services, including medical services, physiotherapy, occupational therapy, speech therapy and counseling psychologists and social workers for old people at home as well as at least one of the two daily or boarding centers.

Each of above centers is established under permit of welfare organization by legal and real persons and presents its services under this organization. (www.behzisti.ir)

### 2.5 Adolescence

Adolescence is a period of transition from childhood to adulthood is the developmental processes during adolescence, especially among psychologists there is no a complete consensus in this regard. They know this course of thirteen to fourteen years, but recent work in psychology usually indicates ages 11 to 13 and 18 to 20 years of age is taken into account as adolescence. (Lotfabadi, 2013)

### 2.6 Orphaned teenagers

adolescents who have been deprived of effective supervision and competent parents permanently or temporary reasons.

### 2.7 Mehr centers

centers under support of governments which foster orphaned children day and night and with different sex and age until providing better conditions for them in the society.

### 2.8 Some joint activities of old people and adolescents

Since that adolescent forms the highest part of the society and their health is effective in improving public health, consequently using environmental psychology can be effective in mental health and welfare of young people and in improvement of health in the society (Saffari Nia, 2011). Studies have shown that if somebody during maturation period loses his parents or member of his family, he will be sensitive respect to depression. (Y: www.prozfe.com).using experienced counselors in these fostering centers can be effective and they can protect children and teens against environmental pressures (Fayaz and Kiyani, 2011).

There are always ways to achieve physical and mental health. Sports spaces as one of the main spaces have educational goals as well (Hanachi and Azad Armaki, 2012). Physical activity and exercises are considered important factors in minimizing stress in all stages of human life and strengthen personal characteristics and personality and mental health and social interactions (Abdoli et al., 2009). If we provide these people more and better measures to encourage them to do physical activity and exercise, not only physically, but mentally they will

be strengthened (Ansari Jaber et al., 1997). Music therapy needs proper space and physical facilities until subjects can do perfectly (Ali Zadeh Mohammadi et al., 2006). In other words, individual and group listening to music and singing reduce agitation in Alzheimer's patients effectively and in fact, the features and personal preferences are the best solutions (Zare et al., 2009). Training and education by group discussions can be effective in improving knowledge of subjects about puberty health (Shirzadi et al., 2013). Also participation in desirable and group activities increases interaction and social support. Researchers found strong evidence for a positive effect of doing leisure activities on improving mental health. (Sheibani Taziji and Pakdaman, 2010) also, loneliness is long-term in treatment centers and animal assisted therapy reduces it. The desire for this treatment is strongly associated with previous owner of the pet. (Banks & Banks, 2002).

### 2.9 Some common psychological needs of the old people and adolescents

It can be said that there is an inverse significant relation among spiritual attitude and positive direction respect to praying, goals of creation, idealism with depression intense. Also performing individual spiritual practices such as praying, trust and cognitive and behavioral levels are associated with a reduction in depression. (Ebrahimi, 2003), experts believe that religious beliefs and activities are more common among the old people than adults and as the age increases, dealing with religion is considered as a stronger predictor for greater health, happiness and satisfaction with life. (Peymanfar et al., 2012).

In general, the self-esteem increases in childhood and decreases in adolescence and gradually increases in middle-age and decreases in old age drastically. (Robins et al., 2002). Old people with lower age, lower income, unemployed, women and old people, who currently do not have any spouse, suffer from severe depression. (Kashfi, et al., 2010). Active life expectancy is lower for the poor than others; (Katz et al., 1983), the economic and social situation of old people as residents of a nursing home has a significant impact on their self-esteem. (Shahbazzadegan et al., 21: 2009). So that the variable of optimism has a direct effect on mental health and an indirect effect on life satisfaction and on the other hand optimism effects on feelings and emotions (Poursardar, 2012), with increase of loneliness, life satisfaction is declined. (Kichaki et al., 2012).

In fact, women have experienced loneliness more than men. (Jones et al., 1985). Social protection has been effective for both men and women (but a little social protection has been better for men than women). (Motamedi Shalamzari et al., 2012). Adult with high hope consider other people as support and overcome challenged in their life and experience greater happiness in their life and are more satisfied. They can also develop this internal discourse in which "I can finish it; I should not fail and be disappointed." They see their success rather than their failure. (Farhad et al., 2009).

### 2.10 Living environment of old people and children in well-being organization

Data obtained from living environment of old people and orphaned children in recent studies show that many standard institutes have not proper educational facilities especially in western provinces of Iran (Tajar, 2011). So, successful centers should be considered as patterns and even more possibilities

created. This can be the result of efforts of philanthropists, successful management and delivery optimal services and even clean and beautiful physical space of these centers (Sajadi and Biglerian, 2006). Fostering centers include education and many educational workshops are presented to children and teens and moreover, well being organization hires psychologists and educational sciences experts to protect children (Khodabakhshi Koolae, et al., 8: 2014). Promoting mental health of teens In addition to the potential benefits in health, is one of the effective methods in preventing risk behaviors but in Iran like other developing countries, mental health studies and researches are in primary stages (Shkiba and Ziyae: 59, 2012).

### 3 Research background

Unfortunately, in direct contact with this research, there is no particular literature. Only one example of shared living environment (old people and disabled people) in Kashan has been studied: Adib Haj Bagheri and Amin Alrayaye Yamin, 2011, in their article entitled "Experiences of primary school children in Kashan about nursing home," indicate: students of this study had not positive perception of the nursing home. Remoteness of nursing homes and keeping disabled people in its vicinity was involved in creating this perception. Isolation of the disabled people care centers from old people can be a better experience for the visitors. This separation in higher value degrees has an important role in improving mood the lives of old people in sanatorium.

It is interesting that in a similar thesis entitled beyond the living (Ghavami Masoule, 2000) it has been concluded that due to the conducted studies and finding proper answers for spatial relationships, practices, climate and welfare of old people and orphans, a shelter to live can be designed.

### 4 Materials and Methods

This research based on the nature and purposes is a descriptive analytic and applied research. The method of this study is field research and using SWOT technique, variables were investigated and tested. This research was conducted by library and field methods and it was carried out through means such as (interviews and questionnaires), to collect information and material. Research statistical community includes all experts and professors in the fields of architecture, psychology and other related professionals with teens and old people in well being organization in Astara and Sari cities which using interviews, at first the matrices for strength and weakness points and opportunities and threats matrices were provided and then based on determined variables, a questionnaire provided with Likert scale II means very low and 5 means very high) and showing importance coefficient in range of 1-4. Questionnaires were distributed and completed among 30 experts and professors in the fields of architecture, psychology and other related professionals. At the end, the results were processed and analyzed using SWOT technique. Also of subjects, the opinions of 4 or 5 experienced experts were used as ranking and other opinions to estimate primary coefficient in tables.

#### 4.1 SWOT technique (SWOT)

One of the techniques that is used a significant part of the design process, is SWOT technique or matrix that sometimes is called simply (TOWS).

Table 1: Definition of internal and external factors in SWOT technique (SWOT)

Internal factors	strengths	features that help us to achieve our goals and have a positive effect and therefore all measures should be designed to strengthen these characteristics
	Weaknesses	Features with negative effects and all measures should be designed to weaken or reduce these characteristics
External	Opportunities	Situations which because of the potential positive effects can help us to achieve these goals and

factors		along with strengths points facilitate goals achievement
	Threats	Situations which prevent us to achieve these goals, so all measures need to convert these into opportunities

In brief, the technique is a means for analyzing the situation and developing strategy, in this order, concepts like "strategy", "internal environment", "external environment", "strength", "weakness", "threat", "opportunity" can be considered as basic concepts of this technique. (Golkar, 2006).

Strategies have been identified in four separate sections and a combination of internal and external factors respectively. This means that:

strategy (SO): utilize opportunities with proper strength points.

Strategy (WO): remove weakness points with using opportunities utilization.

strategy (ST): deal with external threats by identifying the most important internal strength points.

strategy (WT): while removing weakness points, threats are avoided.

#### 4.2 Findings analysis with SWOT

After studying related papers and field observations and opinions of experts in architecture and psychology and jobs related to teenagers and old people in well being organization and other organizations in Astara and Sari cities, all internal factors (Strengths and weaknesses) and external factors (opportunities and threats) were classified as below and strategies of contrasting them together to remove and reduce vulnerabilities and threats and take more advantage of the opportunity and strengths of the feasibility of the adoption of common living environment for old people and young orphans were presented.

Table 2: Statistical evaluation of strength points

item	variables and questions	primary coefficient	Secondary coefficient	Rating	final coefficient
Strengths	1. enjoying the rich experiences of old people	109	0.082	4.75	0.389
	2. The increase of useful feeling in old people	111	0.084	4.50	0.378
	3. loneliness decrease in old people and young orphans	107	0.081	4.50	0.364
	4. creating solidarity between generations as in the past which it is absent today	105	0.077	4.50	0.346
	5. Reducing the chance of premature aging in old people	96	0.072	4.25	0.306
	6. unflinching love for old people and support young people at puberty	104	0.078	4.25	0.331
	7. ideal breeding ground for young talent	97	0.073	4.25	0.310
	8. living in an environment much like The family	93	0.070	4.25	0.297
	9. respect together (respect for elders - considering demands of children	104	0.078	4.25	0.331
	10. Increasing life expectancy in old people and young orphans	103	0.078	4	0.312
	11. Increasing the level of community mental health	102	0.077	4	0.308
	12. Removing problems of young people by consulting with old people	96	0.072	4	0.288
	13. different attitudes and satisfaction towards aging in adolescents	92	0.069	3.75	0.258
	Total	1319	0.991	55.25	4.218

Table 3: Statistical analysis of weakness points

item	variables and questions	primary coefficient	Secondary coefficient	Rating	final coefficient	
	14. dependency of two generations and trauma caused by the death of old people, adolescents adopt	95	0.103	3	0.309	
	15. inconvenience and noise of adolescents for old people	112	0.121	2.75	0.332	
	16. impatience of old people to tolerate aggressive behavior of adolescents in puberty	109	0.118	2.75	0.324	
	17. Adolescents pressure on old people and lack of attention to their aging and fatigue	96	0.104	2.75	0.286	
	18. High expectations of adolescents against old people and related problems	96	0.104	2.50	0.260	
	19. different needs of teenagers and the related problems	112	0.121	2.50	0.302	
	20. aggression in adolescence and the possibility of dealing with old people	101	0.109	2	0.218	
	21. The old thinking of some old people lack of understanding the present time young people	104	0.113	2	0.226	
	22. The adolescent depression due to the presence of old people	95	0.103	1.75	0.180	
		Total	920	0.996	22	2.437

Table 4: Statistical analysis of opportunities

item	variables and questions	primary coefficient	Secondary coefficient	Rating	final coefficient
opportunities	23- supportive role of government	113	0.111	5	0.555
	24. use of psychologists (training collisions and reactions, psychological)	119	0.117	4.75	0.555
	25. Using experienced architects to design a common environment and perfect with the mood and needs of both generations harmonically	119	0.117	4.50	0.526
	26.promoting positive thinking about environment of old people asylum and minimizing their fear to live there	111	0.109	4.50	0.490
	27. attention of society to these centers as different approaches in asylum and orphanage	118	0.116	4.50	0.522
	28. public donations to promote both the generation	117	0.115	4.50	0.517
	29. occasional visiting old people family from the center and creating proper family environment for young people	109	0.107	4.25	0.454
	30. creating communication and friendship between the young people and old people family	108	0.106	4.25	0.450
	31. Giving more responsibility to old people by the authorities to support young people	101	0.99	4	0.396
Total		1015	0.997	40.25	4.465

Table 5: Statistical analysis of threat

item	variables and questions	primary coefficient	Secondary coefficient	Rating	final coefficient
threat	32.insufficient public informing about advantages of common living environment of old people and young orphans and wrong thinking in this regard	104	0.179	3.25	0.581
	33. The lack of interesting of old people and young orphans in having a common housing	98	0.169	3.25	0.549
	34. The general negative attitude towards the joint housing	95	0.164	3	0.492
	35. Lack of community support	91	0.157	3	0.471
	36.rejection of such centers by family of old people and young orphans	94	0.162	3	0.486
	37. The lack of interesting of well-being organization about this plan	96	0.166	2.75	0.456
Total		578	0.997	18.25	3.035

5 Results

studying data of Tables 2, 3, 4 and 5 based on the value or coefficient of each parameter indicates that due to evaluation matrix of strength and weakness points, the advantage of strength points with the final value 4.218 is more than weakness points with the final value 2.437, so it can be concluded that the creation of a common living environment for the old people and young orphans has high capacity. The advantage of

opportunities with the final value of 4.465 over threats with the final value of 3.035 shows the superiority of developmental works against anti-developmental works. Therefore, due to the existence of strategy (SO), proper strength points should be used to create shared living environment for old people and young orphans created and to take advantage of opportunities. The results of the Strategic SWOT factors evaluation matrix are drawn on the figure 1.

Figure 1: Strategic SWOT factors evaluation matrix

## 6 Discussion

In today's society, the gap between generations has increased and the old people are sent to nursing homes. On the other hand, orphaned children experience intangible environment away from family. Old people are sad because of negligence of their children and young children are sad due to lack of parental attention. On the other hand it should be noted that our society is a young society, but it goes toward aging.

Children of any age need firm support of their families. This requires sensitive age of puberty in adolescents and is more important. They are in a period engaging full of contradictions, conflicts, mental, choices, which play a major role in their future. How orphaned children compensate lack of friendly advice in their families? Can we provide better solutions in this regard? How much governments consider their inspired identity, dignity, excellence of character and life? When these children free from heavy pressure of orphaned children title (mentally and identity)?

And old people...who spent their whole life and youth for their children, why they don't have future with their children? Of course, this attitude is not true for all old people and their families. Sometimes old people experience a better life in nursing homes, but such an approach with a strong tradition of family in our society is hard to believe. Old people who not long ago were respected, and the reason why in the present family unity can not establish close relationships with their grandchildren? Whether generations are not able to understand or respect together or people have found a use-by date? Do we think about our old age? What we have done, so that Salarvand and colleagues (2007) in their research entitled "spiritual experience of old people in nursing homes mention that residence in nursing homes are as "final sign of failure". Why the heroes of yesterday, today are far away from us?

The results of the SWOT method in Sari and Astara cities, strength points(218.4), weakness points (437.2), opportunities (465.4) and threats (035.3) that reflect the approach (SO), (with proper using strength points, exploiting the opportunities).

In the ranking of the strength points, taking advantage of the old people with rich experiences with 4.75 is the first strength point in view of respondents, respectively. Since that this research is allocated to common living environment of old people and young children and young people reach puberty, it can refered to research and scientific paper of Shirzadi and colleagues (2013) entitled studying the effect of education by group discussion in promoting health in puberty of the girls in well being organization of Tehran which indicates that, education by group discussions affect positively on awareness of subjects. Old people can transfer their experiences in this regard and also the results of research of Fayaz and Kiyani (2011) entitled "Evaluation of Mental Health for fostered children of shahid Dastgheyb and shahid Namazi in Shiraz" indicate that children and adolescents living in these places should be communicated based on skills, ability to self-respect, assistance, skills. Using the experiences of old people can be effective for teens due to gaining experiences and also increasing the usefulness of old people.

The second choice aspect of importance among strength points with ranking 4.50 is allocated to factors of increase of usefulness in old people, lowering loneliness in old people and orphaned children and creating relation between generations. This finding has been reported by other researchers. Michaela and colleagues (2012) in their research entitled 'comparing loneliness, mental health and usefulness in old people indicate that people in these centers lose their abilities and decision making and eventually they feel instability and dependency. Usefulness of old people increases their reliance and power.

Also Shakiba and Ziyae (2012) in their research entitled 'comparing mental health of female students of well being centre

with high school students in Zahedan city' concluded that the role of family is important in mental health and in different studies the effect of social and economic situations of families on children's mental health has been explored and emphasized perfectly. In sanitarium and orphanage due to lack of family, these two generations overlap together. About relation between generations, the result of research of Haj Bagheri in year 2011 entitled experience of primary school students of Kashan city in visiting old people centre shows that eating and spending time with old people increase the relation if children and old people and improve social behaviors of children. In the article of Kashfi and colleagues (2010) as "the relationship between social and demographic factors and prevalence of depression among old people over 60 years in nursing care facilities covered by welfare center in Shiraz", the results suggest that the activity of old people effects on depression and unemployed are more depressed than employed.

Based on the answers of respondents in ranking opportunities, supportive role of government with rank 5 is the first priority. Mo'tamedi Shalamzari et al. (2002) in an article titled "studying the Role of social support on life satisfaction, general health and loneliness among the old people over 60 years" have come to the conclusion that social support, especially emotional support of old people decreases their loneliness and increases the level of their general health. Fayaz and Kiyani (2011) in their article titled "Evaluation of Mental Health for fostered children as a result of a joint state indicates that the main goal of mental health is prevention of disease and behavior disorders and promotion of health.

The second opportunity is hiring psychologists with score 4.75 and as the results of this research using experienced councilors can protect children in these centers. Also other results of this research, the third opportunity in view of respondents with ranking 4.50 indicated that, it is better that the spaces of these centers should be resembled with family and other opportunities in the third rank include promoting positive view and positivism about sanitarium and reducing anxiety and fear in old people to live there and also society must consider them perfectly. Adib Haj Bagheri and Aminoroayae Yamini (2011) in their research entitled experience of primary school students of Kashan city in visiting old people center indicate that in some sanitariums, mental and physical disabled live with old people with negative consequences for old people and it is necessary to separate their places respectively.

In studying the importance of weakness points regarding answers, the dependency of both generations and trauma resulted by death of old people or adapting young people with the third rank is placed in the first rank and this shows the dependency of both generations respectively.

In the lowest rank of weakness points, young hood violation and aggression and interaction with old people and old thinking of some old people and neglecting present young people in the second rank and depression of young people due to living with old people with a rank as 1.75 which they are considered as the main weakness points of this research but finally ignored perfectly.

## 7 Conclusion

The main hypothesis of researcher (H1- it seems it is possible to have common living environment of old people and orphaned young people) is proved and this means that it is possible to establish centers until old people and young people live together. Old people remain valuable, young people think valuable and society becomes valuable. All human kinds have been created for effective living, so in the nature of all human kind there is an endeavor to change the world. Children, adolescents, young people, old people and elderly with new ideas, endless endeavor and a heart full of energy, a comprehensive overview and depth of experience in the world come together. Building a society based on united foundations

will be remained forever. Let be people as researcher mentioned them.

### Acknowledgments

It is necessary to acknowledge and appreciate all those who have helped us in this study, architects, psychologists (wellbeing organization, old people responsible and adolescents' counselors), occupational therapists, rehabilitation officials and other persons.

<sup>b</sup>sajad.mahdian117@gmail.com

**Abstract.** The objective of this study is to examine effect of human resources costing (human resources accounting) on profitability of listed companies in stock exchange. Statistical population of study consists of companies accepted in Tehran Stock Exchange that 94 companies are chosen as sample size. Researcher hypotheses were analyzed using bivariate and multivariate linear multiple regressions as well as F, and t tests. Results obtained from hypotheses testing indicated a significant relation between dependent variable of firm profitability and independent variables including human resources costs, human resources costs ratio to total assets, human resources costs ratio to Net Operating Profit and human resources costs ratio to Net Operating Profit after Tax (NOPA).

**Keywords:** profitability, human resources accounting, human resources accounting ratios

### 1 Introduction

Human resources accounting is one of important issues considered in Iran. Since users of financial statements need information about all economic resources used in economic entity, the human resources employed in organization are considered by these users. Investors, who are users of financial statements, need some information about human assets value and changes in these assets during financial period to make right investment decisions. Units' managers, who are financial information users, need such information to plan and control human resources. Moreover, human resources accounting is a method for evaluation of management performance in terms of benefiting from human resources. In all organizations, skilled and specialized staffs are scarce resources and all managers of economic units and social institutes search for such staffs to promote their performance levels or tend to spend extra costs to train human resources in order to achieve the optimum level. Obviously, lack of information about economic value of such scarce resources or information about the division of the spent costs into asset account or cost of period would lead to inability to correct or employ these resources properly (Abachi, 2013).

In today's organizations, employed human force not only is able to do general tasks but also can provide professional services, which are value creator more than before. Therefore, it is required to have a system or instrument capable of determining real value of services provided by human resources as intellectual capital. Majority of economists emphasizes on formation of physical capital and human capital as the major determinant of economic growth and development. New growth theories focus on the role of human capital in economic growth and thought and opinion of trained human forces are introduced as the basic factors of economic growth and development within expansion of production technologies. In fact, it can be stated that physical capitals will be productive if the country has required level of human capital.

Moreover, traditional financial statements that are based on the accounting accepted principles just indicate the value of physical assets of organization not providing the level of investments in recruitment, training and maintenance of this precious resource in frame of monetary measures. In traditional accounting system, all of the money spent on human resources are considered as cost and mentioned in profit-loss statement; in contrary, since human resource is treated as income and investment not cost in human resources accounting system, the depreciation cost of human resources is considered as cost in profit-loss statement and the remained costs spent in field human resources are inserted in balanced sheet under the title of human resources investment. Also, all of money spent on human resources are

considered in column related to assets separately entitled investment in human resources, because the money spent on human resources is treated as investment not cost in an organization (Farmahini Farahani, 2011). Accordingly, such attitude in accounting system would lead to transparency of accruals written in balanced sheet and transparency of profit and loss statement of organization.

In this study, the author tends to examine the effect of human resources accounting on profitability of companies accepted in stock exchange.

### 2 Research Background

Johanson and Holmgren (1998) conducted a study entitled "the relation between human resources accounting and concepts of balanced scorecard system" in which, they considered the importance of human resources accounting in performance evaluation and providing strategy map and scorecard. Results obtained from their study indicated that application of human resources accounting is important in factors of balanced scorecard in particular the factor related to employee learning and growth.

Bullen et al. (2000) presented a paper about the relation between human resources accounting and concepts of balanced scorecard system. They concluded that application of human resources measures has a significant effect on evaluation of growth and learning factor as well as long-term success of firms.

Turner (2000) presented a theoretical paper about the effect of human resources accounting of organization on growth and learning. He concluded that information of human resources accounting in effective in supervision on employee performance and human resources creation and evaluation by managers.

Stovall (2001) conducted a study entitled "concepts for theory and practice in human resources accounting" in which, shortcomings of traditional accounting systems and importance of reporting of accounting information related human resources in companies. Results obtained from this study showed that knowledge understanding of demanders of human resources accounting information has not been properly developed in terms of human resources valuating models. Stovall recommended changes in field of educational opportunities in human resources scope.

Flamholtz et al. (2002) defined human resources accounting as an attempt to identify and report investment in human resources, which is expected to create extra profits for the firm in future. According to this definition, human resources of each organization can be reported as assets in financial statements if they can increase future profitability of company through improving production and providing goods and services.

America Association of Certified Public Accountants (1983) defines human resources accounting as follows, "human resources accounting is a process to identify and measure data related to human resources of companies through exchanging this information with beneficiaries in order to contribute to decisions made by users inside and outside of the country". Human capital can be defined as knowledge acquired by individuals obtained through life and used to produce and present more qualified good and services (Afiouni, 2007).

Verma and Due (2008) conducted a study entitled "human resources valuation" in which, they employed current measurement approaches and expected advances to determine acceptance level of human resources valuation models. In this research, questionnaire was used for a sample consisting of 370 American firms. Results obtained from this study showed that

majority of these firms could perceive these models and consider human resources information as a key factor in decision-making.

Deem (2009) studied the relation between organizational culture and practical application of important factors to evaluate performance of governmental organizations. Results obtained from statistical analysis of this study showed that the most important criteria used in governmental organizations for performance evaluation are as follows: 1- employee learning, 2- organizational learning, 3- employee stability, 4- employee satisfaction, and 5- positive attitude toward employees.

Professor Hashemi (2005) conducted a descriptive-analytical study entitled "analytical study of human resources accounting models emphasizing on selective models in companies accepted in Tehran Stock Exchange". Analysis of obtained data shows that possible application of mentioned methods is evaluated at low and average level and among existing models, the model of acquisition cost is chosen as the best applicable model from the perspective of studied members.

Gholami (2005) studied barriers and problems in implementation of human resources accounting in Iran. In this research, awareness level of financial information users, information providers, professional and academic associations of accounting was examined in field of human resources accounting. Results obtained from this study indicated that the major reason for lack of human resources accounting implementation in Iran is related to lack of information among users and accountants; also, professional and academic associations have not conducted effective actions to introduce this kind of accounting.

Namazi and Jamee (2008) studied the role of human resources accounting (costing) information in factors of balanced scorecard of companies listed in Tehran Stock Exchange. They obtained the following results:

Human resources accounting information (costing) is indeed the application of concepts of accounting information system at the range of human resources. This accounting method is a criterion for costing and measurement of human resources as the main resource in every company. Hence, the objective of this paper was to examine the role of accounting information (costing) of human resources in factors of Balanced Scorecard System of companies of Tehran Stock Exchange. This study was conducted for time interval from 2004 to 2008 and consisted of 96 companies. Results obtained from hypotheses testing using "Partial Regression" implied that there was a positive significant relation between human resources accounting (costing) and factors of Balanced Scorecard System (considering firm type and size, education and experience level of human resources managers) at both indexes and companies levels. Moreover, findings of this study at indexes level indicated positive effect of firm type and size on accounting (costing) equation of human resources and financial factor indexes (net profit, management of costs and total income), customer factor (return of sold product, and after-sale service), and internal process factor (bad debts and cost of maintenance and repair). Also, firm size and type, education and experience level of managers could positively affect human resources, growth and learning factor indexes (job quality, empowerment, job satisfaction, and improved employee training).

Almasi and Sepahban (2009) conducted a study to examine the "relation between investment in human resources, physical investment with economic growth of Iran during 1971-2005. They obtained following results: according to the standard Granger Causality Relation, there was a unilateral causal relation between physical capital and economic growth and there was a bilateral Granger causal relation between human capital and economic growth. Results obtained from short-term and long-term Granger Causality Test using error correction model indicated a bilateral Granger causality relation between economic growth and human capital, a unilateral Granger causality relation between physical capital and human capital; also, a unilateral Granger causality relation between physical capital and economic growth in short term and long term. Therefore, increased number of trained human resources can increase supply of specialized, researcher, and entrepreneur labor force. Definitely, such trained and skilled labor force can provide more rapid economic growth through innovations and optimal application of financial facilities in country.

Talebniya and Ghorbani (2010) conducted a study to examine "feasibility of human resources valuation models in Audit Institutions members of Official Accountant Association of Iran" and obtained following results:

"In this research, feasibility of historical cost model application and economic value model were considered in Audit Institutions members of official accountant association of Iran. The purpose of this study was to measure human resources and to report them as asset quantifying value of human resources using mentioned models. This study was a theoretical-descriptive research in which, questionnaire was employed for data collection. Statistical population consisted persons with MA or PhD degree in Accounting and simple random sampling method was used. Results obtained from this study indicated that application of these models was possible to measure human resources value; accordingly, human resources can be identified and reported as asset through quantifying the value provided by human resources based on monetary criteria."

Poormiri (2012) conducted a study to "calculate share of labour force, physical, human capitals as well as Research and Development (R&D) in economic growth of Iran during 1974-2007." The results of this study are as follows:

New growth studies indicate that internal factors of an economy such as human capital and R&D besides physical capital and technology can affect economic growth. The purpose of this study was to calculate the share of some factors such as human capital, R&D, unskilled labor force, and physical capital in GDP growth in 1974. In this research, the generalized Solow Growth Model 1 was employed. Information related to GDP, active population, physical capital, research budget of government, and consuming expenses in education sector were extracted from time-series data of Central Bank of Iran, Iran Census and Governmental Budget Center during 2007. Eviews software was used for calculation. Results indicated the effect of unskilled labor force, physical capital, human capital, and R&D on Iran's GDP growth was equal to 55, 3.28, 7.13, and 3% respectively. Results of other studied out of Iran show that the effect of unskilled labor force is low in developed countries, whereas, the effect of human capital and R&D was high (figure 1).

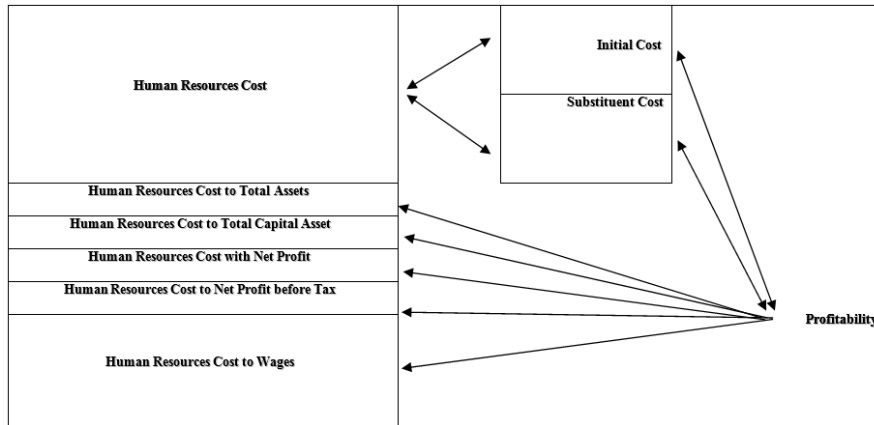

Figure 1. Analytical Model of Research

**3 Research Method**

This is an applied research in scope of Positive Researches of Accounting in which, multivariable regression method and econometric models have been used. Research hypothesis was tested based on the cross-sectional data and combined data. Statistical analyses were undertaken using SPSS, Eviews, and Matlab software. Statistical population of this study consisted of companies listed in Stock Exchange that had following conditions:

- 1) Company stock is exchanged in Tehran Stock Exchange during 2011-2014.
- 2) Transactional logo of company is not transferred to unofficial board.
- 3) Transactional logo of is active and is transacted at least once in year.
- 4) Financial year of company is finished at the end of March without any change in financial year during study period.
- 5) Financial information of company for studied period is accessible.
- 6) The company should not be included in financial mediation companies.

Table 1 indicates data and information existing in stock market during 2011-2014.

number of companies existed in stock market during 2011-2014	423 companies
number of companies not included in investment companies and banks	358 companies
number of companies with financial years ended on March	225 companies
number of companies, which their transactional logos have not been stopped more than 4 months	172 companies
number of companies with available information for research duration	97 companies
number of companies included in statistical population	94 companies

Library studies and note taking method were used as data collection methods and data summarization table was applied to conduct library study. To collect data related to human resources, a designed questionnaire was employed. This questionnaire was not filled out with individuals or companies

but it was completed using financial information of companies in accordance with accessibility of human resources information including cost of recruitment, selection, education, and optimization.

Table 2. Calculation of statistical methods and presumptions analysis

row	subject	method/test
11	descriptive statistics	mean, variance, standard deviation, summarization table, graphical charts
22	evaluation of independent and dependent variables	Kolmogorov-Smirnov
33	selection of panel and combined data	F-Limer
44	determining stochastic variables	Hausman
65	Variance examination	White
66	errors independency	Durbin-Watson
7	analysis of relationships	linear regression
8	parameters generalization	t value and F value

Hypotheses of this study are modeled in frame of regression relations; therefore, it is required to examine basic assumptions of these relations before testing these regression relations and analysis of their results. Hence, three vital tests about regression relations of study are examined at this study. These tests are as follows:

Normality test of research data: Kolmogorov-Smirnov test was applied in this study to test normality of data through SPSS18

software. According to this test, normal distribution of research statistical population was approved at confidence level of 95% if Sig of Kolmogorov-Smirnov table is more than 5%.

To test fitness of linear pattern and lack of unrelated points, scatter diagrams are used. Since these diagrams do not show a clarified pattern (for example, curved, diagonal, etc. diagrams), fitness of linear regression and lack of unrelated points is accepted.

Variance Consistency Test: the last important point about regression relations in this research is related to consistency of variances in residual diagram compared to fitted values. If this diagram determines a specific pattern, one of basic presumptions of regression will be questioned and it can be claimed that data scattering is stochastic. Pearson correlation analysis, which is applied to determine relation between two quantitative variables, can be applied in some cases in which, firstly, both variables are measured and recorded at one section of time (simultaneously) and secondly data distribution follows normal distribution.

#### 4 Research Variables

##### 4.1 Independent Variable

Independent variable of this research is related to profitability criterion. In this study, Return on Equity (RoE) is applied as profitability indicator calculated through profit net dividing by total equity.

##### 4.2 Independent Variables

**Human Resources Cost Ratio to Total Assets:** this ratio is calculated using human resources cost, which its calculation method is described above, and total assets of companies, which is obtained from financial information of companies.

Human resources accounting is a method to identify and report investment in human forces that are expected to create benefits excess of normal benefits for company in future. According to this definition, human resources of every company can be reported as asset in financial statements if they are capable of increasing future profitability of company through improving production and providing goods and services (Flamholtz, 2002). America Institution of Certified Public Accountants (AICPA, 1983) has defined human resources accounting as "a process to identify and measure data related to human resources of companies and exchange of these information with beneficiaries to help internal and external users with their decisions." Human capital can be defined as acquired knowledge of individuals obtained through life and used to produce and provide more qualified goods and services (Afiouni, 2007).

**Human Resources Cost Ratio:** to collect data related to human resources, Flamholtz Formula (1998) was used. In this method, a questionnaire consisting of questions related human resources cost of companies is designed and filled out through financial statements of these companies. This questionnaire was not filled out with individuals or companies but also it was completed using financial information of companies considering inaccessibility of some human resources information including cost of recruitment, training, and optimization.

This concept is obtained from the human resources cost ratio (in accordance with Holtz formula) to total assets of companies (Forooghi & Ahmad Nejad).

**Human Resources Cost Ratio to Total Assets:** this ratio is calculated through human resources, which its calculation method was described, and total assets of companies using financial information of companies (Independent variable).

This concept is obtained from human resources cost ratio (based on Holtz formula) to capital assets of company (Forooghi & Ahmad Nejad).

**Human Resources Cost Ratio to Capital Assets:** this ratio is calculated through human resources cost, which its calculation is described above, and capital assets of companies using financial information of companies (Independent variable).

This concept is obtained from human resources cost ratio (based on Holtz formula) to wages and bonus cost in company (Forooghi & Ahmad Nejad).

**Human Resources Cost Ratio to Cost of Wages and bonus:** this ratio is calculated through human resources cost, which its calculation is described above, and cost of wages and bonus of companies using financial information of companies (Independent variable).

This concept is obtained from human resources cost ratio (based on Holtz formula) to operating profit of company (Forooghi & Ahmad Nejad).

**Human Resources Cost Ratio to Net Operating Profit:** this ratio is calculated through human resources cost, which its calculation is described above, and net operating profit of companies using financial information of companies (Independent variable).

This concept is obtained from human resources cost ratio (based on Holtz formula) to operating profit of company (Forooghi & Ahmad Nejad).

**Human Resources Cost Ratio to before-Tax Net Profit:** this ratio is calculated through human resources cost, which its calculation is described above, and before-tax net profit of companies using financial information of companies (Independent variable).

##### 4.3 Cost Model of Flamholtz

In this study, information of human resources costing is considered as independent variables based on the acquisition cost model of Flamholtz (1998). The acquisition cost model, which is also called "initial cost", consists of a cost of recruitment, teaching and learning of employees. Acquisition cost can be divided into two groups of cost of employee attraction and recruitment, accost of employee teaching and learning (Flamholtz, 1998).

Acquisition cost of Flamholtz can be included in 7 clear accounts in accordance with following headlines:

1-Recruitment costs, 2- selection costs, 3-formal teaching costs, 4- non-formal teaching costs, 5-introduction costs, 6- in-service training costs, 7-development costs. These costs are depreciated based on matching principle. Hence, cost model of human resources acquisition of Flamholtz for a company is as follows:

$$TRChr = achr + tchr$$

**TRChr:** acquisition cost of human resources of company;

**achr:** cost of attraction and recruitment of human resources;

**tchr:** cost of human resources teaching and learning.

This model was applied in this study due to following reasons:

1. Application of this model is matched with accounting situation of Iran. Result obtained from studies conducted by Sheybani (1998) and Professor Hashemi (2009) approves this point.
2. This model is matched with accounting operations for assets evaluation.
3. Acquisition Cost Model of Flamholtz (1998) is a substantive method.
4. This model is more accepted by tax organization compared to other methods.
5. Some researchers named Hassam Ghorbani (2000) and Namazi (2009) have used historical human resources cost model in Iranian companies and this model has been accepted in Iran.

The author of present paper also studies on value of information of human resources costing based on the historical cost model.

This method was developed by Bozada (1997), William C. Pill, R. Lee Bramet, and Eric J. Flamholtz (1998).

**5 Research Mathematical Model**

$$Y = F(X_1 + X_2 + X_3 + X_4 + X_5 + X_6)$$

**5.1 Definition of Variables**

- 1) Y: profitability
- 2) X<sub>1</sub>: Human Resources Cost
- 3) X<sub>2</sub>: Human resources cost ratio to total asset
- 4) X<sub>3</sub>: Human resources cost ratio to capital asset
- 5) X<sub>4</sub>: Human resources cost ratio to cost of wags and bonus
- 6) X<sub>5</sub>: Human resources cost ratio to net profit
- 7) X<sub>7</sub>: Human resource cost ratio to before-tax profit net

**5.2 Definition and measurement of variables**

X<sub>1</sub>: human resource cost (independent), X<sub>2</sub>: human resources cost ratio to total assets (independent), X<sub>3</sub>: human resources cost ratio to capital asset (independent), X<sub>4</sub>: human resources cost ratio to cost of wages and bonus (independent), X<sub>5</sub>: human resources cost ratio to net profit (independent), X<sub>6</sub>: human resources cost ratio to before-tax net profit, and Y: profitability (dependent).

**5.3 Regression Model**

For this purpose, following regression model is used:

$$F = \beta_0 + \beta_1x_1 + \beta_2x_2 + \beta_3x_3 + \beta_4x_4 + \beta_5x_5 + \beta_6x_6 + \varepsilon$$

**5.4 Equation measurement**

Y is estimated using n-variable regression estimating parameters  $\alpha, \beta_1, \beta_2, \beta_3, \beta_4, \beta_5, \beta_6$ .

**6 Findings**

Table 3. Descriptive statistics of research variables

	number	mean	med	standard deviation	minimum
logarithm of company profitability	375	3.4978	1.9184	5.49278	4.14
logarithm of human resources cost	375	0.6695	0.6834	0.22602	0.06
ratio of human resources cost to total assets	375	0.5755	0.5616	0.23225	0.06
ratio of human resources cost to capital asset	375	0.0941	0.0510	0.12238	0.00
ratio of human resources cost to wages and bonus	375	1.4093	1.9872	31.13576	219.21
ratio of human resources cost to net operating profit	375	5.9738	4.2525	5.60331	0.01
ratio of human resources cost on before-tax net profit	375	4421.9611	2324.5800	4371.54356	671.00

According to table 3, descriptive statistics of variables indicate that selected sample has enough diversity; hence, results obtained from sample can be generalized to the population.

Table 4. Results of Hausman Test (choosing between fixed and random effects)

mutual relation between variables	Chi-Square value	df	P-value	test result
the relation between human resources costs and profitability	11.164	1	0.0248	fixed effects method

According to table 4, the obtained value of both models is significant. According to the reported significance, H<sub>0</sub> is rejected and H<sub>1</sub> is accepted at confidence level of 95% for each of models; hence, the fixed-effects methods should be used.

**6.1 Relation between human resources costs and profitability**

The effect of explanatory variable on dependent variable (profitability) is examined using information obtained from financial statements of companies in 2015.

The following part is related to regression estimation of relation between human resources costs and profitability.

As can be seen in table 5, since correlation coefficient (0.821) between two variables of human resources costs and profitability tends to 1 and since correlation at the rage from 0.075 to 1 is a strong correlation and since significance level of human resources costs and profitability is significant, the strong correlation between human resources costs and profitability is generalized as follows:

Table 5. Regression estimation of relation between human resources costs and profitability

variable	abbreviation	coefficient	t value	significance level	adjusted R <sup>2</sup>	R
fixed coefficient	$\beta_0$	-2.529	-94.43	0.000	0.593	0.821
human resources costs	TRChr	0.0024	6.31	0.000		

Significance of coefficient related to independent variable and fixed coefficient is tested using t-student test. Null hypothesis and opposite hypothesis for estimation of model parameters (slop and intercept) are as follows:

$$\begin{cases} H_0 : \beta_i = 0 & i = 0,1 \\ H_1 : \beta_i \neq 0 \end{cases} \quad (1)$$

**6.2 Value amount of test is calculated as**

$$t_{\beta_i} = \frac{\hat{\beta}_i - 0}{S_{\beta_i}} \quad (2)$$

Also, rejection and acceptance areas of null hypothesis are defined as follows:

Figure 2. Rejection and Acceptance areas of null hypothesis at confidence level of 95%

Judgment method is that if  $t$  value is at rejection area,  $H_0$  will be rejected. According to the results of table 5, calculated  $t$  values, and related probabilities, significance level of  $t$  is lower than 0.05% for variables of fixed coefficient and human resources costs. Therefore, the test, equality of regression coefficients of these variables to zero, is rejected indicating significance of mentioned variables at confidence level of 95%. Therefore, the

relation between human resources costs and profitability is described as follows:

$$ROE_{it} = -2.529 + 0.0024 it \quad (3)$$

As can be seen from this model, there is a positive significant relation between human resources cost and profitability. Examination of adjusted coefficient determination of model (0.593) indicates the high ability of model to explain and describe dependent variable. Accordingly, about 59.3% of changes in profitability are explained by human resources costs.  $F$  value of regression of this model implies explaining ability of model, because calculated  $F$  values are significant at 5% level. Therefore, there is a direct linear and significant relation between profitability and human resources cost in accordance with the calculated  $t$  values and adjusted coefficient of determination.

### 6.3 Relation between profitability and other independent variables

Table 6. Regression estimation of relation between profitability and independent variables

Variable	Coefficient	Adjusted R <sup>2</sup>	R	t value	P-value
intercept	3.462			9.522	0.000
human resource cost	0.004%	0.593%	0.821%	6.321%	0.000%
ratio of human resources cost to total assets	0.004282	0.18	0.205	.0119431	0.000
ratio of human resources cost to capital asset	0.046243	0.11	0.078	1.246015	0.0914
ratio of human resources cost to wages and bonus	0.029261	0.08	0.083	2.339441	0.0710
ratio of human resources cost to net operating profit	0.000935	0.17	0.195	0.585351	0.0000
ratio of human resources cost on before-tax net profit	0.031251	0.14	0.104	1.352170	0.0246

According to table 6, coefficient of human resources cost ratio to total assets and profitability is positive; also,  $t$  value and significance level related to it imply significance of positive effect of this variable on company profitability. Therefore, hypothesis 2 is accepted.

Also, there is not any significant relation between ratio of human resources costs to capital assets, ratio of human resources cost to wage and bonus, and profitability of company. In other words, probability value is above 0.5%; therefore, hypotheses 3 and 4 are not accepted.

Variable of human resources costs ratio to net operation profit is positive;  $t$  value and significance level of it also indicate positive effect of the mentioned variable on company profitability. Therefore, hypothesis 5 is accepted.

Ratio of human resources costs to before-tax net profit and profitability is positive;  $t$  value and significance level related to it also indicate the positive effect of this variable on company profitability. Therefore, last hypothesis is accepted. This variable is able to explain 14% of changes in company profitability.

According to the results obtained from table 4-12, the estimated model can be presented. In other words, multiple linear regression model of profitability ratios based on human resources factors is estimated as follows:

Profitability = 0.59 human resources costs + 0.18 ratio of human resources cost to total assets + 0.17 ratio of human resources cost to net operating profit + 0.17 ratio of human resources cost to before-tax net profit.

$$Y = 0.59 + 0.18x_1 + 0.17x_2 + 0.14x_4 \quad (4)$$

It means that a one-unit change in independent variable of this research leads to about 6 units change (increase or decrease) in dependent variable if other variables are fixed.

Also, if other factors are assumed as fixed factors, a one-unit change in second, fifth, and sixth independent variables leads to 1.8, 1.7, and 1.4 unit change (increase or decrease) in dependent variable (profitability).

## 7 Conclusion

The purpose of this study was to examine the relation between human resources accounting and profitability in Tehran Stock Exchange during 2011-2014. Research territory is evaluation of the relation between human resources costs and profitability of company. The obtained results indicated a linear positive relation between human resources costs and profitability of listed companies in Tehran Stock Exchange. Therefore, the null hypothesis about the lack of relation between two variables was rejected; hence, this hypothesis was accepted.

According to the results obtained from final model, adjusted coefficient of determination was 0.588 and it means that this model is capable of explaining 58.8% of profitability changes. In previous researches, Etemadi and Chalaki (2005) found that there was a significant relation between criteria of human resources costs and profitability. This result is matched with the result obtained from present study. Betazi et al (2008) found that companies with higher productivity had higher profitability and more rapid growth. This finding is also matched with results of present study. Some recommendations are presented based on the research results in order to promote and expand further studies.

### 7.1 Practical recommendations based research results

According to the results obtained from hypotheses testing, there is a positive relation between human resources and profitability. Hence, some recommendations are presented as follows:

The present study is beneficial for all companies listed in Tehran Stock Exchange, all investors, and all users of financial statements. This research can:

1. Provide beneficial and accurate information for financial investors in market as well as a proper evaluation of performance of investee firms.
2. be used by stock market brokers to determine transactional price of stocks, to control rate fluctuations in major and minor halls of capital and financial markets.
3. be used by many of users such as stock investors and financial lenders. Meanwhile, the government is one of the important users of this research and can use it as a control measure at financial market level.

## 7.2 Practical recommendation based on further studies

Each study can pave the way for further studies that are necessary. Hence, it is required to conduct some studies considering following options:

1. Adding control variables to this research examining the results
2. Determining the relation between productivity and human resources investment in capital assets
3. Comparing human resources productivity ratios with other profitability factors

**Abstract.** This paper tries to investigate resistance factors of Izadkhash dam such as pressure of stress distribution. At first, by using instrumentation data of construction period, finite difference method and commercial code of Flac by back analysis method, we reach rational data from preliminary data then continuing project procedure, we divide operation period into the two ten-year periods and the first operation period had began since 2008. Results show that using behavioral model of Mohr-Coulomb in core vertical settlements has appropriate accuracy. Also, analysis of dam total structure show that after construction completion and the first water load, the pore pressure of water created in dam core, amounts 370 kpa which is in the middle of core level.

**Keywords:** stress evaluation, back analysis, vertical and horizontal transformation, Izadkhash dam, Flac.

### 1. Introduction

Designing and constructing embankment dams is one of the sciences which has thousands years of background and many countries located in arid and semi-arid areas such as Iran have beneficial experiences in this regard in early 20<sup>th</sup> century. Significant transformations had been strated based on done studies by Karell Tarzaghy. Because of diversity of factors affecting embankment dam behavior, specially significant impacts of natural phenomenon such as geological and geotechnical conditions, hydrological and geohydrological conditions of region and climatic conditions which make this scientific discipline face with complex problems that negligence of them can cause project failure and many financial and fatal damages. Destroying many emabankment reservoir dams in world after 1970, proves this claim (Pagano, et al., 2006). During recent decades, different types of numerical methods such as finite element, marginal element and seprated element are applied in solving engineering problems. Today, these methods are used in designing dams, underground spaces such as tunnels, underground stores and slopes. Reliability of designing assumptions depends on input information accuracy of analysis as if they are not being accurate enough or not representing actual values of mechanical parameter of environment, determining values of geomechanical features including stresss, settlement etc., will be difficult (Zoufaghari, 2005). In investigating embankment dam's behavior, because there's lack of deterministic criteria for evaluating data, often personal judgments of people are stressed. But, from the first time that numerical situation of layered construction of dam was done, many significant advances, both in numerical methods and physical interpretation of problems has been occurred. Although, only finite number of numerical predictions had modeled deformations of the construction period and the first water load accurately (Clough, and Woodward, 1967). Many scholars have taken steps to evaluate ethology of embankment dams. Ziaei (2014) investigated changes of the pore pressure of Maku dam core during operation period. In that research, based on data proposed by piezometer installed inside the foundation and around the cut off wall, significant downfall in downstreams piezometer level of cut off wall could been seen which shows good performance of this wall. This downfall inside the clay which acts as an impermeable one in this kind of dams, also shows good performance of core. In this research, comparison between resulted diagrams of instrumentation results and also numerical analysis show that there is a good match between measured data by electrical piezometer and software results and dam performance in terms of leak is trustable. Rattue (2000) investigated behavior of Santa Margaret dam in Canada with 171 meter height. In that research, because levee materials had high permeability and levee humidity was equal to the optimal

humidity, there was a little pore water pressure in this dam by comparing numerical analysis using obtained parameter of triaxial tests, it was seen that resulted values of analysis does not match with obtained values of measurement and because of that, resulted values of analysis of model were adjusted by performing a trial and error process and it was seen that actual Yung model of dam is 2, 3 times more than obtained values of triaxial tests. Ebrahimnejad, Sediq, Emami Tabrizi and Barari proposed a research named behavior survey of foundation and body settlement of A'lavian dam during operation period. In that research, in addition to the analyzing done measurements regarding displacements and vertical transformations of body and foundation of A'lavian dam with 80 meter height during four years after construction, also interaction between gallery and foundation was done (Jafarzade and Talebi, 2013). Another research was done by Bemaniyazdi under guidance of Dr.Hosseini. In that research, monitoring of Karkhe embankment dam after water load was done and Plaxis and CA2 software were used for back analysis and modeling stress-stress behavior of dam. Main points of this research regarding changes trend of dam behavioral features including pore water pressure and transformations and recreation of these trends by numerical model. Settlement values, pore water pressure and vertical total pressure were analyzed in terms of limit values and changes trend during construction and water load period. Coefficients of pore water pressure and arching were investigated in two done and achieved modes of read out. At the end of that research, predicting dam behavior in effect of reservoir level increase and almost faster decrease than reservoir were done (Haeri, 1996).

In this paper, we investigate behavior of Izadkhash embankment dam during construction and the first water load (which is one of the most important stages of loading and investigating statistical resistance of dams) was done. Also, behavior of this dam was recorded by measurement machines during construction and water load and these information were applied in this research. For investigating this dam behavior in construction and water load mode, Flac software was used and results of this numerical analysis were compared with monitoring results. By this software, displacements and stresss, arching during last stages of construction and water load could be investigated. By back analysis, more realistic parameter are achieved for dam behavior which are usable for analyzing dam behavior under future loadings.

### 2. Investigating behavior of embankment and rock fill dams during construction

#### 2.1. Stress conditions during construction

Total and effective stress values in dam during construction depends on dam geometry and resistance parameter and compressibility of materials. For a homogeneous dam on solid foundation, elastic analysis shows that vertical stress values in dam axis depends on dam geometry and lateral stress values, in addition to the dam geometry, depends on Poisson ratio of core and shell materials values. During early stages of construction in which, width of levee is more than its height, assumption of increasing stress is equal to the depth of soil multiplied by its weight. But, in next stages, this assumption does not seem rational (Duncan, 1996).

#### 2.2. Dam displacement during the first water load

Displacements of dam because of the first water load can has a complex nature. Input of water force can have following effects:

1. Water forcing on core upstream causes increasing in total lateral stress and push dam down.
2. The impact of water on upstream foundation is in this way that if foundation compressibility will be high, it will be so effective on transformations of dam body. Settlement difference in foundation can cause problems.

3. Decreasing effective stress on upstream shell caused by the phenomenon of immersion partly caused uplift deformation in this area. It should be mentioned in this regard that tangent modulus of materials in unloading is higher than loading.

4. Decreasing parameter of shear resistance and elasticity modulus of upstream shell materials caused by stress and absorption of rock fill materials in upstream shell finally leads to subsidence. Figure 1 shows four effects of water load on dam which are mentioned above.

Figure1:Reservoir water loading effects on embankment dam

### 3. How Flac software work

Flac program for materials propose user following featured models (Zamiran, 2013, Ghorbani and Jamshidi, 2012):

Isotropic elastic model, Mohr-Coulomb plastic model, Drucker-Prager plastic model, Hook-Brown plastic model, hardening-softening strain plastic model, plastic model, reyielding model, Cam-Clay adjusted model. Of course there are more models in Flac software for plastic models, creep models and models which cause pore pressure in dynamic analysis. One of the features of Flac software code is capability of defining behavioral model by using C++ program and adding that to the Flac software code.

### 4. Introduction of Izadkhash dam

Izadkhash dam located in Fars province. River bed level at the site is 1310 meter above sea level, area level to the dam site is 910 square kilometer, average raining of area (annual raining) is 365 mm per year, average yearly is 110/9, minimum amount is 28.62 million cubic meter (water year of 49-50) and maximum amount is 386/9 million cubic meter (water year of 72-71) in the period of 30 years. Reservoir level of maximum level (1380.4 meter) is 3.27 square kilometer, reservoir volum at maximum

level (1380.4 meter) is 95 million cubic meter, input flooding to the reservoir with return period of 100 years is 1000 cubic meter per second, input flooding to the reservoir with return period of 1000 years is 1950 cubic meter per second, input flooding with return period of 10000 years is 3100 cubic meter per second (Zamiran, 2013). This kind of dam is embankment- rock fill dam with inclined clay core, crest length of dam is 485 meter apart from the length, plug fuse and the bridge over the spillway, crest width of dam is 10 meter, the height from dam bed is 71 meter, the height from foundation is 77 meter, crest level of dam is 1381 meter from sea level, the width of the base in the biggest segment is 330 meter, normal level of dam reservoir is 1378 meter from sea level, reservoir volum in normal level is 82 million cubic meter and reservoir level in normal level of dam is 2.7 square kilometer.

Also, it has grout curtain of 44000 square meter in calcareous masses. Izadkhash dam of Darab has 3 sections of B, E and H tools category and locating maps of dam tools category are shown below. In this dam, different tools such as electrical piezometer, foundation and vertical pipe, barometer cells, hydraulic and magnetic settlement cell, propane and in place turnkey and accelerometer and meteorological systems were used.

Figure2: Instrumentation layout plan of Darab Izadkhash dam and its section

### 5. Modeling trend of construction and water load stages of Izadkhash embankment dam

There are different methods for creating elements net in Flac software such as Grid, simple, block and Radial etc.; in this modeling, Block method was used. For creating elements, 6 horizontal blocks (2 blocks for foundation and 4 four blocks for body) and 11 vertical blocks (for upstream and downstream shell, upstream and downstream filter-transition, the front space of dam in upstream, downstream and finally in core) were used. Block method could change the mesh density in different areas (9). In defining elements net, it was tried that the length to the width ratio of elements being close to 1 to increase the accuracy

of solutions. In Flac software for to the length to the width ratios which are greater than 10, software shows error message. Generally, command for creating a block is as follow (Zamiran, 2013):

Gen x1, y1 x2, y2 x3, y3 x4, y4 i=1 m j=1 n

By above command, a four-square block with coordinates of  $x4, y4 x3, y3 x2, y2 x1, y1$  is formed in which, number of existed elements is equal to  $m*n$ . In modeling Izadkhash dam, an element net of  $123*53$  is used and total dimension of net is  $450*141$ m. Below figure shows intended elements and geometry for modeling body and foundation of Izadkhash dam in Flac software.

Figure3: Element components and considered geometry For Izadkhanst dam in Flac software.

Table1: The initial values of the parameter of materials

e	$K_y, m/s$	$K_{x,m/s}$	$\psi, deg$	$\phi, deg$	$C, KN / m^2$	$\nu$	$E, MN / m^2$	$Y, KN / m^3$	materials
0.25	$1 \times 10^{-11}$	$1 \times 10^{-10}$	2	30	50	0.25	200	21/3	Foundation
0.30	$1 \times 10^{-7}$	$1 \times 10^{-8}$	1	20	17	0.38	15	18	Core
0.33	$1 \times 10^{-3}$	$1 \times 10^{-4}$	66	31	0	0.35	24	19	Filter
0.35	$1 \times 10^{-2}$	$1 \times 10^{-3}$	4	32	0	0.32	28	19/5	Drain
0.36	$1 \times 10^{-1}$	$1 \times 10^{-2}$	5	33	0	0.31	29	20	Transition zone
0.34	$1 \times 10^{-1}$	$1 \times 10^{-1}$	1	38	0	0.37	33	18/5	Shell
0.32	$1 \times 10^{-3}$	$1 \times 10^{-4}$	3	30	0	0.36	40	21	Cofferdam

**6. Investigating vertical and horizontal deformations of dam body**

One of the most important behaviors of embankment dam is deformations occurs inside and outside of dam body. During construction period and after that if this phenomenon not controlled, can endanger resistance and efficiency of dam. For measuring inside transformations, two settlement cell – turnkey installed in cross section (E-E) of dam body were used. In this way, for measuring vertical transformations, settlement cell is read outed. Also, physical deformations of dam are measured by continuous finding points of signal points installed in areas of

body surface by mapping cameras. Measurement of vertical deformations is done by settlement cell in this way that there are special magnetic levels inside the settlement cell sheath at 5 meter intervals and the lowest level which is the base plate is installed on the rock foundation in which the least relocations had occurred. In (E-E) section, 3 settlement cells named I-E1, I-E2 and I-E3 are located in 3 meter, 53 meter and 103 meter of dam axis respectively in downstream side of shell. For evaluating vertical and horizontal deformations of (E-E) section by Flac software, values of measured settlement were analyzed by above instrument during construction.

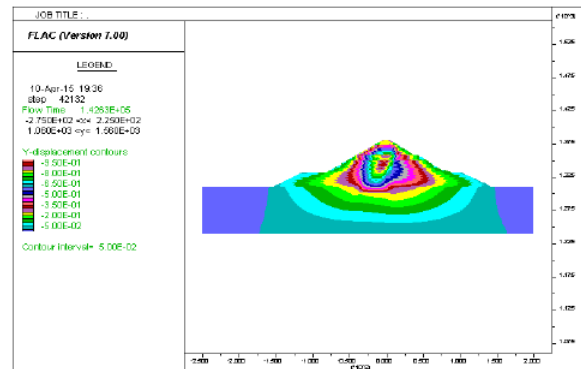

Figure4: Vertical displacement counter in embankment level of 1381 meter and settlement changes in different levels of downstream shell of section (E-E) to the embankment level of 1381 meter.

Above figure shows measured and achieved settlement values from back analysis in downstream shell of dam at the end of embankment is 1381 meter. Error of these data is 0.5. As seen, measured settlements are less than settlement of upstream shell but almost, they have the same changing trend as maximum measured settlement is 92cm and maximum settlement from back analysis is 95cm.

**7. Investigating vertical pressures of (E-E) section**

In (E-E) section, 3 piezometer were installed in different levels that installed piezometer in 1315 meter level which has the highest total tension was used for back analysis. 2 clusters of 3 installed clusters in this section are in 1342.5 meter and 1365 meter level and both of them are in the core. As seen, changes trend of measured total pressure in core shows acceptable values.

Generally, while embankment dam height has increased, results of pressure cells in comparison with the results of software has decreased. Its reason can be possible rotation of piezometer plates and also local arching phenomenon. Based on principles of materials resistance, when one plate has rotated as much as over the horizon, in this case, stress in plate which has angle over the horizon, is equal to:

$$\sigma_{\theta} = \sigma_y \cos^2 \theta \tag{1}$$

Regarding to the installed pressure cells in dam body, if piezometer plate rotated as much as  $\theta$ , finally instead of horizontal stress of  $\sigma_y$ , less stress i.e.  $\sigma_{\theta}$  will recorded.

Figure5: Vertical stress counter in embankment level of 1381 meter

For installing piezometer cells in specific level, a hole being dugged out and piezometer will put on the hole., then digged out hole will filled with same materials and again, they will smashed but as filling soil of hole become dense with lighter rollers, always existed soil in hole has less density than soil around the hole and by embankment level increasing, existed solid materials in the hole rely on around space , consequently, local arching phenomenon occurs in hole location and less stress reaches to the piezometer plate. The total stress error is 0.11 averagely.

**8. Behavior of Izadkhast dam of Darab during the first water load**

Behavior of Izadkhast dam which has 71 meter height, was evaluated by the end of construction when the first water loading was done and reaches 1355 meter levels, behavior of Izadkhast dam will using interpretations of dam read outs by installed instrumentation in its body and also comparing that with done analysis shows natural behavior of dam during construction, except in very minor cases that can be caused by operational problems or damaging very sensitive machines after installation. In the following section, regarding done investigation and also performing back analysis and obtaining real parameter of materials, predictions about dam behavior during operation are proposed.

Figure6: Vertical displacement in water loading level of 1355 meter and counter map of pore water pressure in water loading level of 1355 meter.

Regarding done analysis for total body of dam, after construction completion and the first water loading, the pore water pressure in dam core reaches 370 kpa which is in the middle of core level,

regarding analysis of dam body, after construction completion, the pore water pressure in dam core reaches 96cm which is in the middle one-third of the core level.

Figure7: Total stress counter in water loading level of 1355 meter and horizontal displacement in water loading level of 1355 meter.

As it is obvious in above figure, horizontal displacement become asymmetrical and the maximum amount is because of water loading in downstream shell. Regarding analysis of dam total body, total stress reduced to the little amount which is also exists in the corner of core level.

## 9. Conclusion and discussion

In this research, resistance factors of Izadkhash dam were investigated. At first, by using instrumentation data of construction period, finite difference method and commercial code of Flac with back analysis, we reach rational data from preliminary data, then for continuing project trend, we divide operation period into the two ten-year periods and the first operation period was began since 2006. Flac software is a finite difference method which is appropriate for modeling big transformations, the main formulation of Flac 2D program used in this research is base on 2-dimensional plane strain.

Lagrangian computational method and zoning special technique help Flac software for better modeling of plastic transformations and pulp flow in materials. Since no matrix is used during computations, as a result, 2-dimensional long computations do not need large amount of computer memory. Modeling abilities of this program in comparison with other numerical software including plane strain geometric models, plane stress axial symmetry, solving problems in big strain mode for dynamic analysis of embankment dams, possibility of stage construction modeling in embankment dams, ability of solving model in total stress mode and effective in embankment dams analysis, statistical, linear and non linear dynamic analysis of dams components, solving linear elastic and non-linear elasto-plastic problems (Mohr-coloumb) which are used in embankment dams, investigating between mechanical transformation and fluid flow (2-dimensional consolidations, inflation) in statistical and dynamic analysis, investigating resistance of gables embankment dams, possibility of adding behavioral models to the programming languages of C++ and FISH by user for more advanced analysis of embankment dam. The main drawback of this software is its low speed and models convergence in consolidation problems. Generally, the most important results of this research are as follow:

1. The level of effective strain from the first water loading had decreased till the end of 10-year period but it has decreasing trend since the began of the second 10-year period.
2. Total stress trend in dam body has slow ascending trend which was transferred from the first water loading till the

end of the first 10-year period from the low level beside the core to the middle low level of core.

3. Vertical displacement in Izadkhash dam has slow ascending trend which is slower in upstream shell than downstream shell because of water.
4. Horizontal displacement of Izadkhash, like vertical displacement, has ascending trend but the trend of downstream shell is faster because of lack of water.

**Abstract.** This research attempts to identify urban design principles resistant to terrorist explosions in public areas of airports. The research method was descriptive-analytical and data collection was through library method such as literature review and local survey. To use the research results, Tehran Imam Khomeini Airport is used. The findings indicate that three effective characteristics are required to achieve terrorist blast-resistant urban landscape design. All three qualities are functional components of urban design. Some of these provide facilities for the prevention of explosion and the other part of these qualities minimizes the harm to the individuals and the body of the airport. At the end, according to the stated goals, the solutions will be provided in the format of urban design guidelines document in both substantive and procedural aspects.

**Keywords:** passive defense, urban landscape, airports, terrorist explosion, Imam Khomeini International Airport

### 1. Introduction

In the last century, one of the most serious types of human challenges is the concept of "terrorists" which more than ever threatens physical and psychological safety of human kind that are the most important social capitals. The use of passive defense in order to deal with terrorist threats and to reduce its damage is a fundamental issue. It covers almost all vital and vulnerable centers of economic, political, military, communications, scientific, cultural, and public areas of cities where serve as gathering place for citizens. So, protecting national security and political, economic and defense independence, vibrant urban life and its social life depend dramatically on comprehensive planning on the subject. Countries that have experienced the damage and losses caused by terrorism, today, pay special attention to the passive defense to preserve their national and social capital and vital resources. They have also paid special attention to the subject in their defense strategies.

Airports, in this context, are of particular importance. They are one of the critical infrastructure of each country that cost a lot of material and human costs and a lot of time to be built and maintained and serve as a bridge between cities and countries and, in fact, human beings. Given that airports are in the third ring of Warden's Five Ring's Theory, they are of the most priority among enemy targets. It has additional priority considering Tehran Imam Khomeini International Airport as vital centers of the Ministry of Interior. It means that there have always been the probability of potential threat, for various reasons, to impair the function of the airport temporarily or permanently. One of these threats, as mentioned, is the terrorism. It often considers the following four objectives in its threats: 1- human targets (figures and ordinary people) 2- facility targets (important, crucial, sensitive, and protectable places) 3- equipment targets (Special, sensitive, important and protectable) 4- soft targets (programs, plans and ...). Therefore, it is essential to plan and implement the passive defense in order to prevent these threats from reaching their intentions. According to aforementioned sensibilities, this research tries to somehow fill the gap of the absence of planning and implementing in passive defense in the public areas of airports. It also attempts to provide effective solutions to deal with classic terrorist attacks

(bombings, suicide attacks, remote control explosive cargos) and to minimize vulnerabilities in the field.

### 2. Literature

According to the research topic, topics like passive defense, threat, general introduction of airport, and concepts and principles of urban design have been discussed in this section.

#### 2.1 Defense and passive defense

Defense are measures taken by one or more allied countries to resist against political, military, economic, social, psychological and technological attacks (Jalali and Hashemi Fesharaki, 2011). Defense are of two types: active and passive. Tools and technologies are applied to prevent enemy invasion, especially air strikes, are categorized in active defense (Asgharian Jeedi, 2008).

Passive defense is the set of non-armed measures that increase the deterrent power, decrease vulnerability, cause the continuity of the essential activities, enhance national stability and enhance crisis management in the face of threats and military actions (the first paragraph of the general policies of the government in the areas of passive defense, 2011). It also refers to a series of defensive measures we can use to resist against the enemy's surprise invasion with minimal facilities and technical equipment (Asgharian Jeedi, 2008).

#### 2.2 Threat

In general, the threat can be defined as the result of attempts to cause injury and damage and disrupt the current order and activities (Jalali, 2013). In terms of the source, threats categorized as natural and manmade threats and perceived threats to important centers.

Perceived threats to important centers, including civilian airports, have been mentioned with different categories in different sources. Two examples will be discussed here.

In the draft of twenty-first discussion about the national building regulations entitled "passive defense", the perceived threats to the important centers have been addressed as follows:

- Natural threats include floods, earthquakes and hurricanes
- Man-made military threats including air, land and sea strikes
- Man-made security threats including terrorism and suicide attacks
- Man-made accidental threats include industrial disasters and negligence (draft of National Building Regulations, 2010).
- The book "Architectural requirements in sustainable passive defense" have also described the threats as follows:
  - Natural threats; caused by dust, extreme heat, floods, etc.
  - Security threats; terrorist attacks, explosions, hostage-taking, separatist movements, riots and...
  - War threats; land, air and missile threats and people-centered operations and irregular wars (Asgharian Jeedi, 2008).

It should be noted, the threat in this study is the terrorist explosions that are among the classic terrorist threats (including bombing, suicide attacks and remote-controlled explosive cargos). However, the perceived threats to the civilian airports are beyond this specific type.

#### 2.3 Airport

Airport is a collection of various facilities and equipment brought together to provide facilities for transferring and air

transport. As marine transportation is required sea port, the airport can also be likened to the Air Port that is indispensable for air transportation (Behina, 1985). It is considered as an integral part of a city infrastructure that helps to enhance its business potential (Nazarian et al., 2011). The main purpose of an airport, also, is to provide access for passengers and cargos to air transport. So, the airport aim is to provide essential link between the air and the ground. (Wells and Yount, 2004).

Progress and development of the aviation industry in the late twentieth century as well as the importance of this industry in recent years have attracted attention to the key role of infrastructure development in the aviation sector in order to achieve sustainable development. The requirement for achieving development in today's world is to increase speed in economic activities, exports, communication with the various sectors within and outside the country and etc. With a little reflection, we realize that all this is not accessible except by upgrading capabilities in the aviation sector. So, airports and relevant communication networks and the sustainability of their activities in times of crisis, not as a requirement, but as an inevitable necessity should be pursued in macro level nowadays. Due to the changing nature of wars and smart approaches of new wars with elements of precision, speed and intensity, airports can be targeted precisely in the early hours of conflicts. As far as the opinion of some experts, dual capabilities for airports should not be expected (Hosseini et al., 2015).

#### 2.4 Urban design and urban landscape

In general, there are various definitions of urban design. The definitions are different based on the time period they belong to or the details that the definition provides. One of the definitions of urban design in its adolescence in the late 80s to 90s is as follows: "Urban design is more than concentrating only on aesthetics of urban environment or artistic deployment of its elements. Urban design is concerned with the creation and maintenance of urban areas in which appropriate responses to ecological issues, economic welfare and collective life have been combined."

Given that in this study issues related to urban perspective cover the major part of the intersection of urban design and passive defense, its meaning and principals will be discussed in this section.

"Urban landscape" is considered as the contact area of "man" and "city". Good urban landscape can increase the competitiveness of cities. Urban design can be effective in attracting creative classes and top activities and ultimately improving socio-economic status of cities through urban landscape management and improving the quality of the environment. This effect is so that a good urban design and urban landscape can have well defined and measurable "economical", "social" and "environmental" added value for development projects and urban construction (Golkar, 2012). Urban landscape elements include the structural elements (lining, floor), space complementary elements (natural

elements), unnatural elements (urban furniture, population, various means of transport). In terms of scale, urban landscape fall into three categories: large-scale and the perspective of the city, mid-scale and inner city landscape and small-scale and the city space.

So, according to all that was said about urban design and urban landscape, it can be concluded that the role of the strength and stability of structural elements of the urban landscape and also the functional targets of urban landscape (like readability of the environment) are undeniable in reducing airport vulnerability against explosions and preventing the explosion. They will also help to enhance the safety of the environment and security of passengers.

#### 2.5 The relationship between urban design and passive defense

Paying attention to the normative design of open spaces based on defensive ideas by designers of biological complex and enforcement officers of urbanization laws increases the safety factor and consequently decreases injuries and damage. These losses can be reduced to a minimum by intelligently integrating urban design elements, natural elements of architectural elements and principles of passive defense. Of course, in many urban areas, it is not possible to make secure all the open spaces. Therefore, we can only secure the limited spaces to enable users to feel safe and secure in vacation and leisure time (Farzam Shad, 2008).

### 3. Research process

The main objective of this research is to develop general urban design guidelines for the north side of the spine road of Imam Khomeini International Airport based on principals of passive defense. These guidelines are also usable for other international airports. The research method is descriptive-analytical. After reviewing the related literature and the introduction of the site, urban design guidelines from the perspective of passive defense (to deal with terrorist attacks) have been developed for airport environments. Field study and library method were used for data collection.

#### 4. Introducing the Case Study

Imam Khomeini International Airport Project was planned in 1951 during the Pahlavi era and was called the airport Shah of Iran, but it was after the Islamic Revolution in 1997 that the construction began and continued until 2005. Phase one was completed during the past few years.

Now, Imam Khomeini International Airport has a handling capacity of 4.5 million passengers and 120 thousand tons per year. Its capacity can be increased to 5.6 million per year. In the final phase, it will serve 90 million passengers.

Figure 1: Location of Imam Khomeini International Airport compared to that of Tehran. Source: author

Reviewing studies related to detailed and comprehensive plan of the airport city and Imam Khomeini International Airport Master Plan studies indicate that the spine road of the airport has been dedicated to airport usages (passenger terminal and its parking lots) and commercial corridor that is in relation to the other tourist, cultural, and sports sections in the airport city. Unfortunately, there is no plan for urban design resistant to terrorist bombings in any of future development sections of the airport and airport city. Therefore, there is the gap of urban

design guidelines resistant to terrorist bombings in public area of the spine road of the airport.

**4.1 Assessment of strategic areas**

Strategic area of the research reach to Azadegan highway from north side, Shoor river from south, Tehran-Saveh highway from the west side, Tehran-Qom highway from the east side and to the Industrial Zone of Hasanabad from the southeast side.

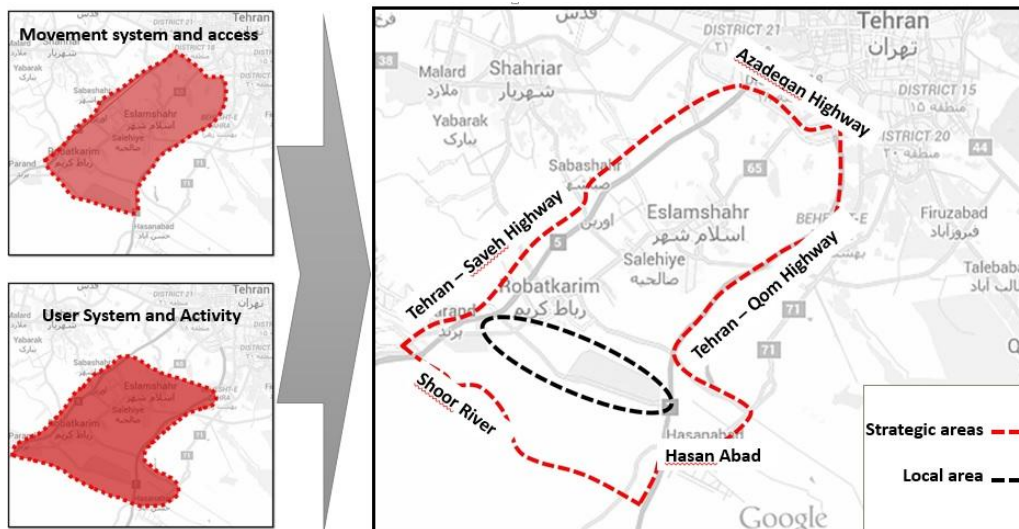

Figure 2: The studied strategic area.

After scrutinizing strategic area, the system of movement and access, the system of land use and activity, and identification of police, relief and services centers around the site, the physical form and urban landscape systems were studied. The results of this study showed that due to the location of the airport (outside Tehran surrounded by desert and dry areas), the role of use and activity and movement and access systems is important in the event of a terrorist explosion and a crisis. So, strategic area should be scrutinized according to the two systems. Thus, quick and easy access of relief and security forces and the existence of such things with the proper distance to the airport are among the important cases that were considered in the assessment of strategic area.

**Terrorist bombing scenario in the Imam Khomeini International Airport**

This scenario is played by terrorist groups supported by enemies of the Islamic Republic of Iran. The members or coaches who trained and equipped by necessary trainings and equipment in hostile countries enter into the territory and attempt to bomb with the aim of tarnishing the international image of the country security, showing it as an opposition fostering country, incurring massive human losses and implying the gap between the people and the government. These terrorist acts can occur in areas with public access such as car parking, passenger terminal and access roads. One of the most vulnerable points to the terrorist blast is the terminal entrance. Due to the glassy wall and the possibility

of the bombed vehicle collision with the door, the most damage will be in the airport terminal.

Also, the maximum bang can be in a bombed truck whose losses and risk radius will be 72 and 286 meters respectively. So, risk radius of 286 meters is the maximum radius that causes slight

damages and leaves the glass cracked or broken. Given that the scope of this survey is the public areas of Imam Khomeini International airport in Northern spine, this number can be used to scrutinize the local area for studies to assess the current situation in the airport. It will be discussed in the next sections.

Figure 3: the radius of loss and the radius of risk

In the event of such a scenario, it has a lot of physical, human, economic and social consequences at the airport.

#### Substantive assessment of local area

In this study, the criteria for the assessment of local area is based on improving safety and security in the public area of airport and its stability against explosion in the form of use and activity

system, movement and access system, urban landscape, public spaces and physical form.

Substantive environmental system assessment was skipped due to the lack of impact on the topic of this article. After assessing the aforementioned systems, integrated analysis has been provided as figure 4.

Figure 4: Integrated Analysis.

According to the assessment of the strategic area and all investigated points, it can be concluded that the local area is vulnerable in the terminal and its surrounding access, the public area between the northern and southern spine and also along main roadways and sidewalks next to the important buildings of the airport. In the event of an explosion in the above mentioned three sections, serious losses will be inflicted on the body of the airport and innocent people lives. So, it is necessary to have effective strategies about the urban design in these three sections to deal with the terrorist explosions.

**5 Urban Design Guidelines**

Design guidelines, as a means of controlling quality content, provide leading details that makes clear how a certain type of development can be implemented in accordance with the policy of designing a design. Design Guidelines is a document to control and guide the qualitative aspects of development.

**5-1 Vision Development**

Developing a vision of a place aims to offer a goal to residents for all their efforts and to describe something that is likely to be achieved in the future.

There are different ways to develop a vision statement including the "Oregon" model. Oregon Model is a process including four steps. Each of these steps is based on a simple question:

1. Where are we now?
2. Where are we going?
3. Where do we want to be?
4. How to get there?

This study is to answer the third question in the Model (where do we want to be?). Developing macro and micro goals of provided urban design guides will also answer the fourth question (how to get there?).

**5.1.1 Vision developing using the Oregon Model**

Table 1: Vision developing using the Oregon Model. Source: author

Application of framework in Imam Khomeini International Airport	Vision statement framework		
Iran as a gateway into security and peace	Implicit meaning	Meaning	Main points
Urban design resistant to terrorist explosions	Explicit meaning		
Business-services activities	Economic morphology	Identity	Details
A safe and full of relaxation place to fly to international destinations and a place for leisure time of travelers, greeters and escorts	Socio-cultural morphology.		

Sustainable urban design resistant to terrorist explosions	Physical morphology		
In and out gateway of the country in international scale	Local position	Structure	
	National position		
	Regional-international position		

**5.1.2 Vision Statement**

1. Where we want to go?

Imam Khomeini International Airport is Iran’s secure gateway in year 1400 and is an entry and exit gate of Iran in an international scale. Public areas of the airport located in northern side of spine which includes airport terminal, safe and green public areas, and metro stations have an urban design resistant to terrorist attacks and provide a safe and full of relaxation place to fly to international destinations and is a place for leisure time of travelers, airport greeters and escorts. Public areas between north and south spine that make a proper connection with the metro station, terminal, public parking, hotel building and mosque have become a convenient place for travelers and their companions to stop and spend time due to the blast-resistant urban furniture and secure corners. On the sidelines of the main access routes, especially around the important buildings, there are blast-resistant barriers designed to preserve the tranquility and beauty

of the urban landscape while making the buildings secure against terrorist bombings and not disturbing the peace of pedestrians. The main entrances of the terminal and directions to them have blast-resistant urban furniture and their glassy walls with proper exposure to the light, covered with green and blast-resistant plants and they have created a green and beautiful wall. Spine road of Imam Khomeini airport is an example of sustainable urban design resistant to terrorist attacks. It is a window to interact with the international community to lead Iran towards security and peace and to represent the genuine and peaceful spirit of the ancient land of Iran.

**5.2 Developing macro and micro goals**

2. How to get there?

In this study, macro and micro urban design goals have been developed to answer to the fourth question of the Oregon Model.

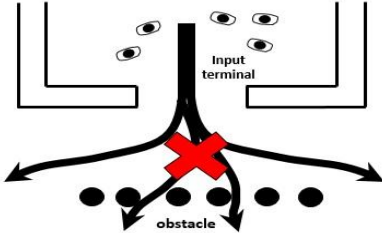

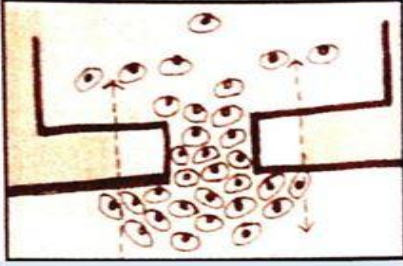

Table 2: Macro and micro goals. Source: author

Micro goals	Macro goals	
Using the terrorist blast-resistant urban furniture Creating safe places and corners in public areas	Promoting public area safety	Substantive aspect
Creating Physical barriers Discharging the blast wave properly	Stability in the terrorist blast	
Immunization of the walls Securing the physical access to the terminal	Improving the quality of the terminal entrance area	
Raising the awareness Increasing social control	Increasing interaction and citizen participation	Procedural aspect

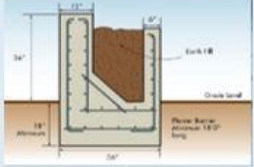

**5.3 Developing the urban design guidelines document from the standpoint of passive defense**

Urban Design Guidelines document from the perspective of passive defense has been developed in two dimensions: substantive (system of movement and access, the urban landscape system and public spaces system) and procedural. The following figures explain it clearly.

Table 3: Urban design guidelines in the system of movement and access. Source: author

Solution	Micro goal	Macro goal
<p data-bbox="352 266 1002 293">It is recommended to avoid installing any barriers to movement in the routs</p>  <p data-bbox="445 573 909 600">It is recommended to floor streets with soft materials.</p> <p data-bbox="248 600 1106 627">Emergency entrance should be legible and distinct and as complementary part to the main entrance.</p> <p data-bbox="220 627 1134 674">It is recommended to Roof the main routes leading to the terminal (to increase safety when explosions and falling debris).</p> <p data-bbox="333 674 1023 701">Emergency exits size should be proper to the volume of traffic in times of crisis.</p>  <p data-bbox="209 969 1147 996">Installation caps should be designed in such a way that when evading, not to disturb the movement of people.</p> <p data-bbox="387 996 968 1023">The caps, for camouflage, should be designed in concert with floor.</p> 	<p data-bbox="1214 622 1238 969">Secure physical access to the terminal</p>	<p data-bbox="1334 568 1358 1023">Improve the quality of the terminal entrance area</p>

Solution	Micro goal	Macro goal
 <p data-bbox="204 593 1166 741">                     To Use obstacles in the form of blast-resistant hills with vegetation between the streets and important buildings such as telecommunication building and security buildings.                      To use physical barriers such as walls in the form of blast-resistant hills with vegetation around the train rails and between the terminal and control tower building.                      To create a blast wave absorbent structures with gaps in it for the proper discharge of the blast around the bridge connecting the metro station to the terminal and its underlying passage.                 </p>  <p data-bbox="217 1059 1153 1155">                     To make street with level difference in front of important buildings where there is not enough space to create retaining walls and hills.                      To use strong gardens (a combination of retaining walls with gardens and vegetation) between the streets and important buildings.                 </p> 	<p data-bbox="1225 790 1249 1014">Create physical barriers</p>	<p data-bbox="1337 707 1361 1097">Resilience in the face of terrorist explosion</p>

Table 4: Urban design guidelines in the system of urban landscape. Source: author

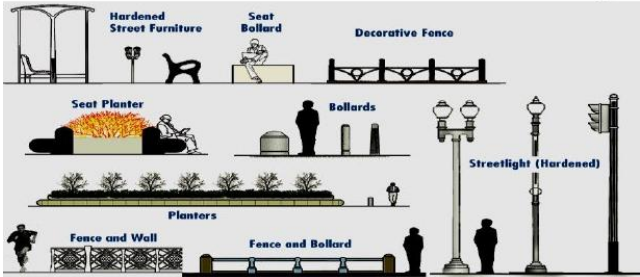

Solution	Micro goal	Macro goal
<p>To use multilayer glass coated with anti-fragmentation technology in facade of the terminal.</p>  <p>To Create filters on glassy walls of terminal (such as walls and green walls covered with plants). Providing appropriate exposure for the terminal, it minimizes the risk of glassy fragments to hit the people.</p> <p>To build the facade of terminal wall with the combination of vegetation and multilayer glass covered with anti-fragmentation technology.</p> <p>-to remove sharp and pointy elements from the walls.</p> <p>To use of blast-resistant barriers such as platforms, sculptures, benches and billboards in the terminal corridor around glassy facades as shelter against glass shrapnel.</p> <p>-to use green walls and green roofs on adjacent buildings and public areas.</p>	<p>Securing walls</p>	<p>Improving the quality of the terminal entrance area</p>

Table 5: Urban design guidelines in the system of public spaces. Source: author

Solution	Micro goal	Macro goal
<p>To create a coordinated and blast-resistant set of urban furniture such as benches, stands, vases and etc. in public areas of the airport which act as shelter and prevent bombed cars from entering into pedestrian passageways and buildings.</p>  <p>To use smart urban furniture such as trash cans equipped with sensors that detect bombs in public places of airport.</p> <p>To use energy-efficient LED lighting which is useful in the event of an explosion and power outages.</p>  <p>To use laminated urban furniture to prevent radiation of toxic gases in case of fire.</p> <p>To use round urban furniture with no sharp corners in the public areas of the airport.</p>  <p>To use decorative elements such as statues and large stones as shelter in public areas of the airport.</p>	<p>Use the terrorist blast-resistant urban furniture</p>	<p>Promoting safety of public areas</p>

To use blast wave absorbent materials in yards and public areas.  
To floor the areas using soft materials.  
To use the short fencing walls with gaps in it for discharging shock waves.

To semi-enclose spaces and places to sit in public areas using level difference and vegetation.

To properly use evergreen trees such as pine and boxwood in the public area.

To install surveillance cameras and monitoring equipment in public areas with camouflage suits them.  
To use detection and warning systems with the ability to communicate bilaterally in the public areas.  
To create an opening in the yards and buildings.  
To create gaps in walls and retaining walls around important buildings.

			
<p>To create pilot and stepped forms for buildings in the public areas of the airport that will be built in future developments.</p>			

Table 6: Urban design guidelines in the procedural aspect.

Solution	Micro goal	Macro goal
Installing warning, informative and educational signs and having places to show educational short films in public places especially in the terminal.	Increase people awareness	Increase interaction and citizen participation
To avoid creating dark corners in public area without good vision, especially inside the airport terminal. To crate proper lighting in streets and public areas at night.	Increase social control	

## 6. Conclusion

In this study titled "urban design guidelines from the perspective of passive defense in airport environments ", we attempted to identify urban design principles resistant to terrorist bombings in public areas of airports. After studying the structure of passive defense in the field of classic terrorist threats (including bombing, suicide attacks and remote-controlled explosive cargos) and urban landscape, it was concluded that passive defense, in the area of terrorist threats related to this study, is an instrument to reduce risk and increase efficiency of airport after the terrorist explosion. In the concerned areas, urban landscape provides suitable framework for passive defense. Thus, according to the objectives of the present study and surveys conducted around them, the blast-resistant urban design that simultaneously incorporates urban design concepts and passive defense in the area of terrorist threats identified as a link to join these disciplines.

Finally, an attempt was made to introduce simple and applicable solutions in the public areas of airport environments to fill the gap of the absence of terrorist blast-resistant urban design. So, strategies were provided that are applicable in public areas of all international airports.

**Abstract:** This study was conducted as survey, the population consisted of the city of Ilam and based on multi-stage cluster sampling 384 citizens aged 18 and over were selected as sample. Data were collected using a questionnaire and Spss software for data analysis used. Based on the findings, the generally low level of participation in citizen participation, and in dimensions as well, social participation of citizens in the informal is stronger than official dimension and trust of citizens is higher and the participation in general, it is also more in two dimensions.

**Keywords:** social participation, social trust, citizens, official dimension, informal dimension, Ilam city

### 1. Introduction

Public participation in autonomy and collective decision-making and participatory democracy considered as visualization component for achieving sustainable development. Civic participation is a process of self-education and participation activities, requires changes at all levels of social and psychological state of mind. This change resulted in new human and social relations (Rezai, 1996: 54). You should know that the evolution of human societies depends on the density and complexity of relationships and social interactions in other words is their network. Such a density of no confidence in the ruling leaven for the formation and sustainability of small-scale social relations, intermediate and macro, it is rarely possible is not allowed and the culture that it needs to be remembered as a culture of trust; a culture that not only generating confidence that social capital is a key motif and fundamental prerequisite for democracy, organized and dynamic social order and the development aspects of political, social, cultural and economic (Zetomka, 2007: a). Since the late 50s, followed by the failure of development programs based on the views modernization, the concept of collaboration and partnership development was developed in the literature. The failure of these programs in achieving their objectives is fostering belief that the lack of public participation in the design, implementation and evaluation of programs is causing their failure. So in response to this, the concept of partnership as "the involvement of citizens in public decision-making and planning related to it" (Roofing, 184: 2004) was considered by planners and strengthening public participation processes, as key areas of development were raised.

The exact definition of participation must be said that participation can be an interactive process between the actor's targeted action and his social environment in order to achieve certain goals defined preset. The process by which people consciously, voluntary collective and specific goals in mind and specified that leads to the sharing of community resources, they will attend. The objective of this is collaborative, cooperative institutions such as forums, groups, NGOs and others (Dehghan and Ghafari, 68: 2005).

In modern societies because of the special importance of the participation requirements of the new life phenomenon, the

extent of communities and increasing population, the variety and diversity issues and social strata has led to a strong role for participation, because people's participation in decision-making processes on the one hand and belief and commitment of managers to take advantage of the comments they and implement the decisions of the underlying potential problems and prevent potential problems will be cured; research has shown that the worst places in the world in terms of economic and social, where people do nothing but follow their individual interests and respect for justice suppressed. Development and prosperity where there is an inner feeling associated with values such as altruism (social partnership), reliability, loyalty and fair play are grown (Basu, 2006: 35-34) which is always a positive relationship between participation in the social, political and...the concept of social trust. Confidence is the central concept in the classical theories of sociology, as well as the core of modern theories of social capital and social interaction and relationships (Moeedfar and Jahangiri, 2009: 48).

In short, attitudes and values related to trust and give / take between people is particularly important. They are essential for social and political stability and cooperation. In this way, in terms of social capital on the values and attitudes of citizens insist that cooperation, understanding, empathy and fellowship with each other towards it (Newton, 67: 2008). And participation in the process of engaging all groups of people in all stages of development to emerge abilities, capabilities and therefore their material and spiritual growth and development and may therefore always been in recent years in the scientific and political circles, citizen participation in social and political discourse have tops, all of it as an important element in achieving sustainable development, democracy and debated. (Abbas Zadeh, 44: 2008) The basis for the development of responsible and informed participation of individuals or in other words, citizens in different social and political affairs and culture is one of the important priorities and if we are to be effective, requires a change in thinking and action which should boil within the community and in the formats acceptable and stable society and state crystallized.

### 2. Theoretical framework

Participation is primarily a social phenomenon that results and other social and political implications too. Participation as a social phenomenon includes the involvement of the social values of membership. When people live within the values and norms of their society, in fact, participate in social life. The interpretative school of Max Weber and his followers, is partnering with the concept of chance or possibility of cooperation. This means that it is possible for the different conditions and the various factors increase the chance, reduce or even completely be ruled out. When the object has the chance to certain expectations that people have of the behavior of others and this objective has always been expected to be realized or fulfilled. So as long as people's expectations to be fulfilled in the context of social relations, they believe that the established order is participation continued (Tavassoly, 2003: 76-74).

Huntington and Nelson participation in the decision-making process affecting citizens of the state are considered to them, the two parameters of social mobility and membership in associations and social groups provide a context for the development of social partnership (Amin-Zadeh, 111: 1997) Maurice Halbwachs's position in the hierarchy of social classes primarily on the degree of participation has higher social class or benefit from activities related (Tavassoly, 2003: 76-74).

Daniel Lerner factors such as literacy, urbanization, access to mass media and public and finally social relationships with

community participation knows and believes that these variables are more in modern society. He named the new society as participatory society (Alerner, 57: 1964). Inglehart also increase participation in advanced societies to three factors: improving the educational level and political information, change the norms governing the participation and changes in the relative value priorities. In his view, these factors have less emphasis on immediate needs and insist on the right to express an opinion (Inglehart, 378: 1994). Inglehart addition to the aforementioned factors, the relationship between trust and participation are examined. According to him, trusting each other of the factors influencing participation, because of predictable behavior can be trusted because resulting in the strengthening of the area of action and decision-making. This approach is somewhat similar approach in discussing Almond and Verba "civic culture" trust appliances democratic culture and secondary relationships are formed. Inglehart also social capital equivalent to trusted and believes that social capital is a culture of trust and tolerance that thanks to its extensive network of voluntary organizations grown. He believes the network is the result of people's trust in one another, rather than people's trust by-product of this forum. Patriotic people, who trust each other, communicate with each other to sports groups to work in various positions, form an association and thereby rely more on each other (Rose, 78: 1999). The Putnam in strengthening cooperation and participation in society, trust is an essential element and not an element of involuntary and unconscious. (Putnam, 2001: 292) is located in Putnam believes the high level of participation is what makes confidence that is created in the form of social and cooperative collaboration (Jadj, 1: 2003)

Trust is required to predict the behavior of an independent actor. In small communities and interconnected this prediction is based on something done and Bernard Williams calls it sincerely trust, the confidence that an intimate acquaintance with the individual. But in larger and more complex societies or indirectly from a trust impersonal trust is essential (Putnam, 2001: 292). According to Giddens, in modern society, people have the time / place to be most of the time, they need more confidence. In pre-modern societies that have local character and more at the local level and face to face interactions occurred, naturally there is social trust relations; but in large communities and extensive social relations are time/location far done and individuals involved in these relationships are less know each other face to face, very dependent on trust. (Taleghani, Farhangi, Abedi, 92: 2010) Giddens, trust described as ensure the reliability persons or relying on quality or character of a person or the authenticity of the statement (Giddens, 1999: 37).

He trusted the existence of a sense of security that the transfer of the individual human being, in a climate crisis and a heart full of potential risks improves. (Giddens, 1999: 63) Giddens, confidence of the main elements of modernity knows and believes four local context trust, that is, kinship, community, tradition and religious cosmology pre-modern cultures have mastered, while in modern times, trust in abstract systems, symbols and systems of this type of trust is a bachelor (Giddens, 2001: 120). It should be noted that many schools have found a strong correlation between trust and democracy in society. They say trust a prominent role in the commitment to sustainable democracy plays in different areas; the schools also beneficial social trust as a source of unity and facilitate cooperation for mutual benefit in the fall. (Lee, 585: 2008), on the other hand,

some schools believe that generalized trust and social capital, people to join voluntary associations and engaging in civic activities is encouraging (Parks and Shane, 18: 2003). Finally, to imagine a world without trust Cook, hard life and social order breaks and society in the regulation and supervision of institutions that typically produce and reinforce provide the organizational conditions for cooperation in the community, need to maintain social order, if uncompromising performance to run (Cook, 5: 2001)

With the backing theory of conceptual model study is designed as follows:

Figure 1:

Based on the above hypotheses are designed as follows:

1. There is relationship between social participation and trust of citizens.
2. There is relationship between trust of the citizens and their social participation in official dimension.
3. There is relationship between trust of the citizens and their social participation in informal.
4. There is difference between social participation of citizens in the formal and informal dimension.

**2. Research Methodology**

The methodology for this study is survey. The population of study is Ilam city and using a sample of 384 citizens in 18 years up to a multi-stage cluster sampling method was studied. The study is based on a survey, a questionnaire was used to collect the information techniques, reliability of the questionnaire in this study for analysis of alpha reliability coefficient was used and for social confidence 0.88 and for social participation 0.725 were obtained, so reliability was approved. The independent variable in this study is that variable social trust, social trust in three dimensions of interpersonal trust or an individual, generalized trust and institutional trust placed. Social participation is also dependent variable in the study of social participation in both formal (community participation in environmental activities, city Council, etc.), and then informally (in cooperation with neighbors, attending delegations, mourning, etc.) are examined. Finally, using the Spss software (Pearson correlation coefficient, t-test ...) to analyze the data studied.

**3. Findings**

**3.1 Descriptive statistics of variables**

In Table 1 Descriptive statistics of variables social participation, social partnership (informal), social partnership (formal) and social confidence shows that social participation in the informal rather than after it is official.

Table 1: Descriptive statistic of variables

	frequency	mean	standard deviation	standard error	minimum	maximum
social participation	315	27.03	9.20	0.518	12	60
social participation (official)	334	11.44	4.82	263	6	30
social participation (informal)	360	15.78	5.20	0.274	6	30
social trust	324	53.75	6.56	0.365	27	73

Test hypotheses

The first hypothesis: there is relationship between social participation and trust of citizens.

According to Table (2) the results of Pearson correlation coefficient value (0.373) and significant level of Sig=0.000 can be considered a significant proportion of the correlation trust; this means that the higher the level of social trust citizens, they are also more social participation and the hypothesis is confirmed.

Second hypothesis: there is relationship between trust of the citizens and their social participation in official dimension.

According to Table (2) the results of Pearson correlation coefficient value (0.303) a significant level of Sig=0.000 means

the higher the level of social trust is higher citizens, the participation in the more formal, and this hypothesis is confirmed.

The third hypothesis: there is relationship between trust of the citizens and their social participation in informal.

According to Table 2 Pearson's correlation coefficient with (0.381) and significant level of Sig=0.000 can be considered a significant proportion of the correlation coefficient, this means that the higher the level of social trust citizens, the participation in the more informal and the hypothesis is confirmed.

Table 2 The correlation coefficient between the social trust of citizens and social participation, social partnership (formal) social participation (informal)

hypothesis	independent variable	dependent variable	correlation coefficient	amount	significant level	error
first	social trust	social participation	pearson	**0.373	0.000	05%
second	social trust	social participation (official)	pearson	**0.303	0.000	05%
third	social trust	social participation (informal)	pearson	**0.381	0.000	05%

Fourth research hypothesis: there is difference between social participation of citizens in the formal and informal dimension.

The results of the t test and differences in the relationship between social participation of citizens in both the informal to the formal dimension with a significant level of Sig=0.000 implies acceptance of the hypothesis H1, this means that the amount equal to Sig=0.000 and given that this amount is smaller than 0.05, it can be considered a significant proportion of the correlation coefficient, this means that the social participation of citizens in the informal to the formal dimension where there is a hypothesis is confirmed.

Table 3. Test of difference between social participation of citizens in the informal and formal

	correlation coefficient	amount	degree of freedom	significance level	error
T test	official participation	43.354	333	0.000	05%
	informal participation	57.561	359		

#### 4. Discussion and Conclusion

The main purpose of this article is check the status of citizen participation, seeks to accomplish the following have also been studied: check the status of formal and informal aspects of social participation among citizens, citizen participation and trust in their social relationships, the relationship of trust with participation in formal and informal dimensions. As noted in the findings, citizen participation is generally low. This result is not satisfactory result for officials and planners and, of course, is a result of numerous factors and has the ability to review and empirical research, the variable in this study the effect of trust in the society. The social participation is addressed. In the present study social participation of citizens in both formal and informal been evaluated. Based on the results of citizen participation in official later than after a small amount is informal; An explanation for this result can be represented like this and management ladder is still a society from top to bottom and the role of citizens is not much clarity and involvement are effective, this task is the responsibility of national authorities/local communication channels with citizens to determine and the influence of citizens are strongly urged to plan goals and so the society from top to bottom with the management ladder from the bottom up change management that will definitely succeed. As

has been the social participation of citizens in terms of strength is more informal, it can be said as regards the informal cooperation among citizens is more the result of communication and interaction with each other official communication with agencies and organizations, elements such as empathy and understanding between the citizens affected this study, the influential elements of trust in each other as we have studied and studied. Based on the analytical results, the average amount of trust between citizens and the rate is positively related to social participation. So should strive to increase the level of trust in society that promotes social participation of people in particular will be in the next official and subsequently saw the development of local /national society. Finally, to explain the relation between concepts citizens, civil society and contribute to interact with different levels of trust in society, it can be discussed with the theory of "Stuart", "Lister" and "Denison" finished. The three theorists, in the order of a few key concepts related to their use. The three key concepts are: Citizen of local government and urban (Stewart), the practical realization of the rights of citizens in the local community and municipal (Lister) and social justice at the local level (Denison). (Nejati Hosseini, 2001) According to Stewart, the most important task of the authorities and local governments is "citizenship". Citizen of the facilities, and facilities necessary mechanisms for citizens, they are entitled to their civil rights, and also being able to appropriate

tasks and duties of the citizens in the local community play. Lister also that the citizens of the Stuart should be practical in order to fulfill citizens' rights to Marshall (civil rights, social and political) provided. Denison with an emphasis on social justice in local and municipal level there is a relationship between citizens and local governments and urban close and the role of local governments and municipal social justice at the local level. Based on what was said identity of the citizen as an acquired identity, the interaction between citizens and official organizations and civil society takes shape. Both sides of this engagement, rights and obligations that it cannot be achieved without a commitment a democratic society to expect. Citizenship certain value system and behavior requires that participation and a sense of belonging to society is its most important feature.

## EVALUATION OF THE CORRELATION BETWEEN CASH FLOW AND CREDIBILITY RISK IN THE KMV MODEL AT THE SAMAN BANK

<sup>a</sup> ABBAS JOZ TOSI, <sup>b\*</sup> HAMID JAMSHIDI

<sup>a</sup> Master of Accounting, Islamshahr Branch, Islamic Azad University, Tehran, Iran

<sup>b</sup> Assistant professor, Islamshahr Branch, Islamic Azad University, Tehran, Iran

Email: <sup>a</sup>abbas.joztosi1@gmail.com, <sup>b</sup>h.j.jamshid@gmail.com

**Abstract:** This study evaluates the relationship between cash flow and credibility risks. Evaluation of theories in collect with data strategies is published by way of reports of the stock exchange and the Modern Strategies software at the Saman Bank. F statistics showed that the possibility for model prediction is confirmed using the panel method. Meaningful correlation was found between cash flow and credibility risks in the KMV model. Additionally, meaningful correlation exists between level of cash flow and power of credibility in the Saman Bank with a 0.03 coefficient. Also meaningful and positive correlation exists between increase and promotion of profitability in the Saman Bank and granting of facilities to rightful customers with a coefficient of 0.06.

**Keywords:** Credit Risk, Cash Flow Risk, Saman Bank

### 1. Introduction

Now a day, cash flow management is one of the greatest challenges faced by today's banking system. The main reason for this challenge is that most banking resources are financially procured by way of short term deposits. In addition, banking granted facilities are spent for investment in assets that have a relatively low fluidity grade (Rostamian & Haji Babaii, 2009). The importance of risk management leads to its increased value for financial agencies. In addition, bitter experiences of some countries such as south-western Asian countries or even western countries leads to increased attention of directors and law makers towards this topic. Political and economic instability in the world due to events such as emergence of information technology and creation of rapid changes in banking environments has doubled financial agency risks such that these factors lead to increased importance of risk management and attention of researchers to this arena. Adequate performance of each risk management responsibility needs strong and scientific tools. Banks face various forms of risk from among which four credit, cash flow, market and operational risks exert the highest amount of harm to their corpus (Ardakani, 2014). Credit risk is important and sensible in monetary and credit organizations because resources used for allocation in fact constitute debt of monetary organizations to asset holders, people and banks and their lack of fluidity can weaken the power of accreditation and payment of debt particularly as mentioned in the balance sheet and credit facilities as due sums and private savings accounts are considered as future endowment. In other words, collection of debts is impossible at multiple time points but payment of endowments (savings) is mandatory at each stage. Otherwise, the monetary organization will encounter bankruptcy (Ebrahimi & Colleagues, 2009).

Additionally, fluidity risk is also one of the most prevalent risks that banks encounter and correct management of cash flow with the purpose of preventing wasting of capitalization opportunities, use of excess fluidity for investment and granting of new facilities for acquisition of increased return, preparedness for encountering situation of crisis and deficit in cash resources is a necessity. For correct management of fluidity, it is necessary that appropriate tools and effective factors for this task are identified (Jaiswal, 2010). Financial crisis (2008) showed that serious increase in delinquency alongside with decrease in and omission of bank fluidity leads to serious problems in the financial system. In an FDI (Federal Deposit Insurance Corporation) report, the main reason for bankruptcy of close to half of 251 trade banks who have announced it between August 2007 and September 2010 has been decreased fluidity and lack of availability of facilities.

Maybe this topic by itself is sufficient for analysis of internal performance of the connection between to risk factors. In addition, the classic theory of micro economy in banking confirms close correlation between fluidity and credit risk (Imbierowicz, 2011). The main purpose of this research is determination of the relationship between the risk of fluidity and credit in the Saman Bank based on the value at risk. Additionally, the test of validity of the hypothesis of peaceful life cycle of the statistical sample is of statistical significance. If the hypothesis of this research is supported, one can with more especial attention to organizational space and better planning significantly help in the regard of desired implementation of management of fluidity of banks in this country.

### 2. Theoretical Bases of the Research

In past theoretical research, various classifications of risk have been presented. Based on the opinion of Sinkey (1992), bank risk and its management focuses on three credit issues of credit risk, interest rate and fluidity (Modares & Zekavat, 2003). Greuning and colleagues (1999) in a research in the World Bank have presented another classification of risk. This classification despite being introduced specifically with regards to risk evaluation in banks, topic and content wise capability of application for other trade institutes and organizations is also accomplished. Greuning in this model makes reference to the risk of events that in a way considers meaning of positive and negative changes in future interests and applies to four classes of risk financial, operational, business and incidental.

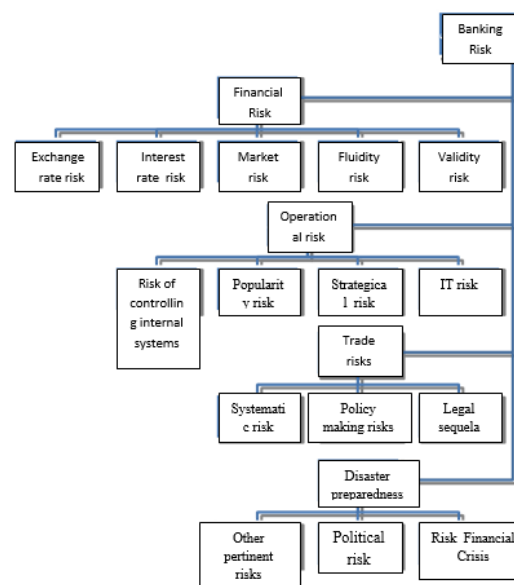

Figure 1. Analysis of risk of Banking (Greuning and Bratanvic, 2000)

Financial risks are those that are strongly dependent upon each other and in total increase overall bank risks (Asadipour, 2009). They are subdivided into two classes specific and market risks. Specific risk includes cash flow risks, credit risk, risk of capital structure and market risk includes interest rate, cash exchange and price fluctuations (Joel, 1999).

Various definitions of cash flow risk should be discussed as follows:

Cash flow risk is the inability of the bank to provide sums for granting of facilities of timely payment of responsibilities such as savings.

This risk emanates mostly from structure of assets and debts and its main source is lack of time compatibility between input and output channels to the bank. Therefore, cash flow risk can be divided into two group fluidity risk of assets and resources (Crouhy & Mark, 2007).

Cash flow risks of assets refer to inability of banks to sell their own capital to provide monetary needs that are not accounted for. The resource fluidity risk is also related to lack of absorption of the resources by banks in its regular way (such as

attraction of savings or use of facilities and credit lines to banks) (Asadipour, 2009).

Cash flow is availability of cash sums or their equivalent. Therefore, it can be stated that cash flow risk is unpreparedness of the bank in provision of facilities or timely payment of its responsibilities (Banks, 2007). A bank has fluidity when it can achieve with an acceptable expenditure sufficient sums both by way of increased debts and transformation of cash assets to money rapidly (Falconer, 2001).

Risk Management: In Table 1, various risks in banking systems and their methods of management have been presented (Mehrabani, 2010).

Table 1. Various risks in banking systems and their methods of management

Methods of Management	Various Kinds of Risk
Creation of appropriate structure for loans and necessary precautions for protection of the interests of loaners, use of credit derivatives with facilities contracts, periodical reevaluation of banking assets, management of combination of facilities due to events that have occurred in the market or acquisition of further proof.	Credit risk
Evaluation, experiment and confirmation of announced market risks including interest rate, exchange, moderation and flow risks.	Market risk
Coverage of harms resulting from negligence and lack of efficiency of human resources, inefficiency of security measures, controls and technology, harms resulting from lack of awareness or lack of correct information, communications, executive risk of contracts and statutes and risk of trust and credibility with focus of control in reactive operations. This control aims to prevent any damages to information and on the other hand to resist access of exploiting individuals.	Operational risk
Estimation of the bank's cash needs in the future. This estimation can be performed based on the following three methods: estimation based on resources and use of cash sums, estimation based on structure of assets and debts and speed of their transformation to cash sums and estimation based on cash flow indices.	Cash flow risk

Credit risk: lack of commitment to guarantees by those who receive facilities (loans) or the second party to the banking contract based on criteria agreed upon in the agreement.

## 2.1 The KMV Model

One of the most applicable revising models is the Blake-Shultz-Merton which in practice improves this model and is one that has been introduced by the Moody Company and is known as the KMV-Merton approach. This approach with moderation of the base BSM model is used for various debit groups and with various bills. According to this approach, solving of concurrency equations if the market is very fluctuating can lead to incorrect estimation and possibility of diagonal negligence. For this reason, KMV applies more complex repetitive strategies as compared to the BSM model in estimation of company value and its ups and downs.

In computation of possibility of negligence, the KMV-Merton approach instead of using interest rates without risk uses the expected return of company assets and instead of the boundary of error of the base model (B) uses a new negligence boundary which is equivalent to the current debt plus half of long term debts. Additionally, the value of the company stock (E) is directly estimated by way of the market. Next, the estimated sums are entered into the concurrency equations of BSM and the values for company value and return fluctuations are estimated and the distance to error is computed.

For the purpose of solving the optimal boundary of error in the KMV-Merton approach, Lee (2011) using the genetic algorithm endeavored to redefine the optimal boundary of this model. Lee's idea (2011) was that the error boundary can be different from one country to another and even within industries. Therefore, the main purpose of Lee's goal (2011) was introduction of a model that can more effectively and simply predict bankruptcy in the country of Taiwan. Lee (2011) named

his model GA-KMV and defined the boundary of error as follows:

$$DPT_{GA-KMV} = \alpha * LD + \beta * SD \quad (1)$$

LD and SD are long term and short term debt respectively. The purpose of Lee (2011) was estimation of the optimal coefficients for these variables using concurrent use of the genetic algorithm and the Blake-Shultz-Merton concurrency equations model system. It should be noted that the KMV-Merton approach considers the short term debt coefficient to be one and the long term one to be 0.5.

## 2.2 Cash Flow Risk and Credit Risk

New research has made reference to financial crisis (2007-2008). The hypothesis of positive correlation between cash flow risk and credit risk is thus confirmed. Examples of these researches are those of Diamond and Rajan (2003), Haigh and Iksoung (2010) and Arshia and Visvanatan (2011). Ambervitch and Rach (2011) in a research titled "Correlation between cash flow risk and credit risk in banks" evaluate the mutual relationship between cash flow risk and credit risk in all trade banks of the United States of America in the years 1998 to 2010.

In this research several indices of differentiation for credit and cash flow risks have been used in multiple analyses so any kind of probable correlation between these two risks are identified. In the first stage, a similar model is used for evaluation of the concurrent and non-concurrent correlation between two sources of risk in American banks. At the second stage, cash flow risk reaction in response to credit risk environment changes outside of the bank was evaluated. The reason is that it is one of the most prominent cases of financial crisis in 2007. At the last stage, distinct and combination effects of credit and cash flow risks on probability of bankruptcy of the banks was computed

using the Log it test model for all 254 trade banks. Results showed that a two ways positive correlation but a weak one exists between credit and cash risks (these findings have been obtained based on utilization of specific bank risk scales). Analyses of cash flow within banks and credit risk external to the bank confirms strong and positive correlation between these two factors. Ultimately, it was shown that both sources of risk not only independently but also together influence probability of bank error.

Diamond and Rajan Mali (2007) in a research titled “Risk of cash flow, creation of cash flow and fragility” have made the assumption that assets do not have capability of fluidity and granting and acquisition of facilities is also a topic based on ability and knowledge of an individual. The bank receives money from depositors and can mortgage this loan money. A problem arises when numerous economic projects financially procured by way of facilities are unable to successfully pay back their facilities and the bank is unable to respond to the demand of depositors. Therefore, banks pay higher interest to depositors to absorb their capitals. Additionally, granting of facilities with lower interest rate is surrendered and benefactors are requested to return their loans and ultimately projects that have been financially supported by way of un- returned facilities cannot achieve high value (therefore, the value of facilities is also decreased).

Yet, with this decrease in value of assets, increased numbers of investors remove their capitals from the bank. Therefore, the main conclusion is that with lack of repayment of facilities, higher credit risk and depositor take over lead to higher risk of bank other funds. With attention to research and the fact that now a day cash flow management is one of the most important challenges encountered by banking systems, we wish to identify the main reason for this challenge. The reason is that most resources of banks are financially procured by way of short term deposits. In addition, facilities granted to banks are spent on investment in assets such as the stock exchange (Rostamian & Hajibabaii, 2009).

Therefore, for higher understanding of banking risks and factors influential on them, this research aimed to respond to the question that “Is there a meaningful correlation between fluidity risk and credit risk in the Samman Bank?”

**3. Research Methodology**

The method of this research when it comes to data collection and implementation was a descriptive study and statistical analysis was of correlation type. Correlation between variables was investigated retrospectively. In this research, statistical population included the member companies accepted in the Tehran Stock Exchange that have had taken advantage of short and long term financial facilities of internal banks. Statistical sampling has also been non-randomly and by way of screening. In other words, selection of sample members is performed by way of omission of newly accepted companies and those with

prolonged contractual interruptions (more than 70 days). Additionally, data was collected from published reports of the stock exchange between the years 2005 and 2014 and searching the Rahavard Novin Software. Data description was performed using distribution tables and histograms and pie charts. Additionally, for better presentation of the data, indices of central tendency and distribution were taken advantage of. In this research, hybrid of asset-debit of banks that have been defined and quantified using financial ratios and indices was assigned as the research independent variable and cash flow and credit risks computed by financial ratios as dependent research variable. The method of hypothesis testing in this research was the Data Time Series Panel Method and the Eviews 7 software was utilized. Research model is as follows:

$$ER_i = R_F + (ER_M - R_F)\beta_{Mi} \tag{2}$$

Ri: Assets return, Rf: Riskless return, Rm: Market return, E: Mathematical error. The market beta for each stock is extruded form the following formula:

$$\beta_{Mi} = \frac{cov(R_i, R_M)}{var(R_M)} \tag{3}$$

Therefore, for testing the first model regression is used as follows:

$$R_i = a_0 + a_1\beta_{Mi} + u_i \tag{4}$$

In which:

a0= riskless return rate or RF, a1= stock return in excess ERM-RF, Ri= Observed stock return I, vi= Expected error or Ri-ERi

**4. Research Findings**

**4.1 Evaluation of reliability of research variables**

Using the method of estimated ordinary least squares (OLS), it is tested whether it is equal to 1 or not. The null hypothesis in the Philips Prune Test states that the variables under consideration lack reliability.

To reject the null hypothesis and reliability of each of the variables, it is sufficient that significance level is less than 0.05. Thus, results of reliability test for the panel data in Table (2) for both variables show complete stability over time.

Table 2. Results of reliability test for model variables

Philips Prune Test			
Variable	Statistics	Significance level	Result
Stock return	-6.85	0.000	Completely stable
Market beta	-7.39	0.000	Completely stable

In this research, the model has been estimated using hybrid data from banks under study. Initially, it should be determined whether in general there is need for consideration of the data panel structure (differences or specific bank effects) or data relevant to various banks can be obtained by the monetary

method. To make a decision, the F statistics is used. Acceptance of the assumption of equality of stable specific bank effects and ultimately selection of the classic method or panel data method is undertaken. The Chow test (F statistics) has been shown in Table (3). Therefore, with a confidence of 95%, the null hypothesis can be rejected and the opposing hypothesis (H1)

is accepted. Therefore, it can be stated that possibility of model estimation using the panel method is confirmed.

Table 3. Results of the Chow test

Test statistics	DOF	Significance level	Result
4.92	(179, 19)	0.000	Use of the panel method

**4.2 Estimation of need for another model**

Considering that the null hypothesis for the Chow test stating equality of distances from origins, to decide whether constant effects or random ones exist or not, the Hausman test is used. As shown in Table (3), it is noted that significance level for the Hausman test has been calculated at higher than  $\alpha=0/05$ . Thus, with confidence of 95%, random effects cannot be supported and

probability of model estimation using random effects is not confirmed.

For evaluation of significance of the regression model, the F statistics is used. To reject the null hypothesis and conclude based on the model significance, it is sufficient for significance level to be less than 0.05 which is shown in Table (4). Additionally, the Durbin-Watson statistics if close to number 2 shows lack of statistical error in the model. With consideration of explanations given in the following table, model main correlation coefficients are shown in Table (5).

Table 4. Results of the Hausmann

Test statistics	Degrees of freedom	Significance level	Conclusion
1.17	1	0.27	Existence of constant factors

Table 5. Results of fitness of the regression model using constant effects

R= Response variable				
Independent variables	Regression coefficients	Standard deviation	Test statistic	Significance level
Formula constant (0)	0.29	0.08	3.37	0.000
B	1.95	0.30	6.40	0.000
Test statistic F= 10.47, Significance level= 0.000, Determinant coefficient= 0.53, D.W. statistics= 1.93				

Table 6. Main estimation parametric

Statistics	Value	Conclusion
Durbin-Watson	1.93	Lack of series correlation in the model
F	10.47	Model goodness of fit
Determinant	0.53	53 <sup>rd</sup> percentile changes in model dependent variable

**4.3 Correlation between cash flow and credit risks**

For evaluation of the correlation between cash flow and credit risks, initially two diagrams related to the two computed risks via the KMV model were drawn (Figure 2 & 3) and to evaluate the correlation between these two variables the Pearson's correlation test was applied. Before model estimation, model variables' correlation diagram can be very useful. Correlation shows linearity of model components. If the Pearson's correlation coefficient is higher than 0.7 and meaningful, then probability of linearity exists in the model. In the following tables, correlation between evaluated variables has been evaluated using the Pearson's test. In Table (7), level of correlation has been shown in the first row and its significance in the second. If significance is less than 0/05, the correlation under investigation is statistically meaningful.

Figure 2. Credit risk

Figure 3. Cash flow risk

Table 7. Correlation between model variables

correlation	profitability	efficiency	credibility	cash flow risk	facilities	cash flow	credit risk	market beta
profitability	1.0000							
efficiency	0.964780 0.0000	1.0000 ----						
credibility	0.038203 0.0012	0.032289 0.0091	1.000000 ----					
Cash flow risk	0.094757 0.0020	0.119112 0.0130	0.035757 0.0052	1.0000 ----				
facilities	0.600000 0.0000	0.964780 0.0000	0.038209 0.0011	0.094758 0.0002	1.0000 ---			
Cash flow	0.420000 0.0000	0.964780 0.0000	0.038209 0.0012	0.094757 0.0010	0.330000 0.0000	1.0000 ----		

Credit risk	0.141228 0.461	0.233105 0.0009	0.194701 0.0057	0.102006 0.0006	0.141221 0.0461	0.141221 0.0461	1.0000 ----	
market beta	0.019541- 0.0036	0.010062- 0.0075	0.461438 0.0000	0.010258- 0.0051	0.019531- 0.0037	0.019533- 0.0037	0.188689 0.0075	1.0000 ----

Existence of correlation between variables signifies meaningful correlation between them during the period of investigation. Table (6) demonstrates that we can confidently state a meaningful correlation exists between cash flow risk and credit risk computed by the KMV model.

#### 4.4 Evaluation of the main hypothesis of the research

Main hypothesis: Meaningful correlation exists between cash flow and credit risk computed by the KMV model (table 8).

Table 8. Evaluation of the correlation between cash flow and valuation

Correlation coefficient	Significance	Conclusion
0.102006	0.0006	Confirmation of the first main hypothesis

#### 4.5 Minor hypotheses

Meaningful correlation exists between level of cash flow and valuation power in the Samman Bank (table 9)

Table 9. Evaluation of correlation between cash flow and valuation

Correlation coefficient	Significance	Conclusion
0.03	***	Confirmation of the first main hypothesis

Meaningful correlation exists between increase and promotion of profitability in the Samman Bank and granting of facilities to legal customers (Table 10).

Table 10. Evaluation of correlation between profitability and granting of facilities

Correlation coefficient	significance	conclusion
0.60	***	Confirmation of second main hypothesis

Meaningful correlation exists between rank of credit risk of legal customers in the Samman Bank and promotion of efficiency of the bank (Table 11).

Table 11. Evaluation of correlation between efficiency and credit risk

Correlation coefficient	significance	conclusion
0.23	***	Confirmation of third main hypothesis

## 5. Discussion and Conclusion

Based on the results obtained, credit risk with a coefficient of 0.1 is equal to 1.0 and has positive and meaningful effect on cash flow risk. Meaningful correlation exists between level of cash

flow and valuation in the Samman Bank with a coefficient of 0.03. Positive and meaningful correlation exists between increase and promotion of profitability in the Samman Bank and granting of facilities to legal customers with a coefficient of 0.6. Meaningful correlation existed between credit risk ranking of legal customers in the Samman Bank and promotion of bank efficiency. Results of this research agreed with studies by Ardakani (2014) and Jafari and Fakhari (2014) and Gholami and Salimi (2014). Considering the results obtained and connection between credit risk and cash flow risks, creation of interaction between these two risks and correct planning in this regard is among most important duties of directors and supervisors of banks. Therefore, it is necessary that the financial organization takes steps in line with decreasing probability of unwanted risk arenas, pricing and more correct valuation, increased ease and accuracy in decision making, decrease in costs of capital and overall decreasing harm from influence of connection between risks and towards a unified risk management.

**Abstract:** In this study the impact of social factors on social disturbances in different provinces of Iran, analyzed through EViews software, econometrics modeling and panel data by the use of data gathered in twenty years from 1995 to 2013 from relevant organizations in the subject of "unemployment, inflation, poverty and inequality in incomes" and social disturbances such as "divorce rates, addiction and robbery". The process of change in economic indicators and social consequences, analyzed. Merton's social structure and anomie theory, constituted the theoretical framework of this study. Descriptive results showed that by the growth of economic indicators, the rate of social disturbances such as divorce, addiction and robbery has been increased. The impact of unemployment and next to it inflation was greater than rest of the economic indicators.

**Keywords:** divorce, addiction, poverty, inequality of incomes, inflation, unemployment, economic policymaking

### 1. Introduction

Recession can be taken into account as the main factor of social insecurity. Economic instability, inflation, employment crisis, illegal social processes formation, the period of social disturbances and decrease of social solidarity, all follow fundamental changes (Balsas, 2001:12; Kimmel, 1998:71; Kallberg, 1986:19; Kingemam and Budge, 1994: 51). Meanwhile, one can find out the great role of government on economy and its consequences, by taking a brief look at history of economic thought. Economic policymaking of government as the main factor of economic development, mainly cover political, social and cultural facets too (Akhondzade et al. 2010). Petras believe, inflation is mainly the product of government policymaking and its social consequences are as the same as wars (Momeni, 2011). In contemporary history of Iran's economy, the Government played the role of "prime impetus", both in respect to the domain and depth of the economic involvement (Shafiee & Hosseini, 2008). On the other hand the proper bedrock for privatization and free market has not yet been prepared (Talebnia & Mohammadzade Solte, 2005; Ghalibaf Asl & Ranjbar Dargah, 2005; Moahmmadi, 2010; Jalilian, 2010; Heydari Kord & Zangane, 2007). Whereas, Manuel Castells believes: government as the chief economic impetus nor cause dynamism in capitalist economy nor take into account different social groups (Castells, 2001:187). Considering the economic policymaking in Iran through the intended period of time, shows that economic indicators which are related to main necessities of people are in crisis status. According to World Bank statistics, Iran is one of the five countries which experienced high rate of inflation (Pourostami and Sobhanian, 2013). Reports of the Iran's Central Bank show that the costs of tenth decile to first decile in 2014 have increased 13.6 times. Through this reports this status is due to profound stagnation, high inflation, intense inflationary expectation and increase in the exchange rate which are the consequence of inappropriate economic policies (Central Bank reports, 2014). The poverty course from 1982- 2003 indicates that the food expense of urban families decreased for 50 percent and this rate is 23 percent for rural families, which is an indicator of economic difficulties of families (Iran's statistics center, 1982-2003, According to Gharavai, 2005). The last official statistics of poverty line declared by Ministry of Welfare at 2004, was 10 million people. At 2008 14 million were under the poverty line, as declared by Central Bank's report (Quarterly of economic statistics, 2008). United States intelligent service, CIA,

In 2012 February report, declared the rate of unemployment 14 percent and Iran's Central Bank reported this rate as 12 percent. This statistics are the indicator of inappropriate policymaking of the Government through last decades. The next important question after the revolution, was this fact that, economic policymaking caused an explosion in expectation level of the people, but in the contrary this policies could not make a change in welfare of people, especially in the deprived areas (Mosala Nejjad, 2011). Transparency International (2008), declared Iran as the rank 142, in respect of measures of corruption, which the rentier structure of the economy and the crucial role of the government, expressed to be the main reason of that (Makipour & Rabani, 2013). United Nations office on drugs and crime reported that Iran has the largest number of addicts in compare with other countries of the world. Internal statistics of addicts is in the state of flux between 2 million to 4 million (Iran's Health organization). On the other hand official statistics of poverty line at 2004, reported by Ministry of Welfare to be 10 million people. Since then, government does not reported any official statistics on that issue.

Considering this fact that through the intended period of time between 1995- 2003 the economic indicators and social injuries in Iran has not an appropriate status, and on the other hand socialist and economists (San Simon, Adam Smith, Marx, Proudhon, Durkheim, Spencer, Parsons, economic crime investigators like, Fleischer, Henry George, Bonger, Engels, ... ) underscore the fact that main reason of disruptive behaviors is in economic facilities, and accepted this fact that economic factors play a vital role in the life of society (Beheshty, et al. 2014: 102-105; Garshabi Fakhri, Mehregan, 2011; Eesazade et al. 2014), then in this study, the impacts and consequences of Government policymaking through the last two decades, constitute the main question of this study. Does government policymaking was advantageous for especial groups or had a public coverage? Does by changes in government and policymaking, social injuries has changed, either? So the main goal of this study is to review the social consequences of government economic policymaking from 1995- 2013, in respect to disturbances such as robbery, addiction and divorce in Iran's different provinces. Social and behavioral investigation on social injuries and disturbances leads to comprehension on social order and behavioral patterns and prevention and decrease in social injuries (Mahjoobi Manesh, 2001; Sarvestani, 2010), which consist the importance of this study. According to documents and statistics Iran is a problematic country and the rate of social injuries is growing, this study can be used by policymakers and those who plan in this domain, as the hazard of social injuries spread can threaten the values and leads to family breakdown, and governmental costs and either prevent development (Abdollahi, 2002:12; Sedigh Sarvestani, 2006: 28). Another urgency of this study, is the lack of comprehensive study on such a topic. But it worth to be mentioned that in the study of Georgezade and Eghbali, 2007; Sadeghi et al, 2011, the positive correlation between economic indicators with crime and social disturbances accepted.

### 2. Theoretical and experimental framework

Amartya Sen, Indian economist, believes policymaking of government should emphasize on human development and factors like justice and discrimination elimination rather than, Income as the most important factor (Mahmoodi, 2006: 773). Government through its structural abilities should prepare the groundwork of individual, social and environmental competences growth such as literacy, technical competence, health and food, fundamental facilities, competent institutions and distributing goods which are necessary for public, struggling with poverty, discrimination and preparing welfare between citizens. Through this approach, one encounters a question called, "social dumping". Lack of attention to the benefits of

social groups in economic policymaking of society means ignoring the social responsibilities by government which will have unpleasant social consequences (mosala nejhada, 2011: 206). In explaining the concept of economic policymaking, Jeymze Diroyee says: policymaking is related to the subjects and domains which will have impacts and consequences on social and economic life of widespread spectrum of citizens (Williams, 1999: 66). There's two kind of economic policymaking, pluralistic government or capitalism, and corporatism or statism. Policymaking essence of capitalistic government can be referred to as diverse, organized, multi facet and pervasive, democratic, responsible role and enhancing the economic interaction level between different social groups. On the contrary, corporatism government policymaking is on the base of large amount of government involvement, mobilization of masses, integration and absorbing different economic groups, inhibiting the social group's entrance to political domains and has a mono-facet essence. Policymaking in corporatism is in the way of maximizing the power, which means enhancing the military and ideological ability of the political organization for the sake of imposing itself to the more wide range of people and imbuing to their mind which this undemocratic essence of politics, is being guided from the outside of institutional structures (brouker, 2005; castels, 2001; mosalanejhada, 2011:37). Through the widespread government involvement in economic policymaking in Iran, the essence of policymaking inclined toward corporatism. Max Weber as one of the founders of economic policymaking theories, underscore the role of organizational factors and use of elites and technical groups in applying the economic policies, which leads to prevention from deviation in organizational behavior, planning and economic policymaking (mosala nejhada, 2011). Organization in the idea of Weber refer to a rationalistic association. This association which can coordinate the available resources and prepare the base for providing the best outcome, actually propose organizational behavior. Organizational behavior for society, elites and policymaking administrators is of chief importance, since the possibility of measuring unpredicted behavior of people is being attended and controlled. In the other words, organization can control and manipulate the unstructured behavior of elites (greiner, 1972: 138). Weber says the economic policymaking should be on the base of indicators such as "economic rationalism". Economic rationalism should lead to production, distribution, exchange and technical evolution control (Weiss, 1980: 28). Different theories has been proposed in the domain of economic policymaking, which underscore the government attention to the social benefits of people and groups in the society. In practical theory, the social consequences of economic policymaking, maximizing the benefits for different layers, classes and groups of society is under consideration (reinand Sheldon, 2007: 93; quade, 2005: 305). In the theory of justice, equality of opportunity for different groups, fair distribution of benefits, giving priority to the individual rights and social competence, individual and social freedom in the process of economic policymaking is of main importance. Welfare state theory, emphasize on the role of government involvement in economy and supporting the vulnerable classes of society at the times of crisis (kakli and vitokof, 2003: 66). The overemphasis of these theories for attending to social groups of society, indicates that policymaking of government will be successful only if take the social domain as the main focus of itself. If the policymaking of the government not be on the axis of social responsibilities, there will be dangerous social consequences for the society. Through this point of view it seem totally rational to analyze the generation and spread of social disturbances as related to economic features of those societies. As for Parsons economic subsystems, for Durkheim profound changes and anomic economic condition and division of labor, for Marx the existence of poverty and unjust distribution of wealth, for Becker (1968) the benefits not being met and expectational utility of individuals, for Judith and peter Blau (1982) and Kuhn (1995), inequality and class gap are the main reasons of disruptive behavior and growth of social injuries. From this point of view,

it's totally rational to relate the generation and spread of social disturbances to economic features of society and analyze them from this perspective (Abdollahi, 2002: 43; sheykhavandi, 1994: 69; tavasoli, 2007:140; sheykhavandi, 2007:291-292; rahgozar, 2010; mosavati azar, 2004: 60; beheshti et al. 2014; sadeghi et al. 2005; shekhavandi, 2000: 200; hosseini nejhadaT 2005; sadeghi et al. 2011; samadi, 2013; abounoori, 1997; goerge zade va eghbali, 2007; mohamadi et al. 2012; kargarbarzi et al. 2014: 5-28; Ahmadi, 2013: 19-17; momtaz, 2002: 52; Kuhn, 1995; according to sarvestav, 2010; mobaraki, 2004:74; parsons, 1942, according to ahmadi, 2005; babai, 2001, revai and others, 2010: 129; sotoode, 2014: 164; ahmadi, 2009: 61-62). Merton says, social injuries develop when the cultural values (such as financial achievement) are being reinforced a lot, but the legitimate ways of access to them is hindered (rafiee, 2001: 5-32). Society encourage accessing to some goals; but the necessary facilities for getting access to them, is no available for all members (sotoode, 2006: 129). The social structure of the society cause injustice lead to crime generation domain (bagheri, 1389:68). Merton believes, in the status of anomie that the imbalance between economic factors follow fundamental goals, such as: disruptive behavior pattern, Invention, such as robbery. Isolation and solitude: the example are the addicts and those who put an end to their marital life.

Empirical Literature Review: The researches which mentioned the social consequences of disturbance in economy include: Williams and Micheal (2012), Gilani et al. (2009), Jensen and Smith (2010), Tang and Lean (2007), Seals and nunley (2010), Agimotokean, Sandra, Haskits, Alexandra, weed, Jack (2015), Roy (2010), Amoto and Biti (2010), Hulerestein and Mouril (2011), Farzanegan and Gholipour (2010). By the results of these researches the social disturbances, economic shocks, economic deprivation and harsh economic period of time, incorrect economic policymaking, unemployment, inequality of incomes and poverty are the main factors of crime generation and robbery.

In addition, empirical research results within Iran indicate that, inflation cause poverty, unemployment and inequality; more than that, inflation causes social gap, crime generation, robbery, and decrease in life quality and welfare, deterioration of living condition and increase of immorality facets, malnutrition and increase of cost of life. The results of the researches also indicate that main reason of robbery is due to the inequality of incomes; unemployment has the greatest relation with divorce. The inflationary policies of government cause disturbances. The research which mention this fact include: Makipour and Rabani (2013), Beheshti et al. (2014), shahouli and rezaefar (2011), Mahmoodian and Khodamoradi (2010), Nasrolahi et al (2013), Mehrban and Garshasbi fakhr (2011), Abas nejad et al. (2014), Kargarbarzi et al. (2014), Isa zade (2010), Sadrol Sharafi et al. (2012), Mohammadi et al. (2012), Mehregan and Garshasbi Fakhr (2011), Fetros et al. (2013), Isazade et al. (2014), Samadi (2013), Bagheri et al. (2010), Mehrbani (2011), Kamijani and Mohammad zade (2014), Mehrban (2010), Faraji Molae (2011), Atbari (2009), Molae va Moradi (2010).

### 3. Research Model

The theoretical model is on the base of Merton ideas about social deviation formation mechanisms and economic instability with the theory of organizational rationality of Weber. In explaining the theoretical model of research, one should note to the Merton idea that according to it, instability between goals, values, and devices to reach this goals is the main reason of deviation. In addition, Weber mention to the lack of organized pattern in economic policymaking, as the main reason of economic disturbance (figure 1).

Figure1. Conceptual model of the study - Extracted from the models presented by Aaker (2001)

#### 4. Research Methodology

##### 4.1 Hypothesis

1. 1-The lack of organizational and rational pattern caused deviation from economic policymaking and this fact increased divorce, robbery and addiction between 1995-2013 in Iran.
2. 2-The social responsibility of economic policymaking of governments, does not progressed in the benefit of deprived layers and classes of the society.
3. 3-The differences between economic policymaking of governments, had different social Consequences

The method used in this research is of secondary analysis kind, which include secondary analysis on the statistics used in this study. The data is gathered form different organizations and centers like Iran Statistics Center, Iran Drug Control Headquarters, Police Social Assistance, Department of Cooperatives, Labour and Social Welfare, Register Organization of Iran and also the calculations done by economic experts. By the use of data had gathered from this centers, inflation rate, unemployment, inequality of incomes, poverty, addiction, robbery and divorce calculated from 1995- 2013. For describing the data and course of change during this period, the Excel and Diagrams has been used. But in inferential statistics, since it was possible the used data overlap with each other or the rate of dispersion be high, and consequently exact information not be obtained, the software of Eviews and Econometrics used for two or three variables relations. Econometrics pattern has different models for data analyzing, the model used in this research is panel data. Panel data estimations has the ability of identifying and measuring the impacts, which cannot be identified easily through cross-sectional data and time series data. Generally, panel data model premise there are P unit of distinct decision which numbered from 1 to P under the index  $i$ , also there are m sequential period of time which numbered from 1 to m, under the index  $t$ , and totally there will be  $n=pm$  observation at the end. The unit of analysis in this research is the provinces of the country. Unit of observation: the necessary data for this research gathered from families through census. As the research population is the all citizens of Iran's society and in this research the census data is used as much as possible, so the there is no need for sampling. Validity and reliability: validity of the measuring device means what be measured that we expect to (Blaky, 2014). Since the data of this research is gathered by official organizations of the government and accepted by the experts of those domains, can be counted as valid. Reliability: since the data used in this research is of the census kind, and as a result change every ten years, the reliability does not consist the main issue of this research.

#### The Operational Meaning of the Variables

**Inflation:** consumer price index, is used for measuring inflation. This indicates the change of average costs of some specific commodities and services being used by families, in comparison with the cost of those commodities and services in the base year (rais dana and ghobadi, 1989).

**Unemployment:** an unemployed person, in one who is older than 10 years of age, and has three criterion simultaneously (Tajdari, 2012). First, in the reference week has not worked even for a single hour; Second, has acquired the proper requirements and preparations; third, in the reference week and three weeks before that, be in search of a job (person has done special deeds in search of wagemworks and self-employment) (Iran Center of Statistics, 2008). The index of unemployment calculated through the number of involuntary unemployed people in every year divided by the employed population of that year, multiplied by hundred (Tajdari, 2012).

**Inequality of income:** the most common used index of inequality is Gini Coefficient. Statistically, Gini Coefficient consists of the ratio of inequality income distribution to the maximum possible inequality, in a totally unjust distribution. The size of Gini Coefficient vary between zero to one hundred: zero indicates complete equality and one complete inequality (jalali, 2004).

**Poverty:** food poverty line, is the least amount of money necessary for acquiring the fundamental food needs of the family. In addition establishing an index for the least amount of food necessary for a healthy diet and life, such as 2100 calories for an adult man daily, also has an important role.

$$\text{Total poverty line} = \text{Food Poverty line} * (\text{total}) / (\text{food}) \quad (1)$$

**Divorce:** ratio of marriage rate to divorce rate, this index indicate the number of registered marriages in compare to every single divorce at a given time. This ratio calculated through the number of registered divorces divided to the marriages, multiplied by 100 and indicates that per every 100 marriages in the year, how many divorces exist (mirzaee, 2005; according to nasrolahi et al, 2013: 165- 186).

**Robbery:** the rate of robbery equals the number of cases of robbery in every year, divided to the population of 10 to 59 years of age people, multiplied by 100 (Al Emran and Ali Al Emran, 2015).

**Drug Addiction:** For calculating the rate of addiction to drug the number of addicts in every year is divided to the total population at that year, the result is multiplied to 1000 (Tajdari and zakaria, 2006).

5. Results

Figure 2. The inflation, poverty and inequality of income course from 1995- 2013

Inflation: by comparing the inflation course between different provinces in the mentioned period of time, the developed provinces had the least inflation and deprived provinces and underdeveloped provinces did not show a significant difference in their course of inflation. In comparison between governments, the rate of inflation averagely increased 10 percent in inflation course, from seventh and eighth governments to the ninth and tenth governments. Unemployment: unemployment rate from 1995- 2013 followed an ascending course. Deprived provinces had a greater unemployment rate that other provinces and the country in total and less developed provinces had least rate of unemployment. In the seventh and eighth governments the rate of unemployment in provinces distinctly and in whole the country was in state of flux between 13- 25 percent. But in the ninth and tenth government, between 2007 -2013, the unemployment course is between 20 to 34 percent, which means a double increase in comparison to two last governments. Poverty: in comparing the rate of poverty based on policymaking of governments, it should be mentioned that in seventh and eight governments the rate of poverty followed a decreasing course. This decreasing course was both at the level of provinces and the country. But on the contrary to the previous years the rate of

inflation in ninth and tenth government follows an increasing rate. In the seventh and eighth governments deprived provinces had the least rate of poverty and the less developed provinces had the greatest amount of poverty, which this was vice versa in ninth and tenth governments. Inequality of Incomes: in seventh and eighth governments inequality of incomes in all the provinces was between 30-40 percent. Whereas in the ninth and tenth governments the inequality of income rate followed a decreasing course, from 41 percent to 31. By comparing the different provinces distinctly, one should note that the rate of inequality of incomes in ninth and tenth governments, follow an ascending course in deprived regions and reach to 50 percent during these two government, and had the greatest inequality in comparison to other provinces. The less developed provinces experienced the least amount of inequality which had oscillation between 30 percent to 40 and this rate was at decrease in final years of these two government. In seventh and eighth governments inequality had not a significant difference in different provinces and the course of inequality indicates that developed provinces, had the greatest inequality during seventh and eight governments (figures 2 and 3).

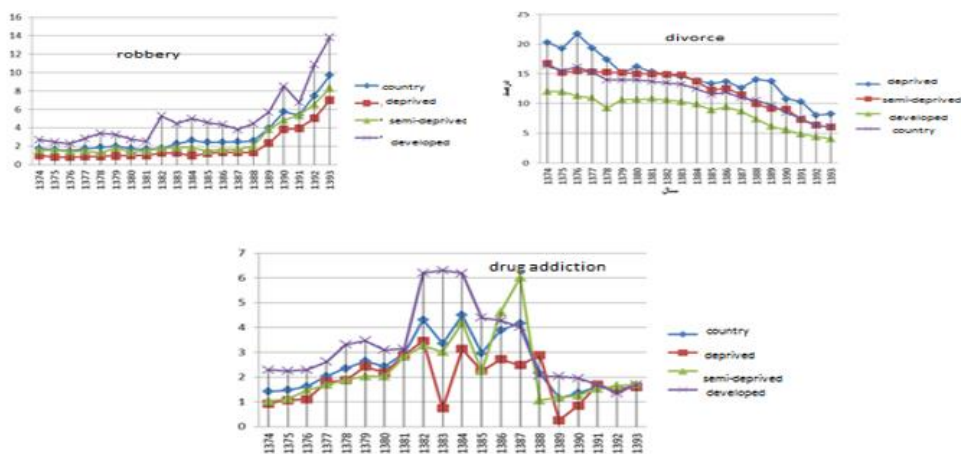

Figure 3. Robbery course, addiction and divorce from 1995 to 2013

Robbery: The course of robbery of different provinces of country according to policymaking of the government indicates that, during the seventh and eighth governments, the rate of (robbery) deprived provinces in comparison to other provinces was less and the developed provinces had the greatest rate of robbery and totally, the rate of robbery in these two governments was

between 1 to 2 percent. On the other hand, in ninth and tenth governments, developed provinces had the greatest amount of robbery and in comparison to deprived provinces show approximately more than double increase in the rate of robbery. In total, during the ninth and tenth governments the rate of

robbery had a manifold increase, and reached from 2 percent in provinces to 10 percent.

Marriage to Divorce Ratio: one of the simple but yet major indexes which analyze the marriage and divorce condition of society simultaneously, is the marriage to divorce ratio. This index indicates the number of marriages registered per every divorce in a certain period of time. In the seventh and eighth governments, the marriage to divorce ratio of developed provinces during the years 1995 to 2005 reached from 12.02 percent to 9.21 percent. This means per every 12 marriages during the first year's one divorce happened either, but in the final years per every 9 marriages only a single divorce happened. According to the statistics, in these governments the marriage to divorce ration of developed provinces with great difference was in the course of decrease and the deprived provinces had the least amount of divorce. In the ninth and tenth governments the marriage to divorce ratio of developed provinces decreased from 9.04 percent to 4.06 percent, which means at 2014 per every 4 marriages one divorce happened. In comparison with developed provinces, deprived provinces in these governments reached from 8.06 percent to 13.07 percent.

Drug addiction: According to figures 2 and 3, in seventh and eighth governments the degree of addiction was increasing, developed provinces had the greatest amount of addiction to drug. The less developed provinces had the least amount of addiction to drug, but in the ninth and tenth governments, due to the paradoxical statistics of this period of time, the rate of

addiction had great oscillation and decreasing inclination; In this period addiction of the deprived provinces is less than other provinces and the developed provinces had the greatest amount of addiction to drug. The greatest rate of addiction was between the years 2002 and 2009 and developed provinces had the highest degree of addiction. Generally, between the years 1995-2014 in the process of analyzing addiction in the country, the developed provinces had the greatest rate of addiction, and then the whole country take the second place. The less developed and deprived provinces had less addiction than the country course.

In addition, in order to analyze the simultaneous effects of independent variables (inflation, poverty, unemployment and inequality of income) on dependent variables (divorce, addiction and robbery), econometrics used distinctly; By integrating the available sets of data, we reached to the panel data. Regression coefficients, is estimated with this set of data either, and are called panel estimations.

In the above mentioned relations,  $c$  and  $\epsilon$  respectively indicate intercepts and are a part of model error.

Analyzing the stability of variables: a time series variable is stable when mean, variance and coefficient of its correlation remain stable during the time. For evaluating the stability of variables LLC test is used. Westerlund and Breitung (2009) indicate that, the power of LLC is more than IPS. The results of this evaluation shown in the 1-4 table.

Table 1. Analyzing the stability of variables by the use of LLC test

variable	statistics	possibility	Result
Unemployment	-1.5591	0.0595	Stability at the level of 1%
Inflation	-2.0956	0.0181	Stability at the level of 1%
Poverty	-2.7400	0.0031	Stability at the level of 1%
Inequality of incomes	-1.4667	0.0712	Stability at the level of 1%
Robbery	-2.9420	0.0016	Stability at the level of 1%
Addiction	-3.5419	0.0002	Stability at the level of 1%
Divorce	-3.0239	0.0012	Stability at the level of 1%

As the above table shows, all the variables are stable at the level of 1%. On the other words, for all the regressions in all tests, null hypothesis which indicate the existence of same root rejected, so we can results in all the regressions accumulated residual is od zero degree and the possibility of false regression in the final model is excluded.

Panel Data Model estimation: For selecting between the integrated model (without considering the group effects) and the approach of stable effects, we used the F-Limer as the statistics.

Table 2. The result of F-Limer test

Model	Null Hypothesis	F Statistics	Possibility	Result
15-4	Sectional effects are not Significant	2.2397	0.0157	$H_0$ Not being accepted
16-4	Sectional effects are not Significant	3.4712	0.0041	$H_0$ Not being accepted
17-4	Sectional effects are not Significant	1.8345	0.0487	$H_0$ Not being accepted

But as the number of sections, analyzed in this study was only three one, and the number of explanatory variables is more than the number of sections, the estimation of model by the use of random effects is not possible, and hence the only available model is the model by stable effects. The next stage after reviewing the model selection tests and selecting an appropriate one, include estimating the coefficients of the model, by the use of Eviews software.

Lack of organized and rationalized pattern that leads to economic policymaking deviations and consequent increase in divorce, robbery and addiction between 1995- 2013, consists the main hypothesis of this research. in order to analyze the simultaneous effects of independent variables (inflation, poverty,

inequality of incomes and unemployment) on addiction, divorce and robbery, the independent variables inserted in the regression equation of the stable effect kind; the results of the multi variable regression calculation is shown in the tables below. According to the results of the table (3), independent variables could predict more than 61% of Addiction variable changes in the regions under discussion; this means 61 percent of addiction changes during 1995- 2013 can be explained by four variables, include: unemployment, inflation, inequality of incomes and poverty. In concern of effect coefficient of independent variables in the equation, one can note that the unemployment variable with the effect coefficient of 0.402 percent, has the greatest effect on the addiction variable changes. On the other hand, the variables of inequality and poverty, indicate an effect equal 0.204 and 0.129

percent on addiction, respectively. Finally, inflation with effect coefficient of 0.129 percent, in addition to poverty, has the least effect on addiction. Besides that, all the estimated variables in the above mentioned model, with the exception of inequality and poverty at the level of 99% are significant and the effect of inequality and addiction cannot be accepted even at the level of 90%, but at the level of 90% the effect of poverty on addiction can be supported. Through these explanations, regression equation of effects of variables, is as follows:

$$\text{Addiction} = \text{Constant (1.239855)} + \text{Unemployment (0.402286)} + \text{Inflation (0.129988)} \quad (2)$$

Table (3) the results of the model estimation 15-4 (dependent variable= Addiction)

possibility	Statistics T	Standard Deviation	Coefficient	Variable
0.000	8.327	0.148	1.239	Constant
0.0001	4.231	0.030	0.129	Logarithm of Inflation
0.226	1.222	0.166	0.204	Logarithm of Inequality
0.0817	1.774	0.072	0.129	Logarithm of Poverty
0.000	5.305	0.075	0.402	Logarithm of Unemployment
$R^2$	Durbin-Watson	F-Possibility	F-statistics	Statistical features of the model
0.6189	2.0955	0.0000	14.3461	
Developed	Semi-developed	Undeveloped		Cross-sectional width of origin differences
-0.01948	-0.01759	-0.00189		

The independent variables could predict more than 70 percent of the divorce changes in different regions. Besides that all the estimated coefficients in the above model, with the exception of Inequality, are significant at the 99% certainty level. Although, the effect of Inequality on Divorce cannot be accepted at 90 percent certainty level, but at the 95% percent level the effect poverty on divorce is significant. Also, the above results indicate that between all the explanatory variables and dependent variables, there's a positive correlation, as a single percent

increase in inflation, unemployment and poverty cause a 0.14, 0.33 and 0.08 percent increase in divorce rate of different regions, respectively.

$$\text{Divorce} = \text{Constant (1.178)} + \text{Unemployment (0.336)} + \text{Inflation (1.149)} + \text{Poverty (0.081)} \quad (3)$$

Table (4) the results of model 4-16 estimations (Divorce= dependent variables)

Possibility	Statistics T	Standard Deviation	Coefficient	Variable
0.000	10.86613	0.108	1.178	Constants
0.0000	5.944628	0.0252	1.149	Inflation
0.1084	1.632962	0.145	0.237	Inequality
0.0513	1.993729	0.0408	0.081	Poverty
0.0001	4.238705	0.0793	0.336	Unemployment
$R^2$	Durbin-Watson	F-Possibility	F-statistics	Statistical Features of the Model
0.7097	2.0253	0.0000	21.6012	
Developed	Semi- developed	Undeveloped		Cross- sectional width of origin differences
-0.0045	-0.00092	0.005411		

The independent variables could predict more than 70% of the changes of robbery in different regions. Besides that all the estimated variables in the above model, with the exception of inequality, at the certainty level of 99% are significant, also the effect of inequality on divorce is significant at the certainty level of 90%. The above results indicate either that between all the explanatory and dependent variables, there's a positive

correlation, as a single percent increase in the rate of inflation, unemployment and poverty cause a 0.18, 0.16 and 0.31 percent changes in robbery in different regions, respectively. Through the obtained results, the regression model is as follows:

$$\text{Robbery} = \text{Constant (1.477258)} + \text{Unemployment (0.401287)} + \text{Poverty (0.165313)} + \text{Inflation (0.182109)} \quad (4)$$

Table (5) the results of model 4-17 (dependent variable= robbery)

## 6. Conclusion

Iran's contemporary history of economy indicates, government always played the role of "prime impetus" in both domain and depth of involvement in economic activities. Three main phase can be mentioned in the domain of economic planning, in Islamic Republic of Iran period. First period refers to Fifth Development Plan, the second one is related to 1989, in this period the Controlled Economy shifts to Free Market kind, and the third phase of economic policymaking refer to the "Targeted Subsidies" (Mosala Nejad, 2011: 22). The statistics indicate that, through the economic indicators and social anomies, Iran passes the state of crisis. Due to this fact, the main goal of this study focused on social consequences of economic policymaking of governments during 1995 to 2013. According to the hypothesis of this study, the growth and spread of social injuries like divorce, addiction and robbery is under the influence of economic disturbances and economic policymaking of government, which different social consequences left behind in provinces. The years during 1995 to 2005 indicate the timeline of presidency of Mohammad Khatami. Structural adjustment policies, economic stability, controlling the inflation and increasing the taxes can be named as the most important economic policies of this period. The years during 2006 to 2014 is considered to be under the influence of economic policies of Ahmadi Nejad. The most important policies of this decade include: expansionary monetary policy, economic development plan, increasing the price of energy carrier, Mehr Housing Project, quick-impact businesses and targeting the subsidies. Generally the results of the research indicate that, the economic policymaking of the Ahmadinejad government in first period in the domains of poverty and unemployment was not in the favor of deprived and less developed classes of the society, but by considering the inflation rates and inequality of incomes, the deprived and less developed provinces, had a better statue than developed countries. By comparing the rate of social injuries in provinces, in first period of Ahmadinejad presidency, deprived provinces had the lowest rate of divorce and robbery; the developed provinces in three indexes of divorce, addiction and robbery had the greatest rate than the other provinces.

In the second period of Ahmadinejad presidency, the economic indexes and social disturbances, not only had an ascending course, but also in comparison to the first period, indicated a manifold increase. Deprived provinces in the fields of poverty, unemployment and inequality of incomes had the greatest rate than other provinces. Less developed provinces had the greatest rate of inflation. Developed provinces in comparison to the other provinces followed a mixed course. Economic policymaking of the Ahmadinejad government at the second period, in the fields of poverty, unemployment, inequality of incomes and inflation was nor in favor of deprived classes of the society and the highest rates can be shown in such provinces; the policies were in the favor of developed provinces in general. Deprived provinces in the second period, in the fields of divorce, addiction and robbery in comparison to the other provinces had a better condition. The less developed provinces' condition is something between the deprived provinces and developed provinces, like the previous period. In this period again, in the field of addiction, divorce and robbery developed provinces had the highest rate. The hypothesis of this study constitute: economic policymaking of the governments has different social consequences and as well as that if economic policymaking not be on the base of rational organized patterns then economic instability and social disturbances emerge as a result. In the period of Mohammad Khatami presidency, a mixture of structural adjustment policies and economic stability caused the rate of social disturbances not reach to the crisis point, and economic policymaking be in favor of deprived classes to some degree and as a result the rate of robbery, addiction and divorce had a favorable condition than the

other provinces. The developed provinces had the highest rate of disturbances, but the economic policymaking changes at the Ahmadinejad period which was along economic instability indicate that the organizational rationality is not taken into account and in all the economic indicators and mentioned disturbances a great rate of growth can be noticed which is disadvantageous for deprived classes. Nevertheless, social consequences in developed provinces indicate a higher rate than the other ones, which is due to the migration of people from deprived provinces to the developed provinces for the reason of unemployment, poverty and financial inability. According to the relational deprivation and failure of dignity theory, it can be noted when this people become acquainted with the life condition of wealthy people in the developed provinces, feel a deep sense of inferiority and discrimination, and on the other hand find themselves in competing with them a failure; their children either have a same feeling toward their wealthy peers in the school. In coping to such a situation a delinquency subculture will be formed which the above findings admit them, as the developed provinces had the highest rate of divorce, addiction and robbery. It seems, unemployment and widespread poverty of deprived regions cause a great number of unemployed people rush toward these developed provinces, and on the other hand, these provinces cannot support the needs of the immigrant. As a result the rate of social injuries is higher in these provinces.

Bu the other hypothesis of this study, which according to it, economic factors of the country are related to social injuries, is supported by the inferential findings. The variables, such as unemployment, inflation, poverty and inequality of incomes, predict more than 61% of addiction changes in different provinces, during 1995 to 2013. Accordingly, unemployment, inequality, poverty and inflation has the greatest effect on addiction rate, respectively. The results of this study indicate that, independent variables predict more than 70 percent of changes in divorce rates in different provinces. Unemployment, inflation and poverty, with 0.23, 0.14 and 0.8 had the greatest effect on divorce. The most and the least effect on robbery, inequality of incomes, inflation and poverty was 0.4, 0.31, 0.18 and 0.16, respectively. It should be noted that, unemployment in comparison to the other economic factors, had a more significant effect on mentioned social injuries. The results of these tests accept our research hypothesis. One question emerge from these findings: why economic indexes have such a significant determinant rate on robbery, addiction and divorce? According to Merton theory, one should note that after the Islamic Revolution, the economic policymaking caused an increase in expectations of the all classes of the society, but on the other hand, the economic structure due to the governments malfunction, could not be response to the requirements of the people. The second reason for this condition can be attributed to the great involvement of government in economy which cannot cause economic dynamism. In addition the government policymaking in Iran, more focus on subjects, such as power, security and expansion of social dominance, and giving priority to the security than social welfare. According to Merton's theory one of the responses which occur in this theory is innovation: that one example of that is robbery. Isolation: such addicts and those who put an end to their marriage life. In addition, according to practical theories and those which put an emphasis on justice, the government's lack of attention on social groups and vulnerable classes, leads to social crisis. In Iran the lack of politician's attention to this mechanisms in the process of policymaking, caused the growth of social disturbances.

## EVALUATING INFLUENTIAL VULNERABLE CENTERS ON THE RESILIENCE IN THE FACE OF TERRORIST'S ATTACKS WITH HELP OF HIERARCHICAL ANALYSIS MODEL AHP (CASE STUDY: METROPOLIS TEHRAN)

<sup>a</sup>REZA MANOUCHEHRI

<sup>a</sup>MSc student in Urban Design, Tehran, Iran

Email: <sup>a</sup>Ar.Manuchehri@gmail.com

**Abstract:** The recent terrorist attacks in Paris, France (2015), indicates that especially in metropolitan cities are always interested to be attacked by the terrorist groups so essentially terrorism can be considered as urban phenomenon. Metropolis Tehran as the capital of Iran that has the most important elements of infrastructure, governmental, political, industrial, and population centers is considered as potential targets of terrorist attacks. According to the results, 6 and 12 because of being within structure of the downtown, the number of applications and critical infrastructures have been more vulnerable to terrorist attacks compared to other regions.

**Key words:** resilience, urban terrorism, terrorist attacks, Tehran, Analytic Hierarchy Process AHP, vulnerable places

### 1. Introduction

Cities are complex and interdependent devices and very vulnerable against the threats of natural, manmade and terrorist. Characteristics that make cities desirable and achievable, such as architecture, population centers, places of community, infrastructure put the cities exposed to higher risks of terrorist attacks (Behtash et al, 2012). Many terrorist attacks are managed in cities, so that the biggest and the most important terrorist attacks would occur in the cities, in Islamic Republic of Iran, the cities have been repeatedly attacked, so the statistics show that so far about 17,000 people have become victimized by the terrorist attacks in Iran. According to the statistics among countries in the world, 82% of people killed in the terrorist attacks were living in five countries Iraq, Afghanistan, Pakistan, Nigeria, and Syria. Iranians has shared borders with 3 out of the five countries and shared treaty with one of them. The statistics of index of global terrorism has embraced our country among the 13 countries in that terrorism index will go up (Global Terrorism Index, 2014).

The metropolis Tehran also due to the role of capital in the metropolis of the country and possession of critical infrastructure, public places and political institutions, and educational institutions is an important one of potential terrorist targets.

### 2. Methodology

The methodology is analytical-descriptive one and based on analogy and reasoning. First, the scientific literature about the adverse effects of urban terrorism in our city becomes studied and reviewed that in the case, documentary-library method, science and news websites are used. Examining the theories, some strategies on the resilience against terrorist attacks are extracted. Tehran is selected study area. In recognition of the area, some efforts are made the GIS-software maps are used and finally analyzed using AHP analysis and software Expert Choice and areas would be categorized in terms of vulnerability to terrorist attacks.

### 3. Viewpoints and theoretical foundations

#### 3.1 Roots of urban terrorism:

The word terror derived from the Latin (terrere) means fear and scare (Zarghani, A., 2010, p. 72) and the words "terrorist" and "terrorism" in various Academies, including French Academy of Sciences, is meant "system or regime of terror" (Tayeb, 2002, p. 55). Jacobins in France before the Great Revolution in their words and writings had used this term with positive impressions about themselves, but after Robespierre's actions who was

influential member of the group this term was converted as the profanity, suggesting that a delinquency act (Tayeb, 2002, p. 56). Furthermore, its historical root got back to the period before the fall of Robespierre's reign known as "terror" (1793-1794) (Kourmount, 2009, p 0.206). Long wave of terrorism in Western Europe with "propaganda action" anarchists arose in the 1890s. Anarchism advocates believed that the best way of achieving political-social change driven from the revolution would be kill those who occupy positions of power. In the midst of all these movements, Russian People's Will Movement (1878-1881) had a lot of far greater importance; many knew this to be a full-fledged example of a terrorist organization supporter of revolutionary violence in the new era. Like trying to explode up a train carrying Tsar and first explosion in the Winter Palace in November 1879. Until 1905 the wave of attacks and assassinations outside of Russia had subsided, and was seen, in a speech, in Central and West Europe, Russia and the Balkans, and in a different manner in Spain. Labors' disputes in the United States almost from the beginning of would be more violence than in Europe including bombings in Haymarket Square in 1886, and many other bloody incidents. Terrorism in the United States would be limited in terms of scope and in terms of goals, neither to overthrowing the government, nor to killing political leaders or changes in the political system (Tayeb, 2002, p. 60). Urban terrorism was best treated as complementary methods for Peasant War and worst, as a dangerous distraction. Castro and Chegvara shared an abiding faith that the city is a "cemetery" for revolutionary struggle for freedom. It was only in the mid-1960s that the urban terrorism became primarily formed independently as a result of the failure of peasant guerrillas in Latin America as well as in the wake of the emergence of urban terrorist groups in Europe, North America and Japan. In the twentieth century, the terrorism by totalitarian regimes such as Nazi Germany under Hitler's control and the regime of the Soviet Union under Stalin's control, in fact, were regarded as policy but not policy-declared. Moreover, in our time, some governments attempted at assassination of the citizens of other countries. This phenomenon causes the generations and popularity of terms like urban terrorism, political terrorism and international terrorism (Tayeb, 2002, p. 63).

#### 3.2 Types of terrorist attacks

The terror and terrorism is as old as history of politics and government formation in the world, but at last decade and from the twentieth century, with the development of technology and communication tools, advanced weapons proliferation, complex organization, and the formation of ethnic, national, and ideological motivations, every day is added to the power and role of political groups and terrorist organizations (Pape, 2003, P. 343). The terrorist threats include all types of threats creating a sense of insecurity among the people and authorities. The terrorist or security threats may be presented objectively or subjectively (Schulz et al., 2002, p. 93). Bomb, thrown explosives and use of any type of fire and cold arms, assassination, kidnapping, or hostage-taking, collective intimidation and fear and forcing people to leave work, home or school, as it is the instances of terrorist threats (Zarghani Vazemy, 16: 931). The terrorism has been classified and divided on the basis of the different views and approaches. Part of this type of classifications includes: the terrorism under the control of countries and independent terrorism, anarchy-loving terrorism, neo-fascist terrorism and ethnic separatist terrorism (Hamzezhadeh, 2002, p. 5), the conventional and non-conventional terrorism, chemical and nuclear terrorism, (Dehghan, 2002: 933). As well, in addition to the above classification, the terrorism experts believed there are seven types of terrorism including nationalist terrorism, political terrorism, narco-terrorism) of addiction-terrorism (religion

terrorism, government-sponsored terrorism, state terrorism and independent terrorism and there are several dimensions including: nuclear terrorism, bio-terrorism, agriculture terrorism,

chemical terrorism and criminal terrorism, suicide terrorism. The following figures show the extent and types of terrorism:

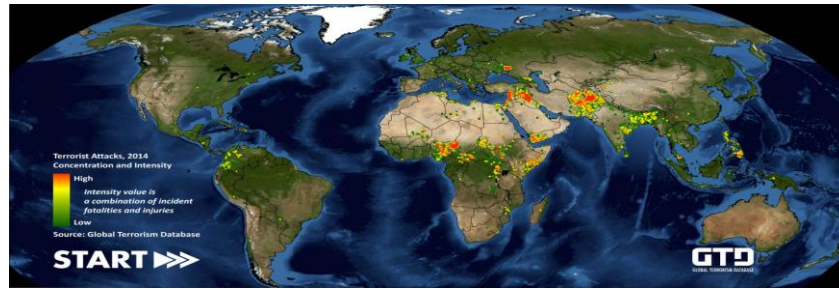

Figure1: Density of attacks occurred in year 2014 (<http://www.start.umd.edu/gtd>: Global Terrorism Database)

Table 1: Types and dimensions of terrorism (source: Zarghani Azam, 2010, p. 73)

Types of terrorism	Dimensions and methods of terrorism
1. Nationalist terrorism	1. Bio-terrorism
2. Political terrorism	2. Chemical terrorism
3. Addiction terrorism	3. Nuclear terrorism
4. Religion terrorism	4. Agriculture terrorism
5. Government-sponsored terrorism	5. Criminal terrorism
6. State terrorism	6. Suicide terrorism
7. Independent terrorism	

In the words of James pain, to start terrorist discourse, it must first perform a type of cleanup, which is what others consider as definition. In Douridian's opinion, it is so difficult to perform the rituals according to semantic confusion and mixture dialog consisting of terrorism and anti-terrorism (Solomon, 2011, p. 18). However, the terrorism in the dialogue at any time would be meant within the stereotyped and specific frames and its manifestations and contents would be drawn and depicted, as dominant discourse recognizes the. However, modern terrorism differs from past versions that the victims are often innocent civilians who were either randomly chosen or merely attended at the terrorist situations. In other words, in our times, unknown victim's pan is heavier than the assassination of prominent and famous persons (Tayeb, 2002, p. 64)

### 3.3 Urban Resilience

Resilience is the new way of thinking about urban design so that engages less vulnerability and more flexibility (Kates, 2007, P. 22). The resilient city is of a stable network of physical systems and human communities. The physical systems include components of natural and built environment of the city. Totally, the physical systems would be considered as a body, bones, arteries and muscles of the city. During a crisis, they must be able to withstand versus great pressure and have a good performance. If the system has many defects that cannot be repaired, the return process will be done slowly after the crisis (Rezaee, Mohammad Reza, p. 27).

The resilient cities make manifest situations of the survival, governance, sustainability, adaptability and flexibility (Arif, 2015, p 1059). Total human communities act as the brains of the city, guide its activities, and respond to the needs of the city. During a crisis, the social network also must be able to withstand extreme conditions and act correctly (Rezaei, Mohammad Reza, p. 28). The resilience is rooted in the ecology; the environmental considerations would be the design of the city. The use of metaphors such as resiliency or the organism have stressed on the nature of the city as a living (Kostof, 1991, p.15). How the urban designer to be inspired by ecology depends on two key components that are common in cities and organisms: 1) post-disaster recovery (Vale and Campanella, 2005) 2) coping with the change and managing

them. The first option comes two options to mind or returning to the previous situation or pursuing a preferred status. The first option represents the equilibrium model with making capacity and achieving a normal cell. The risk of natural catastrophes (floods, earthquakes, etc.) or man-made (wars, terrorist attacks, etc.), the need to reduce vulnerability has been caused by increasing safety and adaptability in the city. Related attempts and actions to post-disaster reconstruction and recovery efforts would seek adjust the risk and mitigate vulnerability, by making capacity. In non-interactive version, this is aimed at promoting greater flexibility to reduce the vulnerability. In this model, there are more comprehensive practices for urban design, which are presented by focusing on three aspects of the built environment, including form, function and flow.

A) Forms: define the buildings. As organisms adapted their resilient to the habitat, specific building species increase urban form for the changes. Modules are representation of mirrors of a certain standardized parts of larger uniform part (Lynch, 1990, P.384). The flexibility of entrances and grid patterns are created within the fixed and standardized parts which consist of structures which are repeatable.

B) Function: reflects the purpose or intent of urban form (and organisms). Both cities are in need of quite specific and non-specific units, but are separated from each other until the adaptability for one does not disturb growth and performances (Lynch, 1990, P.382).

C) Flow: currents that form separate but interconnected networks of relationships which are critical and effective on long-term viability. Infrastructure would manage flows related to services (traffic, gas, water and wastewater).

These three aspects of the built environment would cause conceptual sequence of urban form, ranged from the urban of fixed or rigid (infrastructure) and semi-fixed urban form (public space) to urban form of flexible, adaptable or fluid (open and flexible spaces) (Banerjee, 2011, 1061)

### 3.4 Hierarch analysis AHP

AHP is one of the most multi-criteria decision-making techniques invented by Thomas L. clock in the 1970s (Kusek, 2004). This method when decision-taking action involves in few options and decision criteria. The indicators can be quantitative or qualitative. The method's basis relies on paired comparisons. In stage of preparation of the hierarchy, the problem is defined and the purpose of hierarchical decision-making would be the elements and factors making the decision to draw. Analytic hierarchy process needs to break the decision-taking problem by several indicators into a hierarchy of levels. For this purpose, a decision tree is used which is made up of four levels: The first level includes the overall objective of the decision making. On

the second level are the general criteria on the basis of that the decision is taken. On the third level are the last level of the decision options here are 22 districts of Tehran metropolis.

### 4. Ecology research

Tehran Province is located with an area of 13692.413 km between 34 and 36.5 degrees north and 50 to 53 degrees east longitude. Tehran Province among the metropolis of the country has a privileged position due to the centers of political, economic and social to exist. Some of these centers are unique, less visible in the remained metropolis in the country and this is a good target for terrorist groups to be exposed.

Table 1: Management and Planning Organization, Iran's statistics center 2011-2012

Name	Population	Annual average growth of population	Portion of country's population	Household dimension	Amount of urbanization	Literacy in percent	Area (km <sup>2</sup> )	The number of towns	Number of district	Number of cities	Number of rural areas	Number of villages
Tehran	12183391	1.44	16.2	3.3	92.8	90.5	13692.413	16	33	44	71	757

### 4.1 Terrorist events in Iran and the world

Globally, the country without the violence would be almost nonexistent. But there are some countries that have been associated with the violent events. For example, Columbia would be including in those countries. In this country, the average daily violent incidents killed 71 people and 4 "terrorist attack" took place (Ozzie, 2011, p 281)

Some of the terrorist attacks that occurred in the world, including the following:

In Wall Street in New York City in America, on September 16, 1920 TNT bomb that was locked in the carriage of horses, 35 people were killed and hundreds were injured. Although the Bolsheviks and anarchists were suspected but main officials are not known certainly. On January 24, 1975 in New York City, the historic restaurant Francis was exploded. Based on the explosion, four people were killed and 50 people were injured.

In 1983, two major attacks took place in Beirut. The first occurred on April 18 and throw bombs to the embassies of America included 63 people are dead and 17 injured. The second occurred on October 23. In the port of Beirut near the Americans' accommodation, bomb exploded would kill 241 sailors. Minutes later a second bomb was exploded in West Beirut and the accommodation of French troops and 58 people were killed (Ozzie, 2011, p 282). In America in Oklahoma City, on April 19, 1995, a car bomb was exploded outside a federal office building and it led to 19 child victims, along with 168 others. In August 7, 1998, in Kenya and Tanzania, exploding car bomb next to the building of embassies of America, 224 people have been killed and 4,500 injured. The biggest terrorist attack

in history took place September 11, 2001. This day was marked by an unprecedented terrorist attack on America. Following the collision of two airplanes on the World Trade Center in America, there has been great destruction. After the incident, the Pentagon reported a large explosion in 18/47 pm. After the attacks, in 18.57 pm another huge explosion occurred in a commercial center in Washington. As a result, the 3038 terrorist attacks have lost their lives (Ozzie, 2011, p. 284).

On November 13, a series of coordinated terrorist attacks occurred in Paris, France. Paris AFP reported the number of victims of terrorist attacks at least 120 people and 200 injured. Some news sources declared the number of people killed over 150 people. In Paris attacks, six-shooter and two suicide blasts occurred in Paris seven points. This is the first time in French history that suicide attacks carried out on its territory. The first explosion occurred near a soccer stadium in Paris, during a friendly match between Germany and France and when 'Francois Hollande' French president was inside the stadium. He quickly left the place and went to the Interior Ministry to convene an emergency meeting. The second explosion occurred about 15 minutes later in other parts of the city's six-shooter. At the same time in other parts of the city, six shooting cases occurred and then gunmen got at the entrance to the concert hall more than a thousand 500 people hostage. Hostage-taking ended with police's intervention, during which nearly 100 people were killed and several attackers (Islamic Republic News Agency, December 6, 2015). According to statistics from the 1980-2001, 4155 terrorist incidents happened around worldwide in which 3207 people were killed. Recent statistics showed an increase in the number of victims of terrorist attacks, so that in 2012, 11133 people were killed and in 2013, 17,958 people died occurred among 102 countries (Global Terrorism Index, 2014, P. 5)

Table 2: MKO military operations in Tehran (1971-1978) (Source: Ismaili, 2011, p. 103)

Row	Date	Attack place	Description
1	5/21/1972	Symbols and visions of governed policy power	Bombings in America Information Administration, Building and Construction Forum Anglo-Iranian Council in Tehran
2	5/30/1972	Crowded and public places	Explosion at the way for General Price, the American advisers in Tehran
3	5/30/1972	Symbols and visions of governed policy power	Exploding a bomb in the tomb of Reza Khan, coincided with Nixon's trip to Tehran
4	8/2/1972	Symbols and visions of governed policy power, Crowded and public places	When King Hussein of Jordan to Iran, to the explosion of a bomb at the Jordanian Embassy
5	1/26/1973	Crowded and public places	Exploding a bomb in the cafeteria International Hotel in Tehran
6	4/19/1974	Crowded and public places	The explosion at the headquarters guard Aryamehr University of Technology (SUT)
7	6/25/1974	Critical infrastructure of the city	Explosion-proof electrical installations IRNA factory in Karaj

8	6/25/1974	Critical infrastructure of the city	Power plant explosion Jeep Land Rover factory in Karaj
9	7/21/1975	Crowded and public places	Bomb blast in Forums
10	7/26/1981	Symbols and visions of governed policy power/ Crowded and public spaces	Abuzar Mosque bombing during the speech, Ayatollah Khamenei in Tehran
11	7/27/1981	Symbols and visions of governed policy power/ Crowded and public places	The explosion of the Islamic Republic of Iran, Ayatollah Beheshti testimony
12	8/29/1981	Symbols and visions of governed policy power/ Crowded and public places	Explosion presidential office and the testimony of Mohammad Ali Rajai

#### 4.2 Vulnerable areas against urban terrorism:

Cities especially in metropolitan cities due to demographic, political and economic niches are addressed by the terrorism. However, these people do not choose at random places of interest; according to the studies conducted by the author, the places where 1- there is concentration of population and economic, 2- making a terror a lot 3- have high political and ethnic dimensions, 4- have physical and human casualties, 5- have the symbolic value, 6- have priority than other locations for broadcasting a lot. Based on the terrorist attacks, most places are interested by these groups based on theoretical principles described in the section on resilience can be divided into the following categories:

1) Fix the city: a) critical infrastructure, b) symbols and perspectives of political power (seat of government and state) (Banerjee, 2011, 1062)

2) Semi-fixed city: a) public and crowded places in the city (Banerjee, 2011, 1063)

#### 4.3 City Fixed

##### 4.3.1 Critical infrastructures of the city

Infrastructure systems are known targets of terrorism. Even unsuccessful attacks on critical infrastructure can be extensive broadcasted and cause significant economic losses. For example, security of airlines, marine, railways, roads and transit systems should be guarded against the terrorism. The infrastructure of energy, gas, water, electricity, sewage and communications would be the basic requirements of any progress. The life lines should be protected against the attacks by taking the supports or bringing them out of state monopoly on one area and increasing their number (Edward, 2001, P.10)

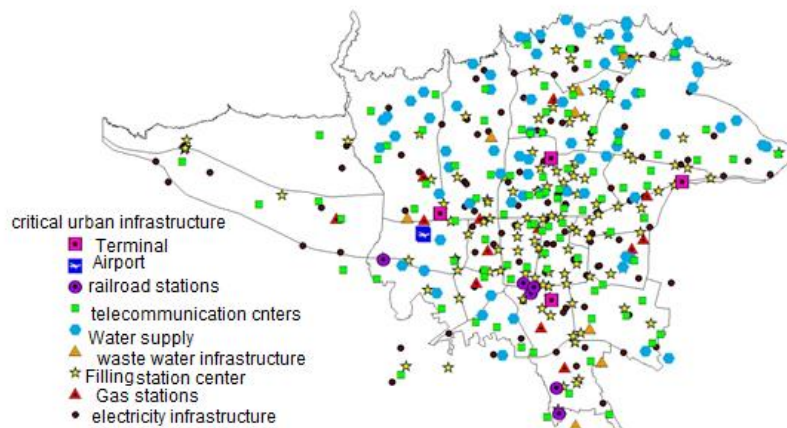

Figure 2: Critical Infrastructure of Tehran

##### 4.3.2 Symbols and prospects of politically governed power (seat of government and state)

Today, the terrorists to challenge the governments, as well as receive the media and the world of existence, have attacked political and even non-political symbols and perspectives of ruling power. The prospect and size usually include Parliament House, the Congress, Ministries, Governors, Office of the Prime

Minister or President, judicial complexes, national radio and television, government buildings and centers and even public statues and sculptures. The following symbols and prospects would practice for the government as a political tool to remind people who is seated in power or what ideology or philosophy governs the society (Jones et al., 121: 2, 48) The symbolic nature of terrorist acts would be considered as an important geographical aspects (Flint, 2 30).

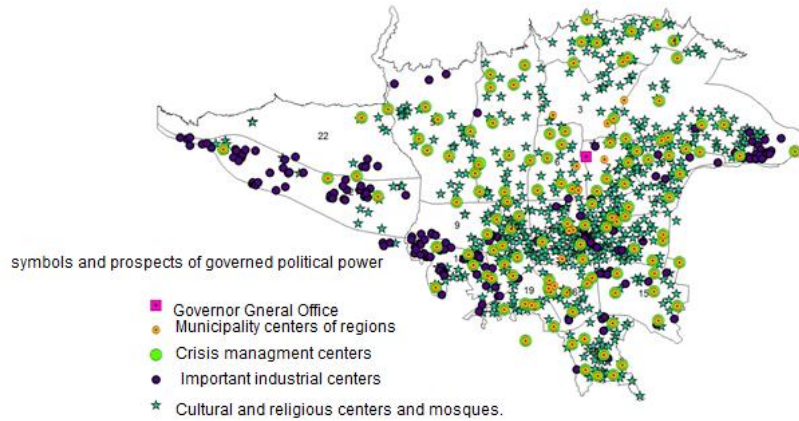

Figure 3: Symbols and prospects of politically governed power (seat of government and administration)

4.4 Semi-fixed Cities

4.4.1 Crowded and public places in the city

The crowded places are a tempting target for the terrorists because ease of access, lack of security protection, high impact and political confrontations are what makes an attack successful

on the existing spaces. On this basis, most of the attention of the terrorism has paid to the spaces of the building environments. These spaces include terminals, major sporting spaces, clubs, shopping malls, cinemas and theaters and health services, also public spaces such as parks and squares, too. (RIBA, 2010, P.6)

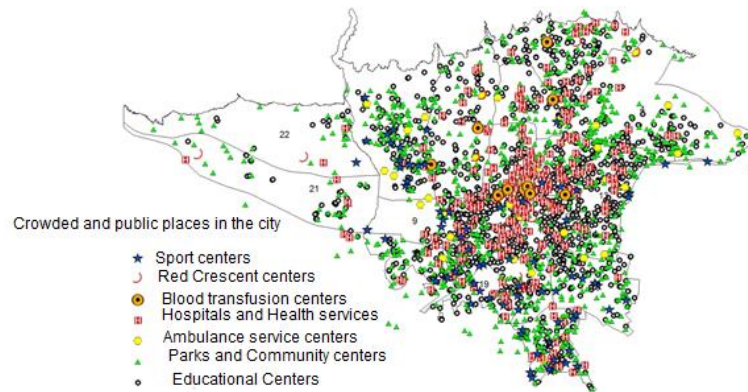

Figure 4: Crowded and public spaces of Tehran (Source: author)

5. Analysis and Results

The cities, as most complex man-made, have encountered with extensive risks due to both the wide range of risks and multi-vulnerabilities. The urban vulnerabilities everywhere, from buildings and infrastructure, to telecommunication, transport and energy lines would be palpable. Tehran Metropolis given valuable structures of economic, political and social has been

considered as a potential target to attack, because Tehran can be attacked due to any of the urban elements by the terrorism to achieve its goals, such as creating panic, damaging the vital elements of the city, putting on the international news' headlines. To rank the areas of Tehran, after identification of centers in the areas of high vulnerability against the terrorist attacks above, first, AHP hierarchy tree that is made up of objective, criteria and alternatives would be drawn.

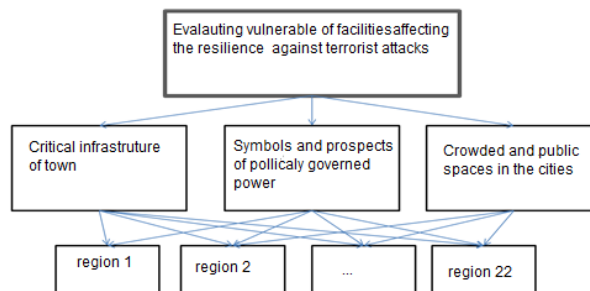

Figure 5: Model Tree AHP

And according to the following graph obtained by software expert choice, the corresponding weights on target options, i.e.

all 22 district of Tehran.

Figure 6: Prioritizing the amount of vulnerability of metropolitan areas against terrorist attacks (Etaat et al, 2014)

Finally, after the classification of regions, Region 6, 12 due to having a central-urban structure and high accumulation areas, especially in the day, traffic and high population density in these

areas and the great health for services applications in times of crisis and important educational centers such as Tehran University, were among the most vulnerable areas.

Figure 7: 22 districts of Tehran categorized based on the amount of vulnerability against terrorist attacks (Source: author)

According to the analysis as shown in the map above how far we are from central and northern Tehran and get closer to the West, the potential of attacks will be less; district 22, according to a detailed analysis, is that are least likely to terrorist attacks.

**6. Conclusion**

Reviewing attacks in Iran and over the world, the vulnerability parameters were selected by the theoretical foundations of urban resilience (in fixed and semi-fixed cities) and identifying the vulnerable in the Tehran metropolitan centers and analysis by AHP that 22 districts of Tehran including 6, 12, 5, 2, 1, 4, 7, 3, 11, 14, 20, 8, 13, 10, 15, 9, 16, 18, 19, 17, 21, 22 are located in the threat of terrorist attacks, respectively.

Table 3: 22-districts vulnerability in Tehran Metropolis against terrorist attacks

Region	Infrastructure	Public spaces	Symbol	Rank
1	High	High	Average	5
2	High	High	Average	4
3	High	High	Low	8
4	High	High	High	6
5	High	High	Average	3
6	High	High	High	1
7	Low	High	Average	7
8	Low	Average	Low	12
9	Low	Low	Low	16
10	Low	Average	Average	14

**Abstract:** Spirituality can be seen as a form of intelligence. Spiritual intelligence integrates exterior aspects of intelligence with the interior aspects of spirituality. The data is collected through a questionnaire and were analyzed using SPSS software. The results showed that spiritual intelligence role and influence on employee performance management, and the meaning and purpose of work is most effective and intelligence components and self-awareness and saving blessing and excellence are the next and finally the actions of the least impact on performance. The evidence also shows that spiritual practice, increasing awareness and insight into multiple new levels of consciousness and the performance of the positive influence to achieve a good performance, its agenda of work and career and their life.

**Keywords:** spiritual intelligence, blessing, excellence, employee performance, government organization

### 1. Introduction

The importance of personality has been nowadays acknowledged managing an organization is one of the major world challenges of current and future organization and this is because the direction of the organization through the thinking and practice managers is possible. One of the core competencies that lead to organizational success, managers need to nurture their intelligence is intelligence managers at all levels to their duty to fulfill a balanced and comprehensive. Including intelligence that enables managers to make strategic decisions in a complex environment and current business world's major spiritual intelligence adopt administrators. This type of intelligence is emerging phenomenon that many experts as well as management and organization managers at various levels has attracted. Many of them have known spiritual intelligence as a sustainable resource for organizations which can at times turbulent and troubled them, help and inconsistencies and irregularities in the organization in order to resolve and the recognition of the value of employees in the organization and create a basis of trust between employees. The concept of spiritual intelligence of managers in terms of the formation of radical change and its impact on the working environment, considerable scientific benefits so organizations and their managers provide opportunities to develop spiritual intelligence, organizations are more successful than others (Naderi and Rajaei Poor, 2010, p. 122). Spiritual intelligence exteriorly combine intelligence with spiritual aspects within the person's extraordinary capacity, in such a way that it can be used spirituality as practical. Yang (2007) states that spiritual intelligence is man's capacity for searching and asking questions about the ultimate meaning of life and simultaneously experience seamless link between each of us and the world in which we live (Zarei Matin et al., 2011). Since the corporate world today, a world full of competition and challenges, this turbulent environment has prompted managers to improve the performance of your employees as your competitive strategy in today's world choose. Therefore underlie any movement towards growth and development and improve the performance of employees in organizations, recognizing the status quo, identify strengths and weaknesses and then design programs to improve performance is measured.

Thought spiritual intelligence of managers influence the employee's performance reveals a new aspect of the organization's activities never to human eye does not look tool and they always treated with respect and kindness and because it's moral, social and academic staff will lead to success and honor. According to George (2006), the spiritual intelligence applications in the workplace include: 1) Providing peace of mind, in a way that affects the person's effectiveness, 2) create understanding between people 3) management changes and the removal of barriers. 4) Providing peace of mind and how it affects the individual effectiveness. Since the type of attitude reflects the success of staff or lack of success of managers in the organization. Therefore, management is of the utmost importance and necessity and appointments to fit and are based on certain standards and requirements to upgrade and career advancement, increase staff efficiency lead and successful operation requires that managers could well intended to evaluate the performance of the staff that creates employee motivation and contributes to the growth performance is positive. Managers have spiritual intelligence of solace and inner satisfaction in employees. Increase creativity, optimism, confidence and according to human values in the workplace reveals and to positively affect employee performed therefore, we can say positive nurturing spiritual intelligence and effective management of employee performance is considered stable source of development and it is the basic requirement of the third millennium since late last century, in the nineties of the twentieth century this kind of integration between the inner and outer life is taking shape. One of the important areas where integration is discussed, the business environment is organized. Many of the things previously were classified within the private sphere, now being imposed on the public domain. Login concepts like morality, truth, belief in blessing, honesty, conscience and trust and forgiveness, work, the emergence of altruism and ... all indicate that the new paradigm. According to the researchers, this new paradigm at work, it derived from quantum physics, science, cybernetics, chaos theory, cognitive science and, in fact, a reaction to modern mechanistic paradigm, the paradigm of spirituality. In this regard, government organization workplaces are in the public domain and improve their performance an important role in improving the delivery of services to citizens. In general, given the importance and necessity of the above-mentioned concepts of spiritual intelligence and employee performance by paying attention to these two concepts, this research effort with the aim of introducing spiritual intelligence as a factor influencing the performance of government organizations and to evaluate the effect of spiritual intelligence on the performance of employees in government organization in Eqldid city to provide recommendations to improve the performance of employees affected by spiritual intelligence of managers in government organization, especially in the city's Eqldid generalize the results to managers and employees of all government organization, in planning and adopting appropriate policies, useful and build on it in the future to excellence and growth and the more government organization and non-governmental and prosperity lead, it was therefore attempted to address these questions to be answered that what is the impact of spiritual intelligence in the workplace governmental organizations on staff performance in the city Eqldid?

### 2. Theoretical framework

Reviewing the existing theory about spiritual intelligence, spiritual intelligence managers were evaluated by employee performance. For this purpose, theoretical framework spiritual intelligence Amraam and Dryer (2008) includes five dimensions of consciousness and self-awareness, blessing, excellence significant resources, the truth and the theoretical framework of employee performance Hersey and Goldsmith (2005) as the seven-factor model 1 «ACHIEVE» includes knowledge and skills, perception and image of the role, organizational support,

motivation or desire, performance feedback, employee practices, environmental suitability was used so that the main questions are:

What is impact of spiritual intelligence in environment organizations on staff performance Eqlid city? So to improve employee performance to evaluate the effect of spiritual intelligence on the performance of employees were managers and in this context, exploratory studies conducted background research on the relationship between spiritual intelligence and employee performance in general and especially in government organization, research by saying some of them are mentioned.

Mitroff et al., (1999) experimentally and with the help of questionnaires and interviews with human resource managers, spirituality in the workplace from the perspective of human resources have run. The results showed that the respondents, had very different views about the definition of spirituality, they did not wish to make your life (family life, personal, business, family), and the separation between religion and spirituality were distinguished, and had a great desire to experience spiritual achievements in the workplace, and often the use of words spirituality and religion in the workplace were afraid and like other Western cultures, spirituality and personal phenomenon considered individually. The researchers concluded that workplace spirituality is manageable and this is the most important and most basic duties. They believed in the West, the separation between science, religion, art and ... too much has been done and now organizations not survive without spirituality. They emphasize that organizational spirituality management methods must be measured without separating them from other elements of management.

### 3. Research Methodology

In this study population consisted of managers and employees of government organization in city Eqlid according to officials with the cooperation of 22 managers and 130 employees were selected as the sample. Instruments were Amraam and Dryer (2008) questionnaire was used to measure spiritual intelligence and its validity has been confirmed. In this study, the validity for formal or symbolic placement of dozens of professors and experts were assessed and the necessary corrections were applied to evaluate the reliability of the questionnaire, 15 questionnaires were distributed among managers and using statistical analysis software (SPSS) Cronbach's alpha coefficient and 0.83 were thus high reliability and internal consistency coefficient of the questionnaire, and acceptable and appropriate. The questionnaire consists of 44 items that are 6 options (Likert) and items 1 to 44 are set. The questionnaire employee performance (self-made) according to the research background and extracting indicators based on the theory of Hersey and Goldsmith (2005) is set and the validity of this «ACHIEVE» Seven-factor for formal or symbolic sharing dozen professors and experts were assessed and the necessary corrections were applied to evaluate the reliability of the questionnaire, 30 questionnaires were

distributed among employees and using statistical analysis software (SPSS) was 0.83 Cronbach's alpha coefficient and thus high reliability and internal consistency coefficient of the questionnaire, it was good and acceptable and questionnaires with 20 questions that are 5 options (Likert) and questions 1 to 20 was set.

### 4. Hypotheses

The main hypothesis: spiritual intelligence of managers has effect on employs performance of government organizations in Eqlid city.

First sub-hypothesis: Consciousness and self-awareness of managers has effect on employs performance of government organizations in Eqlid city.

Second sub-hypothesis: the blessing of managers has effect on employs performance of government organizations in Eqlid city.

Third sub-hypothesis: a sense of meaning and purpose in work of managers has effect on employs performance of government organizations in Eqlid city.

Fourth sub-hypothesis: Excellent seeking of managers has effect on employs performance of government organizations in Eqlid city.

Fifth sub-hypothesis: the fact of actions of managers has effect on employs performance of government organizations in Eqlid city.

### 5. Results

According to our evaluation, findings from the questionnaires showed that:

The main hypothesis: spiritual intelligence of managers has effect on employs performance of government organizations in Eqlid city (Table 1).

Spiritual Intelligence and the assumption by 44 indexes of 20 indicators relating to the performance of public employees in Eqlid city are measured. Since the test significant level equal to 0.01 less than (0.05). So the above test is significant at a confidence level 0.95 and the regression model of spiritual intelligence (intelligence and consciousness, blessing, sense of meaning and purpose at work, and the truth-seeking actions of Excellence) as independent variables and the dependent variable employee performance as government organization in Eqlid city as follows:

$$Y=62.49+0.62X1+0.26X2+1.48X3 +0.19 X4 +0.55X5 \quad (1)$$

Table 1 Parameter values of main hypothesis related to employee performance variable

Variable	$\beta$ regression coefficient	T-statistic	The significance level	Test result
Fact of actions of managers X5	0.55	1.03	0.03	reject HO
Excellent seeking of managers X4	0.19	0.32	0.004	reject HO
Sense of meaning and purpose in the work of managers X3	1.48	1.06	0.02	reject HO
Blessing of managers X2	0.26	0.44	0.005	reject HO
Consciousness and self-awareness of managers X1	0.62	0.64	0.02	reject HO
Intercept	62.49	54.20	0.02	reject HO

After an unit increase in the variable consciousness and self-consciousness managers with all other variables constant increase in variable employee performance by as much as 0.62 as well as an increase in the variable unit managers endowed with all other variables constant increase in variable employee performance by as much as 0.26 and a sense of meaning and purpose in work management unit increase in variable with all other variables constant increase in variable employee performance by as much as 1.48 and energy increment in variable excellence among management with other variables constant and increase in variable employee performance by 0.19 and the actions of one unit increase in variable with all other variables constant increase in variable performance of employees is 0.55 in government organization in the city Eqld.

First sub-hypothesis: Consciousness and self-awareness of managers has effect on employs performance of government organizations in Eqld city.

This hypothesis is related to consciousness and self-awareness by 6 indexes spiritual intelligence of managers and 20 indicators relate to the performance of public employees in Eqld city is measured. Since the test significant level equal to 0.02 less than (0.05) is above test is significant at 95% and the regression model between the consciousness and self-awareness directors as independent variables and the dependent variable employee performance as government organization in Eqld city is as follows:

$$Y=51.62+55.0 X1 \quad (2)$$

After a unit increase in variable consciousness and self-management employee performance is 0.55 by governmental organizations in Eqld city.

Second sub-hypothesis: the blessing of managers has effect on employs performance of government organizations in Eqld city.

The assumption by 11 indicators related to the gift of spiritual intelligence of managers and 20 indicators relating to the performance of public employees in Eqld city is measured.

Since the test significant level equal to 0.03 less than (0.05) is above test is significant at a confidence level 0.95 and the regression model between the gift of directors as independent variables and the dependent variable employee performance as government organization in Eqld city is as follows:

$$Y=52.62+05.0 X2 \quad (3)$$

After an increase unit in the variable endowment managers rate increase employee performance is 0.05 in government organization in Eqld city.

The third sub-hypothesis: a sense of meaning and purpose in work-governmental organizations, city managers Eqld affect the employee's performance.

This hypothesis by 3 indicators related to the sense of meaning and purpose in the work of spiritual intelligence of managers and 20 indicators relating to the performance of public employees in Eqld city is measured. Since the significant level is equal to 0.01 less than (0.05) is above significant at 95% and the regression model between the sense of meaning and purpose in the work of directors as an independent variable and staff performance as the dependent variable in government organization in Eqld city as follows:

$$Y=45.62+31.0 X3 \quad (4)$$

A unit increases in variable a sense of meaning and purpose increases in variable employee performance management 0.31 in government organization of Eqld city.

Fourth sub-hypothesis: Excellent seeking of managers has effect on employs performance of government organizations in Eqld city.

This hypothesis by 3 indexes after excellent seeking in spiritual intelligence of managers and 20 indicators relating to the performance of public employees in Eqld city is measured. Since the test significant level equal to 0.02 less than (0.05) is significant at 95% and the regression model between the efficient management and excellent seeking as the independent variable and staff performance as the dependent variable in government organization in Eqld city is as follows:

$$Y=49.62+07.0 X4 \quad (5)$$

After a unit increase in the variable employee performance management excellence seeking is 0.07 in government organization in the city Eqld.

Fifth sub-hypothesis: the fact of actions of managers has effect on employs performance of government organizations in Eqld city.

The hypothesis by 13 indicators related to the exercise of spiritual intelligence of managers and 20 indicators relating to the performance of public employees in Eqld city is measured. Since the test significant level equal to 0.04 less than (0.05) is above test is significant at 95% and the regression model between the actions of truth as an independent variable and staff performance as the dependent variable in government organization Eqld city is as follows:

$$Y=48.62+02.0 X5 \quad (6)$$

After the actions of one unit increase in variable increases in variable employee performance by as much as 0.02 at government organization Eqld the city (Table 2).

Table 2. First sub-hypothesis parameter values related to employee performance variable

Regression coefficient $\beta$	Standardized coefficients	T-statistic	Variable	The significance level	Test result	Hypothesis
0.55	0.11	1.34	Consciousness and self-awareness of managers X1	0.02	confirmed	<b>First</b>
62.51	-	54.56	Intercept			
0.05	0.117	1.33	Blessing of managers X2	0.03	confirmed	<b>Second</b>

## 5. Discussion

Today one of the topics of interest for animal behavior and psychology is spiritual intelligence. The concept of spiritual intelligence involves an adaptation and behavior problem solving and the highest growth levels in different domains of cognitive, moral, emotional, interpersonal and includes a person in order to coordinate internal and external phenomena around and achieve integration can help. It's intelligent insight about life and all its experiences and events and enables him to framing and reinterpret their own experiences, to deepen their knowledge as to what the basic principles of religion (eg to achieve unity in the multiplicity of forms beyond, find answers about the origin of the universe and detect patterns of behavior based on spiritual and setting them) are the main axes of spiritual intelligence. Discussion of individual spiritual intelligence not only in the field but also in psychological, social sciences into other areas, include management. It can be said that perhaps because of increasing research in the field of spirituality, it see the dramatic impact it has on improving individual and organizational performance. Evidence also suggests that awareness-raising spiritual practice and insight into multiple new levels of consciousness (meditation) and have a positive impact on performance. The main hypothesis of this study show the results of various aspects of spiritual intelligence on the exercise of employee managers finally, the work efficiency has considerable influence according to the main hypothesis of the research data that the Managers having spiritual intelligence on employee performance and government organization should explore the potential of new piety and spiritual growth through excellence as an underlying cause of mental and physical capacity and to the integrity of the internal relationship managers, employees and organization are compliance with rules and organizational performance excellence of understanding interpersonal relationships (between managers and employees) more and more taken into consideration. The results of the first sub hypothesis of this study suggest that increased employee performance to increase the awareness of managers and this result is consistent with previous studies on the other hand, intelligence and self-awareness component not only of spiritual intelligence is interwoven with personality but according to the study on the efficiency and outcomes of staff (staff performance). According to the first sub hypothesis of the research data that employees understand the business results (the employees) should be emphasizing spiritual awareness and deep knowledge of the collection using modern methods of management talent and lofty goal setting to be developed. The results of the second sub hypothesis of this study shows the managers of the blessing of blessing will benefit more positive and significant effect on the performance of employees within the organization and this result is consistent with previous studies so, as a result of the effect of blessing of spiritual intelligence on employee performance, especially after strong point for government organization. According to the second sub-hypothesis of the research data that managers benefit the divine gift of the government organization should align employee performance with spirituality bind to customs and appreciation in everyday activities with no neglect of nature to enjoy and express your creativity in employees' work activities strengthened. The results of this study show the third sub-hypothesis that no matter how managers and meaningfulness of work in the organization to make more sense and more tangible enhanced employee performance and this result is

consistent with previous studies therefore, this study not only the significance of the relationship between factors at work feel invigorated performance but its positive impact on employee performance earned. The third sub-hypothesis based on the results of research based on the positive impact of a sense of meaning and purpose in the work of managers and the performance of the organization employees should managers of different situations with a broad perspective on the issues of daily official visits to take action and daily performance of employees in order to align the work with goals in order to achieve their career advancement feedback. The results of the fourth sub-hypothesis of this study show that no matter how executives with attitude and more effort to move toward excellence have a huge impact on improving employee performance and this result is consistent with previous studies of this study therefore implies who enjoys the spiritual intelligence will empower managers and improve the performance of employees due to the strength and spiritual intelligence of managers in the organization to improve the performance of employees. The fourth sub-hypothesis based on the results of research based on excellence, saving administrators significant and positive impact the performance of employees must get comments from staff at meetings and location of the project with a different perspective with an emphasis on the sense of inner employees pay more depth. The results of the fifth hypothesis of this study suggest that managers are more focused on inner truth has significant positive impact on employee performance and this result is consistent with previous studies and relying on the fact that spirituality in the work life of profound meaning and introspection to discover all aspects of internalized and makes the job worthwhile person thinks and governs the high objectives considered in the light of spiritual experience and a sense of unity or the emergence of a supernatural force at work, intuition and creativity strengthened and more prosperous working environment is expressed. The relationship between spiritual intelligence and performance results strengthened and extended employee and the impact of the actions of the employee's performance highlights. According to the fifth sub-hypothesis research data that the actions of the employee's performance should be based on honesty in carrying out activities and surrounded most managers' advance in the form of better things to strengthen trust and internal consistency in applying the employees interact with others to achieve true inner focus and attention.

## 7. Conclusion

Based on this research a new experience for managers of governmental organizations to provide spiritual intelligence test in addition to the standard questionnaire provided by " Amraam and Dryer " about spiritual intelligence used more attention the concept of spiritual intelligence and its application in the workplace, government organization created and since the results showed a positive and significant relationship between spiritual intelligence and employee performance on the other hand, spiritual intelligence managers have a positive impact on employee performance it will review and improve spiritual intelligence in the workplace government organization to identify factors contributing to the strengthening of spiritual intelligence of managers and staff will help government organization and finally the results can be valuable feedback

legislative bodies, including the Cabinet, the Council of Ministers, Parliament and the Guardian Council, the Expediency Council in evaluating the performance of employees and government organization provided. Hence it is necessary in future research on the application of spiritual intelligence organization and government organization to validate all aspects and findings will be assigned and the pathology of spiritual intelligence staff and managers in government organization and test the relationship between spiritual intelligence staff motivation to work and also to evaluate the staff having state of spiritual intelligence in comparison with private organizations investigated and the results will be disseminated and published.

**Abstract.** The current paper described the child marriage issue, and analyzed consequences and ways of dealing with it. Family social harms including poverty, deprivation of education, addiction and immigration to reduce the economic burden to finance the addiction are other factors involved in child marriage in Iran. Child marriage consequences can be divided into two social and physical aspects; social consequences of child marriages, including non-registered marriages and not having identity papers, the emergence of the widow child, domestic violence and spouse abuse, prostitution, running away from home, deprivation of education, suicide, increased miscarriage and premature delivery, low birth weight increase in teens, lot of pressure for pregnancy and other HIV positive, and many others are physical consequences of child marriage.

**Keywords:** child marriage, social harms, finance issue, Iran

### 1 introduction

Marriage is a socially accepted formal or legal contract establishing contractual rights and obligations between spouses, their children and their families. Although the definition of marriage varies from culture to culture, it is a global cultural institution in which interpersonal relationships are accepted (Haviland et al., 2011). Girls' marriage or engagement before puberty was common in the ancient and medieval societies (Aglilikil, 1992). In ancient Israel, contractual agreement on the young girl was considered a popular privilege to the girl's father. There got married before the age of 15 and as soon as puberty (Friedman, 1979). Studies show the presence of ample references to child marriage in 16<sup>th</sup> century literature; this indicates the widespread child marriage as a norm so that a twelve and a half-year-old girl was considered to be an adult (Ruth Lemden, 2001). In Greece, teenage girls' early marriage and motherhood were encouraged (Nancy Demend, 1994). In ancient Rome young boys were expected to marry early, ie girls and boys were married at the ages of 12 and 14, respectively (D.J.B, 2010). In the middle Ages, marriage under 16 years was common in accordance to England Common Law. Early marriages also happened in imperial China (Zhao Xie, 1999). It was only since the bedding of the 20<sup>th</sup> century that the early marriage of children was questioned. The average age of first marriage rose in many communities and many countries rose the minimum age for marriage.

### 2 Problem Statement

Many believe that child marriage or early marriage affects the lives of children by and face them with various traumatic complicated health consequences at every level of development, growth and excellence of the individual. Early marriage or child marriage is any marriage under age of 18 (United Nations Children's Fund, 2001). Many Iranian families do not register or unofficially register the marriage at an early age. According to

Society for the Protection of Children's Rights in Iran, the number of married girls under the age of 15 has increased from 33383 on 2006 to 43459 on 2009 i.e. a 30 percent increase in three year. Such an increase is the result of the traditional look, social and cultural pressures, state and religion support, deep-rooted poverty and parents desire to have control over their daughters' sexuality. In this article, we explain and describe the child marriage in Iran. United Nations referred to any type of marriage under the age of 18 years before the girl is physically and psychologically ready for marriage responsibilities and

child-rearing as child marriage. Accordingly, any marriage under this age is an early marriage; a marriage arranged by the father or the grandfather without any attention to the minimum legal age of marriage. The main factors involved in this issue include increased levels of poverty, lack of knowledge and education and compliance with the requirements of patriarchal culture and beliefs that mistakenly forces girls into early unwanted marriage, considered as a factor to support and protect them. Unfortunately, despite the physical consequences and discrimination against young girls, few steps have been taken to end the practice of early marriage of children in Iran.

There were very few comprehensive and reliable studies on the effects of early marriage on men and the extent and effects of early marriage on young boys is overlooked even by international experts that combat child marriage. This lack of empirical data led to a serious lack of knowledge about the constraints of very young boys' marriage. They are often forced to drop out of school and employed at low level jobs to meet their new family responsibilities. This marriage before puberty perpetuates cycle of poverty that is the first cause of the same marriage.

### 3 the historical roots of early marriage of children in Iran

Iran as a Middle Eastern country has always exercised part of the cultural practices of Middle Eastern countries, i.e. the Arab world. Arabic countries are located in tropical areas, where the tropical climate leads to early puberty of girls and boys that is enough to make child marriage a socially accepted custom confirmed by clergymen and religious leaders. Early marriage in tropical climate is justified because the body grows faster and there is even more sexual desire. Though Iran is not an Arabic country, but share a long and deep traditions with the Arabic Islamic world. Iranian law is written based on old and static Islam laws. Arabic language is taught in Iran schools unlike nations such as Kurds, Turks, Lor and Baluchis, etc. in Iran, which could not manage to gain the right to teach their own language in schools. Therefore, sensitivity and complexity of Arab world should be taken into account to understand the child marriage historical roots (Ahmady: 2016).

#### 3.1 Marriage law in Iran

Before the Islamic Revolution, on the basis of Article 23 of the Family Protection Act (1974), women under 18 and men under 20 years of age marriage was banned. After the Islamic Revolution this age minimum changed and it was replaced by Article 1041 of the Civil Code. According to article 1041 of the Civil Code, the marriage legal age for girls and boys was changed to 13 and 15, respectively. Moreover, marriages under these minimum legal ages can happen in case of fathers' or courts permission. Additionally, if the guardian (father or grandfather) requests and the Court conclude that she is mature enough to marry, the child can even marry at a younger age (Ahmady, 2016: 103).

Article 1041 of the Civil Code in 1934, declared that in accordance with the constitution and legality, no marriage may be established between a girl under 15 and a boy less than 18 years of age, provided that there is a certain conditions approves the validity of marriages by a lawsuit. This exclusion for fewer than 13 and 15 years of age was not included in a sense that they could not marry in any way whatsoever. A new law was enacted in 1982 that whereby the early age of marriage or age of puberty for girls and boys was 9 and 15 years of age, respectively. Accordingly, any marriage under the age of puberty was illegal. The final change in the law was passed in 2002 that emphasized on the legitimacy of marriages under the age of puberty of 13 and 15 with the consent of a competent judge as a condition.

### 3.2 Factors related to child marriage

#### 3.2.1 Age

Many jurisdictions set a minimum age for marriage, so that person must have reached a certain age (usually 18) to legally be allowed to marry. The legal marriage age at which a person can legally marry differs from the consent age. In the judicial system, the legal age of marriage is lower than that of the age of consent. Law usually is ignored in cases where one spouse is under the age of consent with preferred the age of marriage to the age of consent. Other judicial systems rejected and prevent other forms of sexual relations outside of marriage, regardless of age. Child marriage is a grim reality for many teenage girls continued to exist as a result of factors such as the concepts of honor and pride, deviant views on gender, poverty, family disintegration infrastructure, low literacy, few job opportunities, and war and conflicts. Poor infrastructure and sexual violence and attacks that in nature strengthen the likelihood of early marriage are more intense in times of war and armed conflicts. Humanitarian and Relief interventions inventive, often overlook risk of early marriage of young girls during war and unrest, while child marriage is a reality (Bruce, J, et al: 1997)

#### 3.2.2 Power of religion

Many religions are involved in determining the age of marriage. Religion controls and forms culture and norms as a significant contributing factor for those following it on their basic decisions with its power. The power of religion somehow infiltrated the role of parents that has led to the ownership of children by parents. In the nineteenth century more attention was paid to child sexual abuse (Haley, Boksal et al. 2015). Controversial policy of the Roman Catholic Church and other Protestant churches was to approve secret marriages or marriages without parental consent. In many communities in North-West Europe, marriage was rare in very young age. The church ruled that both bride and groom must be at least 21 years old to get married without the consent of their parents. Compared with Islam, even when geographical and time conditions needed, the rules of life for all Muslims all over the world is the same for both men and women to follow among them are the rules of puberty and the age of marriage as well.

Despite all the complexities of the age and maturity types, various social activities demand a certain age at onset. A certain standard or criterion for the definition of a child and an adult seems necessary in modern societies with the broad and universal social activities, demanding more participation of people. When the marriage age based on religious laws for a person is below the legal age of marriage in a country the government rule of law is predominant. To embrace early marriages culture and the social acceptability of the issue may have played a mediating role in this regard. For example, children who are married early may think that their experience is purely a social repeat of their mothers and sisters experience for generations and thus the culture is institutionalize, internalized and applied.

### 4 Types of marriage

#### 4.1 Women exchange

Women exchange is one of the many common forms of marriage mainly prevalent in Pakistan and is sharply declined in Iran.

In this social custom two girls are exchanged between the two families as part of a trade deal. Women's traditional exchange was a strategy at resolving the conflict. Arranged marriage act for peace between the two warring tribes also been widely accepted. Usually, the men and women consent is not taken into account (Judith Gardner & Judi L Bushra, 2004), and there have been very few cases where parties have refused marriage.

#### 4.2 Forced marriage and arranged marriage:

Since the mid-twentieth century many Western societies enacted laws on the equality of spouses in family law. Forced marriage occurs when one of the spouses or both are not willing to marry and at least one of the spouses is under the domination and coercion. It's a disgusting practice and is indefensible and in Great Britain has been defined as a form of violence against women, abuse and violence against children and violation of human rights. For some people, arranged marriage is a form of forced marriage. In forced marriage, one party or both is forced to marry against desire by intimidation, fear and pressure. But in the arranged marriage both parties accept marriage with their free will and full consent (State Health Office, 2005). An arranged marriage does not mean a forced marriage, because in the former spouses have the possibility to reject a marriage proposal, but it is not possible in the latter. However, the exact distinction between arranged marriage and forced marriage is very hard and may not be such a separation is made between them, because in reality they are very close concepts. It can not be said the girl's consent in arranged marriage has been based on her choice and an absolute satisfaction, because such marriages have usually been imposed through social and emotional pressure from her parents and brothers. A woman or young girl trying to reject a forced or an arranged marriage is often faced with hard reactions and in some parts of the world leads to honor killings. Family adherence to traditional customs, ethnic and tribal beliefs can get people to match. In this sense, the distinction between these two forms of marriage has never been easy, for the second type can be seen as a form of domestic violence against both children and adults (Ganguly Chntr Jay and Kay, 2009).

### 5 Consequences

#### 5.1 Health

This little information on the issue of forced marriage shows that most girls are very sad and isolated. They lose connection with their peers, do not speak to anyone because all the people who are around them approve the act of forced marriage and act upon it. Their problems remain unknown and denied their community and they become hidden victims. Improper socialization and the impossibility of continuing education and the devastating physical and psychological damage due to successive deliveries are very shocking among them. Mental health problems are often ruthlessly seen as an inevitable part of their lives (Borhaneh Selassie, 1992). Statistics on suicide among girls, who were faced with a marriage proposal, have been twice compared to those without the same condition.

#### 5.2 Education

The internal relationship between early marriage and illiteracy and low education of children is an underlying cause for low health and self-esteem and individual isolation. Undoubtedly, early childhood marriage is an end point to girls' education, especially in poor countries where child marriage is common (International Center for Research on Women, 2005). Shorten the period of study seems to be a part of the pattern of traditional social expectations about married girls. A girl is a school dropout to get married as soon as appropriate. It is necessary to point out that from the socio-cultural perspective many of these girls have been bred to marry early and spend their entire lives to household chores (Jones, Gavin, 1997).

#### 5.3 Child divorce

Child marriage with its deep roots in gender inequality affects girls more adversely when the husband is aged more than twice his wife. Children marriage is usually associated with abandoned the wife. Divorced or abandoned wife often causes more poverty, because she usually should assume sole responsibility for their children. Since the majority of these girls are married at very young age and lack education, their skills to earn is very

low (if any), and thus contributes to their further impoverishment (Bruce, G., et al., 1997). In child marriage the age of girls is usually significantly lower than their husbands, thus they were divorced in younger age groups and may experience social and economic challenges in the broader and deeper compared to those married at older age (Jefeny Rice Ruth, 2011). It is interesting that Ali Akbar Mahzon, Director of Information, Immigration Statistics and Census Organization in 2016 declared that the other organizations monthly statistical information relating to the divorce will not be announced on monthly basis from now on, and four critical statistics of (birth, death, marriage and divorce) from now on will change into three statistics with removed divorce statistics.

## 6. Conclusions

Iran has so far remained silent on the effects of child marriage. Early and children marriage is only logical and rational in its own cultural context. Child marriage continues under gender inequality chain under the influence of poverty, social expectations, cultural and sexual violence, explicit sexual norms, sexual stereotypes, social pressure and the family hardships. Changing this will require new policies and finding solutions as well as accepting norms reflection of gender equality. The fundamental reason why early and children marriage continues in traditional Iranian society is patriarchal worldview. This is why child marriage remained for generations in Iranian culture. Early and children marriage at a time when society is in the midst of conflicts and social antagonisms is seen as defense mechanism. When there is unrest or natural disasters in a country, the girls are first affected by. Parents marry their children as a mechanism for dealing with these disasters to provide their daughters with some degree of security and prosperity, especially at a time when the risk of sexual violence increases.

Common poor practices and socio-cultural gender norms in Iranian society help to maintain the custom of child marriage. In a traditional society, where the loss of virginity is still a taboo, weddings and engagement traditions are formed to avoid changing the taboos. Deviation from the norm is rare. The child at a certain age, usually in early adolescence is considered as a threat that must marry quickly. Women with low education and low social participation opportunities pass equal repressive position to their daughters. Neglecting the changes that could potentially arise in the lives of their daughters, child marriage victims who are survivors precisely committed the same manner against their children as experienced.

However, it is suggested, the legal age for compulsory education should be defined in line with defined minimum age for marriage. The law on the legal age of marriage that is now 13 for girls and 9 in case of court permission and 15 for boys, needs to be changed to 18. The official registration of all births and marriages is required to eliminate child marriages. The official registration of marriage is a fundamental step in the fight against early marriage. The government should recognize the existence and nature of early child marriage and wish to eradicate it. The political management should show a powerful policy. In addition, this rule can be coordinated with the shadows of corporate investments as well as on studies of early childhood marriage and other similar projects to provide the necessary funding. This requires long-term solutions, but not quick, short-term cures. There should be more serious effort by the government to punish those who engage in child marriage and parents who forced their children into early marriage. Targeting fathers, mothers, brothers, and husbands in the early marriage eradication interventions causes find better understanding of sexual status and the benefits gained by support and value the women and girls. Religious leaders are key and fundamental factors to change. They have a significant impact on public opinion and trust among the society and can provide cultural acceptance to delay marriage. Religious leaders potentially have

the ability to take steps against child marriage and changing attitudes of society.

Young girls should be helped to gain the power to defend themselves against adults, even parents, who want to force them to marry before they reach the age of maturity. Academic community and researchers should conduct more broad and deep research in the country and present reports on early children marriage, its nature, and the prevalence of sexual violence. In a world where the fight's against child marriage; this issue is still neglected in Iran. In other words, the new informed and active generation should be supported by pioneers in their own community to progressively eradicate children early marriage tradition.

**Abstract:** This research in term of purpose is applied and method of research is descriptive, causal. The population of this research is the fact that in the last two years investors in shares of companies listed on Tehran Stock Exchange have invested sample size, 384 students were selected through random sampling, is. To analyze the data in this study using SPSS software and confirmatory statistical technique of structural equation modeling (SEM) have been used to allow a causal link between the criteria specified model and appropriate strategies can be formulated. The findings show that advertising, marketing mix to desired behavior and the positive effect stronger than the other elements of social marketing in the company's brand equity. Positive customer benefits but also the nature and had less effect.

**Keywords:** social marketing, branding, brand equity, companies listed on the stock exchange

### 1. Introduction

Due to the limited capital of companies in the highly competitive world of today, the importance of funding for the company has doubled. Company shares through the Stock Exchange have always been considered as a way of financing for companies. Today, investment selection investment method, a wide range of factors is considered. The factors that investors consider when making decisions about buying a stock company is a combination of financial and non-financial factors. Knowledge of behavioral finance to non-financial factors influencing investment decisions reviews the company's preferred stock. Customer's subjective evaluations of brand and product companies include non-financial factors (Ghazizadeh et al., 2014). In recent years, the brand marketing has become one of the hottest topics. In decisions on mergers and acquisitions subject company's brand value is very important. Sometimes estimated value of a company is a significant share of the value of the company's physical assets. There are several approaches to measuring brand value. There are two main approaches in the field of financial approach/economic and other behavioral approach (Kapareliotis, 2010). Brand equity as the value of the brand is often described as the product. In general brand equity of all the activities that are being carried out for sale. So it can also be evaluated on the basis of marketing activities for the brand. The most important factors in building and strengthening brand equity marketing activity. The resulting brand equity investment in marketing activities has taken place in the past. Companies through marketing activities consumers are made aware and create a good image of the brand in their minds (Van Riel et al., 2005). In fact, an important investment decision to purchase is made on the market and the choice of the importance and difficulty is considerable (Ghazizadeh et al., 2014). The findings suggest that investors are always rational (predictable and unbiased) as shown by current models, do not act. Based on the theories of psychology, people tend to hold certain events in their minds if they are perceived and the imagery in some situations impacts their actions have on people's behavior. Many studies how irrational people on the issues of investment and monetary shown (Greenblat and Han, 2005)

In the past, consumer markets and investment markets were investigated separately. In fact, researchers prefer to know that

apart from marketing and finance to work together. It was only in recent years that marketing researchers (Lovett and McDonald, 2005; Schoenbachler et al., 2008) and financial investigators (Clark-Murphy and Savtar 2004; Frieder and Subrahmanyam, 2005; Gamaris, 2009) pointed out product and brand perceptions and evaluations of the company may affect individual's decision to invest in company stock. What is a promising field of research in the field of marketing / customer observed and research on the subjective preferences of investors due to factors beyond financial returns and risk stocks (Frieder and Subrahmanyam, 2007). The main focus of modern marketing theory and practice, rather than searching for products customers, satisfaction and create value for the customer to be attracted to the product or service offered (Cutler and Armstrong 2004). Cutler (1971), social marketing, design, intervention and control programs to improve the acceptability of a social idea or practice in a contact group defines (Khila, 2008). The aim is to help in social marketing principles and techniques of commercial marketing, target group needs and demands attention and by reducing barriers and encouraging them to do a social behavior, the desired behavior is common among them. In simple terms, social marketing uses marketing techniques in social issues motivate people to take action or behavior that are ultimately beneficial for them to make. In social marketing approach, marketing strategy must be adjusted the consumer happiness and provide social or improve it. And establish a balance between three main issues:

Company profits, customer demands and interests of the society (Kotler & Armstrong, 2010). The question we face in this study, whether the relationship between social marketing and subjective evaluations of brand products brand equity in a company to support its customers through the purchase of preferred stock and investing in stocks of companies with financial returns there is even less compared to other companies? So in this study, social marketing and brand equity to individual investors prefer to invest in shares of the company described above.

### 2. Research literature and theoretical foundation

Market share and enhance brand value now final concern senior management of each company. The company's performance includes objective and subjective variables and the process and outcome of the many. Some are objective performance variables such as sales volume and financial performance indicators. Some are subjective criteria such as: Good image in the market, innovation and entrepreneurship. Some companies outcome performance indicators such as: Customer satisfaction and competitiveness while some other processes such as performance management and resource planning. Market share index is an indicator of objective and outcome (Azizi, 2011).

#### 2.1 Brand equity

Since the late 1980s and early 1990s, with the advent of value was higher management philosophy, brand equity as a common thread in the business and scientific research and as an important factor for competitive advantage in the market (Leek and Christodoulides, 2012; Horg et al., 2013) 4The marketing literature for the term brand value different meanings and interpretations have been made. The original term brand value in the early 1980s by American workers in the field of advertising was used extensively for the first time. Then by academics such as Lotsr (1998), Farquhar (1989), Aaker (1991) and Keller (1993) and others was extended. The concept of brand equity has an explicit focus on attracting tangible economic value of the brand (Persson, 2011) and has great importance (Biedenbach and Bengtsson Wincent, 2012) as well as in terms of behavior, brand equity is an important criterion for differentiating which leads to competitive advantage based on the price to be competitive

brand equity create value for both customers and companies value that customers in turn used to increase value for the company (Bengtsson and Wincent, 2011). The conceptual framework of this study, different aspects of the Aaker proposed model brand equity associated with brand equity. Based on Aaker (1991) the main dimensions of brand equity and perceived quality, brand loyalty, brand awareness, brand associations and other assets related to brands) such as patents, patents and more. Although Aaker has introduced five factors influencing brand equity, due to the large scope of the Fifth Dimension is actually four factors used by researchers and even if the other views of the same four factors used (Aaker & Joachisthaler, 2010).

**Perceived Quality:** Perceived quality is one of the dimensions of brand equity and brand equity is to have a close relationship variables (Su et al., 2012). As a result of customers' perceived quality judgment by comparing expectations and perceptions of the product or service is in fact defined. **Brand loyalty:** customer brand loyalty can be as deep commitment to re-purchase the product with services on an ongoing basis in the future, despite the position and potential marketing efforts to change the switching behavior is defined (Chattopadhyay et al., 2010). **Brand awareness:** brand awareness can be a consumer's ability to identify or to remember a brand defined in a specific product category (Aaker, 1991). **Brand association:** The association and feelings about brands provides a value, which makes them distinct from other brands. That is not necessarily the name of the product and can be included in the package, specific design or photos or anything else that can be associated in humans (Gil, 2007)

Social marketing uses commercial marketing techniques to achieve a social purpose. The use of social marketing to change behavior in the areas of education, public health, education information members of cause's people adopt healthy practices and avoid unhealthy practices. The first and most important characteristic of social marketing is about changing behavior this property is unique and different makes and social marketing. (Donovan, 2011). This study aimed to investigate the social marketing of integrated social marketing model by Craig Lefevre (2010) raised have been used together to benefit the target market or part of the population is formed and the community-based social marketing of health communication, education and economic support efforts aimed at social change, oat distinguish them. Lefevre model of social marketing include: according to the customer (customer) information on the opinions, desires, needs and preferences of customers and service, idea or behavior is appropriate. (Craig Lefevre, 2010)

**Marketing mix:** a manageable set of a tool that combines them a chance to respond to the target market and customer (Craig Lefevre, 2010). **Desirable behavior:** perceptions, beliefs, intentions and consequences of current actions and behavior to customers. Nature (behavioral, products, services) necessary measures in order to achieve the ultimate goal (Craig Lefevre, 2010).

Brand equity, customer satisfaction, customer loyalty, attract and retain customers, identify and attract and retain customers, customer confidence, respect and customer service is customer-oriented, in other words and the customer is deemed to meet the aspirations and expectations (as measured how much the

customer feel their expectations, their own expectations of the customer as customer satisfaction; the customer perception of the extent to which his demands have been met. On the contrary, customer dissatisfaction, namely: the customer as much as his demands are not met (ibid)

### 3. Research Methodology

This study examines the relationship between social marketing and subjective evaluations of brand preferred stock investors to invest in the company. The study population consisted of those investors is real over the past two years in the shares of companies listed on the Stock Exchange 04.25.2016 to 04.25.2004 that date have invested Tehran (Active customers over the past two years, except for institutional investors and institutional investors) in this research, because of access to all persons who in the past two years have Tehran Stock Exchange to buy shares, unable and also because different stocks even during the day may be frequently changed hands among multiple investors, therefore, the determination of shareholders of a company or a particular industry is not practically possible, so sampling method used in this study.

That first exchange between agencies, members of 7 brokerage brokers randomly selected sampling and with, the main hall of Tehran Stock Exchange as distributing questionnaires to be determined. A questionnaire among members of the population randomly when the Main Board of Stock Securities researcher as well as 7 brokerage, to go there and buys and sells shares are distributed the number of samples using sampling formula is 384 this research is used to determine the validity of the content validity for this purpose the number of questionnaires were distributed between professors and experts in Marketing University to confirm the validity of their opinions have data collection tools. In order to determine the reliability of the questionnaire and SPSS software's alpha coefficient was calculated to separate its parts and finally the total alpha was calculated. The present questionnaire has been calculated Cronbach's alpha reliability because over 94.2 percent. The data is analyzed using structural equation modeling was conducted. Suitable techniques for modeling in this study are through the LISREL. Meanwhile, unknown coefficients of linear structural equation because LISREL method to meet and fit models involving latent variables, measurement errors in each of the dependent and independent variables, two-way causality, concurrency and interdependence are been planned.

### 4. Results

In Table (1) in the questionnaire, standard deviation and variance replies will be discussed. Significance level for all variables is less than 0.05. It can be the difference of these variables were the number 3 (equal to the number 3 rejected). Given that both the variable bound confidence level for social marketing and brand equity is positive (Table 1) it can be concluded and the average of the variable is greater than the average population. Items listed with their results analyzed by SPSS software in Table 1 is presented separately. Due to significant levels and positive bound.

Table 1: test research variables

Test number = 3						Variable
95% confidence interval		Mean difference	Significance level	Degrees of freedom	T	
Lower bound	Upper bound					
0.7006	0.8952	0.79790	0.000	380	16.121	Marketing benefits
0.3833	0.5434	0.46335	0.000	381	11.382	Nature
0.3751	0.5209	0.44797	0.000	369	12.082	Desirable behavior

0.2740	0.4782	0.37611	0.000	373	7.243	Marketing Mix
0.3590	0.5376	0.44830	0.000	381	9.871	Customer Orientation
0.2088	0.3673	0.28806	0.000	376	7.150	Brand loyalty
0.4066	0.6117	0.50914	0.000	382	9.762	Perceived quality
0.5298	0.7185	0.62413	0.000	383	13.005	Brand loyalty
0.5742	0.7609	0.66754	0.000	380	14.065	Brand awareness
0.4293	0.6146	0.52193	0.000	379	11.078	Brand association

Be sure to enter the stage of testing hypotheses ensure the accuracy of the measurement model. In this study using confirmatory factor analysis, path analysis, the factor is taken. The analysis by structural equation modeling using LISREL software is done. In each of those models before confirming the suitability and structural relations must ensure a good fitness measurement model. X2 statistic and other appropriate criteria for fitness must be examined. The appropriate model has the

following optimal conditions. X2 amount to less than 3 degrees of freedom should be and the less the better, because the difference between the test and shows model. Whatever RMSEA index close to 0.5 and 0.8 is smaller (closer to zero), fitted to most models and if that does not provide good fit criteria have to correct the output of the model using the modified payment model and then use the revised model babes and assumptions in the model. Looking at the model parameters (Table 2) it can be concluded that the model is suitable criteria.

Table 2: Measures of fitness of the main research model

CFI	NNFI	NFI	AGFI	GFI	RMSEA	$\chi^2/df$	Fit Index
> 0.9	> 0.9	> 0.9	> 0.9	> 0.9	< 0.08	< 3	Accepted domain
0.93	0.96	0.94	0.98	0.97	0.077	2.66	Result

The study examined the relationships between the structures. Table (3) of the variables and their coding output LISREL

software are diagrams to explain further. In Figure 1 the base model study presented in standard mode and model survey indicators according to the table (2) is discussed.

Table 3: Output of research variables in the model LISREL

Variable	Equivalent to English	Equivalent to the Charts
Marketing benefits	Customer Benefits	CB
Nature	Sales Promotion	SP
Desirable behavior	desirable behavior	PR
Marketing Mix	Direct Marketing	MM
Customer orientation	Customer Orientation	CO
Brand loyalty	Perceived Quality	PQ
Perceived quality	Brand Loyalty	BL
Brand loyalty	Brand Awareness	BAw
Brand awareness	Brand Association	BAAs
Brand equity	Brand Equity	BE

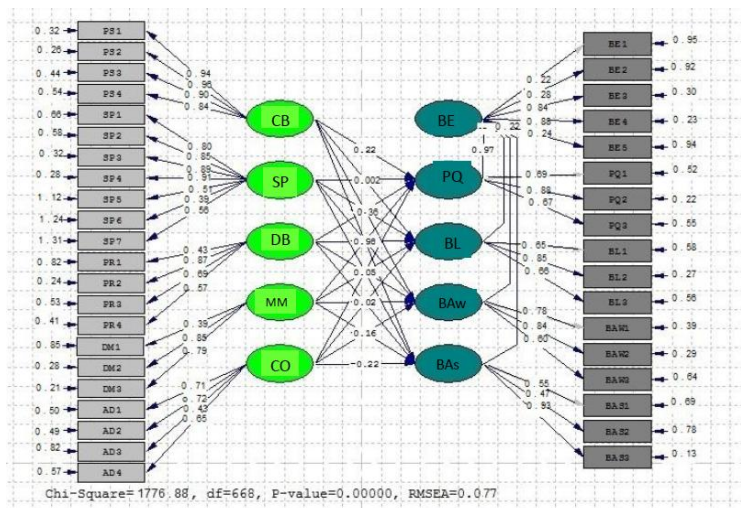

Figure 1: The base model state governor

Figure 2: The base model to test hypotheses (T-value)

After reviewing and confirming the model, the research model hypotheses have been evaluated and assumptions in this section are related to each test question in the next part of the test the research hypotheses. To confirm or reject the hypothesis of a significant structural model research and numbers will be used in standard mode. Criteria for the approval or rejection of any

hypothesis is that if *t* in the interval [1.96 & 1.96] to be refuted and otherwise the hypothesis is confirmed.

Figure 2 shows significant coefficients critical (T-Value) for each. And structural model evaluation results of this study can be presented as Table 4:

Table 4: Summary of structural relations (Result of research hypothesis)

Hypotheses	T statistics	Impact	Conclusion (95 percent)
The nature has impact on the perceived quality of companies listed on the stock exchange.	4.57	0.23	Confirmed

5. Discussion

This study examined the relationship between social marketing to their company's brand equity and preferred equity investment in the company. The main hypothesis of this study entitled "The impact of social marketing and brand equity value of the investment in preferred equity investment firm is "based on the results of this study, showed that social marketing has an impact on brand equity. According to the results obtained at the top and hypotheses to the conclusion that social marketing elements of nature, the desirable behavior, marketing mix, customer

orientation and the customer benefits through affiliate mediator and the dimensions of brand equity, including perceived quality, brand loyalty and brand awareness and brand association with the brand equity of companies listed on the stock exchange is affected. This result means that social marketing policy in the population of the assets managed and liabilities of a brand that represents the value of the product or service affect production and thereby expand their brand equity. The results of the study hypothesis with the result of Sedaghat et al (2012) and Boyle et al (2010), Yu, Danto and Lee (2000) and Beheshti and Zavareh (2011) are consistent. Another finding paths analytical research refers to the conceptual model. Given that a significant

relationship between nature and benefits of brand awareness and nature of contacts and desired behavior on the desired behavior and marketing mix on brand loyalty and brand association was not found, so six routes above analysis of the conceptual model is eliminated. Once the path was split for all the routes, the indirect effect of social marketing elements on brand equity can be achieved. Since each variable through multiple paths may affect the dependent variable, thus, for calculating the indirect effects of one variable on another variable, the variable effects of the two indirect routes, are then assembled.

According to the analysis can be understood that the customer benefits from three directions on brand equity is affected: the perceived quality, brand loyalty and brand associations path, so we can say that the benefits are indirect contacts on the brand equity of companies listed on the stock exchange is effective and to this effect directly. The nature of the route on brand equity securities of companies listed on stock affected: The perceived quality path, brand loyalty. So what can be said marketing mix had indirectly impact on brand equity of companies listed on the

Stock Exchange and this effect is direct. Desirable behavior impact on brand equity is also direct through perceived quality and brand awareness of company listed on the Stock Exchange.

The desired behavior indirectly on the brand equity of companies listed on the Stock Exchange is effective and to this effect is also straight. The marketing mix on brand equity has been affecting the three routes: The perceived quality and the brand awareness and brand association. It can be said that indirect marketing mix on brand equity of companies listed on the Stock Exchange is effective and this place is also effective for customers of the four directions on brand equity is affected: The perceived quality, the brand loyalty, brand awareness and brand association. So it can be said indirectly brand equity and customer-oriented company listed on the Stock Exchange is effective and to this effect directly. On the other hand, according to completed models, we can also calculate the indirect impact. The indirect effects of the 14 route in the graph breakdown variables in the table (5) are provided.

Table 5: The indirect effect of variables

Variable	Path	indirect effect	Total
Customer benefits	X <sub>1</sub> ,X <sub>6</sub> ,X <sub>10</sub>	(0.22)*(0.97)= 0.2134	0.2668
	X <sub>1</sub> ,X <sub>7</sub> ,X <sub>10</sub>	(0.12)*(0.13)= 0.0156	
	X <sub>1</sub> ,X <sub>9</sub> , X <sub>10</sub>	(0.21)*(0.18)= 0.0378	
Nature	X <sub>2</sub> ,X <sub>6</sub> , X <sub>10</sub>	(0.23)*(0.97)= 0.2231	0.2296
	X <sub>2</sub> , X <sub>7</sub> , X <sub>10</sub>	(0.05)*(0.13)= 0.0065	
Desirable behavior	X <sub>3</sub> , X <sub>6</sub> , X <sub>10</sub>	(0.36)*(0.97)= 0.3492	0.3593
	X <sub>3</sub> ,X <sub>8</sub> , X <sub>10</sub>	(0.05)*(0.22)= 0.011	
Marketing Mix	X <sub>4</sub> , X <sub>6</sub> , X <sub>10</sub>	(0.26)*(0.97)= 0.2522	0.2872
	X <sub>4</sub> ,X <sub>8</sub> , X <sub>10</sub>	(0.02)*(0.22)= 0.0044	
	X <sub>4</sub> , X <sub>9</sub> , X <sub>10</sub>	(0.17)*(0.18)= 0.0306	
Customer orientation	X <sub>5</sub> , X <sub>6</sub> , X <sub>10</sub>	(0.41)*(0.97)= 0.3977	0.5037
	X <sub>5</sub> , X <sub>7</sub> , X <sub>10</sub>	(0.24)*(0.13)= 0.0312	
	X <sub>5</sub> , X <sub>8</sub> , X <sub>10</sub>	(0.16)* (0.22)= 0.0352	
	X <sub>5</sub> , X <sub>9</sub> , X <sub>10</sub>	(0.22)*(0.18)= 0.0396	

Based on the findings: total indirect effect customer benefits on brand equity are equal to 0.2668 and against the total indirect effect on brand equity and nature is 0.2296. On the other hand we can say that the total indirect effect desired behavior and marketing mix on brand equity, respectively, is 0.3593, 0.2872. Finally, customer-oriented total indirect effect on brand equity is equal to 0.5037. At the same time the most and least effective promotion mix elements on brand equity of companies listed on the Stock Exchange by changing advertising (0.5037) and variable nature (0.2668). Other variables respectively public

relations (0.3593), marketing mix (0.2872) and the customer benefits (0.2668). Most confounding variables such as the impact on brand equity securities of companies listed on the stock exchange and also the perceived quality (0.97), brand awareness (0.22), brand association (0.18) and brand loyalty (0.13). Analysis of different paths in the model showed that the ads - 0.3977 perceived quality with the highest score and direct marketing direction and brand awareness with 0.0044 the lowest impact on brand equity securities of companies listed on the stock exchange. The situation in other directions and the effectiveness of each is presented in Table 2-5.

Table 6: Ranking pathways influencing brand equity of listed companies

Effect	Path	Rank
0.3977	X <sub>5</sub> , X <sub>6</sub> , X <sub>10</sub>	1
0.3492	X <sub>3</sub> , X <sub>6</sub> , X <sub>10</sub>	2

## 7. Conclusion

The results of the test showed that the greatest impact the brand equity of companies listed on the Stock Exchange for the customer in the store. Therefore it can be concluded that the stronger customer orientation mechanisms, appropriate channels and messages have an impact on customers can improve knowledge of the brand lead companies listed on the Stock Exchange. It is suggested that the combined investment promotion mix, is uniquely positioned to improve customer be considered. We need more measures in the field of the management of listed companies and the Securities and Exchange done in recognition of the company's brand. The second factor influencing brand equity of companies listed on the Stock Exchange has been desired behavior. The desirable behavior today plays a vital role in advancing the goals of institutions and organizations and it can be used to create positive view about brand companies listed on the Stock Exchange took advantage. In this study it was found that variables affect marketing mix on brand equity. Today, marketing in many companies as the most important factor influencing the level of understanding of the importance and special place of companies listed on the Stock Exchange can also use these tools take the initiative and by taking advantage of modern tools of advertising ahead of his rivals and it is a leader in the sale of their shares. The customer benefits also one of the items affecting brand equity in this study were discussed and the results suggest an effect on brand equity of the customer benefits. Also among the five elements of social marketing that were examined in this study, the variable nature puts minimal impact on brand equity. So it seems capitalize on the nature of the investment priorities of the customer and public relations, the efficiency is lower.

- According to the results and determine the importance of customer the desirable behavior in the promotion of the brand equity, in another study can be found in each of these elements and strategies for improving customer orientation and behavior was evaluated in brand equity.
- Investigation of obstacles and problems and provide practical solutions for customers in Iran
- Conduct research with larger sample size and statistical communities, other

**Abstract:** This study aimed to investigate the effect of implementation of Prorider succession management of staff's motivation among staff of Iran Broadcasting University. The study in term of purpose is applied and in term of nature is correlation method and population consisting of staff of training center and Broadcasting University that is 250 people. To test the relationship between variables based on assumptions of correlation coefficient using SPSS software. The results showed that the implementation of succession management and significant direct impact on employee motivation, and a positive correlation between motivation and staff there all its dimensions. Therefore, implement succession management can provide fertile for creating job motivation in staff. Accordingly, some suggestions are offered to managers and researchers.

**Keywords:** Job motivation, succession management, system of succession

### 1. Introduction

Today, the factors that led to the establishment of new organizations tend to supersede and the systems in a manner quite fundamental has changed, the new era of global trends that businesses will also be affected. The most important factor in leading a relatively scarce resource and assets within the organization and always has been that of losing a powerful blow to the organization's director. The importance of this issue to the extent that it with the phrase "war on talent" that used an analogy of trying different companies to attract and keep talent management involvement and supreme leader (Boromand and Tavooosi, 2016) the rising demand of employers to recruit skilled staff on the one hand and the desire to own and taking valuable jobs on the other hand and the battle and a struggle takes shape it should be called talent wars. The successful organizations are trying to battle with the application procedures, programs and strategies that could talents are essential for the continuation of their lives, attract and maintain To this end, organizations must know what needs now and coming face to the abilities and potential of employees to be able to identify and manage talent (Gay & Sims, 2009, p.17) . A proper understanding of motivation can be organized as a valuable tool to identify causes of behavior in organizations and predict the impact of management measures to be used. Recognizing also the motivation of behavior in organizations can be guided in such a way that individual and organizational objectives be met. Several factors in motivation are low in organizations and why management should be to look for ways and techniques that would increase the motivation of your employees. Careful and systematic planning to create and maintain and increase employee motivation is the most important strategies to increase organizational efficiency (Derakhshandeh et al., 2016). Identify and train tomorrow's managers of the most important strategies for the development and survival of an organization and to create incentives for sustainability in organizations capable forces and increase choice and competition in space culturally competent organization. Undoubtedly, systematic and systemic approach to the issue of succession planning as an important element management system can be one of the ways to achieve towards nurturing talent and is a good substitute for managers (Aboallae and Ghafari, 2008)

Organizational strategy requires a holistic approach to talent management and management succession planning staff development and career path together, special strategic role in the organization of today has found. These organizations have found that succession planning is a dynamic and continuous process, it not a static target to achieve talent in today's competitive world, and organizations need to have a view beyond the simple replacement labor. As an employee succession management strategies to achieve their occupational

goals makes powerful, influences on motivation and performance in organizations (Cartwright, 2008) in this regard, experienced managers an important role in motivating employees and successfully led the organization and given the recent rise in the number of pension managers and log manager, planning to develop and replacing them is much more important. Zhasklin (2012) showed that succession management program has been effective in reducing times of economic crisis. Boromand (2016) in a positive effect on employee performance management, succession planning showed Sharifat (2015) in examining the impact on employee succession management Aghajari oil company showed an increase in the rate of succession increases in staff motivation in general, despite the importance of the issue of succession planning and the root of its long history in the field of management in our country has not been studied as a serious need. Alarm lack of systematic research on the topic of succession when played the average age was 16 years, 89 to 49 years and have thousands of industry executives to drive to work between 25 to 30 years and this suggests the need to plan and quick operation to foster worthy successor specializing in strategic posts, is critical (Pour Sadegh et al., 2013). Succession plan as part of a talent management strategy, enabling organizations to understand the current needs wats, as a result align talent development will be based on it. (Bidmeshki, 2014) The aim of this study was to investigate the influence of the main component of succession on employee motivation in order to provide effective solutions to improve employee motivation and ultimately improve the motivation of the employees. If human resources in carrying out assigned tasks, motivation and procrastination are not enough, the quality of work is reduced and thus, other resources will be wasted (Borman, Schmidt, 2007). The question is whether there is positive significant relationship between the implementation of succession management and motivation of human resources work? In this regard, the following hypotheses are proposed to be checked

### 2. Hypothesis and Operational Research Model

The main hypothesis: there is significant relationship between the succession management and employee motivation.

Sub Hypotheses:

1. There is a significant positive relationship between succession planning and employee motivation system policies in organizations.
2. There is a significant positive relationship between candidate assessment and employee motivation in organizations.
3. There is a significant positive relationship between candidate's development and employee motivation in health and therapy in Shahrreza city.
4. There is a significant positive relationship between succession evaluation system and employee motivation in organizations.

#### 2.1 The theoretical framework

Several definitions for the concept succession management, including San Brook stated that succession planning as an attempt to appropriate and high-quality managers and employees to cover retirement, death, serious illness and upgrades or new position defines any organization that could occur in the future (San Brook, 2005). In fact, succession planning decision-making process on how to fill the gaps in the organization's key jobs (Bordbar et al., 2013). Studies of organizations represent different approaches to the issue of succession. Most successful managers of organizations, the role of successor and the issue of

succession planning are considered vital to the extent that GE CEO Jack Welch says:

It seems that for successful managers in the world, selected and designated successor is one of the major management tasks (Shojaei, Seyyed Emad Aldin, Dori, Behroz, 2008)

Father To study the most widely used models in management succession management and succession planning are seven-point

star model Roswell (2003; 2010) model upgrade path led Karan (2000) Bayham accelerate team model. (2002), Kim (2006) model of succession management performance (compared to the original models) with the combination of the three models is high. Model Kim, three main models compare with each other and finally four stages through interviews with seven Asian multinational companies in America offered all three models will take to the stage. These comparisons and similarities in the table 1.

Table 1. Comparisons and similarities

	Determine the policy	Evaluating a candidate	Development candidates	Assessment of Enshin Kaikan management
Model Seven Star Roswell (2003; 2010)	1: Make a commitment to systematic succession management and implementation of succession management 2: assess current needs and working conditions 3: evaluating the performance of individual career 4: needs assessment and working conditions in the future Treasury model accelerates	5: Personal Capability Assessment	6: Closing the development gap	7: assessment succession management program
Treasury accelerate	Treasury accelerate model creation	1: candidates and Identify people with high potential Step 2: Identify development opportunities	3: prescribe solutions to development opportunities 4: ensure that development is happening.	5: review progress and determine new program 5: serious study plans and progress
LED upgrade path	1: compatible upgrade path model of leadership succession needs 2: Create a common language for defining standards for functionality and performance in the organization 3: documentation of standards-based previous step	4: assessing succession candidates Through the integration of Matrix performance capabilities		5: review progress and determine new program 5: serious study plans and progress The entire route promotion

Motivation is the result of combining proper relationship between the individual and the situation, or a situation in which it is placed. In other words, given the desire to work hard to meet the objectives of the organization in such a way that it is trying to satisfy some individual needs. So, if motives be identified and measures taken by managers that the employees feel between individual goals and is consistent with organizational objectives, motivation system organization will be successful. (Robbins, 2012) In the present study, job motivation and job characteristics model Hackman and Aldhamayn model a cognitive model of socio - integrated approach.

I have this theory by Richard Hack, and Greg Oldman developed and means that if desired, or job, or have a few key features staff motivation and satisfaction or Shaghlán or more. It features key or create the conditions that are associated with a specific psychological and in this case, increase the motivation and satisfaction of performance the relationship between job characteristics, mental states and consequences of the escalation of the willingness of employees with disabilities work in progress, namely the importance that employees are given for progress in work mentioned three factors to bind. Major features three basic modes psychological or switch jobs. These features include:

A. Variety of skills or the fact that the person to do the work of several skills, experience, ability or his ability to use (Moorhead & Griffin, 2003)

B. Understanding the job, that person knows exactly what to do from beginning to end and what the outcome or results achieved.

C. The importance of jobs, whether inside or outside the organization to work how they value and care about.

D. Or the freedom and independence of individual reliance in areas such as design, timing, and methods of work. (Mahdad, 2008)

E. Feedback giving clear information about its prototype is the result of doing things to employees (Robbins, 2000) job characteristics model has been investigated in many ways. Most research results confirm the theoretical framework (ie a set of job characteristics, and these characteristics affect behavior). But about which property (or properties) make up the core there is no consensus. Also about the need to grow can be a mediating factor activity or not there is no consensus. (Robbins, 2000, P.931)

### 3. Research method

The study in term of purpose is applied and in term of nature is correlation method. It establishes the theoretical foundations of the internet and library research. The population of Personnel and Training Center School of Radio and Television and the number of population is 250 people. Random sampling was used to select samples. The number of sample based on Cochran sampling formula (as a formula to estimate sample size in qualitative variables) is at least 140 and at most 152 and the 148 questionnaires distributed among samples collected from study and eliminating incomplete questionnaires with drop samples, 109 remained questionnaire and the same number were used for analysis. In this study, two questionnaires with 36 questions based succession management study Kim theoretical model (2006). Hackman and Oldham Job motivational questionnaire was used to measure the variables and both questionnaires answered by the staff. To check the validity of teachers to number 30 in the initial implementation and Cronbach's alpha was used to estimate and reliability of succession management was 82.0 and reliability of the questionnaire 0.83 employee

motivation to test the relationship between variables based on assumptions of the model significant research and operational research (as follows) correlation coefficient using SPSS software taking into account the significant level of  $p \leq 0.95$  for all the tests and to draw LISREL structural equation modeling software is used.

**4. Research findings**

In order to study how to implement succession on motivation and communication requirements of the Pearson correlation coefficient was used and tThe results of which are shown in the table below.

Given that this review is done Ninety-five percent confidence level the null hypothesis is accepted 9% is a significant relationship between variables, if the significance level is greater than the rule, otherwise the relationship is confirmed (table 2).

Table 2: The correlation coefficients succession management and employee motivation

The level of significance	Correlation	Variables
0.001	0.688	Evaluating a candidate
0.001	0.543	Policy determination
0.001	0.630	Candidates Development
0.001	0.722	Assessment Succession
0.001	0.721	Succession Management

The results show that the level of implementation between the requirements of succession management and employee motivation against 0.001 and from 0.05 (level of error) is smaller, therefore, the null hypothesis is rejected and there is a significant relationship between the two variables. The correlation coefficient between succession management and employee motivation is 0.721. So make policies on employee motivation is effective succession planning system, given that the survey was carried out at 95%, if more than 5% significance level indicates a significant relationship between the variables of interest and otherwise denied the relationship is confirmed. According to the results presented in the above table significance of the relationship between all aspects of succession management and employee motivation is approved. This is significant because the value is smaller than the allowable level of 0.05 relations shows that the hypotheses as had been predicted, there is positive and significant relationship between of succession management and employee motivation. The improvement in the situation of each of these dimensions can help to motivate employees. Also among the aspects of system evaluation succession had the greatest impact on employee motivation.

**4.1 Research Structural Equation Modeling**

In order to evaluate right and wrong LISREL software was used research model. In this section we try and then perform the following results were obtained on a model in which the relationships between variables and coefficients of each of them are provided.

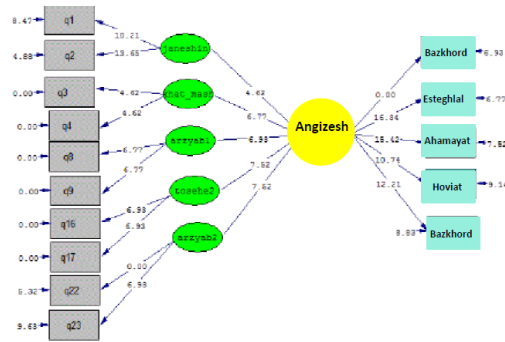

Figure 1. Research Structural Equation Modeling

The path is shown in Fig 1. The basic question raised is whether this model is a good model? To answer this question we must statistic  $\chi^2/df$  and other appropriate criteria being examined model according to the LISREL output value  $\chi^2/df$  is 0.54 times are calculated  $\chi^2/df$  bottom represent suitable fitness model because the value  $\chi^2/df$  is less than the proposed model is more suitable model and according to the results according to the following results were obtained from the output LISREL software.

$\chi^2 /df=0.54$  P-Value = 0.5676 and RMSA = 0.048 (1)

Standard ( $\alpha=5\%$ ) is therefore proposed model is a good model more than significant level.

**5. Conclusion**

Research results show that, implementation of succession management system based on Kim's succession management and employee motivation is a positive and meaningful relationship one of the factors of motivation that arises in relations with the leader of its successor. Thus, managers can make timely and accurate communication, enhances the working environment and staff are more motivated. The results of this Mehraban (2006) Khanifer et al (2009) Sharifat (2015) is consistent. So given that the factors organizations reach their goals predetermined strategic role, efficient human resources, qualified and motivated in different jobs and positions. On the other hand, it seems that the withdrawal of the various organizational levels to various reasons such as resignation, retirement, job promotion is inevitable. The creation of a vacuum and staff retention in enterprises, particularly in key jobs such as jobs, management jobs and sensitive and could cause serious disruption in the movement of the police organization. Therefore, organizations avoid disturbing your progress programs to provide qualified staff from within the organization applies for different jobs. Implementation of succession management, one of the elite force security programs for key positions in the organization is necessary. If you run this program, which in fact is organizational development program once done, will bring problems for the organization and success of the program; thus, succession management requires that the organization has appropriate and effective performance evaluation system. In fact, through this system may be capable staff and obvious competence lies and motivated identified the top job. The organization must be rational and efficient promotion system so the motivation of the personnel competence and performance and career development will increase. Talent management programs should provide areas and the ladder leading out of the ordinary talents can shortcut to the stairs up and acquire key positions. According to research findings and practical recommendations useful strategies and effective use of succession planning programs to achieve labor productivity is presented as follows:

- The organization can volunteer to staff studying related to the activities of the organization, scholarship and grant scholarships to prestigious educational institutions and centers for training personnel conclusion of the contract.
- Since most of the staff are young and highly educated, senior managers must plan and strategies such as the implementation of various training programs in accordance with the present and future needs of the organization to implement newly hired employees.
- The main executor of succession planning is an organization's human resources department. It is therefore imperative that the human resources department with the support of senior executives and managers to develop staff capabilities have been seriously; because success depends on efficient human resources specialist, and such assets that provide competitive advantage in business.
- Wise or good thing for employees to identify important meetings, balls, goals and approaches to succession planning programs to reduce the staff strength to implement these programs.

Abstract. Islamic Republic of Iran has proceeded directly on two occasions submitting resolution to UN Court so that both options have been in favor of promoting culture of peace, compromise, and peaceful existence. In these resolutions, which are concentrated on promotion of human rights and its production, the emphasis is on prevention from violence and extremism. Hence, the task of independent governments is to prepare the field for negotiation and finding logical solution for international conflicts and benefit from this opportunity to prevent from violence and extremism that might lead to terrorism, war, threatening international peace and security. Study of legal activities of Islamic Republic of Iran at international level indicates the matter that use of military force to fight against violence and extremism itself leads to violence and extremism.

Keywords: peaceful existence, human rights, violence and extremism

### 1. Introduction

If objectives and principles contained in United Nation Charter are implemented based on legal aspects, they are holy and sublime objectives. However, experiences indicate that governments have had failures in implementation of these principles and objectives. Despite that government's claim of having policy in line with principles and objectives of UN charter, they tend to maximize their individual interests and this matter is imposed against others using military force and economic pressures. Islamic Republic of Iran, as an independent country in international scene far away from any kind of profit-driven view over West and East blocks, has announced its slogan as realization of principles and objectives of UN Charter. Resolution of Dialogue of Civilization during discussions and debates related to Huntington's Clash of Civilizations Theory in western scientific and politic associations and resolution of the World against Violence and Extremism during past three decades (both resolutions were approved in United Nations General Assembly based on consensus) indicated policy and belief of Islamic Republic of Iran in case of facing events related to international policies. Since various articles and dissertations have been written in detail about the Resolution of Dialogue of Civilizations, this matter is not studied herein; whereas, the international legal of the Resolution of the World against Violence and Extremism, its plan and achievements are examined in this study due to novelty and importance of this document. Resolution of the world against violence and extremism is an extensive resolution in terms of its domain of subjects. This resolution can be legally considered as one of important resolutions in General Assembly in terms of human rights, international peace and security. Fundamentalism raised from promoted violence at national and international levels is a trigger that military action or force is not the only solution for it in view of the Resolution of the world against violence and extremism, because the planner of this resolution assumes that violence creates violence. Accordingly, another solution except for military solution. The content of the Resolution of world against violence and extremism emphasizes on options regardless of military solution and these options are reviewed herein.

### 2. Resolution of A WORLD AGAINST VIOLENCE AND EXTRIMISM (WAVE) and emphasis of objectives and principles of UN Charter

Resolution of A WORLD AGAINST VIOLENCE AND EXTRIMISM (WAVE), which was designed by Islamic Republic of Iran for first time, is one of the most important direct and precise resolutions of General Assembly in field of violence and extremism. The content of this resolution was the agenda number 15 assessed in 68<sup>th</sup> session of assembly and approved through consensus without opposition of any country. This resolution consists of 28 clauses including various subjects that each of them is capable of facing extremism. The issuance reason base of this resolution, as it is mentioned in clause 1 of resolution, is requirements contained in UN Charter and the Universal Declaration of Human Rights. In other words, the assembly reemphasizes all of resolutions issued about violence and extremism, which are indeed originated from the Universal Declaration of Human Rights, in this resolution explicitly. Study of this resolution indicates that it concentrates on three basic subjects. Although it is not a new subject to review this resolution, it depicts that General Assembly has considers violence and extremism as reasons rooted in governments' behaviors.

#### 2.1 Commitment of countries to respect for Fundamental Human Rights

"Whereas disregard and contempt for human rights have resulted in barbarous acts which have outraged the conscience of mankind, and the advent of a world in which human beings shall enjoy freedom of speech and belief and freedom from fear and want has been proclaimed as the highest aspiration of the common people" has been considered by United Nations. One of major considerations in Resolution of a WORLD AGAINST VIOLENCE AND EXTRIMISM is to encourage governments to support and implement regulations related to human rights (Cordell and Wolf, 2014). Clause one of this resolution is about to illustrate a trend followed by assembly mentioning relevant resolutions issued by General Assembly in past.

In viewpoint of UN General Assembly, respect for human rights and outbreak of violence and extremism are directly related to each other. However, the human rights considered by General Assembly are not just consisted of values raised from western culture as some of member states claim, because clause 2 of this resolution and previous resolutions have concentrated on necessity of respect for "Cultural Rights" that are often considered by countries against western human rights measures. In this regard, clause 6 reminds commitment of state members of organizations mentioning necessity of respect for human rights and immediately clause 7 warns about consequences of lack of respect for fundamental freedoms. According to the mentioned clause of the resolution, member states are persuaded that war and armed conflicts might lead to fundamentalism, violent extremisms, failure in promotion of human rights and fundamental freedoms. In this regard, "the first and most important responsibility of governments is ensuring a life full of peace free from violence for citizens living in the country. The result of adherence to such responsibility would lead to peaceful coexistence of government with neighbors leading to international peace and security (Shariat Nia, 2010)".

In this field, complying regulations related to human rights is the first demand of General Assembly to cope with violence and extremism and this demand will not be met unless through academic and purposeful promotion and education of human rights and compromise culture among community members. In this case, Resolution of "A WORLD AGAINST VIOLENCE AND EXTRIMISM" has considered relative comprehensive clauses to promote human rights; of that, Articles 8 and 10 can be named as examples. The perspective of UN members about

education as a mean to cope with extremism is reflected as follows:

“Underlines the vital importance of education, including human rights education, as the most effective means of promoting tolerance, in preventing the spread of extremism by instilling respect for life and promoting the practice of non-violence, moderation, dialogue and cooperation, and encourages all States, the specialized agencies of the United Nations and intergovernmental and non-governmental organizations to contribute actively to this endeavor by, inter alia, placing emphasis on civic education and life skills as well as democratic principles and practices at all levels of formal, informal and non-formal education” and “calls upon Member States to advocate for and disseminate information on tolerance and mutual respect, and underlines the potential contribution of the media and new communications technologies, including the Internet, to promoting respect for all human rights, to developing a better understanding among all religions, beliefs, cultures and peoples, to enhancing tolerance and mutual respect and thus to strengthening the rejection of violent extremism”.

Underlying citizens' education is indeed one of the most basic and fundamental human rights considered in other international documents. According to Clause 2 of Article 26 of Universal Declaration of Human Rights, “Education shall be directed to the full development of the human personality and to the strengthening of respect for human rights and fundamental freedoms. It shall promote understanding, tolerance and friendship among all nations, racial or religious groups, and shall further the activities of the United Nations for the maintenance of peace”.

This subject has a wider domain in International Covenant on Economic, Social and Cultural Rights

Approved on 16 December 1966: “states member of this covenant recognize the right of everyone to free education. This is to be directed towards “the full development of the human personality and the sense of its dignity”, and enable all persons to participate effectively in society. These states believe that education should spread friendship and understanding among all nations, races and religious or ethnic groups developing UN activities in order to protect peace”( Ziaee Bigdeli, 2012).

However, about 77 billion children have existed in the world without any access educational facilities until 2010. Credible reports indicated the fact that more than half of these children are living in countries with war or semi-war conditions. These countries have had either racist, religious, ethnic conflicts or have been attacked by foreign countries. Wrong beliefs are one of the most important reasons for limited access to education at national level. The implication of such constraint is lack of awareness of citizens in problem solving in society that leads to outbreak of violence and extremism (Adami, 2012).

## 2.2 Refrain from threat or use of force in international relations

According to Clause 4 of Article 2 of Charter, “All Members shall refrain in their international relations from the threat or use of force against the territorial integrity or political independence of any state, or in any other manner inconsistent with the Purposes of the United Nations”. According to the explicit content of this Article, use of military force in international community is not accepted as it is not consistent with the Charter of United Nations and social security. “Use of force and formulation of use of coercive force in international community is so ambiguous that is one of the most perplex subjects for lawyers and international law” (Grover, 2011). In fact, this regulation is a complementary for Clause 3 of Article 2 in which, government are asked to “All Members shall settle their international disputes by peaceful means in such a manner that international peace and security, and justice, are not endangered”. Despite the emphasis of Charter on non-use of

force in international relations, we still see the force used by powerful countries. For instance, the campaign of USA against Iraq has been opposed to the UN Charter and Security Council Resolutions in opinion of many of international lawyers.

The purpose of this introduction was to study resolution of a World against Violence and Extremism and its emphasis on non-use of force. Resolution of a World against Violence and Extremism has highlighted the subject in its clause 3 that “state members shall not use force in international relations” and considers outbreak of violence and armed conflicts between governments as a reason for promotion of violence and extremism. “As it is mentioned by Iranian Agent in Organization General Assembly, if states just emphasize on issuance of resolution in UN to convict violent activities regardless of circumstances leading to such behaviors, we will fail to cope with violence and terrorism” (Rosenne, 2004).

Obviously, a more extensive concept should be adopted to study “threat or use of force in international relations”. It means the attitude toward traditional use of force in international relations should be changed. Nowadays, countries rarely use force in international scene; however, use of modern means such as political intervention, economic intervention, and cyber-attacks have been considered by many of countries to influence on other countries over the recent decades. If a country commits political, religious, or racist conflicts supporting a specific political group in a country, violent implications of such intervention is more significant than military confrontation between two countries. “Racist conflicts that its implication was genocide of Rwanda, 1994 were the result of explicit interference of Belgium Government in unbalancing political forces of Rwanda Government” (Goldrick, 2004).

“Nowadays, the concept of use of force has faced a challenge considering doctrine of humanitarian intervention. In viewpoint of majority of humanitarian intervention proponents, humanitarian intervention is the only way of preventing from extensive violations of human rights in some countries; however, humanitarian intervention consists of some criteria and regulations that are not discussed herein. This intervention has not been successful due to hidden political purposes of countries”.

“In Agenda No. 116 of 60<sup>th</sup> session of General Assembly, Syria Agent declared in his speech that use of force in international community will lead to outbreak of violence, extremism, and even terrorism. For instance, occupation of Palestine by Israel and lack of recognition of it as independent country leads to violence. In this case, Israel has prepared the field for violence in this region supporting terrorist groups”. “In this regard, Israel has created serious implications in production of agricultural products and access to health services, educational institutes, and water resources due to construction of retraining walls so that it would lead to serious dangers in future” (Jnzaekovic, 2006).

## 2.3 International Condemnation of “support for violent behaviors”

International conviction of violent behaviors can be examined at two national and international levels. General Assembly and Security Council Resolutions have examined these two levels at the same time. Stimulation of violent behaviors is a potential threat against international peace and security from the perspective of Security Council. The concept of threat against the peace mentioned in Article 39 of Charter is based on any situation that put the peace in danger. In this regard, the risky crisis for peace has two specifications: first, it is explosive and second, it is the result of violation of international commitment. Explosive crisis has either international or domestic root. The root of explosive crisis is international if the behavior of a crisis-maker country is so aggressive or provocative that threatens its neighbors or poisons international environment so that a small conflict leads to a big hostility. The domestic crisis will be explosive if intolerable domestic policy of a country is

applicable for other international community countries and this intolerance is raised from legal regulations. In opinion of some scholars, explosive crisis will be realized in presence of governments that violate primitive regulations of human rights applying aggressive policies.

In case of international condemnation of support for violent behaviors, the studied resolution expresses in Articles 5, 10, and 12:

Stresses that it is important that States strongly condemn all forms of violence against women and refrain from invoking any custom, tradition or religious consideration to avoid their obligations with respect to its elimination, as set out in the Declaration on the "Elimination of Violence against Women". State members are asked to provide field for mutual respect and compromise supporting freedom of information and news.

The other issue about prohibition of violence is the domain of violence should be wider than violence against "human groups". For instance, Resolution for "Freedom of Religion or Belief" dated on 20 December 2012 has considered any kind of destruction or attack to religious places or shrines as an explicit violation of human rights and humanitarian rights in its clause 3 of Article 11. Accordingly, states shall refrain from any support that leads to religious violence or extremism. The other matter related to cope with violence is that discriminative rules existed in domestic laws of countries should be eliminated. It can be stated that General Assembly somewhat has mentioned this demand in each resolution related to "international peace and security" or "violence and extremism".

### **3. Reasons and effects of the project of a World against Violence and Extremism**

In 2013, global and regional conditions and circumstances were so considered by some of countries so that Iran was introduced as the great supporter of violent groups. Almost after September eleven attack and speech of Jorge Bush in which, he introduced three countries named Iran, Syria, and North Korea as the axis of evil. Iranphobia and Shiaphobia became one of propaganda priorities and foreign policy of USA and some other states. This issue was not just confined to anti-Iran propaganda but also it consisted of practical measurements. This subject besides conflicts between West and Iran about nuclear program made Iran to face serious challenges in terms of international relations and economic aspect. Regardless of challenges against Iran, the most important challenging issue of Iran was lack of trust of Security Council in Iran's activity in field of nuclear program and transmission of this opinion to other parts of UN; hence, they tried to prevent from Iran's progress. In such circumstances, a distinguished environment was required to interact with the world. According to such vision and the issue that the first step in international interaction to eliminate concern about "Iranphobia", resolution of a world against violence and extremism was submitted by Iran to General Assembly of United Nation. In the following, details of this resolution are examined herein.

#### **3.1 Necessity and reasons for submission of the Resolution of a World against Violence and Extremism**

As we can see, occurrence of horrendous crimes in Middle East has been expanded over the recent 5 years. Occurrence of revolution in Arabic countries, repetitive aggression of Zionist Regime against Palestine, civil war in Syria, military attack of Saudi Arabia against Yemen and phenomenon of "Daesh" are the most important incidents related to Middle East. In such circumstances, Islamic Republic of Iran is the only country with stable and calm condition in this geographical region. Accordingly, it was expected that Iran could play a key role in creation of peace in this region considering such conditions. One of the initial measurements of Iran was submission of the Resolution of a World against Violence and Extremism to UN General Assembly. In this case, numerous propagandas of

western countries against Iran accusing it of construction of nuclear weapon and creation of insecurity in Middle East, which was not responded through an official and diplomatic reaction, tended to destroy the international face and foreign policy of Iran that have been fluctuating over the years. Accordingly, Islamic Republic of Iran submitted Resolution of a World against Violence and Extremism through understanding of the international fact that "Iranphobia" might impose a high cost to Islamic regime. According to the Author, objectives of Resolution are classified to two following bases:

#### **3.2 Counter with Iranphobia**

"Iran has been superior to its neighbors, in particular southern neighbors, in terms of military and economic power so that this power sometimes have made them concerned, review of contemporary history of foreign relations of Iran indicate that this concern has been existing during history and there has been a fear whenever the power of Iran has been changed. Iran benefits from a considerable power in different power scopes including from population to wide range of resources and geopolitical condition in Middle East and this issue has made other countries concerned. Capabilities of Iran in traditional and modern scopes of power at regional scale have made Iran as the only potential option of regional hegemony. Therefore, the first concerning reason for Iran or Iranphobia is the power of Iran; hence, it cannot be changed due to its structural aspect". Except for factitious conflicts and charges against Islamic Republic of Iran by neighboring countries, the other issue was related to nuclear activities of Iran. Iran's accusation of human rights violation and support for terrorist groups has been more considered after revelation of Iran's progress in peaceful atomic program and modern technologies. Hence, Islamic Republic of Iran submitted resolution of a World against Violence and Extremism to UN General Assembly knowing the combination of atomic activities of Iran with some matters such as human rights in international organizations is only for destruction of international face of Iran government. Official declaration of some positions such as hatred of terrorism, respect for human rights, and governance of law and lack of believe in use of military measures when facing controllable violence could attract the public opinion. Parallel to submission of Resolution of a World against Violence and Extremism, the diplomatic negotiations about nuclear program could achieve suitable results choosing an expert group of lawyers so that these negotiations could lead to reduced Iranphobia. However, it seems that Resolution of a World against Violence and Extremism cannot meet all objectives in this scope during long term due to flow of excuses and sabotages.

#### **3.3 Changes and moderation in international policies of Islamic Republic of Iran**

The other micro-negotiation trend emerged in foreign policy of Islamic Republic of Iran after the rise of eleventh government. This micro-negotiation called moderation based on general negotiation of this government. According to the transformation logic and negotiation cycle of foreign policy of Islamic Republic of Iran, moderate negotiation can be called as "realistic idealism". Central point of moderation is balance that is defined as the balance between ideal and reality, different types of rationalities, Islamic expedients and national interests, objectives of foreign policy, goals and measures of foreign policy, national power elements, use of power and diplomacy, right and task, three principles of dignity, wisdom and expediency, structure of foreign policy and development of foreign relations. Elements and minutes of moderation negotiation consist of idealism, realism, balanced rationalism, result-oriented adherence, constructive engagement, security seeking, and status seeking, peace, justice, transformation-orientation, perfectionism, balanced development-orientation, and balanced multilateralism.

In this case, the moderation that is realized in international scene includes of a calm behavior when facing international issues, in particular in subjects related to international and non-

international conflicts. In other words, full knowledge of quality and reasons for occurrence of an incident before supporting or eliminating it can pave the way to settle disputes and conflicts that are the origin of violence and extremism. Legal doctrine of Islamic Republic of Iran at international level is moderation in making decision on fight against violence and extremism. According to this doctrine, at the start point of conflict, decisions should not be made with opportunity-destroying delay when facing violence and war, because it is harder to control and expanded violence that cope with a primitive violence. Also, the decision not be made as if violent activities of beneficiaries are accepted by others.

#### 4. Conclusion

If objectives and principles contained in United Nation Charter are implemented based on legal aspects, they are holy and sublime objectives. However, the bilateral and interest-oriented approach of permanent members of Security Council, who have numerous authorities, based on the Charter, has created challenges for implementation of these principles. The consequence of changing common principles and objectives, which one of them is use of force in international relations, would expand violence and extremism in international scene. Islamic Republic of Iran is not believed in traditional factions among countries considering that weakening of these principles and objective would lead to violence extremism, and even terrorism and horrendous terrorism. Hence, Iran has tried to invite governments, in international scene and in UN General Assembly in particular, to respect for regulations existing in international agreements such as UN Charter and Universal Declaration of Human Rights, because violence and extremism can be prevented referring to these regulations and documents. Accordingly, Islamic Republic of Iran has considered Violence and Extremism as specific matters. In this regard, Iran has made many efforts to expand the concept of "violence prevention". The result of these efforts include submission of two resolutions to UN General Assembly in order not only draw the attention of states toward prevention but also prevent from political disadvantages for Iran at international level that have been considered lately as Iran Confrontation and Iranphobia.

**Abstract.** This study aimed to examine the relationship between demographic characteristics and information technology acceptance among staff of Youth and Sports Department in Kermanshah. The population consisted of staff of Youth and Sports Department in Kermanshah in 2015. Using Cochran formula, the sample size was determined to be 120 subjects. The research tools included demographic questionnaire and Davis' Technology Acceptance Model questionnaire. Using SPSS software, the Kolmogorov-Smirnov test, Pearson correlation, and regression were used for analyzing the data. The significant level was determined to be 0.01. The findings showed that there was no significant relationship between gender and level of education. There was a significant relationship between age and technology. The education did not impact on technology. The increased employment history led to increased information and technology knowledge score. The increased skill level of people in software led to increased use of other software. The age did not impact on using software. An increase in age led to increase in using technology. The gender had no effect on ease of use of technology. Also, the gender had no effect on skill of using IT.

**Keywords:** Information Technology, Youth and Sports Department's staff.

### 1. Introduction

In informational developed countries, the use of information technology in education system aims to diversify teaching methods and create proper grounds for deepening education and training. For this reason, these countries use various facilities of information technology as a complement to traditional training to increase the richness and quality of education. On the other hand, the informational developing countries use information technology as a means to extend public education and make closer the physical distances, especially in rural and remote areas. In Iran, however, the information technology is notable in both perspectives: increasing the richness of education (access quality) and increasing access to learning environments (access quantity) (Masoudi, 2012). As a way to train healthy human resources, the development of physical education and sport is considered to be a part of national development plans. Thereby, the creation of necessary conditions to facilitate exercise and training, development of community vitality and health, and provision of spaces for using information technology are inevitable to achieve research and service objectives for all (Gerssion & Anderson, 2004). In recent decades, there have been an increase in role of information technology in organizations, especially in universities; however, the resistance to deployment of advanced information technology is significantly high (Ali Ahmadi, 2002). Today, the changes are far more fundamental than the transformations and changes in

industrial revolution era. So, the organizations have to use the late technology achievements to survive in competitive and changing environment and achieve the highest level of their abilities (Shahi Beigi, 2005). The increased market competitions have caused the organizations use new technologies to remain in competition; the IT is one of these technologies. In today's dynamic business environment, the information technology is widely used. While the managers might ignore and avoid from IT-related decisions in the past, this is today impossible in most industries. This high dependence on IT indicates the vulnerability of business which is due to IT nature. The information technology not only has the ability to support the existing business strategies, it may also formulate new strategies. In other words, the information technology is a success factor for continuance of business and also a feature for differentiation and competitive advantage of organization (Van Garm Bergen, 2009). Spacy, Goulding, and Murray (2004) investigated the features of public library staffs which influenced their attitudes towards internet. They examined the effects of gender age, computer skills, experiences in the field of information and communication technologies, and subjective norms. The findings suggested that the job position of employees impacted on their perception of ease of use of internet. Most employees had computer skills, perceived using internet as easy, often worked with it, and had the intention of re-using computers and Internet.

### 2. Methodology

This was cross-sectional descriptive- analytic study. The population consisted of staff of Youth and Sports Department in Kermanshah in 2015. Using Cochran formula, the sample size was determined to be 120 subjects. The research tools included demographic questionnaire and Davis' Technology Acceptance Model questionnaire. Davis's Technology Acceptance Model had five sections: 1) demographic information, 2) employees' subjective perception of usefulness of using information technology which included questions about efficiency, effectiveness, and usefulness of information technology, 3) six questions on employees' perceived ease of use of information technology which included ease of use, ease of interaction with system, and easy learning of technology, 4 and 5) six questions on employees' attitude towards information technology and using information technology. The Likert scale was used to convert qualitative values to quantitative values: 1, 2, 3, 4, and 5 for strongly agree, agree, no comment, disagree, and completely disagree, respectively. The descriptive (tables and graphs) and inferential statistics were used for analyzing the data. Using SPSS software, the Kolmogorov-Smirnov test was used to test the normality of data distribution and Pearson correlation and regression were used to test the hypotheses. The significant level was determined to be 0.01.

### 3. Findings

According to table 1, the sample consisted of 120 subjects. However, 49 (40.8%) and 71 (59.2%) subjects are female and male, respectively.

Table 1. Distribution of subjects in terms of gender

Gender	Frequency	Percentage
Male	49	40.8
Female	71	59.2
Total	120	100

According to table 1, 49 and 71 subjects are female and male, respectively.

Table 2. Distribution of subjects in terms of age (years)

	Frequency	Mean	Standard deviation	Minimum	Maximum
Age	120	33.78	0.886	18	62

According to Table 2, the average age of subjects is 33.78 years old (SD= 0.886). The youngest and oldest subjects are 18 and 62 years old, respectively.

Table 3. Frequency distribution of participants in terms of education level

	Frequency	Percentage
Diploma	28	23.3
Associate	46	38.3
Bachelor	27	22.5
Graduate	16	13.3
PhD	3	2.5
Total	120	100

According to table 3, 23.3, 38.3, 22.5, 13.3, and 2.5% of participants had diploma, associate, bachelor, graduate, and PhD

degrees, respectively; most of the participants had associate degree.

Table 4: Individuals' years of service

N	Valid	120
	Missing	0
Mean		7.48
Std. Error of Mean		0.669
Median		5
Mode		2
Std. Deviation		7.327
Minimum		1
Maximum		30
Sum		897

According to table 4, the average of participants' years of service is 7.48 years.

The following table shows the number of times that people use IT knowledge. As it can be seen, most use of IT knowledge is by those who use 2-3 times a month on average.

The lowest and highest of years of service is 1 and 30 years, respectively. The highest frequency dedicates to people with 2 years of service.

Table 5: Frequency of using IT knowledge

	Frequency	Percentage	Percentage points	Cumulative frequency percentage
Valid	Less than once a month	5	4.2	4.2
	2-3 times a month	36	30	34.2
	Once a week	33	27.5	61.7
	2-3 times a week	9	7.5	69.2
	once a day	16	13.3	82.5
	Several times a day	21	17.5	100
	Total	120	100	100

According to table 5, the use of technology knowledge at least once a day is 13.3 percent. And the people who use it less than once a month is 4.2 percent.

Table 6: Using technology knowledge in related jobs

	Frequency	Percentage	Percentage points	Cumulative frequency percentage
Valid	Library services	2	1.7	1.7
	Finance and Budget	2	1.7	3.3
	Guidance and control activities	2	1.7	5
	Communication with others	6	5	10
	Searching for Information	18	15	25
	Orders	13	10.8	35.8
	Reporting	13	10.8	46.7
	Writing letters	18	15	61.7

	Store and restore	17	14.2	14.2	75.8
	Decision making	15	12.5	12.5	88.3
	Data analysis	3	2.5	2.5	90.8
	Forecasting and planning	6	5	5	95.8
	Analyzing problems	5	4.2	4.2	100
	Total	120	100	100	

According to table 6, the highest use of technology is in letter writing and searching for information area (=15%) and the lowest use level is in library services, finance, and controlling and directing activities (=1.7%).

The level of skill in using electronic tools and technology is specified in Table 7.

Table 7: Skill in using electronic tools and technology

		Frequency	Percentage	Percentage points	Cumulative frequency percentage
Valid	Library software	3	2.5	2.5	2.5
	Online communication	7	5.8	5.8	8.3
	Word processors	28	23.3	23.3	31.7
	Data bases	13	10.8	10.8	42.5
	Graphics software	19	15.8	15.8	58.3
	Statistical software	21	17.5	17.5	75.8
	Programming language	6	5	5	80.8
	Applied and expertise software	1	0.8	0.8	81.7
	World Wide Web	12	10	10	91.7
	Email	10	8.3	8.3	100
	Total	120	100	100	

As it can be seen, 2.5 percent of people use library software and 5.8 percent use online communication.

The lowest usage is in applied and specialized software area.

The highest use of electronic tools is in word processing and typing text areas (=23.3%).

The participants' use of various electronic software is provided in following table.

Table 8: Number of software used in technology

		Frequency	Percentage	Percentage points	Cumulative frequency percentage
Valid	One software	9	7.5	7.5	7.5
	Two software	48	40	40	47.5
	3-5 Software	29	24.2	24.2	71.7
	6-10 Software	16	13.3	13.3	85
	More than 10 software	18	15	15	100
		Total	120	100	100

According to table 8, 7.5 percent of individuals use one software, 40 percent use two software, and 15 percent use more than 10 software.

In the following, the independence or dependence of subscales is investigated.

According to table, the correlation coefficient between age and technology score is 0.4; this shows that there is weak correlation between these two variables. Also, the significant level of 0.00 indicates that there is a correlation between variables.

Correlation between gender and education level of subjects:

According to table 9, the significant level of 0.44 implies that there is no significant relationship between gender and level of education.

Test of independence between dependent and independent variables:

This means that gender and education act independently and do not impact on each other.

Table 9: Correlation between gender and education level of subjects

		Education level of subjects					Total
		Diploma	Associate	Bachelor	Graduate	PhD	
Gender of subjects	Male	9	20	13	7	0	49
	Female	19	26	14	9	3	71
Total		28	46	27	16	3	120

Table 10: Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	3.733	4	0.443
Likelihood Ratio	4.827	4	0.306
N of Valid Cases	120		

Correlation between age and technology knowledge score:

This means that an increase in age leads to increase in technology score.

According to table 11, the significant level of 0.01 implies that there is a significant relationship between age and technology.

Table 11: Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	1171.790	1020	0.001
Likelihood Ratio	436.722	1020	0.000
Linear-by-Linear Association	19.644	1	0.000
N of Valid Cases	120		

Correlation between education level and technology knowledge score:

This means that education level and technology score act independently and do not impact on each other.

According to table 12, the significant level of 0.349 implies that there is no significant relationship between education level and technology.

Table 12: Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	141.816	136	0.349
Likelihood Ratio	136.523	136	0.471
N of Valid Cases	120		

Correlation between service years and technological knowledge in related jobs:

This means that the increase of employment history increases information and technology knowledge score.

According to table 13, the significant level of 0.01 implies that there is a significant relationship between service years and technology.

Table 13: Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	344.883	264	0.001
Likelihood Ratio	175.987	264	1
N of Valid Cases	120		

Correlation between skill of using electronic software and number of used software:

According to table 14, the significant level of 0.047 indicates that there is significant correlation between skill of using software and number of used software.

This means that people with high skill of using software use more software.

Table 14: Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	51.319	36	0.047
Likelihood Ratio	46.087	36	0.121
N of Valid Cases	120		

Correlation between age and using software;

This means that age and using software are independent and not influenced by each other; people in all ages work with any software.

According to table 15, the significant level of 0.886 indicates that there is no significant relationship between age and using software.

Table 15: Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	242.314	270	0.886
Likelihood Ratio	199.135	270	1
N of Valid Cases	120		

Correlation between age and positive attitude to IT knowledge:

This means that the positive attitude to technology increases with age.

According to table 16, the significant level of 0.01 indicates that there is significant correlation between age and positive attitude to technology knowledge.

Table 16: Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	392.253	330	0.010
Likelihood Ratio	223.025	330	1
Linear-by-Linear Association	19.008	1	0.000
N of Valid Cases	120		

Correlation between age and usability of technology knowledge:

According to table 17, the significant level of 0.00 indicates that there is significant correlation between age and usability of technology knowledge.

This means that the usability of technology increases with age

Table 17: Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	433.446	300	0.000
Likelihood Ratio	239.113	300	0.996
Linear-by-Linear Association	17.364	1	0.000
N of Valid Cases	120		

Correlation between gender and ease of using technology:

This means that gender has no effect on ease of using technology.

According to table 18, the significant level of 0.579 indicates that there is no a correlation between gender and ease of using technology knowledge.

Table 18: Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	8.516	10	0.579
Likelihood Ratio	8.705	10	0.560
N of Valid Cases	120		

Correlation between gender and skill of using technology knowledge:

This means that gender has no effect on skills of using technology knowledge.

According to table 19, the significant level of 0.589 indicates that there is no correlation between gender and skill of individuals in using technology knowledge.

Table 19: Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	7.462	9	0.589
Likelihood Ratio	7.902	9	0.544
N of Valid Cases	120		

Correlation between education level and positive attitude to technology knowledge:

This means that education has a significant impact on positive attitude toward technology knowledge.

According to table 20, the significant level of 0.034 indicates that there is significant correlation between education level and positive attitude to technology knowledge.

Table 20: Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	62.604	44	0.034
Likelihood Ratio	55.253	44	0.119
N of Valid Cases	120		

#### 4. Conclusion

There is a significant relationship between demographic characteristics and acceptance of ICT knowledge. The significant level of 0.01 implies that there is a significant relationship between age and technology. The significant level of 0.589 indicates that there no relationship between gender and skill of individuals in using communication technology knowledge. This finding is consistent with research results of Mohammadi, Shams, and Parvin (2008) who showed that the gender has no effect on acceptance of technology. The significant level of 0.349 indicates that there is no significant relationship between education and technology. The significant level of 0.01 implies that there is a significant relationship between service years and technology. This means that by increasing of service years, the information technology knowledge score increases.

There is significant correlation between demographic characteristics and technology acceptance model and IT knowledge acceptance. The significant level of 0.01 indicates that there is a significant relationship between age and positive attitude to technology. This means that the positive attitude to technology increases with age. The significant level of 0.579 shows that there is no relationship between gender and ease of using technology knowledge. The significant level of 0.034 indicates that there is a significant relationship between education level and positive attitude to technology knowledge. This means that education has a significant impact on positive attitude towards technology knowledge.

**Abstract.** The present research aimed to investigate the effect of employer brand dimensions on job satisfaction. The research population consisted of 200 employees of Dana insurance branches in Tehran. The sample size was estimated 131 employees using Cochran formula. Data were collected through questionnaire. The reliability of questionnaire was reported (0.87) using Cronbach's alpha. Regression analysis showed that employer brand has a significant effect on job satisfaction. Also, variables of fame and reputation, social responsibility and diversity affect job satisfaction; however, significant effect of training and development, work-life balance and organizational culture on job satisfaction was rejected.

**Key Words:** Employer Brand, Training and Development, Diversity, Fame and Reputation, Social Responsibility, Work-Life Balance, Organizational Culture, Job Satisfaction

### 1 Introduction

By increasing competition in all areas of business, companies have begun a competition and battle in the new field of competition and market, namely the labor market. Attraction and retention of skilled and experienced workforce have become major challenge for many companies. Several researchers have pointed to the importance of human capital as a source of competitive advantage and warned the necessity to have qualified and skilled staff. As a result, development of intelligent strategies to become a selected employing organization (employer) in labor market can create a sustainable competitive advantage for the company. Employer brand is the main goal of branding activities in labor market which encourages jobseekers to accept a job offer from the employer and also encourages current employees to stay in the organization and consequently, it can create competitive advantage for organization in the labor market (Hamidianpour, et al. 2013)

Prasad (2016) introduces employer brand dimensions, including training and development, diversity, fame and reputation, social responsibility, work-life balance and organizational culture. Various studies in this regard have indicated that future employees (potential) and also current employees of the organization pay attention to mentioned dimensions to choose an employer or stay in an organization and development of each component leads to better attraction of desired workforce and commitment among current employees (Prasad, 2016).

Commitment and job satisfaction are closely related to each other. A positive relationship between employees' commitment and job satisfaction has been approved (King & Grace, 2010).

Job satisfaction is defined as a person's emotional state resulted from evaluation of his work in achieving or facilitating achievement to occupational value (target) (Lok & Crawford, 2004). Job satisfaction is a structure which is directly related to organizational outcomes such as employee turnover, motivation, commitment and productivity (Wright & Davis, 2003).

According to Backhaus & Tikoo (2004), employer brand leads to job satisfaction through a strong organizational culture. However, very little empirical research has been conducted on the effect of employer brand on job satisfaction (Schlager, et al. 2011; Lelono & Martdianty, 2013).

Despite the competitive environment prevailing in the country's insurance market, Dana Insurance Company has been able to promote its position in terms of market share to be the country's

third-largest insurance company through making comprehensive efforts over the last years. The company's managers can develop job satisfaction on one hand and promote brand performance on the other hand through correct use of employer brand and consequently can expand market in different parts of insurance. Hence, investigating and recognizing the effects of company's employer brand can be a great step for gaining competitive advantage. The main question of the present study is as follows:

"Is employer brand effective on employees' job satisfaction in Dana Insurance Company?"

### 2 Theoretical framework of the research

#### 2.1 Employer brand

Employer brand is a combination of marketing and human resource management (Edwards, 2009). Employer brand is a term with a concept of product brand and is an image offered by the company to potential employees in the labor market of the human resources. Different images will attract different types of jobseekers. Watson Wyatt's definition of employer brand includes internal and external aspects. He believes that employer brand means the position of employer in the human resources market showing current and future employees the image of organization brand; it includes two dimensions; external and internal brands. External brand is created for potential employees to be encouraged to join the organization and internal brand is created for current employees including promises which would be implemented by the company (Watson, Wyatt, 2005).

#### 2.2 Employer brand dimensions

##### 2.2.1 Work-life balance

Work-life balance strategies can help promotion of employer brand which leads to increased desire in employee to stay in the organization (Barrow & Mosley, 2011). Development of employer brand with no work-life balance as one of its components can be very difficult for an organization (Barrow & Mosley, 2011). Research conducted by Hillebrandt (2013) shows that work-life balance is an important component to create a strong employer brand.

##### 2.2.2 Reputation

Reputation or credibility has always been a very important asset for a company to gain a competitive advantage over its counterparts. This dimension helps a company become "employer selection" (Sutherland, et al., 2002). According to studies conducted by Moroko & Uncles (2005), reputation is considered as one of the components of employer brand. Combination of company's reputation and employer brand will help the company sustain its reputation (Moroko & Uncles, 2005).

##### 2.2.3 Diversity

Cox (2001) has defined diversity as variety of social and cultural identity among employees in a work environment. Regarding diversity, employers can create a better working environment where in workforces do the best. Schlager et al. (2011) introduced "value of diversity" as an important factor in employer brand. In the present study, diversity reflects both variety in work activities and multi-faceted workforce.

##### 2.2.4 Organizational culture

Robbins (2005) defines organizational culture as "a system of shared meaning of values of the members of an organization which distinguishes it from other organizations." Organizational

culture is an important factor affecting employer brand. Employer brand can be promoted by strengthening and developing important aspects of the culture of an organization (Barrow & Mosley).

### 2.2.5 Training and development

This dimension explains the role of training and staff development by promoting the necessary skills needed for both current and future occupational position. Wilden, et al. (2010) point out the importance of development opportunities (and growth in working environment) by potential employees to evaluate an organization.

### 2.2.6 Companies' social responsibilities

Employees prefer working for a company which offers an ethical work environment. The company would be able to create a positive image in the minds of current and potential employees through doing social responsibilities. Hillebrandt & Ivens (2013) have defined social responsibility as a new significant dimension of employer brand.

### 2.2.7 Job satisfaction

Job satisfaction means employee satisfaction from his current occupational position. Researchers have proposed various definitions of job satisfaction. Robbins (2005) defines job satisfaction as one's total inner feelings towards his job. Job satisfaction is a structure which is directly related to organizational outcomes such as employee turnover, motivation, commitment and productivity (Wright & Davis, 2003; Winterton, 2004).

## 2.3 Employer brand, its dimensions and job satisfaction

Since consumer brand helps create customer satisfaction, employer brand enhances employee satisfaction. Backhaus & Tikoo (2004) concluded that employer brand leads to job satisfaction through a strong organizational culture. However, very little empirical research has been conducted on the effect of employer brand on job satisfaction (Schlager, et al. 2011; Lelono & Martdianty, 2013).

Training and development is an important dimension for companies by which training and transfer of technology related to business or products take place (Biech, 2008). This dimension includes variables such as training and development programs and professional development opportunities and other items. Some of previous studies have also indicated a direct relationship between development and training opportunities offered by organization and job satisfaction (Thacker & Holl, 2008; Mariani, et al., 2013).

Many studies have focused on the predictive role of department image (Yu & Cable, 2011) in explaining job satisfaction. As Elsbach & Kramer (1996) proposed, reducing the credibility of an organization leads to promotion of dissatisfaction among employees.

Studies have shown that diversity is one of the most important factors affecting job satisfaction (Campbell, 2009; Longhi, 2011; Pitts, 2009). According to research conducted by Ongori & Agolla (2007), diversity refers to employees from different social and cultural perspectives within the company.

Work-life balance is an ideal balance between personal and professional life of a person. Clark (200), Pasewark & Viator (2006) have concluded that any conflict between work and family can lead to dissatisfaction among employees. Aryee, et al. (2005) also argue that the higher level of work-life balance among employees, the higher level of job satisfaction among them.

A research conducted by Koh & Boo indicated that if an organization only focuses on profitability with no regard to ethical standards, employee satisfaction will be reduced. Similarly, Coldwell et al. (2008) found that employees will be satisfied, if they observe organization's commitment to ethical responsibilities towards the society.

Dimensions of organizational culture and their effect on job satisfaction have been investigated in different studies (Lok & Crawford, 2004). A research conducted by Odom et al. (2003) showed that attitude and behavior of employees have increased by promoting innovative culture.

## 2.4 Purposes of the Research

### The Main Purpose

Investigating the Effect of Employer Brand on Job Satisfaction

### Subsidiary Objectives

- Investigating the effect of training and development on job satisfaction
- Investigating the effect of fame and reputation on job satisfaction
- Investigating the effect of work-life balance on job satisfaction
- Investigating the effect of social responsibility on job satisfaction
- Investigating the effect of organizational culture on job satisfaction
- Investigating the effect of diversity on job satisfaction

## 2.5 Related review of literature

Table 1. Related review of literature inside and outside the country

No.	Year	Researcher	Title	Results
1	2015	Morakabati	Investigating the Effect of Employer Brand on Employees' Attitudes in Insurance Industry: A Case Study of Central Office of Alborz Insurance	There is a positive relationship between employer brand value propositions and employees' attitudes
2	2015	Barghanmadi & Gholipour	Investigating the Effect of Employer Branding on Attracting Talented Ones in Refah Bank	Five internal factors of employer brand and one different factor have been effective on attracting talented ones in the case of giving information and informing them. Also, external factors have been effective on attracting talented ones in Refah Bank.
3	2013	Sanavifard	Investigating the Effect of Employer Brand on Employees' Performance	Employer brand leads to high performance of employees and eventually competitive advantage.
4	2012	Rabiei	Investigating the Effect of Employer Brand Value Propositions on Domestic Marketing of Asia Insurance Co. in	Among employer brand value propositions, social value and reputation have respectively the greatest impact on the company's domestic marketing and development, economic and diversity values are the next priorities.

			Tehran	
5	2016	Prasad	The Effect of Employer Brand Dimensions on Job Satisfaction: Gender as a Moderator	Training and development, diversity, reputation, organizational culture, ethics, social responsibility and work-life balance are effective on job satisfaction. These components are all important dimensions of employer brand.
6	2011	Longhi	Impact of Cultural Diversity on Wages and Job Satisfaction	There is a positive relationship between cultural diversity and wages. Also, cultural diversity improves job satisfaction among employees.
7	2008	Thacker & Holl	Behaviorally-Based Management Training: Linking Behaviors to Employee Satisfaction	There is a significant and positive relationship between job satisfaction and quality of supervision by the company/organization as an employer
8	2008	Coldwell, et al.	The Effects of Person–Organization Ethical Fit on Employee Attraction and Retention: Towards a Testable Explanatory Model	The dimension of person–organization ethical fit can explain behavior of those who consider corporate social performance consistent with their own ethical expectations and are attracted by them and tend to remain with a company.

**3. Method of the research**

From the aim perspective, this study is an applied research and from data collection perspective, it is a descriptive survey research. The research population consisted of 200 employees of Dana insurance branches in Tehran. The sample size was estimated 131 employees using Cochran formula. Random sampling was used in the present research. Data were collected through Prasad Questionnaire (2016) with 39 questions. 5-point Likert scale (ranging from strongly agree to strongly disagree) was used for measurement. Cronbach’s alpha (0.91) represents high reliability of the questionnaire. Its validity was approved by opinions of experts and university professors.

**3.1 Hypotheses and research model**

**The main hypothesis**

Employer brand has an effect on job satisfaction.

**Subsidiary hypotheses**

- Training and development has an effect on job satisfaction
- Fame and reputation has an effect on job satisfaction
- Work-life balance has an effect on job satisfaction
- Social responsibility has an effect on job satisfaction
- Organizational culture has an effect on job satisfaction
- Diversity has an effect on job satisfaction

**3.2 The research model**

Figure 1. The conceptual model of the research

**4 .Data analysis**

**4.1 Evaluation of demographic characteristics**

Table 2. Results obtained from demographic statistics

Demographic variables		Frequency percentage
Work experience	5 years and less	19%
	5-10	26.71%
	10-15	38.16%
	15 years and over	17.55%
Education	Diploma and lower	0%
	Associate and Bachelor’s degree	67%
	Master’s degree and higher	33%
Age	20-30	25%
	31-40	40%
	Over 41	35%
Gender	Female	41.5 %
	Male	58.5%

#### 4.2 Investigating the reliability status

Table 3. Reliability status

Variable	Cronbach's alpha	Reliability status
Training and development	0.89	High reliability
Fame and reputation	0.89	High reliability
Diversity	0.9	High reliability
Organizational culture	0.91	High reliability
Work-life balance	0.92	High reliability
Social responsibility	0.9	High reliability
Job satisfaction	0.89	High reliability
Total	0.91	High reliability

#### 4.3 Investigating the status of data distribution

Table 4. Result obtained from Kolmogorov-Smirnov test for each component

Variable/index	Number	Mean	Test statistic	Sig	Test result
Job satisfaction	131	3.33	0.095	0.055	normal
Training and development	131	3.13	0.089	0.386	normal
Fame and reputation	131	3.39	0.103	0.234	normal
Work-life balance	131	2.9	0.095	0.365	normal
Social responsibility	131	3.15	0.126	0.055	normal
Organizational cultural	131	3.3	0.11	0.081	normal
Diversity	131	2.82	0.13	0.096	normal

#### 4.4 Investigating correlation among variables

Table 5. The correlation matrix

Variable	1	2	3	4	5	6	7
Training and development	1	0.786	0.652	0.603	0.553	0.905	0.739
Fame and reputation		1	0.617	0.511	0.42	0.81	0.941
Diversity			1	0.525	0.636	0.592	0.695
Organizational culture				1	0.441	0.487	0.499
Work-life balance					1	0.379	0.476
Social responsibility						1	0.713
Job satisfaction							1

#### 4.5 Answer to the research hypotheses

**The main hypothesis:** According to table 6, the correlation coefficient between employer brand and job satisfaction is (0.689) showing that there is a relatively good correlation between these two variables. According to table 7, since the

significance level (0.000) is less than 5%, the hypothesis of linear relationship between these two variables is accepted. According to table 8, since the significance level (0.000) is less than 5%, employer brand has significant effect on job satisfaction.

Table 6. A summary of research model

Model	R	Coefficient of determination	Adjusted coefficient of determination	Standard error of the estimate
1	0.83	0.689	0.686	0.299

Table 7. Results obtained from regression analysis of variance

Model	Sum of squares	Degree of freedom	Mean square	F	Sig	
1	regression	25.642	1	25.64	285.658	0.000
	remaining	11.58	129	0.09		
	total	37.22	130			

Table 8. The impact factor of independent variable

Model	Non-standard impact factor		Standard impact factor	t	sig	
	B	Standard error	Beta			
1	constant	0.338	0.176		2.203	0.029
	Employer brand	0.944	0.056	0.83	16.901	0.000

Dependent variable: Job satisfaction

**Subsidiary hypotheses:** According to table 9, the correlation coefficient among variables is (0.921) in the third model

showing that there is a strong correlation between dependent and independent variables of the research. According to table 10,

since the significance level (0.000) is less than 5%, the hypothesis of linear relationship between dependent and independent variables is accepted. As shown in table 11, beta coefficients of fame, diversity and social responsibility are significant in error level less than 0.05; therefore, they are

effective on job satisfaction. Table 12 shows excluded variables (variables of training and development, work-life balance and organizational culture) which have been removed from the equation due to small amount of beta.

Table 9. A summary of research model

Model	R	Coefficient of determination	Adjusted coefficient of determination	Standard error of the estimate	d-statistic
1	0.941	0.886	0.885	0.18	
2	0.953	0.907	0.906	0.16	
3	0.959	0.921	0.919	0.15	2.1

Table 10. Results obtained from regression analysis of variance

	Work-life balance	0.012	0.379	0.705
	Organizational culture	-0.018	-0.579	0.564

## 5. Conclusion

The effect of employer brand on job satisfaction was approved; therefore, it is suggested that managers strengthen components of employer brand to achieve job satisfaction.

The effect of fame and reputation on job satisfaction was approved; therefore, it is suggested that managers make an attempt to improve their own reputation and credibility. For this purpose, it may be appropriate to offer programs in accordance with the clients' and employees' rights, observe standards, respect opinions and needs of customers, be honest and keep promises, be clear at presenting services, make use of new services and apply fair prices.

The effect of social responsibility on job satisfaction was approved; therefore, it is suggested that company's managers carry out their responsibilities towards the environment and consider and implement some programs to help charities and of course, they can notify these programs in their advertising and marketing programs. It is suggested to monitor an accountability system to customer complaints as well as a private monitoring system can be designed and implemented for workplace crimes. They are obliged to respect all laws and regulations in workplace.

The effect of diversity on job satisfaction was approved; therefore, it is suggested that human resource managers accept employees based on their abilities and skills and ignore their gender and culture as negative categories in terms of

employment and admission. This issue is very important, especially in Iran; since there are different ethnics over the country, culturally, there is much cultural diversity. Also, the category of religion can be highly regarded. Regarding cultural diversity among employees, it can be very important to respect individuals' beliefs and pay attention to their merits. Another fundamental category is gender. Since this research has been conducted on an insurance company which presenting servicing activities and servicing spaces do not usually need men's physical power, it is expected that gender equality in recruitment and individuals' selection be observed.

## 6. Discussion & Analysis

The effect of training and development on job satisfaction was rejected. It could be caused by presenting inappropriate training against employees' needs which are not consistent with organizational culture, employees' current level of knowledge and skill and etc. It is proposed to conduct training needs assessment before holding training courses in order to prevent wasting organizational limited resources in addition to ensure the effectiveness of training courses.

The effect of organizational culture on job satisfaction was rejected. It could be caused by the lack of opportunity and condition for employees' participation, the low level of experience and specific knowledge, and lack of attention to employees' comments and suggestions by managers and administrators. If employees give their opinions but they are ignored in practice, and employees experience it over and over, they will be discouraged and will give no opinion or solution despite the suggestions and criticisms system. Hence, it is suggested that managers take advantage of means such as transformational leadership style, employees' training and most importantly the proper incentive system to create an appropriate atmosphere for participatory culture.

The effect of work-life balance on job satisfaction was rejected. It could be caused by more basic expectations of employees for welfare program. Also, when employees are dissatisfied with more important issues, it seems that implementation of welfare programs will have no significant effect on job satisfaction. According to Maslow's hierarchy needs, if basic needs are neglected, meeting other needs cannot have much impact on job satisfaction; therefore, it is suggested that human resource managers pay attention to this category and implement programs related to work-life balance.

**Abstract.** Afghanistan drug market is considered a potential market due to the absence of modern pharmaceutical manufacturers. The support lent by the Afghan government to the foreign investment, Iran's support for non-oil exports and abundance of favorable capabilities in Chemidarou Co. to enter export markets necessitate development of a written plan. The major goal of this research is identification, comparison and decision-making regarding proper exportation strategies for entrance into Afghanistan market to export Chemidarou pharmaceutical products. The theoretical framework is the strategic planning model of Fred R. David. The research territory included Chemidarou Co. and Afghanistan and the research time slot from which the information was collected was from 2007 to 2010.

**Keywords:** Strategy, Export, Drug, Competition, Opportunities and Foreign Threats, Domestic Strengths and weaknesses, Government, Strategists, Holding, Cartel

### 1. Introduction

Export is the least risky way to enter global markets. Sales through export need the least allocation of facilities and impose the lowest possible changes in the internal programs of companies. This process is carried out directly or indirectly. Lack of favorable strategy and lack of proper methods to enter the market have led to reduction in market shares of Iranian products. Although there are favorable capacities in drug manufacturing in Iran, lack of an effective export strategy will result in losing opportunities available on the neighboring countries markets, especially Afghanistan (Clarke, 2007). Expanding geographic scope of activities, diversifying the activities, acquiring other companies, producing and selling products, penetrating into market, reducing the costs, selling a share of assets, delegating a large part of authority, and arranging for private partnership are among strategies the company can adopt. (Abzari and Alisafari, 2004; Mohammad Mehdi, 2001)

With more than four decades of experience in drug manufacturing and favorable experience in exporting drugs to Afghanistan, Chemidarou Publicly Traded Company needs proper strategy to export its pharmaceutical products. (Alvani, 1997). A sound strategy helps it promote its strengths and reduce its weaknesses in order to make use of opportunities available on the market and get through looming threats; thereafter, the company's share of market will increase and its position will be stabilized. Finally, a favorable mental image of its products will be left on the market (Stringer, 2002).

It is noteworthy that exports to Afghanistan is not a fresh experience, but lack of a proper strategy has led to a reduction in the market share and a slide in the monetary value of exports (Rezaeeian, 1992). To address the issue, the researcher chooses the lack of export strategy as the research problem in order to identify strengths, weaknesses, opportunities and threats to develop a strategy for exports (Zahedi et al., 2000).

Application of a strategy for drug export to the neighboring countries, particularly Afghanistan, seems necessary more than any other times due to their potential markets (Robbins and Judge, 2007). One requirement to enter Afghanistan market is formulating a strategy for export, which contributes to the

powerful presence on that market and also successful competition with foreign and domestic actors (Reymon Brus, 2000). In summary, it is an applied, exploratory field study. Theoretical framework of this research is the strategic management and planning model of Fred R. David. (Armstrang, 2005).

First phase: Entrance phase

First, strengths and weaknesses of the company and opportunities and threats the company would encounter on the Afghan market were discussed at the brainstorming session with the company's 21 middle managers in attendance (Lorndge et al., 2005). The session helped the participators identify strengths and weaknesses and opportunities and threats. A questionnaire to evaluate internal and external factors was distributed among the managers and the questionnaire results were analyzed (Terri, 2002)

Second phase: Comparison phase

A comparison was made by the organizations between skills, internal resources, opportunities and risks. In this phase, using SWOT matrix, all feasible strategies were identified. Thereafter, strategic position and action evaluation (SPACE) matrix was used to specify whether the organization's strategy should be aggressive, conservative, defensive or competitive (James et al., 2003). Then, using grand strategy matrix, the status of the organization was examined to determine what squares of the matrix the organization should be positioned on, and feasible strategies were announced. (Robert, 2005; Walker, 2007).

Third phase: Decision making phase

In this phase, i.e. decision-making, quantitative strategic planning matrix (QSPM) is used to objectively specify different strategies which are the best among their counterparts. (Marshall and Gerchen, 2002)

### 2. Main topics

Using Fred R. David model, the strategy of Chemidarou for exporting pharmaceutical products to Afghanistan was devised as described below:

#### 1.2 Internal Factor Evaluation Matrix (IFE)

Analyzing Chemidarou weaknesses and strengths, we obtained 9 strengths and 5 weaknesses after the brainstorming sessions and seeking guidance from advisors and supervisors. Then, internal and external factor evaluation questionnaire was completed by the statistical population. The final score of the company's strengths and weaknesses was 22.3. It means the company is above average regarding internal factors, so its strengths outweigh weaknesses. (Andrews, 1989)

The most important identified strengths are as follows:

- Product competitiveness on the domestic market, being ranked second in the number of items sold, standing tenth in rial value of the sold items, winning the title of Tehran Province exemplary exporter.
- Production of new products and putting them onto the market annually.
- Developing and building new factory with international standards and obtaining related licenses.

The most important identified weaknesses are as follows:

- Shortage of professional staff skilled at international drug marketing

- Lack of liquidity regarding outstanding claims from distributing companies

**2.2 External Factor Evaluation Matrix (EFE)**

Brainstorming sessions and guidance seeking from advisors and supervisors resulted in identification of 9 opportunities and 5 threats on the Afghan market. After the questionnaire was completed, the final score related to the company's opportunities and threats totaled 2.98. It means the company can react favorably if it faces factors which pose threat or opportunity. In other words, the company makes use of available opportunities favorably and minimizes the effect of threat-creating factors to the lowest possible level (James et al., 2006).

The most important opportunities

- Advanced structure of Iran's pharmaceutical industry compared with Afghanistan
- Development of political and economic cooperation, conclusion of multiple memorandum of understandings and agreements between Iran and Afghanistan
- Having competitors who practice different religions and their remote distance to Afghanistan

Practicing same religion, having historic, cultural and linguistic commonality, and, as a result, existence of positive view over Iranian pharmaceutical products.

The most important threats

- Insecurity, riots and terrorism
- Activities of domestic and foreign competitors in Afghanistan

**2.3 Threat, Opportunities, Weaknesses and Strengths matrix (SWOT)**

Table 1 Threats, opportunities, weaknesses and strengths matrix (SWOT)

	<p><b>Strengths (S)</b></p> <ol style="list-style-type: none"> <li>1- Professional individuals among managers of the company, using incentive and deterrent systems, and, as a result, obtaining an acceptable ranking in the Award for Human Resource Empowerment</li> <li>2- Product competitiveness on the domestic market, being ranked second in the number of items sold, standing tenth in rial value of the sold items, winning the title of Tehran Province exemplary exporter.</li> <li>3- Effective budgeting and planning and, as a result, supplying products to the distributors based on the market needs</li> <li>4- Favorable profitability of pharmaceutical products</li> <li>5- The possibility of increasing production capacity based on the available resources and production in accordance with national standards and obtaining ISO quality management standards</li> <li>6- Favorable experience in Afghanistan and Iraq and exporting products based on the customers' needs</li> <li>7- Manufacturing new products and putting them onto the market on a yearly basis</li> <li>8- Developing and building a new factory according to international standards and receiving related licenses</li> <li>9- Applying IMS to promote efficiency and using paperless systems in official correspondences</li> </ol>	<p><b>Weaknesses (W)</b></p> <ol style="list-style-type: none"> <li>1- Low experience on international market</li> <li>2- Shortage of professional staff skilled at international drug marketing</li> <li>3- Lack of liquidity regarding outstanding claims from distributing companies</li> <li>4- Lack of GMP confirmation from the international organization despite receiving confirmation of its country Ministry of Health</li> <li>5- Disability to manufacture products as the first producer</li> </ol>
<p><b>Opportunities (O)</b></p> <ol style="list-style-type: none"> <li>1- Development of political and economic cooperation, conclusion of multiple memorandum of understandings and agreements between Iran and Afghanistan</li> <li>2- Practicing same religion, having historic, cultural and linguistic commonality, and, as a result, existence of positive view over Iranian pharmaceutical products</li> <li>3- Active participation of Iranian drug manufacturers in Afghanistan and receiving increasingly positive feedback</li> <li>4-Laws which support non-oil export from Iran</li> <li>5- Protective policies for absorbing investment and insuring pharmaceutical products in Afghanistan</li> <li>6- Advanced structure of Iran's pharmaceutical industry compared with Afghanistan</li> <li>7- Having competitors who practice different religions and their remote distance to Afghanistan</li> </ol>	<p><b>SO strategies</b></p> <ol style="list-style-type: none"> <li>1- Participation in building drug manufacturing factories (S1,6,8 / O1,3,5,6)</li> <li>2- Building drug manufacturing factories (S1,6,8 / O3,5,6)</li> <li>3- Direct exports through delegation (S1,2,3,6 / O1,2,3,4)</li> <li>4- Formation of an exportation holding from Iranian companies in Afghanistan market (S1,2,3,6,9 / O1,2,3,4,7)</li> </ol>	<p><b>Strategy WO</b></p> <ol style="list-style-type: none"> <li>1- Trilateral participation for manufacturing products with high technology (FDO confirmation holding company with an Afghan firm) (W1,3,4,5 / O1,2,5)</li> <li>2- Using skilled advisors/advising companies which are experienced in international marketing of pharmaceutical products (W1,2,3 / O2,3,4,6)</li> </ol>
<p><b>Threats (T)</b></p> <ol style="list-style-type: none"> <li>1- Lack of proper IT system in Afghanistan and, as a result, lack of modern distributing systems and databases</li> <li>2- Shortage of specialized doctors and advanced pharmacies</li> <li>3- Shortage of professional staff, low efficiency and, as a result, increase in unemployment rate, and rise in inflation</li> <li>4- Culturally underdeveloped, resolving problems through tribal procedures</li> <li>5- Insecurity, riots and terrorism</li> <li>6- Presence of domestic and foreign competitors on the Afghan market</li> </ol>	<p><b>ST strategies</b></p> <ol style="list-style-type: none"> <li>1- Branding in the Afghan market (S2,5,7 / T6)</li> <li>2- Training professional manpower skilled at drug distribution and providing them with franchise (S1,6,9 / T1,3,6)</li> </ol>	<p><b>WT strategy</b></p> <ol style="list-style-type: none"> <li>1- Insuring the products regarding Afghanistan political situation (W1,3 / T4,5)</li> <li>2- Making use of Islamic Republic of Iran political influence over influential Afghan agents who can support drug exports (W1,2,4 / T1,3,5,6)</li> <li>3- Cash sales with minimum risk (W3 / T1,4,5)</li> <li>4- Taking part at trade fairs and cash sales (W1,2,3 / T1,5,6)</li> </ol>

## 2.4 Strategic position and action evaluation (SPACE) matrix

This four cell matrix determines whether the type of applicable strategy is aggressive, conservative, defensive or competitive. A total of 21 questionnaires were filled out by the senior manager, members of the board and middle managers. The average scores were calculated as described on the table 1 presented in the appendices. According to the annexed diagram, the company falls on the aggressive cell, indicating that it is a financially sound firm and operating in a sustainably growing industry with competitive advantages.

## 2.5 Grand strategy matrix

Any organization falls on one cell of the grand strategy matrix, regardless of its industrial position. The position of organizations can be determined based on their competitiveness and market growth. Results obtained from the questionnaire filled by the statistical population indicates that the organization falls on the first cell of the matrix. It is indicative of its excellent position as described below.

Current markets (market penetration and development)  
Products (product development)

A company which holds such position will find it unreasonable to lose such status (having a strong competitive advantage). The companies falling on the first cell and having large resources should use backward integration, forward integration and horizontal integration strategies. Homogeneous variety can reduce the risks of a unique product when a company commits itself to producing and distributing a distinctive item.

## 2.6 Quantitative strategic planning matrix

The quantitative strategic planning matrix is used as an analytic framework. Relative attractiveness of strategies is determined by using the quantitative strategic planning matrix. Regarding the obtained results from SPACE matrix, which evaluated the organization position as aggressive, strategies resulting from SO were sent to 21 managers through questionnaires and, after they were filled up, the results were calculated. According to the results, the first applicable strategy is "formation of a holding from Iranian companies for Afghanistan market".

## 2. Conclusion

Aggressive strategies are appropriate for the company regarding the result obtained from the SPACE matrix. Four SO strategies from the SWOT matrix were tested. These 4 strategies are listed below in order of priority.

- 1-Formation of a holding from Iranian companies for Afghanistan market
- 2-Participation in building drug-manufacturing factories in Afghanistan
- 3-Direct exports to Afghanistan through agents
- 4-Building drug-manufacturing factories in Afghanistan

In summary, we describe the issues related to the above mentioned strategies.

### 3.1 Strategy of formation of an exportation holding from Iranian companies on Afghanistan market

To effectively implement the holding, the following recommendations are made:

General approaches must be in line with promoting the country's capabilities to use potential and actual opportunities available on the free market.

In line with high level documents (20-Year Vision Plan and the Fourth National Development Plan), the principle of government

downsizing and reduction in government involvement should be taken into consideration. To that end, government involvement should have a descending trend (Boroujerdi, 1991).

Infrastructures and privatization capabilities including capital markets, laws for private sector activities, corresponding political factors, etc. must be promoted.

Professionalizing the management to maintain organizations' dynamic and sustainable equilibrium on free market environment.

In line with maintaining a trade-off between structure effectiveness and strategy, the structure of holdings should be examined. Some structures should be designed to help the organizations become well responsive to environmental complexity. (IRICA, 2007)

Meritocracy and professionalism in assigning managers and avoiding political devastating influence should be institutionalized as the major principle.

### 3.2 Strategy of participation in building pharmaceutical factories in Afghanistan

The foreign investor might obtain its required capital independently (independent investment) or carry out its economic activities through joint investment. Legally, foreign independent investors are the subsidiaries which have 100% foreign ownership (Strategic management of Human resource, 2006). Subsidiaries are headquartered in the host nation but their entire stocks or the majority of them are owned by the foreign company. In joint foreign investment, investment costs and the obtained benefits are distributed among domestic and foreign investors. Nowadays, the majority of developing countries prefer this kind of investment for its benefits (erest, 2002).

### 3.3 Strategy of direct exports through agents

By the time a company has extra capacity in the factory located in the parent country, it can probably operate effectively on limited market. Since the production fixed costs are covered by domestic sales, foreign sales costs can be determined based on the variable costs instead of total costs. When foreign sales outweigh domestic sales, or the production reached the maximum capacity of the factory, this pricing strategy is ignored. (Suzan et al., 2003)

One advantage of this strategy is that companies can receive better indication of foreign sales before engaging their resources for production in other countries (Matching research, 2003).

The other advantage is that companies become familiar to the operating environment of the other country before investing abroad

### 3.4 Strategy of building pharmaceutical factories in Afghanistan

To make direct investment, control should accompany investment; otherwise, it is defined as "investment through securities". Regarding the direct investment, companies should perform in such a way that the government does not dictate whom they must hire, what they must sell (or at what price they must sell), and how they must distribute incomes (Hunger and Wheelen, 2007).

The control over the company will be handed over to the government if all conditions are not included. For investors, the control is an important issue, since they do not feel like handing over all their critical resources to a domestic or foreign organization which can make all operating decisions independently and freely. (Fred, 2007)

If new inventions, trademark and management knowledge are handed over to these companies, they might be misused to degrade the competitive position of the original holder. Next to that, operating costs will reduce, if "control" exist, in addition to the following cases:

1. The parent company and the subsidiary have the same organizational culture.
2. The company can hire internal managers who understand its goals.
3. The company can avoid lengthy negotiations with other companies.

**Abstract.** This research, is an applied research in terms of purpose, and is cross-sectional study in terms of descriptive-analytic method with survey approach, and is causal. Reliability of tools has been approved as (0, 96) by Cronbach's alpha and the validity was approved first ostensibly and then was 0, 72 based on KMO factor analysis. The spss software is used in descriptive statistical analysis and to test the hypotheses from structural equation modeling LISREL software is used in which results show that management commitment in internal marketing has positive effect on understood working attitudes of employees. Considering the results of the study, with increased management commitment in internal marketing of Iranian Central Oil Fields Company the internal communications of official staff of this company will strengthen.

**Keywords:** perception of management commitment - internal marketing - formal internal communication - attitude to work

### 1. Introduction:

In order to create a positive working attitude among staff, service delivery managers must be committed to employees. Result of management commitment in organizations is that to provide benefits for employees that employees willingly try to achieve organizational goals. Nowadays internal marketing is an integral part of management science and how its enforcement has undeniable impact on the profitability of companies. On the other hand, one of the assets of any organization is its employees and satisfied and empowered employees is one of the necessary conditions for progress of each organization (Eric et al. 2016).

So any manager and organization should do set of actions to create a positive attitude among staff. Nowadays internal marketing is known as a strategy for the implementation of organization programs. Studies in this area suggests that internal marketing activities improves competitiveness and enhances competences through influence and motivating employees (Dehghan and Fathi, 2013).

Internal marketing can be considered as a source of competitive advantage. By which managers can prepare and provide a context for performance improvement due to underlying factors in creating a positive attitude to work among their employees. A person can have thousands of attitudes, but in organizational behavior attention is paid on a limited number of attitudes about the job, which include: Job satisfaction, professional affiliations, organizational commitment (Abzari et al. 2010).

In organizations where employees have less positive attitudes toward their jobs there is higher absenteeism, lower job satisfaction and higher displacement. Internal marketing, can cause changes in employee attitudes and consequently, staff eagerly provide high quality service (Cooper and Cronin, 2011).

The important issue that is emphasized more in internal marketing is organization communications. Managers are always in idea of finding ways to communicate efficiently with their employees in order to maintain optimal efficiency and supply goals (Amini and MirDamadi, 2008). A senior executive or manager must understand that success of the organization in maintaining its goals, depends on effective communications network. If CEO know himself committed to communication with words and deeds, the rest of the organization will also obey

him. Successful and leading companies consider relationship with employees as important and crucial process of management. Management commitment in organization and attention to the communication topic, whether it is formal or informal, can play a crucial role in promoting working industry attitudes (Shafiabadi, 2010).

There is types of communication methods that are done over a wide area and in official environments. Social communication and a communication that is established in organizations and administrative educational system for communicating regulations and rules with subordinates. Official relations means conscious network structure of roles in an organization or among several organizations which officially organized and determined. Formal communication is scheduled structure of roles, which is formally organized. In other words, formal communication, is a system or network of communication and disposal that connects together individuals and groups doing important tasks (Qadikalayi et al. 2013, Cascio et al. 2010, Robbins, 2014).

In organizational charts, can show formal structure of the organization and who is responsible for what type of work or activity. Also organizational chart can determine institutional weaknesses, such as additional work or potential conflicts. But the organizational chart makes some features of organizational structure remain hidden from sight (Rostami, 2016). From one perspective, organizational charts suggests that people at the same level, has the same or equal authority and responsibility; While this situation not always is true; Organization Chart cannot cause problem in relationships between individuals (non-official organization), or be stumbling block (Kim, 2012).

Zarei (2007) did a research with the title of "impact of management commitment to internal marketing on the attitude of employees in three star hotels in Esfahan city". The aim of this study was to examine the management commitment to the attitude of staff with mediating variable of internal marketing (official and non-official internal communications). Results of this research is that confirmed internal marketing practices, including formal and informal communication, the only exception was direct relationship between the official communication and attitude and this relationship was moderated by informal communications, therefore hotel managers effectively used informal channels of communications (Shermer et al. 2006).

Eric et al. (2016) studied the effect of trust and commitment on the internal marketing. Their goal was to evaluate the effect of trust and commitment on internal marketing in the hospital industry. The results showed that commitment and trust in 5 main job training, motivation, cooperation, communication and internal company targets has an important role in internal marketing.

Luo et al. (2012) mentioned to assess employee attitudes in their study titled "the effect of management commitment in internal marketing on working behavior of employees". The aim of this study was to evaluate the effect of internal marketing methods (communication, both informally and formally) on working attitudes of employees. The results of this study show that informal communications prior to formal communication and covers it and management can have an impact on employees' attitudes through more efficient and effective informal communications.

Kaplan and David (2008) in an experimental study investigated the correlation between internal marketing, job satisfaction, organizational culture and organizational performance in the insurance industry in Taiwan. The aim of this study was to evaluate the effect of internal marketing factors (remuneration,

development, vision of the organization) on behavioral, financial and service performance of employees. The result is that the internal marketing will have a positive effect. Internal marketing, also, has a direct effect on organizational performance. Internal marketing indirectly and through the impact on job satisfaction also causes to increase organizational performance.

Formal and informal internal communication, has been identified as the main elements of internal marketing. Therefore, in this study we will follow up to investigate impact of management's commitment on working attitude of employees through internal marketing actions according to official internal communications of Iranian Central Oil Fields Company. Since the oil industry is one of the most important manufacturing and development industry of the country and its employees are its main asset, so positive working attitude and performance of employees has a critical role in improving the organization's performance, which can provide a competitive advantage for company. But accepting the current situation shows that positive working attitude of staff in the oil company is not high that reason for this may be the result of individual and organizational factors that in words may be one of the most important factors of senior management commitment to internal marketing discussion and commitment level of this company's authorities may not be enough to the internal marketing (Martin et al. 2013). Even in some situation the first step to do internal marketing mostly is acceptance of this act by the authorities, and if the authorities won't have commitment to it, there will be no action or effectiveness (Moghimi, 2010).

## 2. Purposes and Methodology:

In this study, management commitment in internal marketing is the independent variable, working attitude of employees is dependent variable and official internal communications is the mediator variable. The scientific goals of the study are as follows:

- Determine the effectiveness of management's commitment in internal marketing on staff working attitude
- Determine the effectiveness of management commitment in internal marketing on official internal communications
- Determine the effectiveness of official internal communications on working attitude of staff

Research hypotheses are also defined as follows:

Hypothesis 1- management commitment in internal marketing has positive and significant effect on perceived working attitude of employees.

Hypothesis 2 - management commitment in internal marketing has significant positive effect on official internal communications.

Hypothesis 3 official internal communication has positive and significant effect on perceived working attitude of employees.

Present research, in terms of purpose is among applied researches according to that it moves to the practical application of knowledge. The nature of this study is in terms of methods and research is analytical that is conducted through a survey. In the present study to collect information relating to literature through libraries, internal scientific journals, relevant Theses are used and to collect statistical information, the survey method and questionnaire are used. The tools used for data collection is questionnaire.

Table 2: The KMO value and Bartlett and significance level of research variables

variables	KMO	Bartlett	freedom degree	significance level
management commitment in internal marketing	0.723	90.998	6	0.00
official internal communications	0.823	139.969	10	0.00
Informal internal communications	0.842	123.291	10	0.00
working attitude of employees	0.727	67.601	10	0.00

## 2.1. Reliability (trust) of research tools:

There are several methods used to calculate the reliability of a questionnaire that some of them can be mentioned such as: Reimplementation methodology (retesting), split-half method (half off), parallel method test (peer), Kurd Richardson method and Cronbach's alpha and... (Sarmad et al, 2015, 169). Cronbach's alpha is the method that is used in this research.

Obviously, however Cronbach's alpha is closer to 1, internal consistency between questions is more and thus questions will be more homogeneous. In order to calculate Cronbach's alpha for 30 questionnaires were distributed and collected among workers of company headquarter sector of Iran Central Oil Fields in Tehran and the results were analyzed using version 21 of SPSS software. The following table shows the Cronbach's alpha values of the present study variables.

Table 1: Cronbach's alpha values of research variables

variables	Cronbach's alpha values
Perception of management commitment in internal marketing	0.925
official internal communications	0.936
Informal internal communications	0.944
working behavior and attitude of employees	0.832
All statements	0.961

In case of measuring devices modification (Remove items that cause increase in intended components alpha) alpha values could desire more to its previous amount.

Therefore each of questions questionnaire and internal consistency of the questions were examined but the results showed that in case of removing any of the questions, confidence coefficient will reduce thus these questions has high value and in none of the cases of removing questions will not led to an increase in confidence coefficient therefore, this indicates internal consistency of questions. Finally, with regard to the calculated confidence coefficient and other results was revealed that used questionnaire that its total alpha value equals to 0.961 has required value and reliability (consistency).

## 2.2. Validity (credit) of research tools:

The purpose of validity is that whether the measuring tools can measure features and characteristics that the tool is designed for or not? To measure the validity of present study, face validity method and construct validity were used. In this regard, after adjusting questionnaire data collection tools were given to professors (Supervisor, professors of Azad University of Tehran in the field of management) and statisticians to collect and apply through their comments. After making any necessary amendments finally questionnaire was distributed among Iran Central Oil Fields Company staff in Tehran.

- Second statistic, Bartlett's test of sphericity:

This test is used to ensure the suitability of data for factor analysis stating that correlation matrix that is placed as base factor analysis is not equal to zero.

Results and findings of table 2 shows that all variables with KMO value higher than 0.5 are significant in smaller error level than 0.01 so research variables have higher internal consistency.

**2.3. Implementation Methods:**

First administrative procedure was conducted by the Department of Education and the necessary permits were obtained. 350 questionnaires were distributed among employees by attending desired units (cost control unit, accounting, product, technical inspection, legal, contracts, engineering building and administration). 313 questionnaires of the 350 questionnaires,

were collected in full. The table below show the full questionnaire collected in every unit. It took about two weeks for data collection in which the researcher has personally completed the entire questionnaire.

**3. Analysis of the results:**

In this section, findings and results are presented as descriptive statistics and inferential statistics.

**3.1. Descriptive analysis**

Figure 1: Distribution of respondents by gender

Table and graph 1 shows the frequency distribution of gender. According to the findings reported in this table, 16% of

respondents were female and 84 percent were male. In other words, most respondents are men.

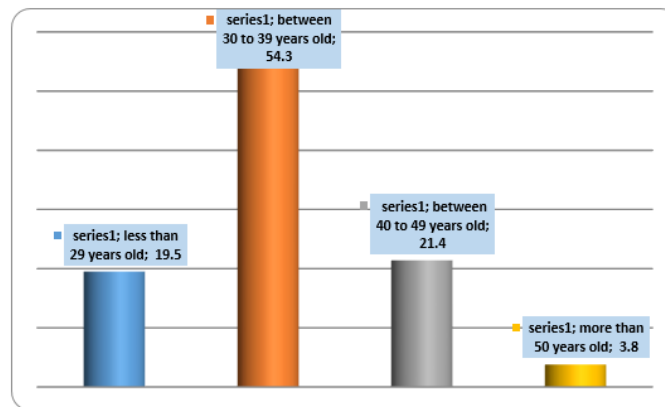

Figure 2: Distribution of respondents by age

Figure 2 shows frequency distribution of age variable among respondents. Based on the findings of this table, 19.5% Of respondents are in the age group 20 to 29 years, 54.3% between 30 and 39 years, 21.4% in the age group 40 to 49 years and 3.8

percent were in the age group above 50 years. These findings show that more than 54 percent of Iranian Central Oil Fields Company employees are in age group 30 to 40 years.

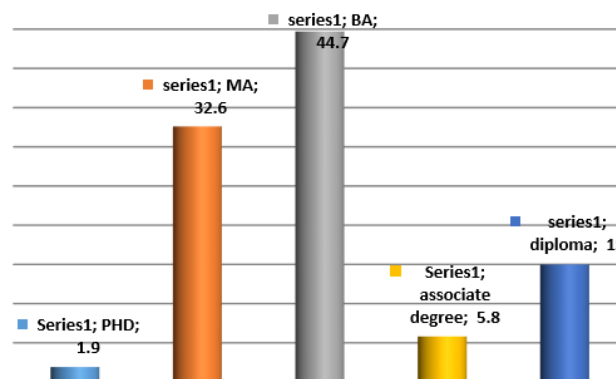

Figure 3: Distribution of respondents based on the respondents' level of education

Table and Figure 3 shows the frequency distribution of educational level of respondents in which 15% of respondents were high school graduates, 32.6% associate degree, 44.7

percent have Bachelor's degree, 32.6 percent have master degree and 1.9 percent have PhD. The results show that most of respondents have Bachelor's degree.

Table 3: partial frequency distribution of mediator factor of internal marketing practices

questions choice	Internal marketing practices					total frequency	observed average	Observed variance	observed standard deviation
	Frequency of response								
	Totally disagree	disagree	No comment	agree	Totally agree				
After the official internal communications									
1	84	113	48	56	12	313	2.35	1.35	1.16
2	55	109	60	71	18	313	2.64	1.38	1.17
3	61	96	64	75	17	313	2.65	1.42	1.19
4	89	80	61	63	20	313	2.50	1.61	1.26
5	82	86	62	71	12	313	2.50	1.46	1.20
Average	89	102	75	44	3	313	2.26	1.10	1.05

Results of Table 3 shows the descriptive information related to the mediator variable of internal marketing practices in examples that in it reveals amount of people which have chosen options related to any question in questions of associated variable. In this table Question 5 to 13 of questionnaires that are associated

with this variable, has been described. As can be seen, observed average of all questions and total average of all questions of this variable (2.31) was lower than the theoretical average that is 3, this shows that the Iranian Central Oil company's internal marketing practices is low.

Table 4: Frequency distribution of the working attitude dependent variable

questions choice	working attitude of employees					total frequency	observed average	Observed variance	observed standard deviation
	Frequency of response								
	Totally disagree	disagree	No comment	agree	Totally agree				
1	15	68	51	140	39	313	3.38	1.21	1.10
2	21	46	53	130	63	313	3.53	1.35	1.16
3	36	82	60	90	45	313	3.08	1.58	1.25
4	15	41	47	149	61	313	3.63	1.17	1.08
5	46	64	69	112	22	313	3	1.43	1.19
Total Average	27	57	125	101	3	313	2.99	0.89	0.94

Table 4 shows the descriptive information related to the dependent variable of working attitude of employees in the sample that in it reveals amount of people which have chosen options related to any question in questions of associated variable. In this table questions 14 to 18 of questionnaires that are associated with this variable, has been described. As can be seen, observed average of all questions and total average of all questions of this variable (2.99) is almost equal to theoretical average 3 and this results show that working attitude of the Iranian Central Oil fields Company employees is average.

In the inferential analysis normality assumption of samples is studied using the one-sample Kolmogorov-Smirnov test, then research hypotheses are tested using structural equation test.

To check and test hypotheses must first check that the parameters or nonparametric tests will be used. For this purpose, the Kolmogorov-Smirnov test is used, and if the assumption of normality hypothesis was confirmed, parametric method is used and if Normality assumption is not confirmed the nonparametric method will be used.

### 3.2. Inferential analysis:

Normality test results of the research variables can be seen in Table 5.

Table 5: normal distribution test of variables

Variable	The amount	score of Kolmogorov - Smirnov Z statistic	p-value	Decision making	Test result
Internal marketing management commitment	313	0.542	0.231	Accepting the null hypothesis	A normal distribution
official internal communications	313	0.731	0.354	Accepting the null hypothesis	A normal distribution
Employees attitude to work	313	0.863	0.278	Accepting the null hypothesis	A normal distribution

According to the p-value amounts obtained in the above table, which all are greater than 0.05, the null hypothesis meaning the assumption of samples normality distribution is confirmed at the level of 5 percent. Meaning there is no significant difference between the distribution of samples with normal distribution. Thus, according to the normality of the studied samples, parametric methods will be used to test the research hypotheses. Then, to test the hypothesis of path analysis and structural equation method (SEM) will be used.

#### 3.2.1. Factor analysis related to perceived management commitment variable in internal marketing

Perceived management commitment model in internal marketing is measured using 4 indicators (items). As can be seen in Table 6 the items include (t1-t4). Standardized parameter estimates show that all indices are statistically significant ( $p < 0.05$ ), and their factor loads are at a high level (more than 5.0). Also fitness indicators results reviews show proper fitness of model and all fitness indicators are placed in the reception area.

So this perceived management commitment measuring model in internal marketing is accepted without any changes.

Table 6: Verified statements of perceived management commitment in internal marketing

Row	Main item	item tag	factor load	Significance level	item status
1	In our company senior management pay attention to satisfy their employees as much attention to customer satisfaction	t1	0.85	0.00	Confirmed
2	In our company senior management acts all promises that gives in line with employees activity	t2	0.81	0.00	Confirmed
3	In our company senior management has understood all effecting factors on employee job satisfaction (salary, management style, work environment, etc.)	t3	0.88	0.00	Confirmed
4	In our company senior management considers staff as the most important valuable human capital	t4	0.89	0.00	Confirmed

**3.2.2. Model fitting indicators**

After outlining the model basic ensure of accuracy and significance of information, the most important topic is significance of model by indicators that commonly are called

Goodness of Fit Index. Often to validate models, using three to five indicators seem to be enough that in this study criteria mentioned below are also used to evaluate the goodness of fit of all models and the number of each of these parameters CFI, RMSEA, AGFI, GFI are listed in tables separatel.

Figure 4: The factor analysis of perceived management commitment in internal marketing

First judgment criterion of model fitting in figure 4, is the freedom degree on the chi-square  $df / 2x$  which is used for one-dimensional structures and its value should be less than 3. Value of this indicators for the present model is  $(df/2x = 2,71)$  also  $RMSEA = 0,89$  that this amount is less than 0.1. Also other

important fitting indicators respectively are given below in the table. As seen in the table below, almost all indices have sufficient statistical, so with high reliability can be realized that researcher achieved a perfect fitting about this indicator.

Table 7: Selection of the important graphical model fitting indicators

Index	Index name	Brevity	Equivalent to English	amount	Acceptable fit
Absolute fitting indicators	Covered surface	-	Chi-square	2.71	Greater than 5%
	Goodness of fit index	GFI	Goodness of Fit Index	0.93	GFI > 90%
Comparative fitting indicators	Adjusted Goodness of Fit Index	AGFI	Adjusted Goodness of Fit Index	0.90	AGFI > 90%
	Comparative fit index	CFI	Comparativ Fit Index	0.94	CFI > 90%
thrifty fitting indicators	Root Mean Square Residual	RMSEA	Root Mean Square Residual	0.089	RMSEA < 1%

**3.2.3. Factor analysis related to internal marketing practices variable (formal internal communications)**

Internal marketing practices model is measured using nine indicator (items). As can be seen in Table 8 the items include (ras1-g.ras4). Standardized parameter estimates show that all

indices are statistically significant ( $p < 0/05$ ) and their factor loads are at high level (more than 0.5). Also fitting indicators results reviews show goodness of fit model and all fitting indicators are placed in the reception area. Therefore, internal marketing practices measuring model is accepted without any changes.

Table 8: internal marketing practices confirmed items

Dimension	Main item	item tag	factor load	Significance level	item status
official internal communications	In our company regular assessments, on issues of staff becomes clear that the demands of the employees involved	Ras1	0.83	0.00	Confirmed
	In our company managers communicate formally and indirectly with their staff to understand what factors lead to more satisfy employees	Ras2	0.87	0.00	Confirmed

	In our company managers met with the employees to understand expectations of their employees	Ras3	0.89	0.00	Confirmed
	In our company survey from employee is carried out at least once a year to evaluate the quality of communication	Ras4	0.85	0.00	Confirmed
	In our company survey from employee is carried out at least once a year to investigate their attitudes towards their jobs	Ras5	0.84	0.00	Confirmed

### 3.3. The final research model (Research Structural Equation)

Figure 5: Final structural equation model of research

Table 9 summarizes the path of structural equation model of this study, in this table, the values of both models are presented in case of T and standard mode.

Table 9: Selection of important fitting indicators of graphical model

(Formative-Reflective) path			Graphic signs	Standardized B coefficient	t
management commitment in internal marketing	F	official internal communications	tahod	0.86	16.71
management commitment in internal marketing	F	Informal internal communications	tahod	0.77	15.06
management commitment in internal marketing	F	Employee attitude to work	tahod	0.52	8.87
official internal communications	F	Informal internal communications	rasmi	0.99	24.76
official internal communications	F	Employee attitude to work	rasmi	0.53	9.41
Informal internal communications	F	Employee attitude to work	Ghir.rasmi	0.50	8.39

## 4. Conclusion

Internal marketing is known as a strategy for the implementation of organizational programs. Studies related to this field suggest that internal marketing activities improve the competitiveness and enhance competences through influence and motivating employees. Internal marketing can be considered as a source of competitive advantage. Through which managers can prepare and provide context for performance improvement due to underlying factors in creating a positive attitude to work among their employees. Of course internal marketing includes set of actions such as attracting, developing, motivating, and continuity of employees through job as a product and satisfaction of them that is identified with two main elements of official internal communications and non-official internal communications.

According to the pattern of path analysis and values in table 9 standard coefficient of path after management commitment in internal marketing equals to 0.52 and ( $t = 8.87$ ). Thus, according to T of this path ( $t = |8.87| > 2.56$ ), It can be concluded that with a probability of 99%, the H0 assumption is rejected and H1 assumption is confirmed. In other words, management commitment in internal marketing have a positive impact on perceived working attitude of employees and thus the relationship is positive and assumption is confirmed. In other words, in increments of one unit in variable of management commitment in internal marketing, perceived working attitude of

employees increases 0.52. Thus with an increase in management commitment in internal marketing of the Iranian Central Oil Fields Company the amount of perceived working attitude of employees in this company is strengthened.

According to the pattern of path analysis and values in table 9 standard coefficient of path after management commitment in internal marketing equals to 0.86 and ( $t = 16.71$ ). Thus, according to T of this path ( $t = |16.71| > 2.56$ ), it can be concluded that with a probability of 99%, the H0 assumption is rejected and H1 assumption is confirmed. In other words, management commitment in internal marketing will have a positive impact on official internal communications of employees and thus the relationship is positive and assumption is confirmed. In other words, in increments of one unit in variable of management commitment in internal marketing, official internal communications of employees increases 0.86 thus with an increase in management commitment in internal marketing of the Iranian Central Oil Fields Company the amount of official internal communications of employees is strengthened.

According to the pattern of path analysis and values in table 9 standard coefficient of path after official internal communications equals to 0.53 and ( $t = 9.41$ ). Thus, according to T of this path ( $t = |9.41| > 2.56$ ), it can be concluded that with a probability of 99%, the H0 assumption is rejected and H1 assumption is confirmed. In other words, the official internal

communications will have a positive impact on perceived working attitude of employees and thus the relationship is positive and assumption is confirmed. In other words, in increments of one unit in variable of official internal communications, perceived working attitude of employees increases 0,53 thus with an increase in official internal communications of the Iranian Central Oil Fields Company the amount of perceived working attitude of employees is strengthened.

## REVIEW AND EVALUATE THE PERFORMANCE OF THE FACTORY RADIATOR VALVES WITH FUZZY INFERENCE SYSTEM

<sup>a</sup>ABULFAZL ASADOLLAHI

<sup>a</sup>MSc of Industrial Engineering, Islamic azad University, Tehran, Iran

Email: <sup>a</sup> aboufazel.asadollahi17@gmail.com

**Abstract.** Using of formal evaluation systems comes back to 19th century. Change and development of evaluation indexes in the form of providing universal principals for evaluating the organizations to total quality management represents the course of evaluation systems development. In one hand, organizations spend lots of cost and time to develop, formulate and implement strategies to be able to achieve long-term objectives and perspectives. Therefore, knowing the performance and the situation of the organization in today's complex and dynamic environment is of great importance for managers. Hence, we want to evaluate the most important factors of radiator valves manufacturers in this study including financial and economic index, customers' index and environmental factors index.

**Keywords:** formal evaluation systems, situation of the organization, managers, financial and economic index

### 1 Introduction

Doing useful, effective and objective evaluations is the driving engine and starter of each improvement project. Performance evaluation is the most important tool for ensuring of precise and timely implementation of strategy in an organization. Conditions, scope, criteria, indexes and features of a performance evaluation system should be set based on the organization's conditions, strategy and features. If a performance evaluation system and its indexes are not proper for a given organization and can't meet the demands and needs of its stakeholders, managers and staff, it not only won't help to the problem solution but also won't be supported and will fail. If performance evaluation is done with processing, continuous and correct view, it will enhance the accountability of executive organizations, public trust to organizations and efficiency and effectiveness of government in governmental section. It also will improve resource management, customer satisfaction, national development, and will help to create new power, stability, and improve of world class of companies and institutions.

Shortage in traditional systems of performance evaluation led to a revolution in performance management so that researchers and users moved toward the creation of systems that consider the current objectives and environment. In this way, multiple processes were created to be used in various organizations. Many frameworks also suggested for supporting these processes, which their objectives were to help organizations in correct and proper evaluation of their performance. By developing and increasing the complexity, the definition of "performance" extended and gradually included all the dimensions of the organization and its processes.

Performance evaluation is one of the main duties of any organization and aspects of performance management. Organizations have complex nature, which is emanating from creative, unique and unstructured activities of this area and needs dynamic management for improving its situation. This management structure should be able to transfer continuously macro level decisions to operational layers and evaluate the results according to defined objectives. For doing so, we seek to evaluate the performance of radiator valves manufacturers and we believe that performance evaluation of this factory will increase the productivity, effectiveness, efficiency and motivation of staff. Since the part of needed information in evaluations are imprecise and descriptive and it is needed to reflect the spectral impacts of many indices quantitatively in evaluation, Fuzzy logic has been used for solving some of the problems (Qolamreza Tabarsa, 2008).

### 2 Performance Evaluation

Evaluation is one of important and effective management tools for achieving needed information for decision-making about the performance of an organization's staff. By correct use of this tool, not only objectives and missions of organization will reach optimal efficiency, but also the interests of staff and society will be met. In other words, it can be said that evaluation is the secret of management's success.

Perhaps, nothing is more difficult for managers than evaluating the performance of subordinates. However, performance evaluation is one of the features of today's professional world and can help to create efficient work force (Ashish & Zachary, 2004). In fact, the main objective of performance evaluation is to stimulate the employees for doing the tasks and the organization's mission. Improvements, assigned tasks, selection for training and increasing the salary based on evaluation can stimulate the motivation (Swansburg, 2002). Recognition of expected consequences of performance evaluation in health care systems can help managers to focus on evaluation process for achieving those consequences (Shah & Layman, 2005).

Expected consequences of performance evaluation contain:

- Performance improvement
- Knowing the educational needs and optimizing human resources
- Providing a basis for rewards and motivation.

It is expected that a valid and reliable performance evaluation system provide information about strengths and weaknesses and the needs of evaluated person for managers and the person itself. If this information is used for reinforcement of evaluated person's strengths and planning for progress in needed fields, it can improve performance, motivation and productivity.

Azadeh et al., (2015) addressed in a research the performance evaluation of electrical distribution units with random data envelopment analysis-based approach. In this research, network length, transfer capacity and staff number have been selected as input and a number of customers, total sold electricity are random output. Also in this research, the best electrical distribution unit is selected based on efficiency scores in random environment. The results of this research showed that network length is the most important and effective input factor.

Nana and Zhao (2016) in a research evaluated the performance of compatible thermal power stations with industrial environment using the combination of GRA-VIKOR in Fuzzy setting. They presented an effective algorithm in this model, which contains the decider's attitude in performance rating of criteria and integrating of objective information and subjective ideas in defining the weight criteria based on Fuzzy analytic hierarchy process and Shannon entropy. The research results showed that dependent criteria to trash recycling and pollutant emission are the most effective factors in this industry.

Khakpour and Zafarqandi (2015) in a research presented the safety performance evaluation based on organizational factors effective on industry safety using Fuzzy inference system. The research findings indicated that formulated model has the ability to evaluate the safety performance in industries and based on it, we can calculate the score, which shows the safety performance of industries. Using of the model in a company as the model's test place shows that safety performance score was calculated as 0.607. This amount is considered desirable with membership of 0.528 and average with membership of 0.472.

### 3 Fuzzy Inference System

For the first time in 1965, Lotfi-Ali Asgarzadeh raised the fuzzy set theory. Since then this theory has been applied as an important research tool in many fields of engineering problems including decision-making, monitoring and forecasting issues. The fuzzy theory means all theories that use the basic concepts of fuzzy set with membership functions so that fuzzy decision-making, fuzzy systems, fuzzy logic and fuzzy mathematics are among them.

Fuzzy math as a starting point in the fuzzy set theory provides a primary language for fuzzy systems. Fuzzy math alone is a vast field in which mathematical principles by replacing the fuzzy sets instead of classical mathematics collections have been developed. In this way all the branches of classic mathematics are converted in the form of fuzzy.

The main thing in the expression of fuzzy mathematics is the concept of fuzzy set. In practice classical sets are defined by specific membership condition. Against the fuzzy set there is a set of elements belonging to a space that its boundaries have not been defined precisely. In this case the membership condition of set isn't ascertained and precise.

Therefore, in the case of fuzzy sets, membership of element X in the A set isn't as binary type (element X belongs to set or does not belong to the set A), and this membership function is called  $\mu_A(x)$ . The membership function presents the amount of members' belongs to a set whose value is between the real deal of zero and one. Membership value close to one, indicates a high element of their belonging to set A and vice versa closer to zero, the less belong in the field. Membership value close to one indicates a high belongs of element X to the set A and vice versa approaching it to zero indicates less belongs to set. Using the concept of fuzzy set linguistic terms can be expressed mathematically. Oberguggenber has offered a way to define a fuzzy set. In this way, the value of each parameter with the membership value of  $\alpha$  has been defined by the interval of  $0 \leq \alpha \leq 1$ .

The definition of  $\alpha$ , is expressed by designer engineer or one who makes decision but remain constant during the whole process of modeling.

In the framework of fuzzy set method if the parameter value is between  $X_a$  and  $X_b$  and close to  $X_b$ , as well as is defined as membership in Equation 1, the fuzzy set will be a triangular fuzzy number (Figure 1).

$$\mu_A(x) = \mu_A(x; a, b, c) = \begin{cases} (x-a)/(b-a) & : a \leq x \leq b \\ (c-x)/(c-b) & : b \leq x \leq c \\ 0 & : x < a \text{ or } x > c \end{cases} \quad (1)$$

The cutting surface of  $\alpha$ , and the corresponding interval values of variable X that the membership degree of  $\alpha$  is corresponding to it, has been shown in the Figure 1. The corresponding interval of  $\alpha=0$  is the abutment of fuzzy numbers and the cutting surface for  $\alpha=1$  for triangular membership function, the range of values are reduce to an absolute number (lowest).

Figure 1 Triangular fuzzy number

### 4 Research goal

The aim of this study is to evaluate the performance of radiator valves plant in terms of three dimensions: financial, customer and an environment for optimal allocation of resources, controlling, directing, organizing and more.

### 5 Types and methods of research

In terms of research purpose, regarding the present study evaluate the performance of radiator valves plant, is classified in the applied research area. Also, the present study in terms of collection of the required data is classified as "exploratory research".

To collect research data in addition to the study of literature, the researcher made questionnaires were used and to prepare questionnaire, a meeting with the participation of seven experts and elites of factories was held and using Delphi technique, 12 components affecting the performance evaluation were recognized and classified in three dimensions, and ultimately, the recognized dimensions using the software MATLAB 2013, based on the Mamdani's mini-max fuzzy inference fuzzy and non-fuzzy of center of gravity method were analyzed.

The study population consisted of all employees of radiator valves factory (plant) with 180 people.

According to the population and using Cochran formula, the calculated sample size was calculated 122 people that these people were randomly selected.

$$n = \frac{\frac{z^2 pq}{d^2}}{1 + \frac{1}{N} \left( \frac{z^2 pq}{d^2} - 1 \right)} \quad (2)$$

### 6 Reliability and validity

To analyze the obtained data through the questionnaire, two methods of reliability and validity have been used.

- The validity: In this study, to ensure the validity of the questionnaire the face validity has been used. In this stage to begin the process of determining the face validity, the questionnaire was submitted to two specialists to examine the questionnaire in terms of desirability of statements about its clearness (using simple and understandable terms), the use of a common language (avoid using the term technical) and some changes were made in the items of the questionnaire to be easier and increase clients understanding. The face validity from the perspective of target group will respond to these questions: Is the designed tool relevant ostensibly to study purpose? Are people who are supposed to respond tools agreed with phrases and wording of tool? Is the perception of lay people (target group) is the same perception that researcher has? Are the components and the totality of tool acceptable for respondents? According to the description provided, the questionnaire in this study was shown to several professors as well as experts and eventually after the correction of errors was approved.

- Reliability: Several methods exist to measure the reliability and Cronbach's alpha is the most common technique and in this study to assess the internal consistency of items of questionnaire the Cronbach's alpha technique has been used. In the present study SPSS software was used to calculate it. The more Cronbach's alpha value, the more reliability of questionnaire, also if the Cronbach's alpha value is more than 0.7, the reliability would be good and in the case of 0.5 to 0.7 the validity is the average and less than 0.5 indicates the questionnaire lacks necessary reliability. According to

information obtained from the questionnaire, Cronbach's alpha for the questionnaire was (0.794), which is good and reasonable.

Table 1 The reliability of the whole questionnaire

Cronbach's alpha values	The number of questions
0.794	12

7 Results

The evaluation of the economic and financial performance of radiator valves manufacturing plant the financial and economic dimension has the following four criteria shown in Table 2. Each of the following criteria is considered an input for the fuzzy system.

Table 2 The sub-criteria of financial and economic dimension

Sub-criterion	Criterion
How much the savings in the financial resources and equipment's of the company	Financial and economic dimension
To what extent is it reasonable rate of sales growth reasonable	
To what extent is it reasonable rate of return on investment	
To what extent is reasonable the Shareholders of the company dedicated income	

The fuzzy system in this section has four inputs and one output. The first input is related to save financial resources, the second input for sales growth rate, the third input for the rate of return

on investment and forth input related to specific income of stockholders that are shown in Figure 2.

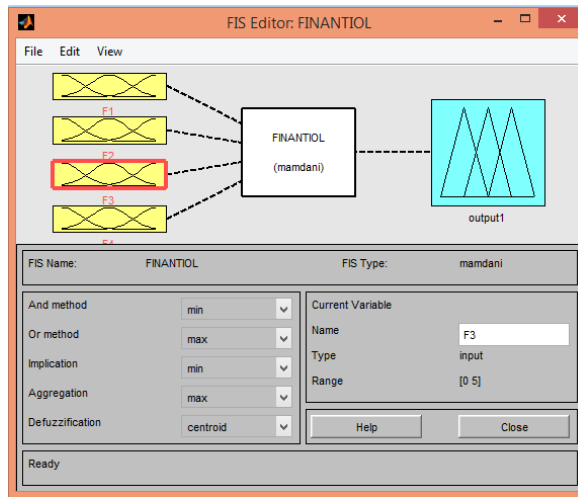

Figure 2 The Toolbox of Logic fuzzy for Financial and Economic dimension

The figure 3-9 (2) represents the amount of each of the fuzzy inputs and outputs of the financial and economic criteria.

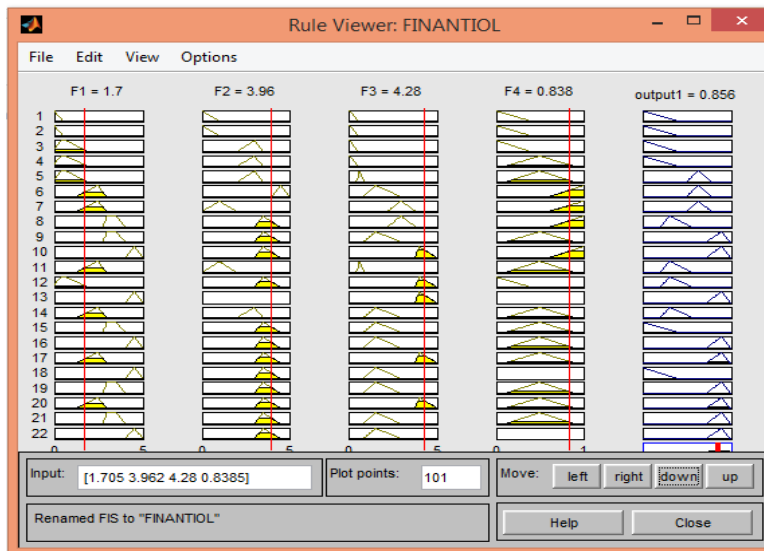

Figure 3 The relationship between the inputs and outputs of financial and economic dimension (criterion)

Figure 4 shows the fuzzy relationship made between inputs and outputs of financial and economic dimension (criterion).

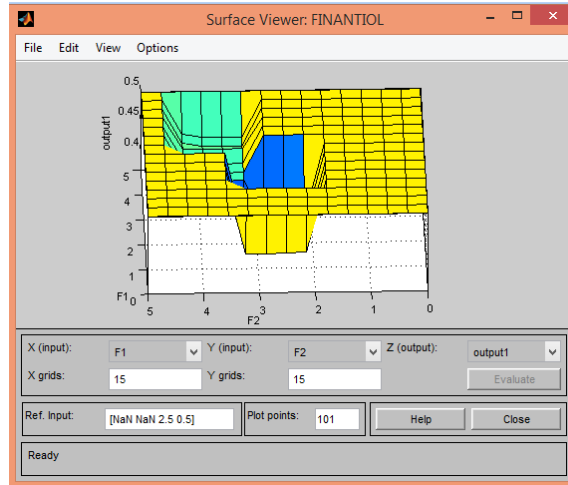

Figure 4 The results of fuzzy making of financial and economic dimension (criterion)

Performance evaluation of the financial and economic dimension based on the four sub-criteria was equal to 0.85 that with the membership degree of 0.34 belongs to higher class and 0.66 belongs to good class.

Performance evaluation of the radiator valves manufacturing factory (plant) in the customer dimension (criterion)

The developmental dimension (criterion) has five sub-criteria are shown in Table 3. Each of these sub-criteria is an input for the fuzzy system.

Table 3 The sub-criteria of costumer dimension

Sub-criterion	Criterion
To what extent is important for this company maintaining (retention) the costumer	Customer dimension
To what extent is timely the delivery of goods and service	
To what extent is desirable the quality of delivered services	
To what extent is reasonable the variety of products delivered by this company	
To what extent is the citizens' satisfaction desirable about products delivered	

The output of the fuzzy rules implementing related to inputs and outputs related to the customer dimension are shown in Figure 5.

Figure 5 The relationship between the fuzzy inputs and outputs of customer dimension

Fuzzy relationship made between output and inputs related to customers dimension is shown in Figure 6.

Figure 6 Results of the fuzzy making of the customer dimension

Performance evaluation of costumer dimension based on the five sub-criteria was equal to 0.81 that with the membership degree of 0.29 belongs to good class and 0.71 belongs to higher class.

The environmental factors dimension (criterion) has three sub-criteria are shown in Table 4. Each of these sub-criteria is an input for the fuzzy system.

Performance evaluation of the radiator valves manufacturing factory (plant) in the environmental factors dimension (criterion)

Table 4 environmental factors dimension

Sub-criterion	Criterion
To what extent is reasonable the company's ability to compete with its competitors	Environmental factors dimension
To what extent is this company compatible with technological changes	
To what extent this company has attempted to implement the new technology	

The output of the fuzzy rules implementing related to inputs and outputs related to the environmental factors dimension are shown in Figure 7.

Figure 7 The relationship between input and output fuzzy of environmental factors dimension

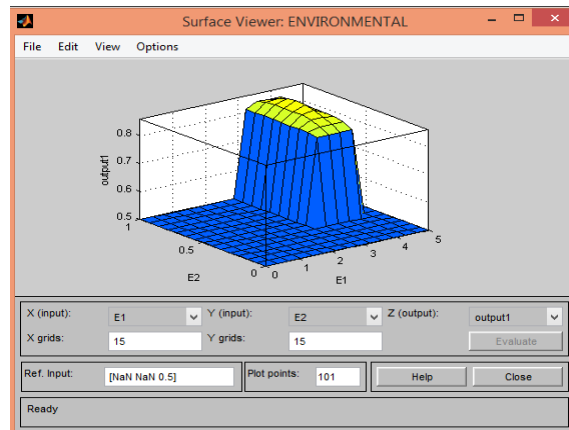

Figure 8 Results of the fuzzy making of the environmental factors dimension

Performance evaluation of environmental factors dimension based on the three sub-criteria was equal to 0.77 that with the membership degree of 0.45 belongs to good class and 0.55 belongs to average class.

## 8 Conclusion

The pundits and researchers believe that performance evaluation is the main theme in all the institutional analyzes and organizational perspective that includes evaluation and performance measurement is difficult. The evaluation and performance measurement lead to smarter system and motivate people to desirable behavior and the main part of organizational policy formulation and implementation, so if an organization wants to have a good performance should assess its operability. In this study, the performance of radiator valves plant was evaluated and the results show, the evaluation of financial and economic performance of this plant is placed in the higher and good class and based on costumer dimension (indicator) is good and excellent and based on environmental factors dimension (indicator) placed in the good and average category.

**Abstract.** This study aimed to investigate the effect of perceived authentic leadership on organizational commitment through the mediating role of organizational trust was performed. The population included an all employees of the Bank Ghavamin branch management in West Tehran in 2016 (N=380). The sample size using Morgan table 180 was estimated. We Perceived authentic leadership questionnaire to measure the variables of perceived authentic leadership and Allen and Meyer (1991) Questionnaire (Nahian and Marlowe, 1997) was used. The reliability and validity of the questionnaire were confirmed. Software for the analysis of the research hypotheses, structural equation modeling approach based on partial least squares was used that the findings confirm hypotheses.

**Keywords:** authentic leadership, organizational commitment, organizational trust, Smart-PLS

## 1. Introduction

Banks as financial institutions have an important role in the circulation of money and wealth in society and can spread through the acquisition of assets of individuals and organizations and injecting it into the economy to create value-added economic activities in the country. One of the important requirements of the banking system overall, is the performance of the national economy and banks can provide services required by citizens as well as effective. On the other hand the development of financial institutions as well as public and private banks in the country more competitive field has made them more than ever. There is consensus in the literature that leadership is an important factor for the success or failure of an organization, organizations began to work with a great leadership, and organizational success is a reflection of the leadership (Garg & Ramjee, 2013). Leadership in organizations is successful long-term effective and genuine. Philosophers, religious leaders and thinkers from ancient time the importance of authenticity for leaders achieve effective administration of affairs under any circumstances; have underlined (Hassan and Ahmad, 2011). Especially when authentic leadership theory emerged that at least three important underlying factors that needs to be raised among the leaders of authenticity - social change, and technological advanced with increased globalization and Managerial malfeasance (Franklin, 2010). In general, the principle of authentic leadership as a requirement for organizations to open the leader-follower relationship dynamics due to ethical issues and deals with the complexities of the organization and improvement of internal and external issues on the (Ghane Nia, 2014).

In addition, organizations need to raise the level of employee commitment. Organizational commitment to personal and organizational consequences that entails is very important. Organizational commitment makes employees more identification with the goals and values of the organization, for the benefit of the organization to spend more effort and more desire to remain within the organization (Morrow, 1983, quoted by Garg & Ramjee, 2013). Ningna (2007; quoted from, Wiza &

Hlanganipai, 2014) states organizational commitment reflects the organization's leadership qualities.

Garg & Ramjee (2013) also suggest that organizational commitment and trust depends on many factors, including leadership. In fact, organizational trust is one of the important organizational challenges which can be a significant role in different organizational results and cause such commitment. In fact, one of the important implications that could cause confidence is increasing its commitment. However, due to the limited research in this area, particularly in banks and financial institutions has been conducted. This study aimed to investigate the effect of perceived authentic leadership on organizational commitment of staff and the mediating role of organizational trust has been done. This research is important in this respect that with new approach investigated the organizational commitment in the bank Ghavamin.

## 2. Hypotheses

### 2.1 Main hypothesis

Authentic leadership perceived the mediating role of organizational trust has impact on organizational commitment.

### 2.2 Sub hypotheses

Transparency of relationship of perceived authentic leadership has impact on organizational trust.

Inner conscience of perceived authentic leadership has impact on organizational trust.

Balanced processing of perceived authentic leadership has impact on organizational trust.

Self-awareness of perceived authentic leadership has impact on organizational trust.

Transparency of relationship of perceived authentic leadership has impact on organizational commitment.

Inner conscience of perceived authentic leadership has impact on organizational commitment.

Balance processing of perceived authentic leadership has impact on organizational commitment.

Self-awareness of perceived authentic leadership has impact on organizational commitment.

## 3. Theoretical foundation

### 3.1 Authentic Leadership

Perceived authentic leadership refers to those who are deeply conscious thoughts and behavior and others see them as those of the values, the vision, knowledge and ability to understand themselves and others are aware; and are also aware of the environment in which they operate; they are the ones who are confident, hopeful, optimism, resilience and moral characteristics are high level (Avolio, Luthans Walumbwa, 2004). Authentic leadership is a four-component (Walumbwa et al., 2009; Luthans, 2014).

**Self-awareness:** self-awareness and confidence as leaders of character, values, motives, emotions and personal perceptions of their relative. Conscious leaders know your strengths and weaknesses, know how their behavior affects others, know themselves and know what they want.

**Balance Processing:** Processing balanced extent to which the leader analyzes the information before making a decision and asked for the views of the other positions that challenged him. In

fact, authentic leadership ability hear, interpret and processing both positive and negative information before making a decision or taking any action.

Inner conscience: this aspect of self-expression is a process by which leaders adapt their activities to the goals and values. Authentic leadership in the face of external pressures that is contrary to the moral standards of their resistance through the process of internal control. Ethical aspects of internalized self-control refer to the internal and evolved.

Transparency relationship between the leaders: the transparency of the relationship between the leader and the others show their originality, sharing information with others and express your thoughts and feelings is real, a genuine leader must communicate this information to others in an open and honest disclosure of their actual.

### 3.2 Organizational Commitment

Organizational commitment is as a psychological state as the relationship of an employee with the organization. This regard, the intention of the employee to maintain a particular path of action in which case stay in the organization-the influence (Allen, 2007). Dimensions of emotional commitment are as follows:

1. Emotional commitment that expresses a person's emotional attachment to the organization.
2. Continuous commitment that includes expected costs is due to leave the organization
3. Normative commitment: the commitment and sense of duty to stay in the show (Meyer and Allen, 1990, p. 4 and 5).

Organizational commitment can be used as the person's loyalty to a particular employer, or loyalty to the organization (Kopru, 2013).

Luthans (2010) states that organizational commitment is defined as an attitude often 1- a strong desire to stay in the organization; 2- The desire to exert great efforts for the organization and 3- Having a strong belief that the values and goals of the organization.

### 3.3 Organizational Trust

Organizational Trust as positive expectations of people based on organizational roles, relationships, interdependencies of different experiences and intentions and behaviors are members of defined (Shokley-Zalbak, Ellis, Winograd, 2000; quoted in Qanenia, 2013). Ellis and Winograd (2000) argue that organizational trust positive individual perceptions that people have about the content and behavior of members of the organization and based on roles, communication, experiences and organizational ties are formed. Trust the other person defined as a voluntary engagement (Zarei et al., 2009).

## 4. Research method

This paper is a research categorized in terms of data collection, descriptive study and based on survey data to investigate the effect of perceived authentic leadership on organizational commitment with mediating role of organizational trust is analytic survey. On the other hand the present study in term of purposes is an applied. The study population included all employees of the Bank Ghavamin branch management in West Tehran in 2016 (N =380) and sample size using Morgan table 180 was estimated and randomly were placed at the disposal of staff in branch of West Tehran. In order to ensure an acceptable return researcher questionnaires were distributed 200 questionnaires to remove 170 valid questionnaires were not answered by the investigator to be accessed. In this study, to

collect data from field study (questionnaire) and Libraries (reading books, journals, theses, articles in Persian and English) is used.

Walumbwa et al., (2008) Perceived authentic leadership questionnaire to measure the variables of perceived authentic leadership in the five-point scale (totally agree to totally disagree) is used which aims to assess how employees perceived authentic leadership in four aspects of transparency, self-awareness, Inner conscience and balance processing.

Allen and Meyer (1991) questionnaire to measure organizational commitment was used and three components of indulging, strength, sacrifices in the five-point Likert scale (very high to very low) has been established.

Organizational trust 16 questionnaire to measure the variables of organizational trust (Nahian and Marlowe, 1997) in a five-point scale (always to never) has been used and trust is based on four components to evaluate the organizational discipline and discipline, sense of responsibility at work, cooperation is working and improve on the job. To determine to what extent the selected components to be acceptable measurement models and components are designed for variable valid, the measurement model is analyzed. So to confirm the construct validity, confirmatory factor analysis using structural equation modeling software (Amos) was used. Given that all perceived authentic leadership, organizational commitment and organizational trust has an acceptable load factor (0.5) and were significant at the 0.05 level, and the construct validity was confirmed. In this study was to determine the reliability test, Cronbach's alpha was used. Cronbach's alpha coefficient was calculated using the software Spss22, the perceived value of 0.719 for the questionnaire authentic leadership; 0.73 organizational commitment, and organizational trust was 0.792. Given that the study of humanities, Alpha higher than 7.0 is acceptable, so we can evaluate the reliability of the questionnaires was good. Software for the analysis of the research hypotheses, structural equation approach based on partial least squares (Smart-PLS) was used.

## 5. Results

The main hypothesis: authentic leadership perceived the mediating role of organizational trust has impact on organizational commitment.

The results of the research conceptual model in Table 1 indicate that the effect of authentic leadership on organizational commitment is 0.37 but with the added variable to the conceptual model of organizational trust, the effects of authentic leadership on organizational commitment amount ( $t=0.565$ ) equal to 0.06 and is insignificant; in other words we can say that authentic leadership directly had no significant effect on organizational commitment but indirectly and through changing organizational trust has a significant impact on organizational commitment, the amount of which is equal to 0.30. Given that the amount of ( $t=4.604$ ) higher than 1.96 and less than 0.05 significance level, with confidence 95 % the main research hypothesis is confirmed.

The results indicate that variable of organizational trust plays mediating role in the relationship between perceived authentic leadership and organizational commitment and the effect of perceived authentic leadership takes place completely via organizational commitment and organizational trust. The results also show the conceptual model the value of authentic leadership on organizational trust is equal to 0.59 and the value of organizational trust, organizational commitment is equal to 0.51. Then, a conceptual model based on quantities of t-value is provided for meaningful path and the higher values of (1.96) reflect the significance of impact factors and factor loadings.

(1) The effect of perceived authentic leadership with mediating role of organizational trust and organizational commitment

Table 1 the direct and indirect effects of variables based on PLS output

Paths	Direct effect	Indirect effect	P	t	Total effect
organizational commitment ← authentic leadership	0.068-	---	0.573	0.565	0.375
organizational commitment ← authentic leadership	---	0.307	0.000	4.604	0.537
organizational trust ← authentic leadership	0.590	---	0.000	10.362	0.590
organizational commitment ← organizational trust	0.513	---	0.000	5.700	0.513

Figure1 the t-value show significant direction of path coefficient and factor loading. Regarding the t values, with confidence 95% it can be said perceived authentic leadership has positive and significant effect on organizational trust, organizational trust has a positive and significant effect on organizational commitment and direct effect of authentic leadership on organizational commitment is not significant.

Figure 1 t-value of significant direction of path coefficient and factor loadings and conceptual model

Sub hypotheses:

First sub-hypothesis: Transparency of relationship of perceived authentic leadership has impact on organizational trust.

Results of research hypothesis based on the graphic output software PLS in Figure 2 shows the transparency of the relationship has direct and positive impact on employee's organizational trust that is equal to 0.54. In other words we can say that about 29.7 percent of the variance in organizational trust by transparency relationship is explained.

Figure 2 The impact of transparency of relationship on organizational trust

Figure 3 the t-value show significant direction of path coefficient and factor loading. T-value show path coefficients between transparency of relationship and organizational trust (8.971) is higher than 1.96; so one can say with confidence 95% transparency of relationship has significant impact on organizational trust so research hypothesis is confirmed.

Figure 3 t-value of significant direction of path coefficient and factor loadings

Second sub-hypothesis: Inner conscience of perceived authentic leadership has impact on organizational trust.

Results of research hypothesis based on the graphic output software PLS in Figure 4 shows the inner conscience has direct and positive impact on employee's organizational trust that is equal to 0.43. In other words we can say that about 18.8 percent of the variance in organizational trust by inner conscience is explained.

Figure 4 The impact of inner conscience on organizational trust

Figure 5 the t-value show significant direction of path coefficient and factor loading. T-value show path coefficients between inner conscience and organizational trust (5.469) is higher than 1.96; so one can say with confidence 95% inner conscience has significant impact on organizational trust so research hypothesis is confirmed.

Figure 5 t-value of significant direction of path coefficient and factor loadings

Third sub-hypothesis: Balanced processing of perceived authentic leadership has impact on organizational trust.

Results of research hypothesis based on the graphic output software PLS in Figure 6 shows the balanced processing has direct and positive impact on employee's organizational trust that is equal to 0.48. In other words we can say that about 23.6 percent of the variance in organizational trust by balanced processing is explained.

Figure 6 The impact of balanced processing on organizational trust

Figure 7 the t-value show significant direction of path coefficient and factor loading. T-value show path coefficients between balanced processing and organizational trust (7.237) is higher than 1.96; so one can say with confidence 95% balanced processing has significant impact on organizational trust so research hypothesis is confirmed.

Figure 7 t-value of significant direction of path coefficient and factor loadings

Fourth sub-hypothesis: Self-awareness of perceived authentic leadership has impact on organizational trust.

Results of research hypothesis based on the graphic output software PLS in Figure 8 shows the self-awareness has direct and positive impact on employee’s organizational trust that is equal to 0.61. In other words we can say that about 38.3 percent of the variance in organizational trust by self-awareness is explained.

Figure 8 The impact of self-awareness on organizational trust

Figure 9 the t-value show significant direction of path coefficient and factor loading. T-value show path coefficients between self-awareness and organizational trust (9.977) is higher than 1.96; so one can say with confidence 95% self-awareness has significant impact on organizational trust so research hypothesis is confirmed.

Figure 9 t-value of significant direction of path coefficient and factor loadings

Fifth sub-hypothesis: Transparency of relationship of perceived authentic leadership has impact on organizational commitment.

Results of research hypothesis based on the graphic output software PLS in Figure 10 shows the transparency of the relationship has direct and positive impact on employee’s organizational trust that is equal to 0.35. In other words we can say that about 12.7 percent of the variance in organizational commitment by transparency of relationship is explained. Then, a conceptual model based on t-value significant direction of path coefficients is provided that values is higher (1.96) reflects the impact factors and factor loadings are significant.

Figure 10 The impact of transparency of relationship on organizational commitment

Figure 11 the t-value show significant direction of path coefficient and factor loading. T-value show path coefficients between transparency of relationship and organizational commitment (4.218) is higher than 1.96; so one can say with confidence 95% transparency of relationship has significant

impact on organizational commitment so research hypothesis is confirmed.

Figure 11 t-value of significant direction of path coefficient and factor loadings

Sixth sub-hypothesis: Inner conscience of perceived authentic leadership has impact on organizational commitment.

Results of research hypothesis based on the graphic output software PLS in Figure 12 shows the inner conscience has direct and positive impact on employee’s organizational commitment that is equal to 0.31. In other words we can say that about 10.1 percent of the variance in organizational commitment by inner conscience is explained. Then, a conceptual model based on t-value significant direction of path coefficients is provided that values is higher (1.96) reflects the impact factors and factor loadings are significant.

Figure 12 The impact of inner conscience on organizational commitment

Figure 13 the t-value show significant direction of path coefficient and factor loading. T-value show path coefficients between inner conscience and organizational commitment (2.357) is higher than 1.96; so one can say with confidence 95% inner conscience has significant impact on organizational commitment so research hypothesis is confirmed.

Figure 13 t-value of significant direction of path coefficient and factor loadings

Seventh sub-hypothesis: Balance processing of perceived authentic leadership has impact on organizational commitment.

Results of research hypothesis based on the graphic output software PLS in Figure 14 shows the balanced processing has direct and positive impact on employee’s organizational commitment that is equal to 0.31. In other words we can say that about 10.1 percent of the variance in organizational commitment by balanced processing is explained.

Figure 14 The impact of balanced processing on organizational commitment

Figure 15 the t-value show significant direction of path coefficient and factor loading. T-value show path coefficients between balanced processing and organizational commitment (4.579) is higher than 1.96; so one can say with confidence 95% balanced processing has significant impact on organizational trust so research hypothesis is confirmed.

Figure 15 t-value of significant direction of path coefficient and factor loadings

Eighth sub-hypothesis: Self-awareness of perceived authentic leadership has impact on organizational commitment.

Results of research hypothesis based on the graphic output software PLS in Figure 16 shows the self-awareness has direct and positive impact on employee's organizational commitment that is equal to 0.37. In other words we can say that about 13.8 percent of the variance in organizational commitment by self-awareness is explained.

Figure 16 The impact of self-awareness on organizational commitment

Figure 17 the t-value show significant direction of path coefficient and factor loading. T-value show path coefficients between self-awareness and organizational commitment (4.251) is higher than 1.96; so one can say with confidence 95% self-awareness has significant impact on organizational commitment so research hypothesis is confirmed.

Figure 17 t-value of significant direction of path coefficient and factor loadings

## 6. Discussion

This study aimed to investigate the effect of authentic leadership on organizational commitment with mediating role of organizational trust was done. In summary findings approved the research hypotheses about the effect of authentic leadership on organizational commitment with mediator role of organizational trust. Then explains the results and compare it with previous studies will be analyzed. According to research findings about the main theory, we can say that the hypothesis about the effect of authentic leadership on organizational commitment with mediator role of organizational trust accepted. Various researches have been done on the effect of authentic leadership on organizational trust. Mirmohammadi et al., (2012), Clapp Smith et al., (2009), Kliuchnikov (2011), Kim (2014) Maximo (2015), Hedayat (2016) in their research showed that authentic leadership through the mediating role of trust can influence the organizational variables, including organizational commitment.

According to the result of first sub hypothesis, transparency of relationship has direct and positive impact on organizational trust and its value is equal to 0.54.

Also, about 7.29 percent of the variance of organizational trust by transparency of relationship is explained. This component because can be closer the level of leaders - followers is more important. In fact, according to Gardner et al (2005) compared the willingness to share information and ideas, the proper exposure, and express higher levels of reliability high, some factors are transparent relationship and causes employees to be able to form a more accurate assessment of competence, ethics and their leader (Norman et al., 2010).

According to the results of the second sub hypothesis, inner conscience has direct and positive impact on organizational trust and it value is equal to 0.43. Also, 18.8 percent of the variance in organizational trust by inner conscience is explained. In fact, the authentic leadership of an internal reference point for morality, a sense of right and wrong, or what some have called it a moral index. Inner conscience aspects, is a process where your authentic leadership values, intentions and coordinate their actions, so that between the governor and the results of a compliance and coordination. This leads to an increase in employees' organizational trust (Mirzaeian et al., 2016).

According to the results of the third sub-hypothesis, balanced processing has direct and positive impact on organizational trust and its value is equal to 0.48. Also, 23.6 percent of the variance in organizational trust by balanced processing is explained. Authentic leadership is able to analyze all the information about them. In this case the simultaneous processing of positive and negative attitudes and judgments about them refers resolutions. It features authentic leadership to help them avoid rash judgments and prejudices and intolerance and realistic view of their assessments apply. This feature helps to create justice and trust in the organization (Mirzaeian et al., 2016; Qane Nia, 2014).

According to the results of the fourth sub-hypothesis, self-awareness has direct and positive impact on organizational trust and its value is equal to 0.61. Also, about 38.3 percent of the variance in organizational trust by self-consciousness is explained. Self-awareness helps leaders energy, work and apply their resources are targeted for further development and more effective guidelines for employees regarding the improvement, empowering and giving them. This self-awareness is the leaders who were in the path of personal growth and development and welcome feedback from employees in the organization. Therefore, authentic leadership cannot be trusted to know their causes (Mirzaeian et al., 2016).

According to the results obtained from the fifth sub hypothesis, transparency if relationship has direct and positive impact on organizational commitment and its value is equal to 0.35. Also, around 12.7 percent of the variance in organizational commitment by transparency of relationship is explained. Transparency about authentic leadership, cause an open and transparent relationship with the leadership of their employees. Channels of communication open and transparent relationship allows employees greater confidence in their leaders. Staff makes themselves known member of the organization, have aligned themselves with the goals and vision, and increase their efforts to achieve organizational goals (Qane Nia, 2014).

According to the results of sixth sub hypothesis inner conscience has direct and positive impact on organizational commitment and its value is equal to 0.31. Also, about 10.1 percent of the variance in organizational commitment by the inner explained. Conscience/moral leaders internalized an important role in job performance followers. It makes moral leaders not to think about the misuse of staff, the tasks entrusted to them to be fair and realistic, at the time of the problems and crises of support staff, always by fairness, justice and morality in relation to work and

meet the staff. In total, these features and behaviors can lead to increased organizational commitment (Qane Nia, 2014).

According to the results of the seventh sub hypothesis suggests a balanced processing has direct and positive impact on organizational commitment and its value is equal to 0.31. Also, about 10.1 percent of the variance in organizational commitment by balanced processing is explained. When employees feel that leaders are processed simultaneously positive and negative information and do not spend bias in their judgment: first, to feel more perceived fairness; second, their tendency is more towards leadership; thirdly, more intrinsic motivation that ultimately leads to increased organizational commitment (Qane Nia, 2014).

According to the results of the eighth sub hypothesis self-awareness has direct and positive impact on organizational commitment and its value is 0.37. Also, about 13.8 percent of the variance in organizational commitment by self-awareness is explained. Because authentic leaders are aware of the strengths and weaknesses of their own and welcome feedback from employees on their understanding that it would be influence on development goals and prospects for their business and employees under their follower (Qane Nia, 2014).

## 7. Conclusion

In order to benefit from increased research and prepare managers and leaders of Ghavamin Bank below practical recommendations provided.

1. The part of the nature of the formation and development of authentic leadership is based on stories and personal narratives leaders.

For this purpose it is necessary to explore opportunities for leadership development programs to be provided about the stories of people's lives. In particular, it would be a considerable help to develop self-consciousness leaders.

2. Development of conscience and moral challenges they face in the leadership through the use of approaches such as providing instructional videos or scenario.

3. The use of role models, positive role model, Mrshdyt, coaching and experienced leaders. Short periods of training and web-based training courses.

**Abstract.** Arabic nationalism was affected by Islamic reformism raised by ideologists like Jamaluddin Afghani, Mohammad Abduh and Rashid Reza was another branch of Islamic reformism and fundamentalism and Hassan al-Banna and Seyyed Qotb were raised as spokesman of that. Islamic fundamentalism was raised for the first time against created challenges of nationalism at 1960. Meanwhile these countries failed in their modernization and they had suffered of threats and challenges such as Islamic opposition and the crisis of legitimacy and political authority. Threat is widely regarded today to international security. This threat is from non-state actors such as terrorist actors. One question is raised here what is the risk of this group for the region, especially Asia? And also it has been tried to noting the dimensions of the crisis.

**Keywords:** nationalism, fundamentalism, Islamic government, terrorism

### 1. Introduction

Nationalism as mainstream of ideology in most Muslim countries was in order to expedite the formation of modern national state in the region and this nationalism to traditional ideology of Islam in secularization policy has been created as an important file of renovation in countries of the region. According to these changes countries of the region are placed in various situations. Countries with the separation of religion and state, countries that have integrated religion and state and they have been governed as the Kingdom that has been led to the downfall of Islam in policy. And countries that have gone to secularization in relation with developing ideology of politic system, party organizations, institutes like department and... by reduction of Islam traditional position. In these countries legal system and the education system have been stabilized. Done reformations of economic renovation and reformation of national economy bring deep changes in structures and relations and life style in Islam world and traditional norms of Islamic economy and ethic have been affected by secularization. Development of nationalism and reduction of Islamic viewpoints are seen in this region. Production of the Arab League and dealing with Israel and the policies of Gamal Abdel Nasser in Egypt and the presented pan-Islamism by Saudi Arabia can be named as some of made changes in nationalisms which all of them have been finished to detriment for all Islamic countries. During the struggle of Arabs and Israel the Arabic nationalism was applied as an ideological weapon against Israel (Zionists) and western imperialism by Arabic countries.

In politic evolution of west Asia it can be said that relations between Islam and modern nationalism can be considered from the date of Islamic reformism which the source of that is nationalism and Islamic politic thoughts. Influence of Islamic reformism to nationalism and Islamic politic thoughts to is obvious that its result is promoting rational revision and reformation of Islamic society and opposition to foreign invasion and modern secular nationalism with an emphasis on tradition. Jamaluddin Afghani is one of the first people who was active in this field that this thoughts were going on among Islamic nationalism and reformism. Muhammad Abduh and Rashid are other people who did some politic reformations and thought on the field of relation between religious identity and national identity that they promoted Islamic fundamental ideology and politic theory differ from secular nationalism which has been led to production of Islamic fundamentalism (shuzhi, 1992). Nationalism in Islamic countries of the region was begun after attach of colonialism and downfall of the Ottoman Empire. John Esposito the famous researcher believes that appearance of

Islamic nationalism in the region is the result of interaction of following forces.

- Destruction of the Ottoman Empire after the First World War and the appearance of the modern nation and state.
- Development of independence movements with the aim of silent development to political and religious goals of western imperialism.
- Started movements by Jamaluddin Afghani and his followers Muhammad Abduh and Rashid Rida (Esposito, 1984, p59).

Certainly internal crisis as a result of the collapse of the Ottoman Empire and the imposed economic, military, political and cultural pressures of western countries can be named in the creation of sense of legitimacy and survival and identity crisis to the Arab world. In this meaning it can be said that nationalism had been in the response to western imperialism and European colonialists' government. We observe in these countries that many national liberator leaders have received modern western training assistances and affected by modern western nationalism and they had been emanated from French Revolution, equality and brotherhood freedom and modern western ideologies especially in political and democracy fields, constitutional government, the parliamentary system and individual rights. These are against the ideologies of politic Islamic society (nation) and common beliefs. The concepts of state and nation which are advocated by modern nationalism, are not based on religious beliefs and also they are different in language, ethnicity and history (Esposito, 1999).

As a result it can be said that secret war between national and religious loyalty exists in political arena of the region as the relations between nationalism and Islam. Arabic nationalism, Turkish nationalism and Iranian nationalism are existing nationalisms in the region which have similar but different attitudes to Islam. Arabic nationalism tried to introduce Islam as a cultural and functional resource from Arab nation in the first half of the 20th century which creates consistency between Islam and nationalism. But Arabic nationalism of dominant region on Egypt and Syria; sees itself close to national culture and Islam is not considered so much and yet by showing some of Islamic works different from Islamic ideology and culture (Lius, 2001).

After 1960 and following the created problems the Islamic resurgence nationalism is as a form of political discourse competing with counterparts in liberalism secular, socialism and nationalism (Ibrahim, 1980). Among this Egypt can be mentioned as the main center of Arabic nationalism which has been threatened by Muslim Brotherhood and following the assassination of President Anwar Sadat in 1981. After that we face a regime in Iran which implement the national reformations and it is known as Reza Khan Reformations. After Iran we face Baath party formation in Iraq and Syria. Also after the cold war, the Islamic Renaissance culminate in some countries in the west Asia, north Africa even in some areas of Asia especially Algeria, Sudan, Egypt, Morocco, Tunisia. Also we face revival of Islamic forces in moderate countries such as Saudi Arabia and secular countries like Turkey. We face ending the Islamic Renaissance after Mid-1990. So in ideological future in west Asia struggle between nationalism, modern ideology and Islam, traditional political culture is considered as key factor as renovation.

### 2. Islamic fundamentalism challenges against nationalism (Liu, 2001)

#### 2.1 The conflict between national and religious identity

Nationalism consistent with national identity includes national culture and political identity which creates formation of modern state and nation. Nation is propounded as its main body and national identity is propounded as main underlying in creation of political and social necessities. However the religious identity

emphasis on nation which pay attention to universal religious community.

## 2.2 state domination and god domination

The modern nationalism believes that domination is people and in this among this domination is as illustration movement favorer of state domination but oppositely Islamists believe to god domination which argue that god is independent and each type of domination against god is an illegal domination. Dealing with secular nationalism in the region is one of the purposes of believer to Islamic domination. This fundamentalism believes to form an Islamic state and its combination in policy and religious in this meaning the Islamic state is a state in accordance with the religious law.

## 2.3 opposition of secularization and Islamists

In this among secularization believes to separation of state, law, education and religion. While Islamists are integrating the religion and state with integration of policy, religion and the combination of law and religious education and they insist on integration of policy and religion. Oppositely these nationalists in favor of secularization believe that social and political frameworks should be coincident to secularization. Appositely Islamists believe that this is a type of westernize and creation of chaos and disorder in society. Islamic renovation is the only unique way to the Islamic world and different from modern nationalism. However it seems that the foundations of Islamic social movements for Islamic revival have made impedimenta in development due to lack of national development theory, bafflement in the type of development, identity crisis of political legitimacy and social cultural identity. In relation to political legitimacy and creation of the national unity ideology it seems that some states of Muslim countries are not interested in this work and also they aren't successful in their works in return great enthusiasm can be observed for despotism in this type of countries. This is dominant yet especially in some countries with kingdom state, military and semi-military autarchies in the Islam world (Esposito, 1999). In fact Islamists emphasis on god domination as the tradition and religious politic culture of Islam is considered as political power. This cultural system of religion and policy exists as a historical tradition in social mentality (Shuzhi, 1997). This type of ideal domination is known as the return to religion and cleans up corruption which this is considered as religious policy. Islamic theories are considered different from nationalism and through evaluation of rich sources of Islamic political culture (Liu, 2000).

## 3. Opposition of national nationalism and Islam

### 3.1 structure of state and nation

The struggle is between national identity and religious identity. Struggle is between creation of Islamic and ethical culture and native culture and struggle between national ideologies and Islamic native politic culture.

### 3.2 modern legitimacy and traditional legitimacy

Struggle has been existed between modern and traditional legitimacy. We face identities, ethnic-racial groups, religions and religious sects in the region that these are in relation with deep Islamic politic culture. Immaturity of nationalism can be considered in creation of ideological space to revive Islam.

### 3.3 opposition between traditional and modern political system

Nationalism of the region can be known as a sample of western political reformations in creation of political systems which this is effective on Islam in its turn. Apart from this, some despotisms can be observed in the form of military and another form of autocracy which face many challenges.

## 3.4 political association and democracy

It can be said that lack of opposition between political association and Islamism has led to creation of social anarchies by observation of amount of political association and democracy in the region especially Arabic countries. Nationalism of the region is in opposition with opponents of its Islamism because they criticize the legitimacy and authority of state. Generally it can be said that struggle between nationalism and Islam has been increased and this causes that the made renovation prevents the historical development and political development. This is consulted as a long work to solve the problems. This means that how nationalism of west region of Asia can adjust to Islamic integration. So countries of the region should clear the root of Islamic fundamentalism to can observe a prospects for peace in the region.

## 4. Appearance of terrorist groups in west Asia

### 4.1 Taliban

Appearance of Taliban in 1994 is one of important phenomenon in contemporary political history of Afghanistan, southwest Asia, Middle East and Islam world. At first Taliban had wanted unity, and clean up the country from autocratic local rulers, removing forward groups and making regularity and stability in Afghanistan. They created a system based on religious law and Sunna after achieving some victories. This group could surround some regions of Pakistan and Afghanistan in a short time even it could also seized Kabul. After capture of Kandahar in 1994 they asked people to do some behaviors. Such as not shaving beard, the absence of women in the streets without their confidant, closing cinemas and paintings. They changed cinema of Kandahar to mosque and stadium of Kandahar to the center of enforcing the rulings of their courts (Mahdavi, 2006). They prevented girls and women from education and they know radio and television inconsistent with Islamic rites. After long times the condition became difficult and men who shaved their beard were incarcerated from one day to one month (Hashemi, 2001: 23). Including some important factors of get into power of Taliban can be mentioned disability of Clerics leaders to form an inclusive and national state with presence of ethnic minorities, existing struggles between Clerics and Taliban continued until 1996 which led to occupation of Kabul. And supports of Rabbani from Taliban became a reason for creation of Taliban,

Rabbani was willing to ally with Taliban he was not willing to compromise with Pakistan in no way which was trying to take power from him. Unaware that this soon Taliban become a power that Kabul take his power that in this case Laurel Qurna believes that although state of Rabbani was grateful from Taliban for expelling Hekmatyar, but soon he found that Taliban is considered a serious threat for himself too. The influence of Islamic countries neighboring Afghanistan in jihadist forces can be named as external factors in get into power of Taliban. As a result these intervention led to movement of these groups and Taliban increased its power. Pakistan and Arabia are including these countries. After independence of Afghanistan many numbers of jihadist forces have been deployed in Pakistan. State of Pakistan was not satisfied to decision of power in Afghanistan by Rabbani's forces and without any consideration and hesitation they interfered in the affairs of the Mujahidin's state and used their own forces to interfere in internal affairs of Afghanistan and destroy Mujahidin's state (Andishmand, 2007). Support of Pakistan's military intelligence from Hekmatyar by using financial and armaments methods in order to attack on Kabul is one of supports of Pakistan. Hekmatyar could destroy a part of Kabul and kill a lot of people (Seighal, 1998). Saudi Arabia was a supporter of the Afghan mujahidin since the Soviet attacks on Afghanistan. Arabia was involved on the get to power of the Taliban by financial assistance for the establishment of thousands religious schools and help to extremism and fundamentalism (Rashid, 2004).

## 4.2 other terrorist groups

The roots of this group can be attributed to early 2000. Especially by attach of United States to Iraq and downfall of Saddam Hussein in 2003 while coalition forces were trying to control Iraq Led by the United States, a group was formed named Al Qaeda (AQI) in 2004 with the launch of guerrilla war against coalition forces . Meanwhile, Abu Musab al-Zarqawi who has been announced as a terrorist by Foreign Affairs Ministry of America, he announced creation of Al Qaeda. He was making a dangerous campaign against Shiites in Iraq. But Abu Musab al-Zarqawi was killed in Air Attack of America. Abu Ayyub al-Masri was replaced in October 2005 who changed the name of group from Al Qaeda to Islamic state of Iraq (ISI) and determined Abu Omar al-Baghdadi as its leader. ISI name was selected with the aim of attracting support and patronage of Iraq's people. Finally Abu Ayyub al-Masri and Abu Omar al-Baghdadi were involved to the fate of Al-Zarqawi and killed in operations of American forces in 2010. Abu Bakr al-Baghdadi became the leader of this group and he changed the group name again to Islamic state in Iraq and Syria (ISIS). Al-Nusra Front was another involved group in Syria which was fighting against Bashar Asad in Syria and achieved some successes. Announcement of unity of ISIS group and Al Qaeda in early 2013 by Abu Bakr al-Baghdadi (Stanford, 2014) made a gap between ISIS group and Al-Nusra. Abu Muhammad Julani announced that we are not alliance with ISIS group and competition between two groups was made in order to dominance on the region. After doing some affairs in order to alliance between Al Qaeda and ISIS and Al-Nusra Front in February 3 2014 Al Qaeda announced that it has separated itself from dependence of Takfiri groups in Iraq and Syria and they believe that ISIS is not a part of al Qaeda and this was a beginning of struggle between these groups (, 2014 Sly). One of purposes of al Qaeda is to unite all Muslims throughout the region, but actions of Militant groups such as targeting civilians and the local people were against the mission of al Qaeda. But ISIS commit themselves to do behavior of strict norms which this strategy is completely different from other militant organizations in the region. ISIS in early actions killed its competitors and thousands Iraqi soldiers and 100 Syrian forces in order to attract the universal attention. And it massacred foreign nationals, including aid workers and journalists in the middle of 2014 and claimed that it has implemented Islamic punishments. Some of its actions are thong, impose ban on smoking and ban on music which are very stronger than other terrorist groups such as Al Qaeda.

## 4.3 Islamic state in Iraq and Syria

One of the most important threats which have covered a large part of west Asia is extremist Takfiri groups. This group changed its name to Islamic state (IS) after occupation of considerable lands in Iraq and Syria. One of its main purposes is making a Caliphate or Islamic state based on religious law around the world. In 29 June 2014 the leader of this group Abu Bakr al-Baghdadi introduced himself as the leader of believers and introduced Awwad Ibrahim Ali al-Badri Alsamraty as the alternate. This shows the culmination of ambition of this person. So that the last Caliphate or the downfall of the Ottoman Empire have been destroyed in the First World War. Analysts believe about potential of terrorist group and a danger that these groups can make for Asia it should be referred to history of these groups and presented an accurate analysis (Chinyong Liow, 2014). How are amount of threat and underestimate the threat of Islamic State? We should evaluate the threat realistically about reason of concerns of terrorist groups especially ISIS on the rest of Asia, because rowdies should be avoided to evaluate threat. So that in 11 September 2014 president of United States of America Barak Obama promised for strong military and political coping with terrorist groups but this issue should be analyzed in the fact of affair, because it should be referred to roots of formation of these terrorist groups which who created them?

A treat that these terrorist group has is distribution of these groups in the whole world and if United States and its allies do their task as well about this the results will be this military and political abilities of terrorist groups will be reduced in important regions such as Syria and Iraq. But this issue remains yet as a universal threat for many regions of the world such as Africa, Asia and especially the sensitive region of the Middle East. By cooperation of United States and some of powers of the regions it can be said that in some periods remains of these terrorist groups are destroyed in regions like Syria and Iraq but these groups comeback to their regions by failure and weak for this failure and this is a reason for lack of required effort of United States and its allies for a serious fight with terrorist groups.

## 5. Conclusion

Destroying the current political system in Middle East may lead to a strategic transformation. In the present time the made Interactions between Syria and crisis of Iraq are the most important challenge of the Middle East. Both states face their legitimacy following the strong challenges and controlling these interactions such as war of Takfiri groups with Bashar Asad and their refusal to accept the new condition in Iraq and contiguity of these two groups in the two country have make the region a gunpowder warehouse. The happened events from Islamic Awakening in Muslim countries of the region in 2010-2011 through opponent religious groups of western interference in countries have been caused to some groups to comply with this opportunity target Syria and Iraq. In this among it can be mentioned to the role of Islamic republic of Iran to end the crisis. Foreign policy of Iran is in a form that it is trying to maintain its regional role and applying leadership of resistance front. The purpose of Iran is destroying ISIS in the region (Zarif, 2014). Iran is willing to maintain territorial integrity and national unity in Iraq. Some states announce that this country (Iraq) should be divided into three states of Sunni, Shiite and Kurdish. The crisis that ISIS has created is the predicted and planned crisis by studying factors of entering people to this terrorist group it can be said that there are three main reasons for this matter: The first reason is fear of people and groups in the region which lead to cooperation of them. The second reason is ideological and religious support of regional ethnic groups and tribes from this group and the third reason is mental operation and advertisement of this group in order to enrichment of its supporters to form an Islamic State. One of issues that can be propounded in copying with this group is the serious consideration on unity among different religious and ethnic groups in the region, particularly Shiites and Sunnis. Unity of interfering countries in the region especially on this issue that ISIS is considered a danger for its supporter.it seems that the United States and western countries that support terrorism become close to this result that it is possible that this group gets out of the control and acts against reactionary countries of the region and especially West. For example the created crisis can be mentioned in Turkey and Kurdish groups. The informational and operational actions should be done by countries of the region to prevent the influence of this group. So that the United States is trying to divide terrorist groups and it has divided them to the good and bad terrorist. It seems that western countries are trying to use bascule of these terrorist groups along with their benefits and particularly Zionist entity.

**Abstract.** The aim of this study was to compare the impact of innovative teaching models and brainstorming on the creativity of elementary school students in Ardabil city. The research methodology is "quasi-experimental" and the goal of it is "applicability". Data collection method for this study was based on field and classroom selections. Data collecting tool in this study was Torrance creativity questionnaire that its reliability is calculated by using Cronbach's alpha equal to 0.81. The analysis of the collected data, SPSS software was used and tests which are used in this study were the co-variation analysis and T-test in two independent groups. The results showed that innovative method have a greater impact on students' creativity than brainstorming method.

**Keywords:** *teaching models, brainstorming, students' creativity, SPSS*

### 1. Introduction

By Giving the central role of the state educational system in training the younger generation it's responsibility is doubled in this realm and in comparison to other institutions and the only ability which could equip students in future with the growth of human capabilities, is creating related skills and strengthen abilities of the creative spirit in them. The main objective and basic concern of the educational system, is foster creativity and creative education in students then first important step in doing so, is identifying the foundations of creativity and its applications (Hosseini, 2003).

Robbins has expressed creativity the ability to combine ideas in a unique way or creating a connection between the ideas (Darzi Ramandi et al. 2015).

One of the active and innovation-driven methods is Synectics teaching Method. Like other forms of innovative methods, it helps to flourish students creativity by educational guidance, so that, as in this method life skills is taught by using the simile, metaphor and analogy, therefore, students have more freedom in response to questions of this lesson and this will lead to the development of skills of students based on creativity and innovation (Aqazadeh, 2009).

In the teaching of brainstorming, the teacher gives examples to students and asks them to express every solution to the problem which comes to their mind. The main solution cannot be expressed before providing different solutions by all the learners (Mellow, 1996 was quoted the Madandar Arani and Kakya, 2009).

Teaching creativity by Synectics and brainstorming method are among the ways that can increase people's creativity. The method of brainstorming also as a way to foster creativity has created a certain effective steps. Teaching creative thinking through brainstorming and Synectics method can be effective in increasing the creativity and problem-solving ability.

The main objective approach to creative thinking in students is that teachers can understand students' mental structures and to change their current plan. These changes include: identifying and removing barriers to learning (misunderstanding and shortcomings), create arguable ideas based on factual evidences and spread more accurate ideas, upgrading skills and improving the point of views of teachers and professors in the field of

active teaching methods, to teaching-learning process and increase vitality and joyous educational atmosphere, promoting self-direction in learning, understanding goals and self-assessment ability between teachers and students, group cooperative learning in teacher and student and increase the power of scientific attitude and achieve higher levels of cognitive domain and strengthen the ability of interpretation and judgment in the students are other purposes of this training method. If a learner becomes familiar with his knowledge, resources and research methods during his studies, he will create new materials and write, criticise and review ideas on the training, therefore at the end of the course can be an efficient and effective person in any environment, and can produce new ideas and knowledge. Amiri and Noruzi (2013) in a study have indicated that the method of brainstorming in creative thinking skills course, has a significant impact on increasing the creativity of students. Momeni et al. (2011) also presented that the use of Synectics teaching model causes in the growth and development of students' creativity. Also, applying this model brings about improvements in fluency, flexibility, originality and elaboration of students' thinking.

The results of Darzi Ramandi et al. (2015) also indicated that Synectics approach on the academic achievement of students in social studies lesson has a positive effect on increasing the amount of components of creativity (fluency, originality, flexibility and elaboration). The Results of the Madandar Aran and Kakya (2009) indicated that teaching creativity by method of brainstorming is confirmed on the issue of developing elaboration but on the other components, there isn't any significant difference between the two methods of brainstorming and guided discovery. However, with regard to previous researches, this study attempts to measure the creativity of elementary students in Ardabil city based on two models of brainstorming and Synectics.

Therefore the following assumptions were investigated in this study:

The impact of Synectics teaching method in comparison to brainstorming method is different on the fluidity of creativity of the students.

The impact of Synectics teaching method in comparison to brainstorming method is different on flexibility of the creativity of the students.

The impact of Synectics teaching method in comparison to brainstorming method is different on the initiative thinking of the students' creativity.

The impact of Synectics teaching methods in comparison to brainstorming method is different on the development of students' creativity details.

### 2. Methodology

The target population of this study is included all elementary school students in Ardabil city that are equal to 3,100 members. In this study, 40 students were randomly selected from one of the elementary schools in Ardabil city and homogenization was carried out according to their average score of their last semester and they were divided into two 20 students classes and to collect data we used the standard 60-item Torrance verbal creativity questionnaire that measures four-components of fluency, initiative, flexibility and elaboration. In order to ensure the reliability of the questionnaire, 20 questions before final implementation, was conducted randomly among participants and after the collection, the amount was calculated by Cronbach's alpha equal to 0/81.

After the equivalent of two classes of students in accordance with the assumptions of statistical control, through academic achievement, scholars to study the impact of independent variables on the dependent variable have thought learning methods to both teachers of two classes and during two pre-consultation meeting the scholar offered the training program to them in order to make them run it for 2 months in class.

In the first session Torrance creativity questionnaire as pre-test was conducted in both classes during the implementation of Synectics teaching and brainstorming method as independent variables, the scholar communicated with the teacher and was present in both classes so conduct them in difficulties then at the

end of two months, the same papers as the post-test questionnaires were conducted in both classes. One of the preconditions for the use of co-variation test is examination of normal statistical distribution of variables. For this purpose, by using the Kolmogorov-Smirnov test, the normality of the variables has been examined and confirmed .

**3. Findings**

Hypothesis 1: The impact of Synectics teaching methods in comparison to brainstorming methods is different on the fluency of creativity of the students.

Table 1: One-way-variance analysis

The intensity	The significance level of p-value	amount of F
0.61	0.000	51.253

Table 2: The mean of pre-test and post-test examinations

p-value	$\alpha$	the amount of t	Standard deviation	Mean of replies	Number	group	level
0.711	0.05	1.45	6.01	28.14	20	Control	Pre-test
			6.94	29.96		the experiment	
0.000	0.05	8.05	7.01	31.45	20	Control (brainstorming)	Post test
			8.26	12.39		Experiment (Synectics)	

According to the p-value it is concluded that the fluency between the students in both Synectics teaching and brainstorming, has a significant difference that according to the amount of mean of fluency score in post-test subjects we can see that in the Synectics method, Fluency score of students are more than

brainstorming that this effect is also higher due to the value of 0/61.

Hypothesis 2: The impact of Synectics teaching methods in comparison to brain storming methods is different on flexibility of creativity of the students.

Table 3: One-way-variation analysis

the intensity	The significance level of p-value	Amount of F
0.598	0.000	22.31

Table 4: pre-test and post-test of flexibility

p-value	$\alpha$	the amount of t	Standard deviation	Mean of replies	Number	group	level
0.355	0.05	1.44	6.56	23	20	Control	Pre-test
			5.33	21		the experiment	
0.000	0.05	19.67	5.82	27	20	Control (brainstorming)	Post test
			7.19	34		Experiment (Synectics)	

According to the p-value it is concluded that amount of flexibility between the students in both methods of Synectics and brainstorming, there is a significant difference which according to mean score of amount of flexibility of subjects at post-test, we realize that in the Synectics teaching method, students flexibility

score is more than brainstorming that this effect is also higher due to the large amount of value 0/598.

Hypothesis 3: the impact of Synectics teaching methods in comparison to brainstorming method is different on the initiative thinking of the students' creativity.

Table 5: One-way-variance analysis

intensity	The significance level of p-value	Amount of F
0.621	0.000	21.44

Table 6: Statistical Indicators of innovation

p-value	$\alpha$	The amount of t	Standard deviation	Mean of replies	number	group	level
0.558	0.05	1.39	6.55	32	20	control	Pre test
			5.28	33		experiment	
0.000	0.05	16.42	6.59	36	20	Control (brainstorming)	Post test
			6.19	41		Experiment (Synectics)	

According to the p-value it is concluded that on the initiative level of students between the two methods of Synectics teaching and Brainstorming there is a significant difference which by considering the subjects' post-test mean score of initiative participants we realize that in Synectics approach, the initiative

thinking of students score is higher than brainstorming that this effect is also more due to the large amount of 0/621.

Hypothesis 4: The impact of Synectics teaching methods in comparison to brainstorming method is different on the detail elaboration of students' creativity details.

Table 7: One-way-variance analysis

intensity	Significance level of p-value	Amount of F
0.711	0.000	26.78

Table 8: statistical indicator of detail elaboration

p-value	$\alpha$	Amount of t	Standard deviation	Mean of replies	number	group	level
0.712	0.05	0.69	6.45	24	20	control	Pre test
			5.79	25		experiment	
0.000	0.05	18.28	6.77	30	20	Control (brainstorming)	Post test
			6.46	34		Experiment (Synectics)	

According to a p-value it is concluded that between the detail elaboration score of students in two methods of Synectics and brainstorming, there is a significant difference which according to the mean score of detail elaboration of participants at post-test we can notice that score of detail elaboration in the Synectics method is more than brainstorming and this effect is higher also due to the large amount of 0/711.

#### 4. Discussion and conclusion

- Results of first hypothesis indicated that in Synectics teaching method, students' fluency score increases more than brainstorming method. Fluency or fluidity, expresses the mental ability of relationships between idea and thought which is measured based on the number of ideas or solutions and the ability to provide multiple answers to a given location at a given time, students in Synectics method without any fear of providing wrong answers, participate in learning process and practice giving multiply answers, so that's why students in the experimental group in terms of fluency have a better position compared to the control group. These results are consistent with researches of Amiri and Noruzi (2013), Momeni et al. (2011), Darzi Ramandi et al. (2015).

- The second hypothesis results indicated that in the Synectics teaching method, students' flexibility score increases higher than brainstorming method. The flexibility is the ability to think in different ways to solve a new problem, students in the traditional way were busy on memorization and learning stereotypes and didn't have flexibility and providing answers in other ways, but in Synectics teaching they, freely and without fear, practice different ways of thinking and responding to new issues, therefore, this method increases the flexibility for students. The results of the research are consistent with results of Amiri and Noruzi (2013), Momeni et al. (2011), Darzi Ramandi et al. (2015).

- The third hypothesis results indicated that in the Synectics teaching method, the score of initiative thinking of students' increases higher than brainstorming method. Initiative thinking is the ability to think in an unusual way and contrary to common habits that comes with the unusual, strange and subtle answers. Thus, in the teacher-centered teaching and learning methods in traditional ways, students are empty containers whom the teacher has a duty to give content and on-side-transfer them and students do not have the guts to talk, but to call the stereotype answers that the teacher previously has taught to them, so we do not expect the initiative thinking. But in Synectics teaching method, students learn how to think for metaphorical and analogous types of work. They use analogies to solve new problems and new ideas and express their opinions freely and find new ideas.

Therefore Synectics teaching method enhances the students' initiative thinking ability. These results are consistent with findings of Amiri and Noruzi (2013), Momeni et al. (2011), Darzi Ramandi et al. (2015).

- The fourth hypothesis results indicated that in Synectics teaching methods, students' score increases higher than brainstorming on detailed elaboration of students. The ability to complete a thought and add details to it is called detail elaboration. Unlike ordinary people who are always looking for solutions and carefree ways and use easy to traverse ways, creative people, selects complexity, and is looking for an easy solution for them. In traditional teacher-centered approaches, the teacher provides full content and also evaluates them. As a result, students are not given any opportunity to think, vice versa in Synectics teaching ways not only contents are not provided completely, but students are actively participate in learning by using metaphor and analogy, discovery and description of concepts, and are accurate on their ideas and thoughts and complete them by linking them with other ideas, so that introduce their new ideas. Thus students expand their practice. In this way students perform better in developing content. These results are consistent with findings of Amiri and Noruzi (2013), Momeni et al. (2011), Darzi Ramandi et al. (2015).

#### 5. Suggestions

1. According to the obtained results and the positive impact of Synectics teaching method it is proposed to increase training students in this method rather than listening to the teacher and learning the lesson by teacher and finally memorizing the content and responding parroting. Through descriptions, similes and analogies, they can have an active learning process and production of creative ideas; foster their creativity, by using what they have learned in the early stages of innovative methods, therefore helps in their academic achievement.

2. The use of different methods and techniques fosters creativity (brainstorming, research skills, etc.) in the teaching process, that fruitful results will be achieved in various aspects such as the development of creativity, improving the teaching-learning process, communication and interaction in the process of revision training.

3. The existence, nature and impact of this informal and non-codified aspect "hidden curriculum" of school should be completed and understood by administrators, teachers, parents, students and community members. Any official attempt at designing curriculum development should turn its attention to all aspects of the hidden curriculum. Such an effort, particularly in defining the overall goals and behavioral objectives of the emotional realm and the realm of interpersonal contraction,

learning opportunities that have major importance in facilitating socialization process, particularly in relation to moral development and character has to be taken into consideration.

**Abstract.** Nowadays, due to the fact that business condition has become more competitive, organizations try to be more entrepreneurial and have higher productivity and efficiency. Using Analytic Hierarchy Process, three main factors and for each of them some sub-indices are determined to prioritize the factors and indicators that are related to factors affecting the development of entrepreneurship. The main achieved results include: in terms of structural factor, information technology has the greatest impact on the development of entrepreneurship. In terms of behavioral factors, the characteristics of employees has the greatest impact on the development of entrepreneurship. Finally, some recommendations are presented for research improvement.

**Keywords:** structural factors, behavioral factors, contextual factors, development of entrepreneurship, Department of Natural Resources and Watershed Management

## 1 Introduction

Nowadays, due to the various events that have occurred at the social, cultural and business levels, special attention has been paid to entrepreneurship and entrepreneurs in different countries. Reinforcing organizational entrepreneurship in the current organizations and paving the way for its development is considered as a means for the economic progresses, especially in developing countries. (Hadizadeh Moghaddam, 2010) Entrepreneurship is a concept that has existed since the beginning of human creation. Entrepreneurship can be regarded as the center of work, development and progress in the modern era. Without sufficient attention to "developing an entrepreneurship culture" it is not possible to achieve growth and development indices, which can be achieved through changes in the process of production, efficiency and technical and industrial progress in the economy. In the transition from the traditional to the industrial stages, it is necessary to pay special attention to the capacity of individual entrepreneurs in taking advantage of natural resources and modern technologies, because they employ new methods in the market to prepare themselves for optimum use of tools and attaining high-quality products and services (Dariani, 2011).

Entrepreneurship is the main pillar of economic growth in any country. Entrepreneurship can be strengthened by instilling correct entrepreneurial skills at the training stage. Entrepreneurship is one of the main entrances to economic development. Entrepreneurship can be considered a continuum which shows the intensity of entrepreneurship in an individual or company (Perakash et al., 2015).

Undoubtedly, the development of entrepreneurship involves several factors that should be identified and determined in terms of affectivity. The Department of Natural Resources and Watershed Management in the provinces, as part of the Ministry of Agriculture, play an important role in the development of cities and countries. It is necessary to pay attention to this issue and the entrepreneurship development (ibid).

## 2. Literature Review

### 2.1 Entrepreneurship

Entrepreneurship derives from the French word "Entrepreneur" which means "commitment". According to Webster's Collegiate Dictionary, an entrepreneur is a person who organizes, manages and undertakes the risks of an economic activity. The word entrepreneur was invented in French language long before the emergence of the general concept of entrepreneurship in modern language. In the early sixteenth century those who would lead the military mission were called entrepreneur. Since then this word has been used for other types of risks, though with some limitations. Since about the year 1700, the term entrepreneur has been frequently used to refer to the French government contractors involved in the construction of roads, bridges, ports, and facilities (Cochran, 2012).

Entrepreneurship is the process of discovering new ways to combine resources (Grace and Ihomo, 2013). Morris (1996) has defined the relationship as the relationship between entrepreneurs and the environment and the role of government in building the economic, political, legal, financial and social structures. Reynolds et al. (1999) have defined entrepreneurship as any attempt to create a new business or new risks, such as self-employment, organizing new business or expanding an existing business by an individual, a team or an already established business. Hindel and Rushworth (2002) defined entrepreneurs as having access to and understanding and exploiting the opportunities. Gartner and Carter (2003) defined entrepreneurship as an organizational phenomenon, especially as an organizing process (Harley, 2009). Kerry and Toric (2003) defined entrepreneurship as behavioral characteristics of individuals. Lowry (2003) defined entrepreneurship as an economic system that includes entrepreneurs, legal and institutional arrangements, and government. Stevenson et al. believe that entrepreneurship is the process during which opportunity are observed by individuals (for themselves or for the organizations in which they work) regardless of the resources that are under their control (Harley, 2009).

The European Union defines entrepreneurship as the ability of people to create ideas and to turn them into reality. This includes creativity, innovation and risk taking. Meanwhile, the entrepreneurs should be supported to be able to recognize and exploit the opportunities better. Training entrepreneurs is one of the means that enables them to take advantage of opportunities. The best time to start the training is the primary school (Minniti, 2008).

#### 2.1.1 Entrepreneurship Development

Development of entrepreneurship is a complex, long-term and comprehensive process that plays an important role in the growth and economic development of countries. Today, entrepreneurship is the most strategic and important tool for economic development in the developed countries (Rabiyi and Nikraves, 2014).

In the literature of entrepreneurship, the development of entrepreneurship contains 9 levels;

- A. Micro level
- B. Macro level

Micro level includes nine categories of policy making in terms of government investment and programs. The first policy is education that covers the development of entrepreneurship. It includes improving and balancing the curriculum in the higher education and the business environment. The second policy is the structures that include all government programs in terms of business loan development or risky investment, and Internet access. The third policy is entrepreneurship culture that involves all government programs regarding social entrepreneurship and

cultural development for new entrepreneurs, such as creative economic development (Hoffman, 2011).

### 2.1.2 Factors Affecting the Development of Entrepreneurship

#### 1. Organizational Factors

Moghim (2005) divides the factors that influence organizational entrepreneurship into three categories:

A. Entrepreneurial structural factors; including items such as organizational structure, organizational strategy, payroll systems, financial and budgetary systems, information systems, research and development system, control system, and monitoring human resources systems, processes and methods.

B. Entrepreneurial behavioral factors; including issues such as organizational culture, motivating human resources, leadership style, characteristics of staff and managers, human resource training, and human communication system.

D. Entrepreneurial contextual factors; including issues such as relationship with the client, political and legal environment, social and cultural environment, and administrative environment (Moghim, 2004).

#### 2.2 Research Background

Considering the role and significance of entrepreneurship and the brilliant history of entrepreneurs in the development of many countries, and due to several economic problems in our country, promotion and dissemination of the concept of entrepreneurship, and providing an infrastructure to support entrepreneurial culture are of vital importance and necessity. Entrepreneurship is a process that takes place in different environments and places. It involves some changes in the economic system through innovation by people who react to economic opportunities that create individual and social value (Ecole Vanak, 2010).

Entrepreneurship is a process that leads to satisfaction or new demand. Entrepreneurship is the value creation process through formation of a unique set of resources to take advantage of the opportunities.

There are various studies about entrepreneurship development and the factors that influence it. Some of them are presented in the following section:

Marioni and Mirzaneti (2015) studied the development of entrepreneurship in the creative industries in Indonesia. They found out that the development of entrepreneurship in the creative industries can be strengthened through assistance and cooperation of other institutions, and for solving business problems the government policy makers should develop and improve inefficient government bureaucracy, corruption, financing, poor infrastructure, and trained work force. Jelonek (2015) examined the role of innovation in the development of electronic entrepreneurship. The research asserted that customers play the main role in terms of innovation. In addition, the present study confirmed the hypothesis that companies rely heavily on the implementation of electronic entrepreneurship. Thus, strengthening their position in the virtual market is important. Rajae et al. (2011) examined the factors influencing the development of entrepreneurship in agricultural production cooperatives in Zanjan. The research was a descriptive survey study. The results showed that from the standpoint of managers the major factors affecting entrepreneurship in the cooperatives include financial support and tax cuts, granting of bank loans, creating special conditions for entrepreneurs and providing documentation for international entrepreneurship development.

Hosseini and Bozorgi (2016) examined the factors affecting entrepreneurship on the establishment and development of organizational entrepreneurship opportunities. The results suggested that the structural factors in the General Office of Ports and Maritime of Mazandaran Province had no impact on organizational entrepreneurship opportunities and that there is no relationship between them. The contextual factors in the General Office of Ports and Maritime of Mazandaran Province had an impact on organizational entrepreneurship opportunities, and there is a relationship between them. Behavioral factors in the General Office of Ports and Maritime of Mazandaran Province had an impact on organizational entrepreneurship opportunities and there is a relationship between them. Jamshidi et al (1394) examined the factors affecting the development of entrepreneurship in the agricultural production cooperatives of Minoodasht city. The results showed that the average total score of the entrepreneurship of the studied population is 2.585 with most people (2.58) being in the weak or very weak categories. It was also found that education level, number of shares, previous experience in the field of entrepreneurship, income, and experience in agricultural production cooperatives have a positive impact on entrepreneurship. Ghanbari et al (2015) examined the influential factors on the development of entrepreneurship in rural tourism. The results showed that factors associated with the strengths and weaknesses of development of entrepreneurship in tourism in the studied villages had the highest rating. Being located on the main roads of the country is an asset, lack of a strong culture of entrepreneurship in the local residents and negligence and failure of the authorities are weak points, availability of diverse ways of making money is an advantage, and finally destruction of ancient monuments and historic buildings and changing the usage of the land and landscape in the villages are among the most critical threats. Eftekhari et al (2014) analyzed the factors affecting the development of tourism entrepreneurship. The results showed that from the viewpoint of all 9 groups, the economic factor has the highest average and is more important in the development of entrepreneurship. Hosseininia et al (2015) examined the environmental factors influencing the development of the technological entrepreneurship of electric power industry by using PESTLI technique. The political, economic, social, technological, legal and international factors were studied. The results showed that, with a very high average rating than other factors, economic factors are the most effective dimensions among the factors. Then the ranking of international, legal, executive and political factors are close and finally technological and social factors are the least influential factors.

Therefore, it can be concluded that for Marion and Mirzaneti (2015), Rajae et al (2011), Lerner and Hub (2010), and Hosseininia and Bozorgi (2014) financing, government financial support, and providing financial support are the factors affecting organizational entrepreneurship development.

Rajae et al (2011), Hussein and Bozorgi (2016), and Hosseininia et al (2014) believe that legal factors, bank loans, environmental factors and political factors influence the development of entrepreneurship.

Hosseininia et al (2014), Rajae et al (2011), and Hussein and Bozorgi (1395) believe that environmental and social conditions are the factors that affect the development of entrepreneurship.

The present research and the examined factors to some extent are similar to the studies of Hosseini and Bozorgi (2016). They have studied the effect of the triple factors, while the present study examines the subcomponents of each factor individually.

### 3. Research Methodology

#### 3.1 Research Method

In terms of method, the present study is a descriptive-survey research and in terms of objective is an applied research. Statistical population of the study is 130 people who are all

employees of the Department of Natural Resources and Watershed Management in Sistan Baluchestan Province in 2015. The study used Morgan Table to determine the sample size which included 98 people. Using Analytic Hierarchy Process three main factors and for each of them some sub-indices were

determined to prioritize the factors and indicators that are related to factors affecting the development of entrepreneurship.

3.2. Research Model

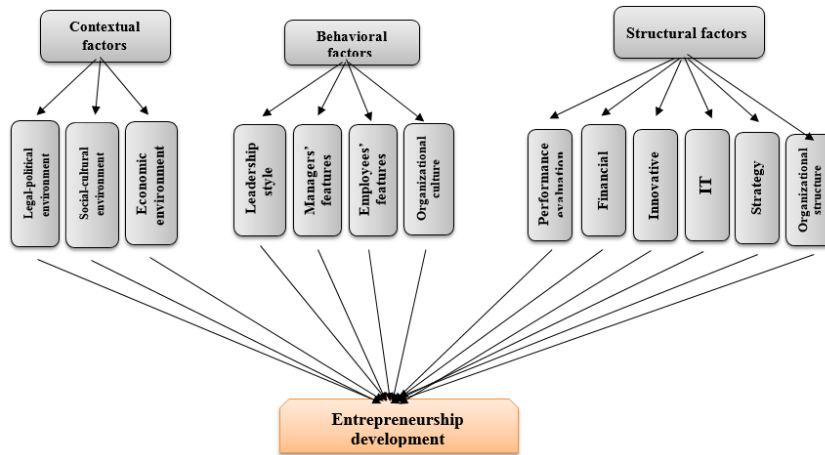

Figure 1: Conceptual Model of the Research

4. Data Analysis

The result of Analytical Hierarchy Process (AHP) for the main factors and research indicators

Using Analytic Hierarchy Process the present study determined three main factors and for each of them some sub-indices to prioritize the factors and indicators that are related to factors affecting the development of entrepreneurship. The integrated paired comparison matrix of 130 decision makers is shown in table (1).

Table 1: Paired comparison matrix of the main research factors

contextual	behavioral	Structural	Indicators
		1	Structural
	1		behavioral
1			contextual

After making the model by Expert Choice software and entering the paired comparisons matrix, the weight of criteria and sub-criteria were obtained which can be seen below. The figure (2) shows prioritizing of the main factors that affect the development of entrepreneurship based on the combination of decision-making methods by using AHP and Expert Choice

software. As shown in Figure 9, technological factor with the relative weight of 0.447 is the most important factor, structural factors with the relative weight of 0.319 is the second priority, and contextual factor with the relative weight of 0.233 is the third priority. The paired comparisons inconsistency rate is 0.3 and since it is less than 0.10, the comparisons are acceptable.

Figure 2: Prioritizing the main factors using the Expert Choice software

Table 2: Prioritizing the main factors that affect the development of entrepreneurship

row	criteria	weight	priority
1	structural	0.319	2
2	behavioral	0.447	1
3	contextual	0.233	3

Calculating the relative weight of structural indicators

Paired comparisons for each of the indicators with respect to structural factors are shown in Table 3 and Fig. 3. Considering

the table and figure, it is clear that communication between all sub-indicators is two-way.

Table 3: The paired comparison matrix of structural indicators

performance evaluation	Financial	innovation	Information Technology	strategy	Organizational structure	structural indicators
					1	Organizational structure
				1		strategy
			1			Information Technology
	1	1				innovation
						Financial
1						performance evaluation

Figure 3: Prioritizing the main indicators according to structural factors

Table 4: Prioritizing the main indicators according to structural factors

row	criteria	weight	priority
1	Organizational structure	0.171	5
2	strategy	0.134	3
3	Information technology	0.212	1
4	innovation	0.142	2
5	financial	0.172	4
6	Performance evaluation	0.170	6

According to the above table and considering the original weight that is obtained, the following components have the highest to lowest importance in the group, respectively: information technology, innovation, strategy, financial, organizational structure and performance evaluation. On the other hand, since the inconsistency rate is 0.08, which is smaller than the standard 0.1, the questionnaire is completed by respondents with high precision.

**Calculating the relative weight of the behavioral indicators**

Paired comparison for each of the indicators according to behavioral factors is provided in Table 5 and Figure 6. Regarding the table and figure, it is clear that there is a two-way communication between all sub-indicators.

Table 5: paired comparisons matrix of behavioral indicators

<b>Behavioral indicators</b>	cultural	Employees' features	Managers' features	Leadership style
cultural	1			
Employees' features		1		
Managers' features			1	
Leadership style				1

Figure 6: Prioritizing the main indicators according to behavioral factors

Table 6: Prioritizing the main indicators according to behavioral factors

row	criteria	weight	priority
1	cultural	0.569	1
2	Characteristics of employees	0.190	2
3	Characteristics of managers	0.178	3
4	Leadership style	0.063	4

According to the above table, in terms of the original weight the following components are of highest to lowest importance in the group, respectively: culture, characteristics of employees, characteristics of managers, and finally leadership style. Since the inconsistency rate is 0.02 which is smaller than the standard value 0.1, the questionnaire was completed by respondents with high precision.

**Calculating the relative weight of contextual indicators**

Paired comparison for each of the indicators based on the contextual indicator is provided in the table (7) and figure (8). Considering the table and figure, it is clear that there is a two-way communication between all sub-indicators.

Table 7: paired comparison matrix of contextual indicators

legal	political	cultural	social	economic	Contextual indicators
				1	economic
			1		social
		1			cultural
	1				political
1					legal

Figure 8: prioritizing the main indicators regarding contextual indicators

Table (8): prioritizing the main indicators regarding contextual indicators

row	criteria	weight	priority
1	economic	0.240	1
2	social	0.232	2
3	cultural	0.179	3
4	political	0.171	5
5	legal	0.178	4

According to the above table, in terms of the original weight the following components are of highest to lowest importance in the group, respectively: economic, social, cultural, legal and political. Since the inconsistency rate is 0.08 which is smaller than the standard value 0.1, the questionnaire was completed by respondents with high precision.

**5. Conclusions and Recommendations**

Nowadays that work and business involve self-entrepreneurship and self-employment, the entrepreneurship and entrepreneurs play a key role in the economic development of different societies. Due to the growing competitive business conditions, organizations are trying to be more entrepreneurial and have higher productivity and efficiency. Entrepreneurship as an important social phenomenon is influenced by several factors. Some experts believe that economic conditions will lead to entrepreneurship. They argue that entrepreneurship is the main force of economic development and brings change and innovation, along with growth and production of services.

Numerous studies have been conducted on the factors affecting the development of entrepreneurship. The studies have investigated different factors.

This study examined the major and minor factors that affect the development of entrepreneurship by using three main components: structural factors, behavioral factors, and contextual factors, as well as their subdivisions. The results are as follows;

In terms of structural factor, the following components are of the most and the least importance in the group, respectively: information technology, innovation, strategy, financial, organizational structure and performance evaluation.

In terms of behavioral factor, the following components are of the most and the least importance in the group, respectively: cultural components, characteristics of employees, characteristics of managers, and leadership style.

In terms of contextual factor, the following components are of the most and the least importance in the group, respectively: economic, social, cultural, legal, and political components.

Considering the results, the following suggestions are provided to improve current research and future studies;

- The study suggests that managers and macroeconomic decision makers use incentives such as low-interest loans, tax breaks, etc. to encourage entrepreneurship among economic agents. Given the great importance of economic criteria, adopting such policies will lead to the promotion of entrepreneurial activities in the region.

- The study suggests that economic authorities and policy makers pave the way for the private sector to actively take part in entrepreneurship. In this regard, strategies such as reducing red tape and unnecessary bureaucracy, recognizing the rights of the legal sector and giving financial incentives can be advantageous.

- The study suggests conducting conferences and meetings in the region in the presence of top entrepreneurs. Holding such seminars on the one hand leads to exchanging experiences and skills and on the other hand encourages entrepreneurial activities in the economic agents.

- The study suggests that senior managers and authorities use Leader-Member Exchange (LMX) leadership style to advance their jobs. In such circumstances, employees will be allowed to freely express their creative and new ideas. This ultimately will

lead to improvement of innovation and entrepreneurship development.

- The study suggests that the organizations use a fair and accurate reward system in accordance with the degree of activity of employees. On the one hand this encourages employees to work more and on the other hand by increasing the perceived organizational justice, increases the organizational commitment and engagement of the employees.

#### Suggestions for future researches

- Investigation of the relationship between improvement of the employees' quality of life and the development and promotion of entrepreneurship
- Investigation and identification of other factors that affect the development of entrepreneurship
- Investigation of the relationship between leadership styles and entrepreneurship development
- Investigation of the factors such as self-esteem, job security etc. on the organizational entrepreneurship.

**Abstract:** This study aimed to investigate the impact of service quality on customer satisfaction at Saderat Bank in Tehran. The present study is correlational and is applied in term of purpose of the research. Statistical society includes customers at Saderat bank. Statistical sample size included 823 customers of Saderat Bank in Tehran was determined by Cochran formula. Sampling was conducted using simple random sampling. Data were analyzed in descriptive level by frequency, mean and standard deviation. The results showed that the physical condition of components, reliability, assurance, responsiveness, empathy will have a significant positive impact on customer satisfaction at Saderat Bank. Research findings also showed a positive and significant impact of service quality on customer satisfaction.

**Keywords:** Service Quality, Customer Satisfaction, Customer, Saderat Bank

### 1. Introduction

The service sector has enjoyed significant growth in recent years, so that its share of global GDP was more than other sectors. It was found that the basic trends of the twentieth century has led economy to transfer from industry orientation to service orientation. Accordingly, services plays an important role in marketing at businesses and superior service is part of the value requested by customers. Hence in a free and competitive markets, strategies such as providing quality service, has attracted the most attention. [1]

If have a glance at the history of quality activities in recent history we will find that the quality of the product and tangible goods has nearly a century of history. [2]

Today's competitive market requires any production or services company to try to their survival and profitability, to improve its position among other competitors. Success of companies and institutions, largely depends on further understanding of customers and competitors and other factors affecting the market. In addition, in recent years competition has increased in the services market.

Companies that have real understanding of the needs and expectations of customers and to provide an appropriate response to changes in the market, can ensure success than other competitors. In the service organization, customer is concerned as a core. Increase awareness and knowledge of customers and, consequently, increased expectations and demands of the organization, the organization is faced with a serious challenge. [3]

Quality is a key element for success in business. Assessment of quality of service is the main topic of empirical and conceptual research in marketing services. [4] Nowadays, more than ever, the issue of quality of service as an important factor for the growth, success and sustainability of local organizations as strategic, effective and comprehensive management of organizations has been concerned. [5]

### 2. Research theoretical framework

It seems, quality is a dynamic target in current markets. No service cannot be considered truly great unless its products meet the highest quality standards. "Bond", defines the customer based quality as "customer can only judge what quality is. In fact, the customer is always right and the last word with him. "

In terms of "Wright", the concept of quality of service is: Provide appropriate services to achieve organizational goals, providing appropriate services in place and the right time or the right services at the first request. "Zeithaml", "Parasuraman" and "Barry", in 1990 defined the quality of services "between the demands of customer expectations and perceptions of services received". Several definitions of service quality provided, some of which include:

A) Service quality includes three Physical, location and behavior dimensions. In other words, quality of service is focus on what is the delivered to customers and the situation of the services to be offered in the future.

B) The sustained attention of the organization to meet the needs and demands of customers.

C) The difference between customer expectations and perceptions of services received services.

What can be concluded from a literature review service quality is the third definition that customer expectations are based approach disapproval, over the years, the definition has been dominant. However, a subset of cognitive recently used this approach further. [1]

Services include various activities in order to respond to the wishes and desires of the customer. From the perspective of customer one of the signs direct service, or service quality when facing a decisive moment turns out. Because of the nature of their interpersonal customer service evaluation is based on their perception of the service encounter are doing. So far, most research on exposure to the consumer sector focused service. But since commercial services due to the exposure of individual service and quality centric. It plays an important role in trade. There have been various definitions of exposures serving.

These definitions often focus on serving nature of interpersonal encounter, such as:

Two-hand interaction between customer and service provider

The length of time during which clients communicate directly with their service providers.

Contact aspects of individual and social / interpersonal service provider that a greater role than technology plays in shaping the perception of quality.

The length of time during which the customer is served.

If the above definition implies, the most important factor in meeting individual customer service interactions with employee's span of service. Customer look is one sign of quality service to the straight in the face decisive moment back service or service provider. Because of the nature of interpersonal evaluation services their customers based on their perception of the service experience. [1]

In this respect, quality assessment services, including basic steps in developing quality improvement program. According to Zafiroflos (2007) service quality is for survival and profitability for vital strategic and profitable at organization. [6]

Dimensional approach to quality of service in the face of the objective criteria used to evaluate it. Because it is assumed that customers and employees used certain criteria to conduct the evaluation. Chandon et al, provided dual assessment of the quality of service exposure that is of direct relevance to due process. Winsted three-dimensional criterion for assessing the quality of service provided exposure that includes respect, civility and agreement.

Rajput provided seven dimensions to assess the quality of service provided include: tangibility, reliability, assurance, integrity, personalization, recognition and accountability. Keylor et al in several countries examined the level of service, quality of service exposed as a physical product quality, service quality, desertion and behavioral intentions.

In another study by Jayavardna et al, service quality dimensions are the professionalism of the staff, employee's intimacy with customers, staff courtesy and competence. What is clear from this study is that most research in the field of consumer and four commercial research is done: Rajput et al., Chandvn et al., Winsted and Chanaka et al. [1]

There are two models in the field of service quality include:

1. Model of service quality. Dimensions: tangibility, reliability, responsiveness, assurance and empathy.
2. The model includes faceplates functional dimensions of service quality: technical quality and performance.

Although the above models have been used in the consumer market, but their use in commercial markets / industries is impaired. To solve this problem and to assess the quality of commercial services, interactive approach was proposed by the Marketing Department and the purchase of equipment. This model focused on buyer - seller interaction and its analysis unit. Based on the exchange and communication interaction between the two components, forms the perception of commercial service. [1]

There are measurement models such as the Kano model, Fournel model, and SERVQUAL Model to assess the quality of services. In this research SERVQUAL is used to evaluate the quality. This model was introduced in the early '80s by Parasuraman et al. In this model, customer satisfaction with the quality of services provided is measured. Also gap between customer expectations of service provided is measured. Also, the gap between customer expectations and perceptions of the services offered are determined.

According to Parasuraman et al, with the help of this model, but given that organizations may be different. Managers according to the characteristics and needs of organization, to make the appropriate changes should be exclusive to this model. In this model, a questionnaire with 22 questions (criteria) is designed to offer a service in which clients and customers to assess the situation. These 22 questions included five aspects of quality of services that are provided below:

**Tangible:** the physical facilities, equipment, communications equipment, in terms of their appearance and appearance;

**Reliability:** the ability to provide accurate and reliable service commitments;

**Responsiveness and accountability:** the willingness to help customers and provide prompt service;

**Assurance:** knowledge and courtesy of employees and their ability to instill confidence in the integrity of services;

**Empathy:** involves special attention of university to its students.

This model is composed of two parts:

The first part consists of 22 questions measuring the expectations of our customers and to identify customer expectations in connection with a service is used.

The second part of the evaluation of customer service is concerned is that it contains 22 questions. The main and primary aim was that SERVQUAL model developed by slightly modifying an appropriate tool for measuring the quality of services provided in all organizations. [7]

This model indicates that the activities of the organization to affect the perception of quality. In addition, this model indicates the interaction between this models, the interaction between these activities; connections between the activities of the organization or marketer to provide a satisfactory level of service quality. This connection can be described as a gap or mismatch. This model enables management to service gaps and find out the causes of these gaps. This SERVQUAL model has five scales. (Physical, reliability, warranty, responsibility and empathy)

These measures include:

**Physical dimensions:** including the availability of facilities and equipment is working and communication goods. All this resolution provide the client to assess quality, it gives consideration. Like amenities in the physical environment of the organization.

**Reliability:** means the ability to perform reliably and reliable service, so that customer expectations are met.

In fact, reliability is fulfilling obligations, meaning that if organizations provide services in the field of time, manner and cost of services.

**Accountability:** Accountability is the willingness to cooperate and help the customer. This dimension of service quality, emphasis on showing sensitivity and awareness for requests, questions and complaints from customers.

**Warranty and Guarantee:** warranty or guarantee is competence and ability to represent employees in instilling a sense of confidence to the client, to the organization. This dimension of service quality, especially in the important services that they have a higher risk.

**Empathy:** personal attention and allocation of work time for all customers, This means that due to the mentality of individuals, with each of them is special treatment, As they become convinced that agencies understand their customers and they are important to the organization. [5]

The first and most important marketing principle according to the customer's wishes. Organizations regardless of the customer's wishes cannot survive. But much less expensive to retain existing customers than attracting new customers. Providing appropriate services to retain the customer. [8]

One of the organizations in the provision of services and its role and importance in the economy and the country's development is banks. Talk banking customer satisfaction in a few years in the

current atmosphere of Iranian society is of particular importance and sensitivity. Banks and banking industry due to the type of services offered and to consider the type of close relationship that exists between the organization and its customers.

For the customers of the banks are the only source of income for the organization and the organization would not exist without them. So from the time of production to supply customer service, have opinions, tastes and wishes him well considered and addressed. Given the importance of the ideas of belonging and loyalty to the client organization and causes not only a customer satisfaction in it, but she knows her part of the organization. For the above reasons the banks in order to attract new customers and winning their loyalty to their steps.

Therefore it seems that whatever the variables that are associated with customer satisfaction in banks, this ensures that banks can take steps to satisfy customers the better. Given the importance of what was said, this study is to follow the impact of service quality on customer satisfaction at Saderat Bank in Tehran.

### 3. Research hypotheses

#### 3.1 General hypothesis

Quality has an impact on customer loyalty of Saderat Bank at Tehran.

#### 3.2 Special hypotheses

1) Physical condition has an impact on customer satisfaction of Saderat Bank at Tehran.

2) Reliability has an impact on customer satisfaction of Saderat Bank at Tehran.

3) Ensuring has an impact on customer satisfaction of Saderat Bank at Tehran.

4) Accountability has an impact on customer satisfaction of Saderat Bank at Tehran.

5) Empathy has an impact on customer satisfaction of Saderat Bank at Tehran.

### 4. Research Methodology

The present study is correlational and in terms of the purpose of the research is applied. Statistical society of this research includes customers of the Saderat Bank in Tehran. Because the number of statistical society is not specified, the first 30 questionnaires were distributed among bank customers. Then enter a score Cochran questionnaire variance in sample size formula for indefinite societies, the sample size was determined. Cochran's formula for determining the sample size for communities were uncertain that this formulation is as follows.

$$n = \frac{z_{(\alpha/2)}^2 s^2}{d^2} \quad (1)$$

$$n = \frac{[(1.96)]^2 (0.536)}{[(0.05)]^2} \quad (2)$$

$S^2$  = variance;  $n$  = sample size;  $z_{(\alpha/2)}$  = estimate taking into account the 95% confidence level is this amount equal to 1.961;  $d^2$  = amount of estimated accuracy (tolerance) is assumed here 0.05

According to Cochran's statistical sample size was 823 people. Sampling is done using simple random sampling. The main instrument used in this study was a questionnaire. To measure customer satisfaction questionnaire customer satisfaction by

Seyyed Mohammad Moghimi (2013) [11] was designed. This questionnaire is Likert scoring.

Quality of service are measured using the Khajehpour (2011) and has the physical condition of components, reliability, assurance, responsiveness, empathy. Survey questionnaires are being replicated in several studies and reliability necessary components are standardized questionnaire. Since the research questionnaire, which will measure the same thing, in terms of content, have validity. On the other hand questionnaire research has also been approved by university professors.

To determine the reliability of the study, Cronbach's alpha was used. Cronbach's alpha of customer satisfaction was 0.819 and service quality questionnaire was 0.837, indicating the high reliability of the questionnaire research. Using research data descriptive and inferential statistics were described as mean and standard deviation of the regression was performed to confirm or refuse research hypotheses.

### 5. Descriptive statistic

Table 1: Description of research variables

Variable	Minimum	Maximum	Average	Standard deviance
Physical situation	1.23	5	3.19	0.613
Assurance	1.96	5	3.85	0.512
Guarantee	1.73	5	3.41	0.752
Responsiveness	1.21	5	3.43	0.674
Empathy	1.39	5	3.50	0.452
Customer satisfaction	2.11	5	3.18	0.551

### 6. Deductive statistic

Table 2: Results of regression tests for research hypotheses

Hypothesis	No.	Correlation coefficient	Determination coefficient	Significant level	Result
(1)	823	0.654	0.504	0.000	Approved
(2)	823	0.721	0.614	0.000	Approved
(3)	823	0.546	0.400	0.000	Approved
(4)	823	0.812	0.578	0.000	Approved
(5)	823	0.719	0.611	0.000	Approved
Main	823	0.735	0.621	0.000	Approved

According to Table 2, the significance level is less than 0.05, the result is all the more meaningful relationships between variables. Correlation between the variables in the hypothesis of the study revealed a direct relationship between the research variables in all hypotheses. On the other hand determining factor in all of the quality of service indicates that all components of service quality on customer satisfaction have influence. Also coefficient of determination Quality of Service (0.621), which shows the quality of services as well as 1.62% impact on customer satisfaction.

### 7. Results

Results obtained of the first hypothesis suggests that physical condition has a significant effect on customer satisfaction. This result suggests that the Bank should be used in the field of modern equipment, physical facilities, the staff, the regular service, neat and clean invest. Because the physical dimension of service quality is better since then has physical effect on customer satisfaction leads to greater customer satisfaction.

Results obtained of the second hypothesis suggests that reliability has a significant effect on customer satisfaction. This result suggests that banks should provide timely services related to the field, perfect effort and passion to solve problems such as the ability to ensure the quality of service customers invest

better. Since then there Reliability effect on customer satisfaction leads to greater customer satisfaction.

Results obtained of the third hypothesis suggests that ensures a significant effect on customer satisfaction.

This result shows that the bank must provide services in areas such as quality, create ensuring the quality of services offered to tourists in the hotel, creating a sense of security and comfort to passengers who have received services. Because whatever better service quality assurance dimension, since then has an impact on customer loyalty will be to ensure customer loyalty more hotels.

Results obtained of the fourth hypothesis suggests that accountability has significant effect on customer satisfaction. This result suggests that customers should be able to easily transfer their problems to the bank personnel and personnel should be the improvement of the comments and suggestions of the customers who apply in their work.

Results obtained of the fifth hypothesis suggests that empathy has a significant effect on customer satisfaction. This result suggests that bank staff should pay more attention to their customers' expectations. Also bank must sensitivity and awareness of requests, questions and complaints from customers. Because whatever better service quality is empathy dimension, since empathy dimension is the effect on customer satisfaction makes the bank more customer satisfaction.

Results obtained show that service quality has a significant impact on customer satisfaction Saderat Bank in Tehran. The result of this hypothesis with the results of Aref and colleagues (2013), Sigoro (2013) Feizi and Tatari (2011) is consistent. About result can be said that whatever banks improve their service quality, customer satisfaction will be greater than the Saderat Bank.

## 8. History of research studies

Aref, Evin Yan, Zakhani, Khaled Ismail (2013) study entitled impact service quality and customer satisfaction on customer loyalty in Internet banking did. These researchers from the online version of the servqual questionnaire to assess Internet banking services in Malaysia used a commercial bank. Random ones of 265 questionnaires were collected from internet users banking services.

Findings showed that the realization of confidence, attractiveness of the website, guide the use of the website, system availability, privacy, internet banking services are the answer. Research results showed that the attractiveness of the website, A Guide to the site, the availability of systems, online banking accounts with a positive effect on customer satisfaction. E-mail customer loyalty also customer satisfaction has a significant impact.

Electronic satisfaction with charm website and FAQ Use of electronic banking services and electronic customer loyalty mean there is a significant relationship. As a result, the attractiveness of the website and appearance, providing information and tips about web services, the features are important for online banking users.

These findings reflects that of Internet banking along with technical aspects, the quality and availability of services such as system efficiency, web site attractive and appropriate guidance for quality assurance and critical e-mail to the satisfaction and loyalty of customers. [9]

Sigoro (2013) article due to perceived service quality, customer satisfaction and loyalty did the factors contained. The results showed that customer's perception of service quality and its surrounding factors. Then understand the services have a direct

impact on customer satisfaction. Finally, customer perception of service quality and relationship quality and customer satisfaction have a direct impact on customer loyalty. [10]

Kamran Feizi and Saeed Tatari (2011) in the article "Improving service quality in airline flights Islamic Republic of Iran (navigational model based on quality of service)" concluded that the Iran Air can improve service quality and meet customers' satisfaction through they will provide in the future. [2]

## 9. Conclusion

The results showed that the physical condition of components, reliability, assurance, responsiveness, empathy will have a significant positive impact on customer satisfaction Saderat Bank. Research findings also impact service quality on customer satisfaction showed a positive and significant.

**Abstract.** The purpose of this study was to investigate a core stabilization exercise on static and dynamic balance with cerebral palsy spastic diplegia were girls. For this study, 20 volunteers were selected and randomly divided into two experimental and control groups. Protocol core stabilization training for 8 weeks, that was conducted and the control group continued with their normal lives. To test hypotheses and significance level  $0.05 > p$  was considered and Spss software version 20 was used for calculations. The results showed that the static balance with eyes open and closed Romberg test, the difference was not significant but no significant difference was seen in dynamic balance with Y- test. It can be concluded that postural control and balance in patients with cerebral palsy spastic diplegia resulting in core stability can be improved.

**Keywords:** cerebral palsy, spastic diplegia, static balance, dynamic balance, core stability, proprioception sense.

### 1 Introduction

Human beings are animated by all means and his survival depends on his movement and physical activity. Today, as a result of lack of exercise and physical activity among schoolchildren on the one hand and stressful situations caused great concern and has made life on the other machine many physical and psychological effects, including musculoskeletal pain and discomfort caused by it are quite tangible increase (Izadi, 2007). Although the use of heavy bags, sit behind a desk and non-standard benches and inappropriate, wearing tight shoes, inert, bad move, poor nutrition is the most important reasons in this regard. On this basis, the skeletal spine important part of the person's physical condition. The upper part of the spine is important that in addition to protection and support is one of the most sensitive parts of the body, spinal cord and at the same time the movement is important to maintain the strength of the human body (Alizadeh et al., 2007). Body condition, general health and performance metrics to express the movements and activities. In other words, the foundation of all human movement to the start and end of each move depends on the species status and physical structure. A more appropriate body condition less fatigue and more efficiency. In the meantime, given the very important role of the spinal column to appear. Keep the spine in alignment and placement and attachment to the effective functioning of human muscles and ligaments He added vulnerability. Therefore, any weakness in the muscles holding the spine, will disrupt his stature. The weakness of the muscles of the spine will be adverse effects on the body structure, in the absence of these mechanical failures and unrecoverable come in the form of fixed defects. In view of the side-view backbone structure with arches of cervical, thoracic, lumbar and abroad. The arches are responsible for several tasks, including the ability to increase the strength and diversity and facilitate the movement of the spine. (Gharakhanlou and Alizadeh, 2009). As a result, the importance of postural kyphosis deformity has led to this complication is considered by researchers. Abnormalities in terms of treatment and no right to be different ways in which the use of corrective exercises, postural Kyphosis deformity and reform of the common methods and researchers typically for

topical administration of these exercises, the anomalies in the management of patients (Qadiri, 2013). In Iran, research in this area in recent years has gained a special place, Because officials and community leaders, one after physical education and sports as a means to prevent and treat a variety of physical deformities and mental disorders are community and a large part of the slogan <what is now treated, is yesterday prevention has> been put in charge of physical education and sport. For this reason, Physical Education and Sports as new knowledge with other sciences, has a special place and utilizes the findings of the humanities, and sciences, biology, an important role in health, prevention and treatment of many diseases has taken. Now more than ever, it's important to have medical knowledge that As much as possible rather than prescribe a variety of drugs in the body is associated with many side effects the types of corrective exercise and sports as varied for the treatment and prevention of many diseases prescribed (Daneshmandi, et al., 2009). Statistics regarding the various causes of deafness and are not available in our country, some studies 4.13% of the subjects were suffering from hearing loss (Izadi, et al., 2012). Meanwhile, mental imagery is very useful in rehabilitation, mental exercise is also beneficial for the acquisition of a new skill may improve performance skills in rehabilitation to relearn a skill as well as traffic police officers are also useful due to the effect of a period determined mental exercises and corrective spine status is considered deaf girl kyphotic.

### 2 Problem statement

The human body is composed of multiple components. These components are located next to each other in a certain way to communicate with each other and form a single structure. Several factors in integrating the collection of structural units work together. Exposure to various body parts over each other like blocks that are positioned relative to each other have to interact, and must be in balance to form a whole. Head, trunk and extremities are the main components of anatomy, as well as reciprocal performance, fit with each other structure and status of the relationship of these sections together physical condition is known. Given the likely impact of different factors on human physical condition throughout life, it is stated that the acquisition of ideal body condition is very difficult and less can be found people who have the ideal body (Alizadeh et al., 2013). Spine basis for the head, shielding the internal organs, ligaments and muscles to connect stable basis, chest and pelvis, and the connection between the upper and lower limbs and trunk mobility provides (Sokhango Akbari and Najafi, 2006). Depending on how the pieces fit onto each other need to be backed up through the muscles of the spine are not distorted. But to count when the muscles holding the balance of power and stature in the spine may not be over, So that groups tend to atrophy, weakness and shortness of another group, the spine curves disrupt his balance and causes the abnormal curvature of the spine occur (Ilkhanlar and Balochi, 2010). Kyphosis of abnormalities that started from a very low level and gradually progresses to the point that structural problems such as wedge-shaped (Wedging) osteoporotic vertebral fractures, which can be a prelude to or neurological disorders later in life, especially in women is. (Hijazi, 2007). The event will be rounded upper back, sternum goes down and comes down chest the small chest cavity is thus very sensitive and possibly internal organs from their original position to move around. The normal kyphosis 20-40 degrees. If the angle of 40 degrees is known as malocclusion. Following the false patterns in the manner of maintenance of the body, such as excessive working hands in front of the body to strengthen the muscles of the opposite, kyphosis is a primary cause of the anomaly. Despite the complications it causes in the body over, hands forward and back feel will have an abnormal curvature of the state, due to falling shoulders forward and back muscles stretch the muscles of the chest area is short, and if this anomaly timely detection and prevention will be irremediable effects (Daneshmandi, 2015). In developed countries through

various tests from the early days, different people in different age groups to evaluate and test the anomalies in the body and preventing the initiation abnormalities such as kyphosis from the early beginning of their life. So it seems that such tests are necessary at all levels of education including primary, secondary, high school and university so that to prevent such anomalies and their treatment action is necessary. (Arian et al., 2010). The disability to a set of physical, mental or psychological refers to a person of ordinary life and their own personal or community opens. Disabilities with limitations and disabilities experienced person as a result of disorders associated. In other words, disability is a function of the relationship between persons with disabilities and their environment and when that happen the people to the cultural, physical or social encountered and probably unable to various systems of society that is accessible to other people, use (Asmirnova, 2003). A hearing impairment usually diagnosed during early life. The growth of abnormal posture with delays physical disabilities are common among deaf children And is often related with atrial malfunctions. (Ryan, et al., 2000). Hearing disability problems often only considered the aspect of communication. However, communication problems, the main defect is caused by hearing loss, hearing bow is also likely to have other health issues (Behrman, 2004). Deafness is a sensory disorder nervous that more than 120 million people worldwide suffer from it, this impairment annually about 150 million dollars to bring that one of the goals of the World Health Organization encourage countries to prevent deafness in international projects such as reducing the age at diagnosis and it is done at birth. Ten percent of the country's disabled population 2.16%, ie 470 thousand people, hearing impaired and speech disabled population and from each thousand children born in the form of Iran, between five and six children with hearing impairment is dumped (Behrman, et al., 2003). Children with sensory disabilities due to adopt a sedentary life-coincides generally suffer from poor physical fitness more important reflected the sensory systems. The human sensory systems play a major role in motor control systems that include proprioceptive sensory, vestibular and visual. Any failure of this system leads to problems with balance posture and coordination are (Kuban, 1990). Research on postural stability in patients with impaired vestibular apparatus indicates that, in the absence of both visual and somatosensory data to be transmitted without difficulty, postural deviation natural state will stand. In contrast, when the data were insufficient visual and somatosensory, had difficulty in maintenance of your posture (Rine, 2013). It seems that children with disabilities to achieve health goals, not enough activities (Liao, 2007). So there is a disability would limit the involvement of children in normal activity (Sadeghi, 2008).

Thus, according to the study sought to answer the question whether the period of mental exercises and corrective spinal condition affects deaf girl?

### 3 Research purposes

#### 3.1 The overall goal

The effect of a period of mental exercises and corrections the status of kyphotic spine deaf girl.

#### 3.2 Specific objectives

1. The effect of a mental exercise period extension and repair of the spinal kyphotic deaf girl.
2. The effect of mental practice and correction of lateral flexion of the spine kyphotic deaf girl.

#### 3.3 Hypothesis of research

##### 3.3.1 The general assumption

A mental exercises and corrective effect on the spine is kyphotic deaf girl.

##### 3.3.2 Specific assumptions

1. A period of mental exercises and corrective to the extension affects the spine kyphotic deaf girl.
2. A period of mental exercises and corrective lateral spinal flexion deaf girl kyphotic impact.

##### 3.4 Default Research

1. The validity and reliability of measuring devices is acceptable.
2. The subjects in this study have contributed to the good.
3. The experimental group did the exercises correctly and under the supervision of a researcher.
4. Subjects have sufficient incentive to participate in the study.
5. Participants do not have the mental and emotional problems.

##### 3.5 Conceptual and operational definitions research words:

###### 3.5.1 Conceptual definitions:

1. The mental exercise: simply a symbolic exercise, including frequent mental imagery visible muscle in the absence of any major moves aimed at improving the performance.
2. Practice Reform: A subset of movement-therapy is used to change various body shapes.
3. Deaf person who prevented him from understanding what others hear the way the ear is even with the use of hearing aids.
4. Status of the spine: spine, the core of the human body in the form of S drawn, and four (arc) is formed, three play an important role: protecting the central nervous system, the weight of the body and the movement and participate in the various movements of the trunk and the supporting role of breast shelves.
5. kyphotic: increase excessive curvature of the spine and posterior sagittal plane thoracic kyphosis to say. This anomaly with increased curvature of the chest, shoulder and round shoulders clear away the situation. In this disorder usually has a curvature of the spine, severe posterior longitudinal.

###### 3.5.2 Operational definitions

1. The mental exercise: In this study, corrective exercises embodiment of the method is a mental workout by deaf girl has kyphosis.
2. Corrective exercises: In this study, carried out corrective exercises selected by the deaf girl with kyphosis, which include power movements, stretching and mobility sector.
3. Deaf: In this study, mean girls kyphosis that the hearing and the ability to hear surrounding sounds and conversations Ha61-80Dsy but not, in fact, people who are deaf and absolute extreme.
4. Status of the spine: In this study, measuring the lateral spinal flexion-extension of the spine and deaf girl with kyphosis by goniometer before and after exercise (mental corrected) is.
5. Kyphotic: In this research kyphosis angle greater than 40 degrees is equal curved deaf girl.

### 4 Methods and Outline of Research

Sample and sampling, sample 30 deaf girl kyphotic are the inclusion criteria of the study and purposefully into three groups

of 10 patients tested (a group of 10 patients corrective exercises and a group of 10 people mental exercises) the control group were homogenous groups.

Inclusion criteria for research are: 1. All participants are deaf, 2-athletes are, 3. savvy enough to understand simple verbal requests and instructions over the measure have and doing exercise, 4. Ability to have mental imagery, 5-individuals with no symptoms of other diseases, respiratory tract diseases is not, 6. The participants not taking any medication soothing.

Independent variables: 1. Mental exercises, 2. Corrective exercises. Dependent variable: 1. the extension of the spine, 2. Side flexion of the spine, 3. Abduction shoulder, 4. Chest expansion

#### 4.1 Collection tool of data

1. Personal Information Form (age-weight-height - medical history, damage) 2. Consent (to attend the training program) 3.Revised scale visualization capabilities MIQ-R (to assess the ability to visualize the subjects on deaf girl) 4.Flexible ruler (measure-extension of the spine) 5.Goniometer (measuring range of motion in abduction of the shoulder and flexion lateral spinal) 6. Tape measure (to measure the expansion of the chest-height) 7.Protocol 6-week corrective exercises kyphosis 8.Protocol 6 weeks e-mental exercises 9.Mats (for running exercises as well as run quizzes) 10.Foam (for running) 11.Ball (for running) 12.Digital scale beurer Germany (for weighing)

#### 4.2 Procedure

First complete explanation of the process is presented by researchers, students and their parents (group corrective exercises and mental workout as well as the control group), then to express their consent to participate in research 6 week by the participants or their parents completed and more personal information form to be completed by them .Having abnormal postural kyphosis greater than 40 degrees inclusion criteria for this study. After this phase (of three): Measurement of the expansion of the chest, shoulder abduction, extension, lateral flexion of the spine and the spine takes place. Measuring abduction: This measure individually with a goniometer with the goniometer axis in the posterior appendage of the acromion and the shoulder abduction for active and moving animated arm goniometer hand movement takes place at the same time. Extension of the spine, spinal papillae T12, C7 is detected and the normal mode and stand with flexible ruler to measure the distance. Then the person asked to do the maximum extension in the spinal dorsal. And again the distance is measured. Lateral spinal flexion measurements measured with lateral spinal flexion side of the little finger goniometer-measured distance to the ground. Upon completion of the tests (extension of the spine, lateral spinal flexion, the abduction of spine and chest expansion) scores are recorded. Next, the subjects were randomly assigned to three groups and targeted (mental-correction-control) are divided. Each number is 10, after dividing groups, mental practice group questionnaire imagery ability MIQ-R ((The purpose of this questionnaire is to evaluate the ability to see (visual imagery) and feeling (Kinetic Imaging)) to complement and, if necessary rating businesses fail of the band are removed. then participants in their groups fall and training groups provided to them to be. protocols rehearsals correction: this exercise protocol for 6 weeks, 3 times a week and every

other day the girls deaf has kyphosis carried out. duration of the exercise in each session 60 minutes (10 minute warm-up with the use of walking and exercise stretching, 1 minute workout harness, 12: 30 minutes of stretching exercises 31 to 30 minutes of strength training and cohesion, resting between exercises inhibitory elasticity and strength 4 minutes) runs. during training, all exercises under the supervision of researchers carried out and supervising the participants there. after the completion of the 6 week period re-test on them is done to determine the difference between pre-test and post-test that this training has taken place. Weekly protocol is repeated 6-week corrective exercises that time.

Mental exercise training program based model is Zhang Lei. This training lasts a few sessions. (Willson, 2007) of the video (to show the exercises) as well as the teacher of a deaf who are fluent in sign language can be used for this purpose.

The exercise protocol for 6 weeks, 3 times a week for a day among on the deaf girl has done kyphosis. The training for 45 to 50 minutes (definitions of mental exercise - relaxation - learn how mental exercise - training exercises related to the presence of kyphosis in mind) runs. During training, all exercises are carried out under the supervision of the investigator and supervising the participants. After completing the 6 week period on their re-test is done to determine the difference between pre-test and post-test exercise was conducted during this period. Finally, the tests will be taken away from them again. The control group did not do any exercise at this time.

#### 4.3 Statistical methods

Results with an average  $\pm$  standard deviation and percent changes are reported. Kolmogorov-Smirnov test to verify the normal distribution of data is done in the case of normal parametric tests will be used. The difference between the mean and the variance homogeneity, adopted by analysis of variance test and Levin were checked. To investigate the effect of corrective exercises and mental workout program on the dependent variables of t-test and for comparison group mean from ANOVA with post-test post hoc test and if non-homogeneity of variance post hoc Dunnett T-3 will be used. An alpha level of 0.05 is considered to be meaningful. Spss software version 20 will be used for calculations.

#### 4.4 The test of hypotheses

In this section to test the hypothesis will be discussed.

H0: A period of corrective exercises on deaf girl kyphotic spine extension has no effect.

H1: A period of corrective exercises on deaf girl kyphotic spine extension has effect.

H0: a period of mental practice on deaf girl kyphotic spine extension has no effect.

H1: A period of mental practice on deaf girl kyphotic spine extension has effect.

Initially, before the hypotheses to be addressed, should ensure the normal or non-normal data. The results presented in Table 1.

Table 1 Kolmogorov-Smirnov test

significant number	Statistics	Standard deviation	Average	Number	Level	group
0.992	0.432	1.312	18.269	10	Pre-test	Test (corrective exercises)
0.391	0.901	1.440	20.606	10	Post-test	
0.982	0.452	1.210	18.229	10	Pre-test	Test (mental exercise)
0.514	0.810	1.323	20.006	10	Post-test	
0.704	0.705	0.563	19.389	10	Pre-test	Control
0.926	0.547	0.626	20.169	10	Post-test	

According to Table 1 As a significant amount of surface area larger than the amount of errors ( $05/0 = \alpha$ ). So the assumption is not rejected and it is concluded that the distribution of the data follow a normal distribution and the default is observing the

normality of the data for analysis of covariance. After the distribution of data was normal, Levene test for homogeneity of variances in the samples examined. Results are shown in Table 2.

Table 2 homogeneity of variances test

A significant number	DOF 2	DOF 1	Levene's test	Level
0.567	18	1	0.340	Test (corrective exercises)
0.238	18	1	1.492	Test (mental exercise)

In Table 2 Equity sample variance is related to the amount obtained significant level (sig) in the (group corrective exercises) equal to 0.567 in (mental practice group) is equal to 0.238 greater than 0.05. Therefore it can be concluded that the sample variance, is homogeneous and the assumption of homogeneity of

variance and covariance analysis were not met. After the homogeneity of variances was evaluated, The analysis of covariance on two experimental and control groups and in both pre-test and post-test described above. Results are shown in Table 3.

Table 3 Covariance analysis

statistical power	The effects	Significant	F	Mean Square	DOF	Sum of squares	Source changes
1.000	0.671	0.000	34.727	14.915	1	14.915	Group (corrective exercises)
							Pre-test
0.980	0.615	0.001	18.157	7.798	1	7.798	Post-test
				0.429	17	7.301	Error
0.970	0.495	0.001	16.693	9.323	1	9.328	Group (mental exercise)
							Pre-test
0.341	0.119	0.119	2.693	1.505	1	1.505	Post-test
				0.559	17	0.559	Error

According to the data of Table 3 Analysis of variance (group corrective exercises) show between mean measurements for corrective exercise and control groups in post-test is significant difference ( $P < 0/05$ ). The hypothesis (H1) that corrective exercise training, on the deaf girl kyphotic spine extension is effective in the experimental group confirmed. Also according to Table 4.5 the effect of (eta squared), which is equivalent to 0.615 per cent is acceptable. The corrective exercises have about 61 percent in the spine extension deaf girl kyphotic make a difference. And also considering the data in Table 4-5 Covariance analysis (mental practice group) show that the average measurements (mental practice group) and control is not at post-test showed significant differences ( $P > 0.05$ ). The hypothesis (H0) that mental exercise training, on the extension of the spine kyphotic deaf girl groups not effective is confirmed.

The second hypothesis test is as follows:

H0: a period of corrective exercises on lateral spinal flexion not affect deaf girl kyphotic.

H1: a period of corrective exercises on lateral spinal flexion deaf girl kyphotic affected.

H0: a period of mental practice on lateral spinal flexion not affect deaf girl kyphotic.

H1: a period of mental practice on lateral spinal flexion deaf girl kyphotic affected (table 4).

Table 4. test hypothesis, normal or abnormal data

significant number	Statistics	Standard deviation	Average	Number	level	group
0.793	0.650	1.411	22.399	10	Pre-test	Test (corrective exercises)
0.523	0.813	1.048	24.394	10	Post-test	
0.902	0.570	1.187	22.199	10	Pre-test	Test (mental exercise)
0.827	0.627	1.435	23.051	10	Post-test	
0.983	0.464	2.038	22.419	10	Pre-test	Control
0.914	0.559	1.781	22.764	10	Post-test	

According to the results presented in Table 4 for this reason the significant amount larger than the amount of errors ( $\alpha = 0.05$ ). So the assumption is not rejected and it is concluded that the distribution of the data follow normal distribution and default

data normality for the analysis of covariance is met. After the data distribution was normal, Levene test for homogeneity of variances in the samples examined. See the results in Table 5.

Table 5 homogeneity of variances test

A significant number	DOF 2	DOF 1	Levene's test	Level
0.777	18	1	0.083	Test (corrective exercises)
0.075	18	1	3.570	Test (mental exercise)

Table 5 concerning the equality sample variance is due to the significance level obtained (sig) in the (group corrective exercises) equal to 0.777 in (mental practice group) equal to 0.075, which is larger of 0.05. Therefore it can be concluded that the samples variance is homogeneous and the assumption of

homogeneity of variance and covariance analysis were not met. After the homogeneity of variances was evaluated, the analysis of covariance of two experimental and control groups in both pre-test and post-test described above. See the results in Table 6.

Table 6 Covariance analysis

statistical power	The effects	Significant	F	Mean Square	DOF	Sum of squares	Source changes
1.000	0.880	0.000	125.156	33.866	1	33.866	Group (corrective exercises)
							Pre-test
1.000	0.746	0.000	50.031	13.538	1	13.538	Post-test
				0.271	17	4.600	Error
1.000	0.838	0.000	87.985	39.501	1	39.501	Group (mental exercise)
							Pre-test
0.328	0.132	0.127	2.577	1.157	1	1.157	Post-test
				0.499	17	7.632	Error

According to the data in Table 6 Covariance analysis (group corrective exercises) show that the mean of measurements in the experimental and control groups in post-test is significant difference ( $P < 0.05$ ). The hypothesis (H1) that corrective exercise training, the deaf girl kyphotic side flexion test group is effective is confirmed. Also according to the table (4-8) the impact (eta squared), which is equivalent to 0.746 per cent is acceptable. The corrective exercises have about 75 percent in the lateral flexion deaf girl kyphotic make a difference. As well as the table (4-8) analysis of covariance (mental practice group) shows that the mean of measurements in the experimental and control groups in post-test will be significant differences ( $P > 0.05$ ). The hypothesis (H0) that mental exercises on lateral flexion deaf girl kyphotic group test is successful, is confirmed.

## 5 Conclusion

### 5.1 The first hypothesis

A mental exercises and corrective to the extension affects the spine kyphotic deaf girl. The results showed a course of corrective exercises on the extension of the spine kyphotic deaf girl had an impact. After stretching the anterior trunk, the act of opening the dorsal spine and posterior trunk strengthening exercises are carried out, The mechanism of this effect is that stretching exercises to improve flexibility Kyphosis through the creation of a favorable stretch in the muscles and ligaments, the anterior segment such as small and large pectoral muscles, intercostal muscles, latissimus dorsi muscle and muscle anterior and posterior trunk muscles become weak as spine muscles, large rear, trapezoidal and-a parallelogram, thereby increasing the flexibility of the spine extension, improve range of motion and improve performance, increase mobility and reduce the risk of injury, increase muscle strength girls kyphotic act deaf.

### 5.2 The second hypothesis

A mental workout and repair of the lateral spinal flexion deaf girl kyphotic impact. The results revealed that a period of corrective exercises on lateral flexion of the spine kyphotic deaf girl had an impact. After stretching in the anterior and posterior trunk strengthening movements, the mechanism of this effect is that stretching exercises to improve flexibility Kyphosis through the creation of a favorable stretch in the muscles and ligaments in the anterior region, such as small and large pectoral muscles, Intercostal muscle, latissimus dorsi muscle and muscle anterior and posterior trunk muscles become weak as spine muscles, large rear, trapezoidal, parallelogram, increase lateral flexion of the spine, improve performance and improve range of motion and increased mobilization column lateral spine acts.

In general, the results of this study indicated that corrective exercises on the spine extension· lateral spinal flexion·abduction and chest expansion is an impact but merely mental exercises on chest expansion and abduction deaf girl kyphotic influence. As a result of the impact mental exercises and corrections on the spine kyphotic there is a deaf girl.

### 5.3 Suggestions

1. According to the results suggest the corrective exercise program as a complementary approach should be used to reduce the kyphotic deaf girl.
2. Also due to the positive effect on the mental training reduced chest expansion deaf girl abduction and mental exercises to reduce the kyphotic kyphotic recommended that these samples are considered therapists.
3. It is suggested that similar research study on girls and boys with hearing loss has done kyphosis.
4. It is recommended to reduce other forms of hard of hearing and deaf girls and boys over the kyphosis and the results of the present study done compare the products.
5. It is suggested that the impact of the reform program and on other mental disorders are examined.

**Abstract:** One of the accepted principles of financial management is that the main and fundamental purpose of companies' management is to maximize the stockholders' wealth through optimal allocation of company resources. Since the beginning of the twentieth century, traditional accounting criteria such as earnings of each share, return on assets and return on equity have been used to operationalize such concept. The primary purpose of this research is an investigation of the relation between the companies' comparative financial efficiency and their stock returns with data envelopment analysis method. To this end, active pharmaceutical products and related material companies in Tehran Stock Exchange are investigated among 2011 to 2014. Regression is used to test the hypothesis. The findings of the hypothesis tests show there is a significant and partly permanent relation between stock returns and efficiency with data envelopment analysis in this period.

**Keywords:** Stock returns, efficiency, Data envelopment analysis, constant returns to scale, variable returns to scale

### 1. Introduction

During the last few decades, growth strategies and industrial developments are affected by two factors that are growth and capital accrual and augmentation of performance and efficiency in industry section. Scarcity and lack of manufacturing factors especially capital in developing countries has made the augmentation of performance and efficiency quite important in economic growth process in that the development strategies and effective growth has promoted efficiency and performance in various economical sections. One of the most common parameters by which potency of industrial activities to gain comparative advantages among various industries is revealed, is considered efficiency level and its promotion. Undoubtedly, efficiency augmentation in an industry by reducing average cost of the goods and service production causes a decrease in prices and subsequently an increase in the profitability amount of final products in industrial production entity. The result is an enhancement of competitive power of local products in foreign markets and an increase in the volume of new industrial investment (Chien and Douw, 2015; Feroz and Raab, 2012).

Today, efficiency measurement is done through different methods. Data envelopment analysis is one of the powerful management instruments which can help management out to get organization toward higher goals and optimization and allocation of sources and profitability as well (Feroz and Raab, 2012). This method gives managers an instrument by which they can evaluate their company performance against other competitors and then based on its result they can decide for promising future. (figure1)

### 2. Statement of the problem

Men has always been interested to make his life easier and better and all his effort has been to optimize the result through the minimum available facilities to create value added. It is way obvious that due to the restriction of available resources, man

always pays attention to get more output with higher quantity and quality. Hence, the measurement of efficiency has always been an important management issue. What makes a defense body of an economical entity strong that surpass other competitors is a sharp vision of the entity decision makers to recognize the weak and strong points as well as remove the flaws and promote the strengths in the whole entity, by creating an appropriate infrastructure. (Khajavi et al., 2010; Khajavi et al., 2005; Kodadad Hoseini and Shahtahmasbi, 2012)

It has always been significant to study the relation between the companies' efficiency with their stock returns and determine proper methods to measure the efficiency in various researches. Due to the use of mathematical techniques, avoiding the mental practices and personalization and high accuracy to reach conclusion, data envelopment analysis method is one of the most principle methods that has particular scientific place in recent decades. Therefore, the decision maker sections utilize this method widely in order to evaluate the efficiency (Mehregan, 2013). So in this research two questions will be raised:

1. What is the relation between company's financial efficiency (analysis via DEA method) and stock returns?
2. What is the difference between the calculation of efficiency model via BCC and CCR method and its relation to stock returns?

#### 2.1 Research purpose

The main purpose of this research is to find a relation between the financial efficiency and stock returns in pharmaceutical product and related material industry in order to find practical solutions in our investment beside stock returns.

In other words, if an investment in an efficient economical agency accompanies with stock returns, it can increase the stockholder wealth. It is quite important to know the relation between these two variables though.

#### The main hypothesis of research

- There is a relation between comparative efficiency of the active pharmaceutical product and related material companies presented in stock exchange and their stock returns.

#### The secondary hypothesizes of the research

1. There is a relation between companies' stock returns and CCR model efficiency.
2. There is a relation between companies' stock returns and BCC model efficiency.
3. The stock returns in efficient companies are not equal with inefficient ones.

#### 2.2 The research variables

##### A. Computational variables:

- Input (Input indexes):
    1. Operating expenses
    2. Fixed assets
  - Output (output indexes)
    1. Operating profit
    2. Operating cash flow
- ##### B. Statistical variables:
1. Independent variable: Efficiency
  2. Dependent variable: return

Research conceptual and administrative model is illustrated in figure 1. Research style is based on the Inferential descriptive, correlation type.

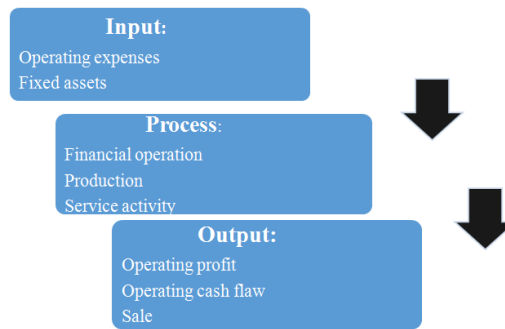

Figure 1. Conceptual model of data envelopment analysis cycle

### 2.3 Research thematic domain

The measurement of comparative financial efficiency with regard to active pharmaceutical products and related material companies accepted in Tehran stock exchange in data envelopment analysis method and investigating its relation with stock returns. Active pharmaceutical products and related material companies in Tehran stock exchange

### 2.4 Statistical society and sampling method

Statistical society of this research include all active pharmaceutical products and related material companies in Tehran stock exchange. Samples have been selected in systematic elimination method. Therefore, 18 companies have been selected as purposive sample among 26 pharmaceutical products and related material companies from 2011 to 2014. Library resources, articles, books, thesis researches and different websites have been used in order to collect information regarding theoretical principles and research literature and subject.

### 3. Data analysis method

After the company's financial efficiency via data envelopment analysis has been measured, its stock returns have been calculated as well and subsequently the relation between these two variable has been investigated.

#### 3.1 Selecting the appropriate model to evaluate companies' efficiency

After the intended inputs and outputs have been recognized, we need to find the appropriate DEA model. Through solving DEA model, efficiency of each decision-making entities (DMU) will be measured based on the related inputs and outputs. One of the most significant goals in this research is ranking the decision-making entities; therefore if we can release the entities from restrictions in order to get efficiency (more than one) as much as they can, we will be able to separate them far from their efficient envelopment level which necessitates using a super-efficient model (Anderson Peterson method). In order to adjust efficiency and performance, both inputs and outputs can be varied. In some

cases, making changes in outputs is easier while in other ones making changes in inputs is much simpler (Kodadad Hoseini and Shahtahmasbi, 2012) Hence according to the model, input or output approaches will be used for model solution. In the study of active pharmaceutical products and related material companies in Tehran stock exchange, because of the inputs nature and its manageability, selecting BCC and CCR input is the best option in order to measure the efficiency of the evaluated companies. (Mehregan, 2013; Mohammady, 2013; Seong-Jong, and Keebler, 2013)

#### 3.2 DEA Performance Method

Performance steps in this research include two parts as A and B which is as follows:

After CCR and BCC were performed and compared in part a, types of efficiency in scale of decision making entities will become clear. In part B, after CCR model was performed, companies that have scored one in efficiency will be ranked based on Anderson-Peterson model (Mohammady, 2013). In Anderson-Peterson model, based on investigated entities, limitations are removed so that the entity can get more than one in efficiency score and eventually entities will be ranked from high to low. (Shahooth and Battelle, 2014)

Companies input and output data will be analyzed based on output BCC model, then the companies will be ranked. All calculations have been done by DeaP and DEA Solver software.

### 4. Results

Measuring companies' comparative financial efficiency is conducted through data envelopment analysis. After the information related to inputs and outputs of data envelopment analysis was extracted, the companies' efficiency level was determined by the mentioned software. The steps are as follows:

1. Ranking companies with input oriented CCR: Companies input and output data with input oriented CCR is analyzed and then companies are ranked. In the table1, efficiency level of each company have been calculated per four years. (Feroz and Raab, 2012).

Table 1. The calculation of the company's efficiency (input oriented CCR)

company	efficiency			
	2012	2013	2014	2015
Cosar Pharmaceutical Co.	0.2984184	1	0.1483847	0.1353972
Osveh Pharmaceutical Co.	1	1	0.5962948	0.6501159
Farabi Pharmaceutical Co.	0.3096573	0.3641576	0.2869898	0.3556246
Sobhan Darou Co.	0.5149289	1	1	0.2815705
Loghman Pharmaceutical Co.	1	1	1	1
Pars Darou Co.	0.4052165	0.46277	0.3098395	0.367056
Rooz Darou Pharmaceutical Co.	0.2762636	0.1857993	0.2298166	0.2193414
Exir Pharmaceutical Co.	0.3265454	0.3498342	0.2265657	0.6469968

Jaber Ebne Hayyan Pharmaceutical Co.	0.4725181	1	1	1
Alborz Darou Co.	0.2976419	0.7654277	0.5662146	0.9173136

In the table 2, the evaluated companies have been ranked based on the obtained efficiency score. As it is clear, companies such as Loqman, Osveh, Sobhan darou and Jaber ibn Alhayyan have

reached efficiency score one, over one year which shows these companies were able to retain their efficiency over time.

Table 2. Ranking companies (input oriented CCR)

company	efficiency			
	2012	2013	2014	2015
Cosar Pharmaceutical Co.	5	10	3	18
Osveh Pharmaceutical Co.	3	15	18	4
Farabi Pharmaceutical Co.	2	8	2	2
Sobhan Darou Co.	10	5	12	15
Loghman Pharmaceutical Co.	12	16	6	7
Pars Darou Co.	17	11	11	8
Roos Darou Pharmaceutical Co.	14	3	9	16
Exir Pharmaceutical Co.	1	18	1	11
Jaber Ebne Hayyan Pharmaceutical Co.	11	1	17	10
Alborz Darou Co.	16	17	14	4

2. Ranking companies with input oriented BCC  
Next, companies' efficiency with input oriented BCC can be seen. All efficiencies have been calculated for each four years

separately in order to see company efficiency change over time. Finally, through efficiency average, the companies will be ranked. (Tables 3, 4)

Table 3. The calculation of the company's efficiency (input oriented BCC)

company	efficiency				Average efficiency	Overall Rank
	2012	2013	2014	2015		
Cosar Pharmaceutical Co.	0.4234228	1	0.2795438	0.2620069	0.4912434	15
Osveh Pharmaceutical Co.	1	1	0.6611885	0.6611411	0.8305824	9
Farabi Pharmaceutical Co.	0.3408334	0.440697	0.3690811	0.3710203	0.380408	17
Sobhan Darou Co.	0.5175828	1	1	0.3041088	0.7054229	11
Loghman Pharmaceutical Co.	1	1	1	1	1	1
Pars Darou Co.	0.4076104	0.5930593	0.3167724	0.3722524	0.4224236	16
Roos Darou Pharmaceutical Co.	0.3088312	0.2436368	0.2474926	0.2271774	0.2567845	18
Exir Pharmaceutical Co.	0.5334347	0.5363887	0.3847134	0.6737693	0.5320765	14
Jaber Ebne Hayyan Pharmaceutical Co.	0.6473733	1	1	1	0.9118433	6
Alborz Darou Co.	0.373954	0.8145594	0.6219181	0.9305734	0.6852512	12

Table 4. Ranking companies (input oriented BCC)

company	efficiency			
	2012	2013	2014	2015
Cosar Pharmaceutical Co.	5	8	4	16
Osveh Pharmaceutical Co.	14	10	6	6
Farabi Pharmaceutical Co.	10	13	8	9
Sobhan Darou Co.	15	9	17	1
Loghman Pharmaceutical Co.	13	1	13	11
Pars Darou Co.	16	15	2	2
Roos Darou Pharmaceutical Co.	8	12	10	12
Exir Pharmaceutical Co.	1	7	15	3
Jaber Ebne Hayyan Pharmaceutical Co.	4	16	3	17
Alborz Darou Co.	2	3	12	7

In the table5, return has been obtained compared to intended companies scale by DEA Solver software.

Table 5. Returns to scale of company

company	Type of Returns to scale			
	2012	2013	2014	2015
Cosar Pharmaceutical Co.	additive	fixed	additive	additive
Osveh Pharmaceutical Co.	fixed	fixed	additive	additive
Farabi Pharmaceutical Co.	additive	additive	additive	additive
Sobhan Darou Co.	decreasing	fixed	fixed	additive

Loghman Pharmaceutical Co.	fixed	fixed	fixed	fixed
Pars Darou Co.	additive	decreasing	additive	additive
Roos Darou Pharmaceutical Co.	fixed	fixed	fixed	fixed
Exir Pharmaceutical Co.	additive	additive	additive	additive
Jaber Ebne Hayyan Pharmaceutical Co.	decreasing	fixed	fixed	fixed
Alborz Darou Co.	additive	additive	additive	decreasing

For companies faced with increasing return over scale, if there were an input increase possibility, they could utilize the economies of scale.

Because most companies' return over scale were varied (decreasing or increasing), BCC model is more appropriate to evaluate companies' efficiency. After that, the companies which

have efficiency one for at least two years in BCC model with Anderson-Peterson model (Superefficient) will be evaluated in order to be ranked more accurately and their efficiencies will be calculated. The obtained results are in the table6. In the last column there is the four-year efficiency average. (Thore et al., 2011)

Table 6. Super efficient calculation table (Anderson-Peterson)

company	efficiency				Average efficiency
	2012	2013	2014	2015	
Cosar Pharmaceutical Co.	0.5452263	2.0415683	1.9150624	-0.838394	1.500619
Osveh Pharmaceutical Co.	3.002181	2.4053681	2.622131	2.5101016	2.6349454
Farabi Pharmaceutical Co.	0.8304402	1.4690041	5.5083173	1.2749391	2.2706752
Sobhan Darou Co.	1.280646	1.5767405	0.6524194	1	1.1274515
Loghman Pharmaceutical Co.	1	1.1858594	1.1588819	0.5596137	0.9760888
Pars Darou Co.	1.0317817	1.2698021	1.1793989	1.0312856	1.1280671
Roos Darou Pharmaceutical Co.	1.0909121	1.3980806	1.2994392	1.6354465	1.3559696
Exir Pharmaceutical Co.	1.1337233	1.178556	0.2872226	0.0979365	0.6743596
Jaber Ebne Hayyan Pharmaceutical Co.	0.2913225	1.0514701	1.0797343	1.255028	0.9193887
Alborz Darou Co.	1.3424303	1.5805901	7.02843	-0.255864	3.3171501
Sobhan Pharma Group Co.	1	1	1	1	1
Iran Darou Co.	1.0843695	0.6867413	1.0087545	1	0.9449663
Zahravi Pharmaceutical Co	1.0638108	1.027298	1.192281	1.3676478	1.1627594
Kimi Darou Co.	1.046976	1.2998586	0.7644676	1.0574233	1.0421814
Abo Reyhan Pharmaceutical Co	0.4597935	1.2835759	1.1988004	-2.765988	0.0440455
Sina Pharmaceutical Co	9.9531374	1.0165473	4.1637344	1.1210478	4.0636167
Razak Pharmaceutical Co	0.5853602	1.1236185	1.0331864	0.6011799	0.8358363
Dr. Abidi Pharmaceutical Co	1.0514701	1.2994392	1.0312856	1.1588819	1.0909121

Now all information related to stock returns and efficiency based on data envelopment analysis has been determined. In this step the relation between stock returns and active pharmaceutical products and related material companies in Tehran stock exchange will be investigated.

## 5. Hypothesis test evaluation and description

### 5.1 The main hypothesis

Test result shows that there is a direct relation between the stock returns and the companies' efficiency. It means the more effort the managers make to increase their companies' efficiency; the higher stock returns will be experienced.

### 5.2 The first sub-hypothesis

Based on test findings, there is a direct relation between stock returns and the companies' efficiency with CCR method. It means the closer the efficiency is to number one, the better result they will have.

### 5.3 The second sub-hypothesis

Based on test findings, there is a direct relation between stock returns and the companies' efficiency with BCC method. It means the closer the efficiency is to number one, the better result they will have.

### 5.4 The third sub-hypothesis

In data envelopment analysis, the software outputs are between zero and one. If the calculated efficiency of a company equals one, the company is efficient, otherwise it is inefficient.

A limitation of data envelopment analysis method is if companies are efficient, they are all scored one that means they are efficient enough while their efficiency cannot be similar to each other in practice. Therefore, companies with efficiency score one for over a year are investigated with Anderson Peterson model beyond data envelopment analysis. Results of the test shows that significance level of the company return is more than 0.05 so its normality will be approved. Then variations were investigated using Levin test. (Khajavi et al., 2005; Kodadad Hoseini and Shahtahmasbi, 2012).

Test results represent that significance level of Levin test for all variations are over 0.05. So the hypothesis of equality of variations are approved.

Besides, the significance level of t Steve dent test for stock returns variation is less than 0.05 that rejects the hypothesis that efficient and inefficient companies returns are equal by %95 confidence. Regarding all mentioned issues, the hypothesis is accepted.

## 6. Conclusion

The hypothesis was tested for a period among 2011-2014 using Regression method. Findings show a significant and a stable relation between return and efficiency of the companies during

the given period. As a result, focusing on efficiency will increase stock return for the following year. According to the present research findings, following suggestions are proposed respectively:

#### To securities and exchange organization

It is proposed that a list of efficient and inefficient companies is presented to investors in order to direct investments in better ways as well as get them more profits.

It is proposed that efficiency and inefficiency is used as one of the evaluation standards in performance of accepted companies in securities and exchange organization.

#### To investors

It is proposed that as investors, they request this factor from those companies and projects in which they invest in order that they experience lower risks and more efficient investment.

#### To managers of this industry

Regarding to the deep effect of efficiency in obtained outcome of organization effort, it is proposed that managers include this criterion into their organization strategic plan.

Since the most significant part of inefficiency is because of ignoring education, survey work, timing and so on it is proposed that managers consider this important point that their stock returns and subsequently their investors will be increased with efficiency increase.

## LEGISLATIVE REVIEW OF GENERAL AND SPECIFIC CRIMINAL LAW, CYBER CRIMES CRIMINAL LIABILITY, AND INTRUDING ON INDIVIDUAL PRIVACY IN CRIMINAL LAW

<sup>a</sup>ALI KASRAY KERMANSHAHI, <sup>b</sup>MEHDI SALIMI

<sup>a</sup>Department of law, International Branch, Islamic Azad University, Bandar Anzali, Iran

<sup>b</sup>Department of law, Qaemshahr Branch, Islamic Azad University, Qaem Shahr, Iran

Email: <sup>a</sup>Ali\_Kasray@yahoo.com, <sup>b</sup>Mehdi.salimi.55@gmail.com

**Abstract:** The current paper investigated the terms of criminal liability in cases of cyberspace crimes. The reason for investigation of instances was that we found it tough to provide a definition of the crime since these crimes cover a wide range without a single issue and cannot be addressed in the context of a concept to define. Moreover, we examined legislative aspects of general and specific criminal law. Finally, it should be noted that the current paper mainly focuses on crimes against public morals and ethics occurring in cyberspace.

**Keywords:** Crime, Cyber space, Criminal liability, Ethics, Computer, General, Specific

### 1 Introduction

Legal rules evolve and progress as other sciences. Legal research contributes to the development of legislation by addressing those aspects of reality overlooked by legislators with a big share in amending legislation. It seems that the violation of morals and ethics concepts in cyber space is less taken into account and the legislator is required to address them. Some cyber crimes are more important than the others, because directly contribute to ethics and morals and face families with serious crisis. The current paper seeks to provide answers to the following questions:

1. Is there any criminal liability in cybercrimes?
2. Can we say cybercrime is affecting public morals?
3. What is the legislative approach in the legislation against these crimes?

Accordingly, we reviewed legislative of general and specific criminal law, cyber crimes criminal liability, and intruding on individual privacy in criminal law.

### 2 The concept of cyber crimes

There is no commonly agreed single definition of "cybercrime". The first organization to initiate cyber crimes definition was the Organization for Economic Co-operation and Development (OECD) through a group of experts gathered at the invitation of the organization in 1983 in Paris. They defined cybercrime as "Misuse of computers, including any illegal, unethical or unauthorized behavior of automatic processing and transmission of data." The misuse of computer is the cybercrime in the provided definition, although the definition does not explicitly refer to. Another definition of cyber crime reads: "Any positive illegal action uses computer as a tool or thread is a cybercrime". The above definition is not satisfactory and comprehensive because refers only to the material element of the crime and overlooks other elements of the crime as well as instances of cyber crime. Germany's Federal Criminal Police Office provided the definition of cybercrimes: "Computer crime encompasses all things, conditions and qualities in which forms of electronic data processing are used as the tools or target of committing a crime or as the basis for the suspicion that a crime has been committed". Also under the US Ministry of Justice "any act of violation of the penal code that requires knowledge of computer technology to commit the act, track or trial is a cyber crime".

### 3 The concept of liability and its variants

Dehkhoda dictionary defined the term as guarantee, responsibility, obligation, accountability and being aware of responsibility. Liability can be classified into two civil and criminal responsibilities, the civil liability discussion is out of the article scope and the current paper addresses the criminal liability. Lawyers have taken criminal liability in two different ways; one meaning constitutes "the liability to bear the criminal consequences" and the other "coercion to bear the criminal consequences". The former represents the abstract aspects of liability while the latter is the indicator of concrete aspects of the liability. Moreover, Imputed Liability is a kind of liability assumed as the liability of the person (whether natural or legal) without having all real terms of criminal liability ranging from spiritual to objective conditions alleged to be responsible. We discuss criminal liability in cyberspace, thus it requires articulating the challenges in cyberspace law and criminal liability.

Many legal scholars believe that the Cyber Crimes concept has created serious challenges to the traditional model of criminal law, so that the current criminal law is not capable to deal with problems that arise in cyberspace. In general, criminal law in principle is based on historical cultural and social community facts and shaped by certain social realities over the centuries. When, conflict arise over time criminal law is not be able to solve the problems (Kashian, et al., 2005). Basic features of cyberspace and cybercrime includes extensiveness, universality, hidden, the selectivity of information, lack of control, lack of vicinity of the perpetrator and the victim, the prevalence of crime and victimization, ease of crime, survival of criminal phenomenon, the extent of harm caused by crime, as well as detection, investigation and prosecution complexities. In fact, criminal law tries to apply preventive strategies with certainly less cost, more secure and more effective than persecution of the criminal instead of applying the traditional rules of law, due to the characteristics of cyberspace; and this is why non-criminal prevention methods are priorities. In the meantime, particular attention to technical solutions that unlike educational strategies are easier to receive binding nature without a long time required for institutionalization gain special importance. Clearly, this is also causing major developments in the area of liability, of course, the preventive measures task put some liability on others and the decentralization of liability of the main perpetrators makes others bear part of the liability.

The current paper has classified the contents into two sections, described the concepts and general discussion on the issues;

Cyber Crime General Criminal Law, Cyber Crime Specific Criminal Law

#### 4. Cyber Crime General Criminal Law

##### 4.1 Components of cyber crimes

###### 4.1.1 Legal element

1. Production, reproduction, distribution and storage of unauthorized works

Legislator in Article 3 of the Law (2007) has shown specific approach with a harsh response to the factors involved in audiovisual works contrary to public morals and ethics (the spread of non-ethical).

#### 4.1.2 Material element and the realization of forms of crime

Legislator in the above-mentioned Article (Article 3 paragraphs and notes) provides the realization of the different elements of the crime, the subject of this article. The form can be divided into 18 types in the study of the behavior of the material elements of the crime. The author tries to clarify the facts on different forms of crimes through the provided explanations in terms of the factors involved in crime and the type of material behavior given various punishment to each category that in some cases is two-fold as the cases may be explained below:

- 1 Distribution: distribute, disburse, divide
- 2 Proliferation: to add, multiply
- 3 Effect: signs, logos and symbols remaining from anything, remains of serious or practical work
- 4 Production: create, procreate
- 5 Rape: literally means contrary to tolerance, and the so-called criminal law action of forcing someone to do something without their consent, whether by action or material incentives, or not.
- 6 Reluctance: in criminal law is the impact outside force on the offender so that it is usually impossible to resist.
- 7 The key factors of production of audiovisual works: include producer (investor) director, camera person, cast the main roles
- 8 Wholesale: The number of more than copies of tape or CD
- 9 Vulgar: vulgar audiovisual refers to works that have scenes and forms and content against Islamic law and ethics to promote and conclude. (Note 1, Clause b of Article 3)
- 10 Publish: publishing vulgar audiovisual through electronic communication and computer or other similar means and techniques is an example of multiplication and dissemination.
- 11 Pornographic: pornographic audiovisual are those with female nudity or genitalia or sexual intercourse contents.

#### 4.1.3 Mental element

The offenses set forth in article 3 of the Act of 2007 and according to enumerating the various types as a material element of the crime, all alternatives are essentially spiritual elements a deliberate crime and obtaining the malicious intent to commit is necessary.

Of course, in some cases, the legislator specifically identified examples of corruption on earth the accused is sentenced for the offense (corruption on earth) that the spiritual element of the crime of corruption on earth should adhere to the same principles that according to Article 183 of the Islamic Penal Code, in hadd, creating fear and deprivation of liberty and security of persons as criminal intent must be established.

#### 4.1.4 Enforcement

Names Act 2007, after the study of the law, particularly Article 3 of this law clearly come to the conclusion that Law-makers hastily wrote enforcement of criminal laws associated with it, a kind of haste in legislation (substantive) and also in composition (form). An example may be the crime of "key factors of production". In an assumptions, they are not subject to as a corruptor on earth and the legislator has inadvertently forget a sanction for perpetrators of behavior while legislator has provided sentence to the secondary factors of production in Note 3, Clause (a), Article 3, but main factors that normally should be punished more severely than non-original elements have been overlooked. And another example of audiovisual "producer" less than 10 copies, that legislator has criminalized the act again, but inadvertently does not provide any penalty. In some special

circumstances, the legislator intensifies some of the penalties. Note 3 Paragraph B of Article 3 reads:

[Use of minors for maintenance, display, supply, sale and proliferation of unauthorized tapes and compact discs under this Act, causes the maximum penalty prescribed for the agent]. Therefore, pursuant to the above provisions, the use of minors in the cases mentioned above leads to the exercise of maximum punishment. It should be noted that tapes and compact discs shall be described as "illegal" or otherwise they are not subject to the provisions of this Note as maximum penalty prescribed.

Also note that there is no mention of offenses against the dignity of people in the Budapest Convention on Cybercrime, but Iranian legislator's attempt to criminalize such acts are properly is important. This category of cyber crimes includes three categories of offenses; first as defamation by publishing fake audio and video content, second, as people defamation by publishing the secrets of their private computer, and publishing lies, each with legal, material and spiritual component, which we will refrain from mentioning them due to limitations.

### 5 Cyber Crime Specific Criminal Law

First we discuss crimes against morality and ethics and then turn to cybercrime punishment.

#### 5.1 Crimes against public morality and ethics:

According to the provisions of our law of Islam, crimes against public morals and ethics are not limited to the publication of images of people younger than 18 years and criminalized of all acts incompatible with chastity. For this purpose has taken into account three criminal cyber crimes against chastity and public morality. The first is production and distribution of contents contrary to public morals. Legal element of the crime is Article 14 of the Cyber Crime and its amendments. It provides: Everyone publishes, distributes or deals pornographic content by computer systems or telecommunications and data carriers, or produces or stores to trade or corrupt will be punished by Ninety-one days to two years imprisonment or a fine of five million Rials (5,000,000) to forty million Rials (40,000,000) or both.

The second is to provide grounds for facilitated access to the obscene or vulgar contents that is the legal element of the Article 15 Clause (a) of the Cyber Crimes Law that provides: Whoever organized by computer or telecommunications, and data carriers, committed the following acts, will be punished as follows:

(a) Whoever stimulates, encourages, threatens or bribes or tricks, facilitates access to or teaches people in order to achieve pornographic content is subject to imprisonment of ninety-one days to one year or a fine of five million Rials (5,000,000) to forty million Rials (40,000,000) or both. Committing acts of vulgar content results in a fine of two million Rials (2,000,000) to five million Rials (5,000,000).

The third is providing grounds for committing acts contrary to chastity or moral grounds through computer systems or telecommunications that is the legal element of the Article 15 Clause (b) of the Cyber Crimes Law that provides: Everyone committed the following acts through computer systems or telecommunications and data carriers will be punished as follows:

Whoever stimulates, encourages, threatens or bribes or tricks, facilitates access to or teaches people drug abuse, suicide or sexual relations is subject to imprisonment of ninety-one days to one year or a fine of five million Rials (5,000,000) to forty million Rials (40,000,000) or both.

## 5.2 Crimes against accuracy and integrity of data

Legislator in this category of computer crimes has predicted three general headings: computer forgery, destruction and disruption of data or computer systems and, theft and computer fraud. Computer forgery as is a crime against accuracy of data, destruction and disruption of data or computer systems is a crime against integrity of data and telecommunications systems. Theft and computer fraud also investigates the theft and cyber fraud (Qadir Golkarian et al., 2005).

At the end we briefly refer to the competence jurisdiction of the criminal courts on non cyber crimes, because determining the competent court either plays a major role either in the realm of domestic or transnational in scope, location and geographical borders. The discussion of cyber space shows the without border nature of the space regardless of geographical location and thus theories based on geography and borders on the non-cyber crime cannot govern issues of the crimes committed in its realm. Therefore it is necessary to provide theories and new rules in addition to the rules governing the jurisdiction of courts in the non-cyber crime problem to express rule to determine the competent court for crimes committed in cyber space.

However, it may be possible to observe some traditional theory despite the disparity of them with special features of cyber crimes as its non geographical borders nature. While others such theories, has little relation with the offense, may be fully applicable on cybercrime. However, the jurisdiction or actual support is created based on the outcome of the offense and the danger created for a particular country, and the location and method of committing plays no special rule in determining the competent court which is fully applicable on cybercrime. So, non cyberspaces theories have been proposed with other criteria expression and analysis in expressed theory in terms of crime competent jurisdiction in cybercrime.

## 6 Overview of cybercrime on social networks

The social networking technology is undeniable phenomenon with public welcome due to its ease of communication and many facilities. Misusing social networks especially Facebook, Instagram, and Telegram and. etc. are on the rise in line with the increasing use of cyberspace. The abuser usually intrudes on cyberspace by hacking sites or personal profiles or stealing personal information and or offering insults and threats or publishing personal photos and videos. Thus, given the novelty of computer crime, the prosecution of offenders and complain and track and prove of this crime requires detailed information on the law as well as that of the cyber domain. Common the social network crimes include:

- a) Content against public morals and ethics
- b) Content against security and public peace
- c) Content against Islamic sanctities
- d) content about cybercrime
- e) Provocative content, promotes or inviting to criminal acts
- f) Criminal content related to audiovisual and intellectual property
- g) Criminal content related to presidential and parliamentary elections

More recently, Telegram cybercrime is also added to the list of examples of cyber crime, because this is a newly launched computer network. Telegram Social Network has opened a new place in Iran with a growing internet marketing crime rates in such a short time, and measures should be taken in this regard.

Telegram penetrated in large among individuals, and thud along with the many opportunities in the social network, we discern abundant and sometimes irreversible threats, as well.

## 7 Conclusion

At the end, we conclude that identification of the crimes in cyberspace and pillars and principles of liability and the conditions for its perpetrators along with the legislation can contribute to the process of preventing and reducing cyberspace crime. Accordingly, the crimes occurred in cyberspace are formal and coordinated efforts to deal with a cybercrime will be complex and complicated if different countries judicial systems do not provide the same definition of cybercrimes. Moreover, domestic reactions and dealing with a cybercrime do not suffice, and International Coordination is essential in this regard. Regarding crime detection, Police and judicial authorities are required to gain full knowledge of computer in the investigation and judgment. It would involve providing the necessary technical facilities, trained investigators in the field of computer and issues related to data and information as well as regulate the procedure by cybercrime. The jurisdiction procedures should determine the investigating authorities and judges on how to achieve the information contained in a computer environment to detect and prosecute computer crimes and gather evidence. Also, to provide resources with the admissibility of evidence of arrest and trial of the perpetrators of such offenses so that to prevent intruding on individual's privacy and freedoms.

The most serious action that has been done in the realm of cybercrimes is the Fighting computer crime judiciary bill prepared in 2002 that the bill was not passed and ratified by General Assembly. However, legislation in 209 on the subject of the current treatise has already helped accelerate the pace of this process. Finally, in the current paper, we concluded on the policy of Iran regarding the cybercrime to prevent the criminal and non-criminal occurrence of the crimes by investigating elements of the material and psychological conditions of cybercrime and its penalties, as well.

Abstract. Statistical population of the present research consists of the Ayandeh bank employees. The ACHIEVE model (Hersi & Goldsmith 2014) standard questionnaire and a cyber-loafing questionnaire was used to collect data. In order to check the normality of data, the Kolmogorov- Smirnov test was used. And also the confirmatory factor analysis was used in order to evaluate the questions of the questionnaire, and structural equation modeling was used to investigate the hypothesis of the research. The results indicated that there is a significant relationship between the employees' attitude to cyberloafing and job performance, the perceived cyberloafing barriers and the job performance and the descriptive norms of cyberloafing and job performance in Ayandeh Bank Branches.

Keywords: Cyber Loafing, Job Performance, Ayandeh Bank.

## 1 Introduction

Job performance is the most critical topic in every organization. In order to reach to organization goals, every organization expects acceptable level of job performance from employees. Considering this issue is essential for organizations Ghafoorian and Faramarzi, (2010). (Belanger and et al, 2002 & Block, W, 2001). Information and communicational technologies are among the tools entered the job context in order to improve the job performance. But this also creates means for employee's leisure times in the working times. In other words, availability of technologies in the organization is like a double edge sword. However, while some organizations use electronic systems in order to communicate, collaborate, research and data management in some cases many employees abuse these technologies (Baturay & Toker, 2015) and/or use it for their own personal matters. This topic i.e. cyber loafing catches the attention of academia and managers of organizations in recent years. According to some researchers, one of the consequences of cyber loafing is the decrement of employees' job performance (Blanchard & Henle, 2008). Considering the importance of job performance for managers so that they also trying to find ways for improving it, so the cyber loafing can be a preventing factor or a barrier in job performance and this issue catches the attention of managers Yilmaz et al., (2015). Regardless of the amount of spending time as cyber loafing in organizations, the fact is that it is so much which regarded as a challenge for organizations. It means organizations concern that this issue would have negative effects on the productivity of the organization (Mastrangelo, 2006; Jia, 2008). Accepting the provided definition by Lim, i.e. "cyber loafing occurs when the employee uses the net for non-business means in business hours", it is easy to explain the objective of this research. So the present research aims to study the intensity of the relations between cyber loafing and job performance of employees. Considering the applied attitude of the present work, the relationship between cyber loafing and job performance of Ayandeh Bank employees examined.

### 1.1 Theories on Cyber loafing

On the whole, cyber loafing refers to the act of employees using their companies' internet access for personal purposes during working hours. But it should be noted that there is not a common definitions for cyber loafing among the scholars (Lim, 2002).

Some researchers used the term cyber loafing to indicate serious behaviors such as hacking and spreading computer viruses (Blanchard & Henle, 2008) although these radical behaviors are interesting topics for research, but their causes and consequences are different and should be investigated in a separate study. In the present study, cyber loafing refers to internet access of employees in working time such as YouTube, Facebook or personal internet searches. The reason for using such a simple definition for cyber loafing is that it is better to start the topic with a simple definition of the term in order to create a correct and better understanding of this phenomenon in the mind and then, discuss the different aspects of cyber loafing. We should consider two issues in defining cyber loafing. First, cyber loafing can be carried out not only by computers but also by smart phones and tablets. So in order to prevent the complexity of the term, we narrowed our definition of cyber loafing to use computer in office for personal matters and cyber loafing.

As mentioned, one can cyber loaf using tablets of mobile phones. For example, sending SMS is so widespread in work places that imagining an employee does not send SMS during work time is unlikely to happen. Augrin et al., (2013) defined cyber loafing as abusing internet in the work times. They believed cyber loafing is using internet for personal purposes more than necessary. Examples of cyber loafing can be online shopping, personal investment management, using social networks, sending emails and listening audio files or watching videos online. Yilmaz et al., (2015) defined it as using internet in work time in order to fulfill personal objectives. Wilson et al., (2010) in a similar definition defined it as pretending doing company works while fulfilling personal objectives in internet.

### 1.2 Types of Cyber loafing

Blanchard (2008) categorized cyber loafing in two different for;

1. Minor cyber loafing
2. Sever cyber loafing

Minor cyber loafing includes items such as checking personal emails but in sever cyber loafing, person does time consuming and negative activities such as viewing adult oriented sites, online gambling and such cases. They believe controllable cyber loafing is not only harmful but also can be regarded as break time and rest time activities and can improve job performance but in case of sever cyber loafing which is a dangerous one and there should be clear rules regarding this kind of cyber loafing and should be regarded as a destructive organizational behavior and against rules (Blanchard & Henle, 2008).

### 1.3 Effective Factors on Cyber loafing

Different variables introduced as the creating factors of cyber loafing and have higher integration in the emergence of this phenomenon. Factors such as social norms, personal attitude to cyber loafing, hiding cyber loafing from managers and supervisors and objectives of cyber loafing (Askew et al., 2014). Also two other variables i.e. responsibility and organizational justice have strong relationship with cyber loafing (Restubog et al., 2011) It is noted that the effect of these two variables on cyber loafing strongly affected by the work condition, it means that in some studies a strong relationship is reported between these variables with cyber loafing and in some other weak relationship is observed (De Lara, 2007). This incoherency can be due to the fact that although nonconformity of organizational justice is a determining factor on cyber loafing, but nonconformity of social justice among the people under survey was not so much to be introduced as a causing factor for cyber loafing. The strong relationship between loyalty and cyber loafing confirm the self-control theory introduced by Wagner et

al. (2012). The incoherency of correlation between loyalty and cyber loafing in different studies can be due to the different amount of work in different samples of the study, i.e. when the employee has not so much work to do then the effect of self-regulation and cyber loafing is not so strong.

Moreover, there are some other factors though they are less important but can be related to cyber loafing namely as personality, emotional non-planned works, extremism (Jia, 2008; Krishnan et al., 2010).

Also it has been observed that the individual skills in using computer have direct relationship with cyber loafing (Garrett & Danziger, 2008). Moreover, some other factors such as company's supervision on employee's internet access, performance bond of non-cyber loafing rules, policies of the company regarding internet and having personal computers can be affective in the emergence of cyber loafing among employees (Mastrangelo, 2006; Jia, 2008). As observed, age and gender can affect cyber loafing. Men and young people more than women and old people do cyber loafing (De Lara, 2007 & Garrett & Danziger, 2008 & Blanchard & Henle, 2008). Cyber loafing in educational setting is more widespread among boys than girls (Baturay & Tokar, 2015).

#### 1.4 The relationship between Cyber loafing and Job Performance

Although there is few information regarding the way cyber loafing affects job performance, but checking the available literature four perspectives can be recognized about the effect of cyber loafing on job performance.

According to the first perspective, cyber loafing decreases job performance by wasting effective work time (Blau et al., 2003). Based on this perspective the time used for cyber loafing could be used for organizational works and so the wasted time in cyber loafing resulted in decreasing the productivity. If this perspective proves true, then one can expect a negative correlation between cyber loafing and job performance.

The second perspective is somehow like the first one and stated that some cyber loafing behaviors negatively affects job performance or have more negative effects than other cyber loafing behaviors.

Lim & Chen (2009) stated that social behaviors have more negative effects on the productivity because these behaviors necessitates time, energy and perceptual resources. So abandoning these behaviors and returning to organizational works is more difficult than non-social behaviors for employee. Blau et al. reported the same result from interactive behaviors like social behaviors and online games. If such perspective proves true, then we can expect negative correlation between social behaviors and job performance. The relationship between such behaviors and decreasing productivity is stronger than the relationship between internet searching and job performance.

The third perspective has positive attitude toward cyber loafing effect on job performance. It states that cyber loafing creates a delay and rest time in business hours and when the employee returns to organizational work she/he continues more productivity (Belanger and et al, 2002 & Block, W, 2001). In this perspective it is assumed that decreasing the productivity is enough that compensate the wasted time for cyber loafing. Adherents of this perspective benefiting the Ego depletion model in order to confirm their own beliefs. If it proves true, then it is expected that a positive correlation exists between cyber loafing and job performance.

The fourth perspective stated that cyber loafing does not affect job performance or affect insignificantly (Blanchard & Henle 2008). It states that employees have specific amount of time dedicated to work and they cyber loaf when they have the time to do it. This perspective believes that the productivity of all

employees are the same and each person has a specific standard of working and cyber loafing when they have extra time to do it. If such an attitude proves true, then there is no correlation between job performance and cyber loafing. Moreover, cyber loafing creates negative effect only if it takes too long. As a general principle we can infer that long time of cyber loafing have negative effect on job performance.

To confirm each of the above mentioned principles, some evidences provided by the researchers and it is not clear cut which of the above mentioned perspectives is more correct than the other. The hidden link of all these investigation is that none of these studies evaluated in a real organization. Analyzing the cyber loafing and job performance relations let the researchers to determine which of the above mentioned perspectives explains the way cyber loafing affects job performance in real world.

## 2 Review of related Literature

Estiri (2010) wrote a review article titled as " cyber loafing". Based on this research to find out the best way to use internet access by employees is to know what exactly the employees do and how much time they spend to do it. He thinks that, results of the studies and also the idea of specialists confirms that the best way a company can do regarding cyber loafing issue, is to make comprehensive, precise and clear cut policies before employees gave access to internet.

Hengameh (2011) did a research entitled as " Studying causes and consequences of cyber loafing in Tondar Air Line Agency of Tehran". The aim of this study was to specifying the causes and consequences of cyber loafing in the air line agency and suggesting recommendations to reduce cyber loafing. The results indicated that personal, organizational and environmental / external factors are among those factors which play important role in cyber loafing. Thus it is expected from managers that have better and deep understanding of their environment and context and improve their company's performance by properly using modern technologies. Lim & Chen (2009) studied the impact of cyber loafing on the work and emotions of employees. Moreover, gender differences of employees regarding their understanding of cyber loafing was studied. Their findings indicated that activities such as internet search have desirable effect on the emotions of employees while receiving and sending email had negative impact. The obtained results of this study give novel perspective for managers and researchers regarding employee's idea about cyber loafing phenomenon. Pearson and Augrin studied the impact of punishments and preventive actions on cyber loafing in organizations. They believe that benefiting such preventive mechanisms will result in decreasing the cyber loafing of employees in business hours. The results of their study indicated that threats and diagnostic mechanisms, are effective factors in preventing activities such as visiting adult oriented sites, management of personal financial affairs and online shopping. To prevent activities such as sending and receiving email or visiting social networks simultaneously applying these preventive mechanisms are mandatory. In a study Kakolian and et al (2013), investigated positive consequences of cyber loafing in universities of Babol. Along the positive factors in cyber loafing, in this research the researcher tried to detect and present some of the positive consequences of cyber loafing in universities of Babol. Some hypothesis regarding the existence of positive relationship between the activities and behaviors of cyber loafing with job satisfaction, organizational commitment and job interest were tested. In order to check the relationships among variable the Pearson product-moment correlation coefficient and Structural Equation Modeling was used to calculate the amount of correlation between variable of the model. SPSS and LISREL software were used for related calculations to variables and suitability of the model. Analyzing statistical data revealed the positive relationship between job satisfaction 0.255, organizational commitment 0.451 and job interest 0.186 with cyber loafing.

### 3 Methodology

#### 3.1 Research Method

This is a kind of applied research and basically it is a kind of descriptive research and correlation one and regression analysis (Structural equation modeling) was used to analyze the data. Statistical population of the present research consists of the Ayandeh bank employees ACHIEVE model (Hersi & Goldsmith 2014) standard questionnaire and Askew cyber loafing questionnaire was used in order to collect data. The inferential and descriptive statistical methods were used. Descriptive method was used in order to check and describe general characteristic of those who answered the questionnaire. Inferential statistical methods namely normality of data test, structural equation modeling and confirmatory data analysis were used. The obtained data were analyzed using SPSS and LISREL software.

#### 3.2 Research Hypothesis

This research has one main hypothesis and three alternative hypothesizes (figure 1).

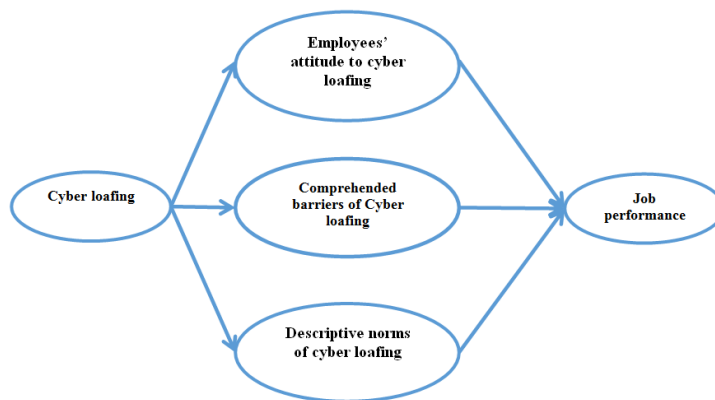

Figure 1. Schematic of research

#### 4 Data Analysis

Respondents' demographic characteristics were studied and the results are:

**Gender:** 158 of the respondents were Men (79%) and 42 were women

**Age:** 57 of the respondents were less than 30 years old (29%); 121 of them were between 30 and 40(61%); 19 of them were between 40 and 50 (8%); and three of them were more than 50 years old.

**Degree:** 12 respondents with associate degree (6%); 121 of them with BA degree (60%); 64 of them with MA degree and 3 of them with diploma or less than diploma degrees.

**Work Experience:** 82 of respondents with less than 5 years job experience (41%); 101 of them between 5 to 10 years job experience (51%); 9 of them between 10 to 15 years job experience; 8 of them with more than 15 years job experiences.

Then the normality of data tested using Kolmogorov- Smirnov technique with 5% significance level. The results are:

To check the normality of data, null hypothesis is that the data distribution is normal. So if the significance amount be higher or equal to 0.05, then there is no reason to reject the null hypothesis and distribution of data will be normal. The results of research hypothesis are:

Main Hypothesis: There is a significant relationship between cyber loafing and job performance in branches of Ayandeh Banks

Alternative Hypothesizes are as follows:

I. There is a significant relationship between the attitude of employees to cyber loafing and job performance in Ayandeh Bank Branches of Guilan, Mazandaran and Golestan provinces, Iran.

II. There is a significant relationship between the understanding barriers of cyber loafing and job performance in Ayandeh Bank Branches of Guilan, Mazandaran and Golestan provinces, Iran.

III. There is a significant relationship between the descriptive norms of cyber loafing and job performance in Ayandeh Bank Branches of Guilan, Mazandaran and Golestan provinces, Iran.

#### 3.3 Research Conceptual Model

According to the results in all cases the amount of significance is higher than 0.05; so, there is no reason to reject assumption. It means that data distribution is normal and we can use parametric tests and confirmatory factor.

Confirmatory factor analysis was used for the questions of the questionnaire. Considering the fact that the main tool of gathering data was questionnaire then all the obtained results of this research depends on the validity of questionnaire. Confirmatory factor analysis was used in order to check whether the items of questionnaire properly evaluated the variables of the research. The results are:

#### 4.1 Confirmatory Factor Analysis of Job Performance Questionnaire

To evaluate job performance 7 main factors (latent variables) and 16 questions (visible variables) were used. The acquired factor loading in all cases were a little higher than 0.2 which means the correlation between hidden variables (dimensions of main construct ) and visible variables are acceptable.

According to the results, measurement indexes for every used scales in confidence level of 5%, the t-values is higher than 1.96 which means that the observed correlations are significant (figure 2 and 3).

Figure2: Standard factor loading of confirmatory factor analysis for evaluating job performance scale

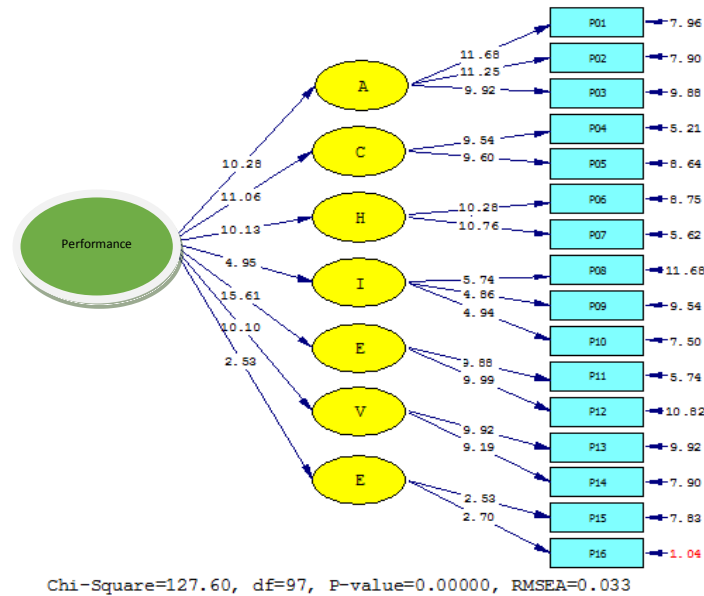

Figure3: T-value of confirmatory factor analysis for evaluating job performance scale

Also due to the use of second order confirmatory factor analysis, the relationship between hidden variable with the main construct i.e. job performance was investigated, too. In all cases, standard factor loading was higher than 0.4 which means there is higher correlational between job performance assessment and this construct. In all cases T prepared value was greater that the critical value (1.96) which means job performance was truly assessed for this construct.

In the second stage, model goodness of fit test was carried out and the result was:

$$\chi^2/df = \frac{127.60}{97} = 1.31 \tag{1}$$

In this research normal chi-squared was 1.31 and as it is between 1 and 5 then it is ideal. Also in the saturated model of the present

study RMSEA index is equal to 0.033 (lower than 0.05) which indicates the fitness of the model is ideal.

#### 4.2 Confirmatory factor Analysis Measuring cyber loafing

In order to measure cyber loafing, we used 3 latent variables (factor) and 14 observable variables (question). In order to assess the power of the relationship between factors (latent variable) with observable variables (questions of the questionnaire) standard factor loading of confirmatory analysis was greater than 0.2 in all cases. Therefore, factor construct of the questionnaire is valid. Also according to the observed results, factor loading of t-value for assessment indexes of each one of the studied cases with the significance level of 5% was a little bit more than 1.96. So the observed correlations were significant (figure 4).

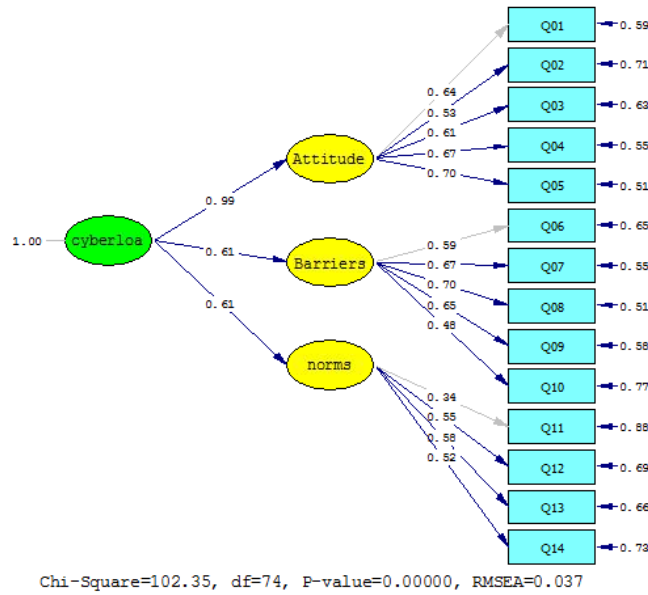

Figure4: Cyber loafing standard loading factor of confirmatory factor analysis

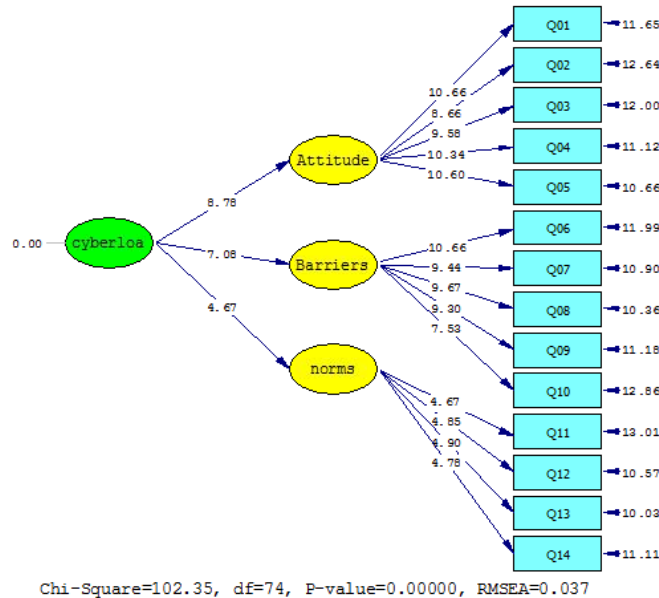

Figure5: Cyber loafing confirmatory factor analysis for t-value

Because of using second order confirmatory factor analysis, the relationship between hidden variables and main construct was investigated. The standard loading factor in all cases was a little bit more than 0.4 which indicate acceptable correlation between cyber loafing and the structure. Amount of t-value in all cases was greater than critical value (1.96) which means correctly assessment of the structure (figure 5).

After the test, research hypothesis was carried out using structural equation modeling and the results are:

**Hypothesis 1:** there is a significant relationship between job performance and employee's attitude toward cyber loafing phenomenon in Ayandeh Bank Branches of Guilan, Mazandaran and Golestan provinces, Iran.

The results obtained from investigating the relationship between two variables indicated that loading factor between employees' attitude toward cyber loafing and job performance was -0.40.

The t-value was -3.10 which greater than 1.96 was and it means the observed correlation was significant. Therefore, there is a significant relationship with 95% confidence level between employee's' attitude toward cyber loafing and job performance in Ayandeh Bank Branches of Guilan, Mazandaran and Golestan provinces, Iran.

**Hypothesis 2:** There is a significant relationship between perceived barrier of cyber loafing and job performance in Ayandeh Bank Branches of Guilan, Mazandaran and Golestan provinces, Iran.

The results obtained from investigating the relationship between two variables indicated that loading factor between perceived barrier of cyber loafing and job performance was -0.35. The t-value was -2.12 which greater than 1.96 was and it means the observed correlation was significant. Therefore, there is a significant relationship with 95% confidence level between perceived barrier of cyber loafing and job performance in

Ayandeh Bank Branches of Guilan, Mazandaran and Golestan provinces, Iran.

**Hypothesis 3:** There is a significant relationship between descriptive norms of cyber loafing and job performance in Ayandeh Bank Branches of Guilan, Mazandaran and Golestan provinces, Iran.

The results obtained from investigating the relationship between two variables indicated that loading factor between descriptive norms of cyber loafing and job performance was -0.57. The t-value was -4.42 which greater than 1.96 was and it means the observed correlation was significant. Therefore, there is a significant relationship with 95% confidence level between perceived barrier of cyber loafing and job performance in Ayandeh Bank Branches of Guilan, Mazandaran and Golestan provinces, Iran.

#### 4.3 Main Hypothesis of the Research: Relationship between Cyber loafing and Job Performance

Standard loading factor between cyber loafing and job performance was -0.45 and the t-value was -4.42 which indicates this relationship was significant. Therefore, there is negative and significant relationship between job performance and cyber loafing.

Also the rate of cyber loafing in Ayandeh bank was investigated and the results are:

The means of respondents' viewpoint about employees' attitude toward cyber loafing was 2.51. The significant 0.000. Therefore, the observed mean was significant. The t-values was -12.38 which was less than -1.96. Therefore, based on the statistical findings we can say with 95% confidence level that employees' attitude on cyber loafing was undesirable.

The means of respondents' viewpoint about perceived barriers was 2.02. The significant 0.000. Therefore, the observed mean was significant. The t-values was -24.18 which was less than -1.96. Therefore, based on the statistical findings we can say with 95% confidence level that perceived values of cyber loafing was undesirable.

The means of respondents' viewpoint descriptive norms was 2.08. The significant 0.000. Therefore, the observed average was significant. The t-values was -16.5 which was less than -1.96. Therefore, based on the statistical findings we can say with 95% confidence level that descriptive norms are preventive factors on cyber loafing.

#### 5 Conclusion

Cyber loafing which is defined as using a computer and net access for personal matters during business hour catches the attention of academia and managers of organizations in recent years. Some of the researches reported that decreasing job performance is one of the consequences of cyber loafing. Decreasing the job performance of employees is one of its consequences while the performance is critical for managers and continuously trying to increase it. So, cyber loafing as a preventing factor in job performance gained the attention of organizational managers more than before.

This research investigated the relationship between cyber loafing and job performance in order to offer suggestions to deal with this phenomenon.

There results of present studies are:

- Based on gender, most of the respondents were men (158).
- Based on job experience, most of the respondents have experience between 5 to 10 years.
- Based on age, the majority were between 30 and 40 years old.

- Based on the degree, the majority have the BA degree.

The relationship between different aspects of cyber loafing and job performance was investigated with three different hypotheses. The results of hypothesis test revealed that there is a positive and significant relationship between job performance and three aspects of cyber loafing in northern branches of Ayandeh Bank. Based on the observed loading factor, the descriptive factors of cyber loafing have notable relationship with job performance. There is a moderate relationship between employee' attitude toward cyber loafing and job performance and the perceived barriers in cyber loafing barely affects job performance.

- Therefore, there is a significant relationship between employee's' attitude toward cyber loafing and job performance in Ayandeh Bank Branches of Guilan, Mazandaran and Golestan provinces, Iran.
- Therefore, there is a significant relationship between perceived barriers of cyber loafing and job performance in Ayandeh Bank Branches of Guilan, Mazandaran and Golestan provinces, Iran.
- Therefore, there is a significant relationship between descriptive norms of cyber loafing and job performance in Ayandeh Bank Branches of Guilan, Mazandaran and Golestan provinces, Iran.

The relationship between aspects of cyber loafing and job performance was investigated using three hypotheses. To evaluate the general relationship between cyber loafing and job performance we used structural equation modeling. The standard loading factor relationship between cyber loafing and job performance was -0.45 which was moderate. The t-value was -4.42 which indicate this relationship is significant. Then there is a negative and significant relationship between cyber loafing and job performance.

I. It is recommended to have certain educational programs to improve the attitude of employees on cyber loafing. Presenting statistical documents on some damages caused by cyber loafing and the negative results which ultimately affects the employees themselves (directly or indirectly) can be part of this program. This perspective which states using the internet is not pastime to end the business hours, should be boosted. The employees should know that unbridled cyber loafing will result in inefficiency of the whole organization.

II. The organization should have special contrivances to supervise and administer on the net access during business hours. Also, preventive and punitive mechanisms should be clear, in this case, preventive and precautionary mechanisms will lose their preventive nature.

III. The organization's convention and common-law should not lead the employees to cyber loaf in social networks during business hours. There should be contrivances to prohibit cyber loafing, checking personal emails and surfing unrelated websites to the work and nature of the organization during business hours and

IV. Controlling cyber loafing would result in improving job performance of the organization. If and only if the negative aspects of the cyber loafing bolded to employees and knowing that too much using on net access and cyber loafing for personal purposes in work context threaten their own and organizational success, then we can expect the cyber loafing would decrease and consequently job performance will increase.

#### 5.1 Suggestions for Further Studies

- 1) The researchers can use the designed scale to investigate the relationship between cyber loafing and job performance in other provinces.
- 2) Studying other variables relationship with cyber loafing is recommended for the future researchers. Also it is recommended to study and investigate this relationship in a mid-term period on a specific job or organization so that the results will be valid and notable.

- 3) The researchers can improve the designed scale by increasing their range of studies to recognize and modify factor and items.
- 4) It is recommended to investigate other factors influencing cyber loafing.

**Abstract.** One of the most important assets of the organizations is human resources, one of the factors that is important to personnel today, is organizational justice. Most direct relationship in the hypotheses test of this study, related to procedural justice and then interactional and finally distributive justice which suggests that personnel consider greater importance to the accurate implementation procedures and processes and correct division of tasks and responsibilities and also interactions and exchanges full of reverence and respect to personnel. Also the highest intensity of the relationship related to the relationship between distributive justice and the administrative health human resources improvement subsystem which shows the more effect of distributive justice to motivate the personnel to learn efficiently.

**Keywords:** subsystem, administrative health, human resources system, organizational justice.

### 1. Introduction

If review our daily life we conclude that the organizations are penetrated strongly in our lives, we are in daily contact with the numerous organizations and most people spend much of their lives in the institutions. In this way, our consideration of the organizations may be positive or negative. This understanding that comes from our personal experiences in contact with the organizations, form our understanding of the organization. This common sense tells us that we should examine the organizations in a systematic way to get more recognition of them (Iran Nejad, Parizi and S. Gohar, 25: 2006). Stability of the collaboration networks needs to provide the preparations and to notice to the type of the interactions. In the inter-organizational cooperation, justice has a pivotal role because the cooperation, is a category that shapes in social networks and one of the most important social stability, is justice (Avtarkhany 30: 2008 so that justice is a human issue that is important for people who work in an organization, other means, justice is directly linked to the job. In the organizational justice arises with what ways should have worked with Personnel to feel they have been treated fairly (Naami and Shokrkon, 2006:91). In this case, the organization goes ahead towards the health because the organizational health causes to the organization growth and improvement. A healthy organization is a place people want to stay there and work and be helpful and effective people themselves. So, the healthy schools as an organization, created the causes of the stimulation and interest in work on the teachers and in this way, raise their effectiveness (Hui and Vlfvk. (1993:128 the existence of justice whether when attracting the employees and whether after the absorption causes the growth of the programs, the continuous improvement of the organizational performance and the creation of a great force in order to synergies ,development and creation of the sublimity organizational opportunities (Poorsoltani et al, 2010: 154). Checking of the existed administrative health effects and the problems that occur in the absence of it, as the administrative corruption expresses the significance level of the research. If the administrative system, does not be safe and effective despite the good intentions of the policy makers what is realized in practice may be in conflict with those objectives and policies. The corruption and fake are phenomenon that all the countries grappling in the world with it more or less. The destructive consequences of the corruption and its conflict with the public

interests, such as wasting of the resources, slowing the economic growth and reducing the effectiveness, causes the increasing attention to the importance of this phenomenon in different societies (Habibi, 1996:27). Justice as a tangible factor can have a significant impact on the administrative health system with suitable and low-cost policies and these conditions for today's organizations and especially to Iran which have the substantiation of the twenty years old vision in mind seems a necessity

Review of carried out researches regarding the relationship between the organizational justice and the administrative health, indicates that most of these researches are done in the Industrial, the production and the treatment organizations and in the educational institutions such as schools, have been paid less to this subject , also the carried out studies on the human resources management subsystems and in particular, the administrative health of the human resources management subsystems were lower that so reveal the necessity of this study far more. In this research attempts have been made that by studying the same researches and conducting a research in the area of checking the relationship between the organizational justice on Human Resource Management System Organizational Health in Zahedan Education system, employees relations be investigated. The main question that this study deals with is that is there a significant relationship between the organizational justice and Human Resource Management System Organizational Health in Education system?

### 2. Theoretical Foundations

#### 2.1 Organizational justice

Word of the organizational justice for the first time, has been used by Greenberg in 1987. According to Greenberg the organizational justice is related to the employees' perceptions of the job fairness in the organization. He applies this term for the explanation and definition the role of fairness in the workplace. (Taheri Attar, 2008:1). Fairness and justice is a fundamental value in the organizations (Konovsky 2, 2000:37). And it is focused on how people understand fairly or unfairly the within organization events from the social viewpoint (poll, 170).2007: the organizational justice refers to the employees' perception of fairness and occupational fair behaviors (Jex & Beehr, 1999). And it pays to the judgments of individual and public of fairness or moral merit.

In the division of the organizational justice, three types of justice as, distributive justice, procedural justice and interactional or interactive justice have been proposed. Distributive justice refers to the fair distribution to employees' perceptions of the organization's outcomes. This kind of justice is based on the theory of Adams. Based on the theory of equality, individuals compare their received rewards from the organizations with their service to the organization and with other employees. In the other words, equity theory claims that people compare data rate to their output with other people to determine the level of fairness. Distributive justice reflects people's perception of the fairness observance amount in the distribution and the allocation of the resources and rewards, in other words, it implies to the extent to which people linked rewards to the performance ( Rezaeian 2010:43). While distributive justice describes fairness consequences that employees get, procedural justice expresses the fairness of the used procedures to determine the outcomes.

Procedural justice, that means a process to achieve the fair results, must be fair. That means people do not have the right and should not be able to achieve the fair results of the methods and the unfair

processes (Cohen 3, 2001:241). Fair procedures can be as signs for people that they feel they have valued and respected in the organization and can improve the balance and the confidence in the relationship with others. Interactional justice means that all communication and interaction between people must be fair on the way to achieve fair results. This means that individuals have no right to strive the unfair compromises between themselves and others on the way to achieve fair results (Rogue 4 18: 2006). This type of justice is in connection with the aspect of the communication (such as courtesy, respect and honesty) between the sender and the receiver of justice (Cohen, 2001:69). The interactional justice predicts better the job performance in comparison with the procedural justice. Procedural justice linked mostly to the organizations and organizational policies, while interactional justice is linked more with the management or the guardian) Kovartz et al., (2002:230). For the organizational justice variable, one of the most prestigious models, is the model of Niehoff and Moorman organizational justice (1993) which has three dimensions, distributive, procedural, interactional with the relevant index and the measurement takes place by the standard questionnaire (20 questions).

### 2.1.1. Distributive justice

Distributive justice refers to the judgment of the results distribution equality such as the rate of payment or the scale and the promotion opportunities in an organizational context. This theory expresses that people consider the relative balance of the desired results and compare their relative data - output with their colleagues. Rawls (1971), describes the justice conception accurately. According to him, when there is an inequality in the expectations, poor people in the organization may become worse. At this time the only thing that the organization should do, is to identify parts of the organization where distribution is done unequal, and prevent them (Corpanzo & Folger, 1991:138).

### 2.1.2 Interactional justice

Perceptions of fairness in the organization not only affected by the results, but also affected by the applied process to achieve the results as well. Procedural justice theory suggests people can look beyond the short-term decisions. So, undesirable results appear acceptable when it is thought that the applied process was fair (Greenberg, 1987:12). Justice implementation requires adopting the fair procedures. This means that regardless of whether the content of the law must be fair, the process that is supposed the justice is concluding from it also must be fair. Justice and fairness heed in the implementation process must provide equal opportunity for all.

Therefore it can be said, justice requires the rules precision and the laws implementation procedure when is fair that benefit possibility from the law easily be available to everyone. Baron and Greenberg believe that scientists have considered two aspects to procedural justice, structural aspect of procedural justice, that this aspect of procedural justice examines this phenomenon that how decisions are made to seem fair. It is important to note that this aspect does not pay to what are the decisions, but it considers that how decisions are made. About the social aspect of procedural justice, Greenberg believes that although the structural aspect of procedural justice, is very important but it does not cover issues of procedural justice, in other words when making judgments about the fairness heed in the organizational procedures, the quality of the interpersonal behavior of decision-makers with the organization personnel is considered as a key factor (Greenberg & Baron, 2000:147).

### 2.1.3 Interactional justice

The word interactional justice was used for the first time, by two researchers with names of Bayess and Moog in 1986. They believed that interactional justice is another type of justice that conceptually is distinct from distributive and procedural justice and refers to the social action of procedure. People are sensitive to the quality of the treatment with them in the interpersonal relationships and also to the structural aspects of the decision making process (Rezaeean, 2005:59).

Interactional justice suggests that the quality of interpersonal behavior during the procedures is important and effective in determining the fair judgments. Justification or presented explanation is effective in the perception of fairness and increases this probability that the fair decision-making procedures are considered fairly. Interpersonal behavior includes trust in people's relationships and behaviors with humility and respect. Good shape of the procedures is defined as five behaviors: enough attention to personnel data, prevention of personal prejudice, consistent use of decision criteria, Timely feedback, justification a decision. These factors play an important role in the personnel perceptions of equality, acceptance the decisions and orientation towards the organization (Konovsky & Cropanzan, 1991:702). Interactional justice can have two dimensions: Interpersonal dimension, that shows that behavior must be politely and respectful. Managers should show a behavior of trust and respect when dealing with their personnel. A second dimension is expectations and social responsibility. With people justification adequately, people's tolerance power of an unfair result become more. This means that people's expectations of heed of one aspect of the organizational justice can affect the personnel behaviors to the reaction to heed the other aspects of the organizational justice (Corpanzo & Greenberg, 1997:330).

### 2.2 Organizational health

A healthy organization is a place where people want to stay there and work, are proud of the organization and they are useful and effective themselves. Parsons in the definition of the organizational health, expresses all social systems for survival and development, must adapt themselves to the environment, mobilize their resources to get their own purposes, co-ordinate their activities. And motivate their personnel and in this case, health of them is guaranteed (Hoy & Wolfolk, 1993:265). In Miles opinion, the organizational health refers to the situation beyond short-term efficacy of the organization and refers to set the relatively enduring traits that are the sustainability and survival of the organization in their environment, compatible with it, and upgrade and expansion of the organization's ability for the greater compatibility (Jahed, 2005:94).

If the organization wants to survive and expand, should solve the problem of compliance, goal acquisition, a unity and invisibility. Organizations must obtain sufficient resources and adapt themselves to the environmental demands (compliance), define their goals and do (goal acquisition), maintain the union solidarity among personnel (unity) and maintain and renew the cultural patterns and motivations of the organization climate (continuity) (Beikzadeh and Bayrami A. Luyee, 2005:68). Hoy and Myskel (1971) have defined the organizational health in seven dimensions that form the pattern of interaction and behavior within the organization. Institutional level; the institutional integration in an organization programs, means the understanding of the personnel interests and the organization's ability to adapt to its environment (institutional requirements).

Administrative level; refers to organizing, task-oriented and success-oriented behavior. Manager specifies his expectations,

maintains rigorous standards of the performance (tools need). Consideration, shows managers friendly, supportive and open behavior, (expression need). Manager influence refers to the manager ability in influencing its superiors, manager works effectively with influential to its local director (tools need). Resources support, refers to the organizations that have the necessary resources for effective action (tools need). Technical level and spirit, refers to the sense of community, openness and trustiness between managers and personnel (expression need). Scientific emphasis refers to the organization emphasis to personnel learning. Managers believe the ability of personnel to success in learning and respect them (tools need). Leiden and Klyngl (2000), write in conjunction with the organizational health, organizational health is a new concept includes not only the organization's ability to perform tasks effectively, but also the organization's ability to grow and improve (Nazem et al., 2010:145). According to Lynden and Klyngl model a total of eleven components are provided for the organizational health (separated dimensions related to each other).

1. Relationship: in healthy organization continuous communication between personnel and as well between subordinates and elites must be facilitated. In the organization face-to-face discussions are equally important as same as documents.
2. Participation and involvement in the organization: in a healthy organization personnel at all levels appropriately are involved in the organizations decisions.
3. Credibility or reputation of the institution: a healthy organization reflects the perceptions of the credibility and positive reputation to the personnel and the personnel in general value for the credibility of its domain or a part of it.
4. Spirit: appropriate mood is shown in an organization by the friendly atmosphere where personnel often love each other and their jobs and overall they are excited, personally, and for the organization.
5. Loyalty and commitment: high trust has always been in a healthy organization, there personnel waiting to come and work and have a good sense of their work in the organization.
6. Ethics: in a healthy organization ethics has a special place personnel tend to value for the ethics
7. Identification or recognition of performance: in a healthy organization personnel are encouraged and feel that they are valuable, manager select these kinds of personnel for the improvement of the organization.
8. Purpose: in a healthy organization objectives are clear and personnel activities of is accordance with those objectives. Personnel are also involved in setting the organization's objectives
9. Leadership: Leadership is considered the determining factor in profitability and effectiveness of the organization. Leaders often have friendly behaviors and personnel can easily communicate with them
10. Improvement or development of personnel efficiency: in a healthy organization environment often there is a special group to support education and improvement of the action of the force
11. Use of resources: personnel need to see that the resources are properly divided between them (AlagheBand, 1999:237).

### 2.3 Human resources management system

Human resource is one of factors that are effective on survival of organizations and always are considered by authorities and managements of organizations. Skilled and educated human resource has an undeniable role in process of evolving traditional society to industrial society in a way that human resource has been considered as the most important and main factor of developing societies and organizations so that by increasing complexity of today's society certainly missions of organizations will become more sensitive and important in order to meet expectations of societies. A thing which has been changed to a certainty among technicians is the basic role of human as main operator of organizations. Humans vitalize spiritless body of organizations and practically make realization of purposes possible. Administrative system is referred to collection of governmental and public organizations and institutions which provide public services and goods and human resource system is considered as the first basis of administrative system which include 4 main subsystems (Mirsepasi, 2010: 20)

**Supply and adjustment system of human resources:** human resources should be supplied and adjusted in strategic planning framework in large and medium organizations and naturally purposes and strategies of planning human resources are affected by major mission, purposes and strategies of organization such as other subsets of organization.

Therefore when a human resource plan is considered strategic that not only its purposes and strategies to be situated in line with strategic movements of organization but also way of decisions about estimating and supplying human resources from a hand by recognizing opportunities and treats of work market and from another hand determining strengths and weaknesses and pivotal capabilities of available human resources of organization and at the same time benefits of organization, personnel and society to be considered. An important point which exists in predicting required human resources and method of supplying them is making flexibility and dynamiting human resources supply and adjustment system and in this regard emphasis from a hand is on making people multi-skilled and from another is on proportionality of types of work and organization with type of employees' personalities (Mirsepasi, 2010: 169).

**Human resources improvement system:** human resources need preparation and education in accordance with changes in out of organizational and within organizational environments especially strategic changes of organization. Strategic selection of training programs plays pivotal role in aligning purposes of organization and human resources management and this alignment can be supplied by educating and strengthening insight, knowledge and professional skills of managers and personnel and make organizations to have learner features. Human resources are basic assets of organizations and sources of each type of evolution and innovation in organizations. Human is a changeable creature and with numerous potential evolutions and abilities, these abilities should be evaluated and become from potentiality to actuality by favorable educations. An important point about educating managers and training personnel of organizations is that trainings plans should not be only in order to strengthen professional skills but also its culture making role especially in developing countries are important as much as that or maybe more than that (Mirsepasi, 2010: 235).

**Human resources maintenance system:** no chapter is observed with topic of maintenance or similar to that in textbooks of human resources management, especially books which have been written in 1990s with strategic attitude and has been reflected with topic of "motivation and reward" (book of Landi and Kuling, 1997), or "participation of personnel in success of organization and

connection of reward to strategies of human resources" (Walker, 1992) or "security and health and helper programs of personnel" (Casio, 1989) and such as them in the books. Maintaining personnel of organizations and especially maintaining managers have aspects more than communicating human with receiving rights and benefits or supplying health and security in work environment. Meanwhile it should be not imagined that personnel's expectations from their organizations are equal in everywhere and in each work space and easily these expectations can be recognized. Imagination of each cultural space from quality of work life is an especial imagination that manages should try to identify that. When affairs related to maintaining and keeping personnel in an organization are spoken, it is necessary to be considered various and complex aspects that create individual, group and organizational needs and individual and group differences in interpretation of high quality work and humans to be studied with all their existence aspects in relation with work and social life. View to human as a system or a part of a work system should not create this imagination that human can be studied as a mechanical system; but identifying intangible aspects of human makes its maintenance difficult (Mirsepasi, 2010: 305).

**Human resources usage system:** strategic view to dominion of human resources which has formed theoretical structure of human resources system emphasizes particularly on interaction between system's components with each other and interaction of system with its external environment. Therefore quad subsets of human

resources management system should be balancer of interactions of each other in order to realize purposes and strategies of organization. If there is any insufficiently or limitation that makes other subsets of human resources management system (supply and adjustment system, improvement system and maintenance system) disable to conduct their duties effectively, human resources usage system should try to compensate that. Effective using human resources is responsibility of all managers and administrators of organizations but in terms of planning and executing, managers can be divided to two major fields named strategic field and operational field. Strategic managers provide policies and major purposes of organizations about way of attracting, maintaining and using and suggest required guides about within the organizational and interorganizational replacements and such that and operational managers mainly make strategic plans to action stage (Mirsepasi, 2010: 355).

**2.4 Human resources system organizational health**

**Human resources system organizational health**

generally has been used from combination of general indexes of administrative health and corruption of Leiden and Kolingel (2000) with human resources system indexes that include 4 subsystems with criteria of each one, this model has been expressed in Table 1 and is tested by researcher-made questionnaire (70 questions).

Table 1. Administrative health aspects of human resource system (Alagheband, 1999: 240, Mirsepasi: 2010, 10-250)

Variable	Dimensions	Indexes
		1. The alignment of strategies adsorbed

## 2.5 history of the research

Both inner and foreign researches related to variables of the research have been studied in order to evaluate history of the research and it has been tried to express subject, purpose and final result of the research in short.

### 2.5.1 Inner researches

Shiva Zare (2012) in MA thesis of Sistan and Baluchestan University with topic of "evaluating relationship of organizational justice with organizational health and personnel's job burnout of Education Department of Zahedan" found that results of correlation test between aspects of organizational justice and aspects of organizational health show positive and significant relation and only there has been not a significant relationship in aspect of distributional justice with institutional unification with ( $r=0.122$ ). Results of correlation test between organizational justice and job burnout have shown negative and significant relation except in aspect of distributional justice with individual operation ( $r=-0.047$ ).

Also among aspects of organizational justice, three aspects of procedural justice, interpersonal justice and informational justice have the most roles in predicating organizational health and only distributional justice has role in predicting job burnout and eventually there was no difference between personnel in terms of demographic features about organizational justice, organizational health and also job burnout. Khadijeh Sheykhi (2013) in MA thesis of Tehran Payam Noor University with topic of "evaluating relationship of administrative health with organizational justice and job satisfaction and civil behavior in Education Department of East Azerbaijan Province" showed that there is strong correlation ( $r=0.657$ ) between administrative health and organizational justice.

Correlation between organizational justice and civil behavior had maximum correlation coefficient (78.6) and had minimum

correlation coefficient (0.106) between organizational justice and job satisfaction also results of multivariable regression indicated existence of maximum effect coefficient related to variable of organizational justice ( $a=0.251$ ) and coefficient of variable of civil behavior ( $a=0.217$ ) was confirmed but coefficient of variable of job satisfaction was not confirmed due to higher being than 0.5 of its significance level. Whole regression was confirmed due to lower being than 0.05 of sig of test.

### 2.5.2 Foreign researches

Olovaynio (2004) has conducted a research about effect of organizational justice on personnel's health; this research is longitudinal type and has lasted for two years. 2969 people of Finnish personnel were evaluated in this research. Results of this research showed that executing justice in organization has a significant relationship with personnel's health and reducing absence of job due to disease. Another finding of this research is that making healthy organizational space and increasing organizational justice can lead to more organizational health and reducing delay and absence.

Hui and Wulfolk (1990) have studied relationships between aspects of teacher's efficiency (individual and group) with aspects of atmosphere of healthy school (institutional cohesion, manager's influence, observance, organizing, supporting by resources, morale, and scientific emphasis) in a research under topic of evaluating relationship between teachers' efficiencies and organizational health of school. Results of the research have shown that atmosphere of a health school with strong emphasis in scientific aspects and existence of influential manager has a very strong relationship with individual and group efficiencies of teachers.

### 3. Development of hypotheses and conceptual model

#### 3.1 Main hypothesis

There is a significant positive relationship between organizational justice and administrative health of human resources subsystems in the education of Zahedan city. (H1)

#### 3.2 Sub-hypotheses

1. There is a significant positive relationship between distributive justice and administrative health of supply and adjustment of human resources subsystems in the education of Zahedan city. (H1a)

2. There is a significant positive relationship between distributive justice and administrative health of Improvement of human resources subsystems in the education of Zahedan city. (H1b)

3. There is a significant positive relationship between distributive justice and administrative health of application of human resources subsystems in the education of Zahedan city. (H1c)

4. There is a significant positive relationship between distributive justice and administrative health of maintenance of human resources subsystems in the education of Zahedan city. (H1d)

5. There is a significant positive relationship between procedural justice and administrative health of supply and adjustment of human resources subsystems in the education of Zahedan city. (H1e)

6. There is a significant positive relationship between procedural justice and administrative health of Improvement of human resources subsystems in the education of Zahedan city. (H1f)

7. There is a significant positive relationship between procedural justice and administrative health of application of human resources subsystems in the education of Zahedan city. (H1g)

8. There is a significant positive relationship between procedural justice and administrative health of maintenance of human resources subsystems in the education of Zahedan city. (H1h)

9. There is a significant positive relationship between interactional justice and administrative health of supply and adjustment of human resources subsystems in the education of Zahedan city. (H1i)

10. There is a significant positive relationship between interactional justice and administrative health of improvement of human resources subsystems in the education of Zahedan city. (H1j)

11. There is a significant positive relationship between interactional justice and administrative health of application of human resources subsystems in the education of Zahedan city. (H1k)

12. There is a significant positive relationship between interactional justice and administrative health of maintenance of human resources subsystems in the education of Zahedan city. (H1l)

13. There is significant difference in amount of relationship between organizational justice and administrative health of human resources subsystems in terms of administrative and educational personnel. (H1m)

14. There is significant difference in amount of relationship between organizational justice and administrative health of human resources subsystems in terms of demographic variables (age, education, and gender and work experience). (H1n).

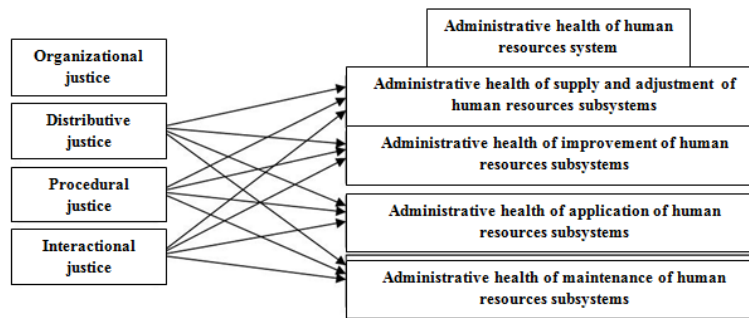

Figure 1) conceptual and theoretical model of the research

#### 4. Methodology

The present research due to this reason that develops usable knowledge about quality of relationship among variables is practical in terms of purpose and descriptive in terms of method of collecting data. Method of conducting research is as survey because describes statuses of variables and also relationships among them. SPSS software has been used in order to analyze data which was conducted as sampling. Variables of the research are: distributional justice, procedural justice, interactional justice, administrative health of subsystem of supplying human resources, administrative health of subsystem of improving human resources, administrative health of subsystem of maintaining human resources, administrative health of subsystem of human resources usage.

##### 4.1 Tool of collecting data

Using questionnaire is one of common methods in collecting information in survey researches. According to this issue that way of measuring variables of the research is specified the best method of collecting data in this research was considered questionnaire. Questionnaire of this research includes 90 items with 5-Likert spectrum which has spectrum of I completely agree to I completely disagree. Used items in this research can be divided to 7 parts of distributional justice with 5 items, procedural justice with 6 items, interactional justice with 9 items, administrative health of subsystem of supplying human resources with 11 items, administrative health of subsystem of improving human resources with 11 items, administrative health of subsystem of maintaining human resources with 20 items and administrative health of subsystem of human resources usage, with 28 items, items of part of organizational justice of the questionnaire is taken from researches of (Niehoff & Moorman, 1993). Items of part of administrative health of subsystem of human resources are as researcher-made and have been adapted from researches of (law of health of administrative system and cope with corruption, Hamzehli, 2012), (organizational in higher education, Leiden and Kolingel quoted by Alagheband, 1999), (questionnaire of

organizational health of school, Saatchi; Mahmud. Kamkari; Kambiz. Askarian; Mahnaz. Psychological tests, Virayesh publish 2010.), (strategic planning human resources, Dr. Naser Mirsepasi, 2010).

##### 4.2 Population and sample of the research

The statistical population of this research includes all administrative and training personnel of Education Department of Zahedan city in total number of 3438 people that will be in separation of administrative personnel 109 people and training personnel 3329 people.

The sample volume was formed as random stratified, in this way that schools of (group a) and the department (group b) were assumed as stratum and in ratio of number of each stratum and by using Morgan table 346 people of schools' teachers and 86 people of the department's personnel were selected as the statistical sample in order to execute the questionnaire. In this research among 500 questionnaire that were distributed (400 questionnaires among schools and 100 questionnaires in the department) 460 questionnaires were returned according to conducted follow-up and presence of the researcher on answering time that 432 main samples were obtained by reducing 28 uncompleted cases.

##### 4.3 Reliability and validity of the tool and normality of the statistical sample

All stages related to reliability and validity was completely passed to measure accuracy of measuring tool. To evaluate validity of the questionnaire first all questions were extracted from valid references, then probable problems of it were evaluated by conducting pretest. After that the measuring tool was given to some experts for more evaluation and its reliability was confirmed. Reliability of the measuring tool was evaluated by using Cronbach's alpha coefficient which is the most common inner adaptability test. Table 2 shows value of this coefficient for components of the research. Cronbach's alpha higher than 0.7 is considered as the acceptable number in reliability of the tool.

Table 2. Results of determining reliability of the research tool

Cronbach's alpha of administrative health	questions of administrative health of system	Number of sample	Cronbach's alpha of organizational justice	Questions of organizational justice	Number of samples
0.984	70	30	0.946	20	30

First skewness and kurtosis of each variable were evaluated to test normality of variables of the statistical sample that were between normal range of (-2 and 2). Second all values of sig higher than 0.05 were obtained through especial menu of evaluating normality of SPSS and by using chi-square test so distribution of the statistical population is normal according to Central Limit Theorem.

## 5. Analyzing data

### 5.1 Evaluating demographic features of answerers

From all answerers to questionnaires in terms of gender 210 people were male and 222 people were female, in terms of education 63 people had diploma degree and were under diploma, 111 people had associate degree, 170 people had Master degree and higher, in terms of age 100 people were between 20 and 25 years old, 128 people were between 25 and 35 years old, 121 people were 35 and 45 years old and 83 people were between 45 and 55 years old, in terms of service experience 89 people had 0 and 5 years, 139 people had between 50 and 10 years, 114 people had 10 and 15 years and 90 people had 15 and 30 years.

### 5.2 Evaluating hypotheses of the research

According to normality of the distribution, in order to explain and interpret variables of the research, Pearson's correlation coefficient test is used in order to determine relationship between two variables and is indicated with symbol of r. If the obtained value to be positive means that changes in both variables occur in the same direction and if r to be negative indicates this point that two variables move in contrast direction of each other and if the obtained value of correlation coefficient to be zero means that there is no relationship between two variables (Kalantari, 2010, 108).

Also we use independent t test to test hypothesis 13 and use variance analysis test in order to test hypothesis 14. When we want to compare averages of two populations (or samples) with each other and evaluate significance of difference between them, t or z test is used but when research want to evaluate difference of averages of more than two populations (or samples) variance analysis method or test of F is used (Kalantari, 2010, 125). Results of testing hypotheses are provided based table 3.

Table 3. Results of statistical tests of hypotheses

Row	Hypothesis	Hypothesis testing	Results
1	The main hypothesis: examine the relationship between organizational justice and administrative health of human resources system Through the Pearson test	The correlation coefficient = 0.658 Intensity of the relationship = 0.321	Hypothesis is confirmed. with compliance and increase in organizational justice with its various aspects an ideal platform to achieve the organization to objectives and aligning and is provided healthy and effective enjoyment of human resources and thus administrative health of human resources puts upward.
2	Hypothesis 1: examine the relationship between distributive justice and administrative health of supply and adjustment of human resources subsystems Through the Pearson test	The correlation coefficient = 0.615 Intensity of the relationship = -0.124	Hypothesis is confirmed. But with increasing distributive justice and payments among personnel the unity and cohesion between them is increased. That this consistency in negative mode will be increased in the little corruption in the category of order and nepotism of hires Therefore, due to the positivity of category of distributive justice reducing it is not rational. But with the increase should be done enough building a culture order to justify personnel to benefit of them of capacity internal cohesion on the right path and avoid of corruption.
3	Hypothesis 2: examine the relationship between distributive justice and administrative health of Improvement of human resources subsystems Through the Pearson test	The correlation coefficient = 0.115 Intensity of the relationship = 0.376	Hypothesis is confirmed. With increasing distributive justice and payments among personnel interest of personnel to learning and specialized, doctrinal and educational training to play an effective role in the organization becomes more and more. Therefore, can be increased employee motivation to learn more and more and aversion of tendency to academic degree and tendency to certificate with increase in justice in payments.

4	Hypothesis 3: examines the relationship between distributive justice and administrative health of maintenance of human resources subsystems Through the Pearson test	The correlation coefficient = 0.344  Intensity of the relationship = -0.146	Hypothesis is confirmed. But with increasing distributive justice and payments among personnel. A type of hand-picked is created in organization that all personnel supply in terms of material and there will be not a protest for the rights and benefits. this will be created too little corruption in the field of financial and non-financial compensation and appointments of jobs that we need more making culture.
5	Hypothesis 4: examine the relationship between distributive justice and administrative health of application of human resources subsystems Through the Pearson test	The correlation coefficient = 0.148  Intensity of the relationship = -0.17	The hypothesis is confirmed but by increasing distributive justice and payment among personnel a kind of misconception has been created in the organization that because all personnel are financially supplied, there will be no protestation in the field of nonfinancial needs such as delegation of authority and giving management posts to inappropriate people and this issue will make a little corruption about way of managing organization that we need more culture making.
6	Hypothesis 5: examine the procedural justice and administrative health of supply and adjustment of human resources subsystems Through the Pearson test	The correlation coefficient = 0.629  Intensity of the relationship = 0.323	The hypothesis is confirmed, by increasing justice in wok processes and way of conducting affairs, personnel's hopes to existence of justice in in the organizations become more and they will try to respect this matter about attracting and employing acquaintances of themselves.
7	Hypothesis 6: examine relationship between procedural justice and administrative health of Improvement of human resources subsystems  Through the Pearson test	The correlation coefficient = 0.614  Intensity of the relationship = 0.324	The hypothesis is confirmed, by increasing justice in wok processes and way of conducting affairs, processes are conducted correctly and as the result personnel's enthusiasm and interest in real increase of knowledge and learning in order to more domination to processes and work routines are increased.
8	Hypothesis 7: examine the relationship between procedural justice and administrative health of application of human resources subsystems Through the Pearson test	The correlation coefficient = 0.594  Intensity of the relationship = -0.126	The hypothesis is confirmed, but by increasing justice and accuracy and correctness in work routines and way of conducting affairs, personnel will have more expectation about receiving more salary and benefits for more work in their own imagination, this issue causes a little corruption about distribution of salary, benefits and overtime that those who have more expectation will receive more benefits. So we need more culture making and more training for personnel that working in correct way means spending energy in correct way and preventing wastes.
9	Hypothesis 8: examine the relationship between procedural justice and administrative health of application of human resources subsystems  Through the Pearson test	The correlation coefficient = 0.775  Intensity of the relationship= 0.314	The hypothesis is confirmed, by increasing justice and work routines and way of conducting affairs, the process is conducted correctly and as the result organization is managed more correctly and for this purpose we need using more competent personnel for management posts and effective leadership of organization.
10	Hypothesis 9: examine the relationship between procedural justice and administrative health of application of human resources subsystems Through the Pearson test	The correlation coefficient = 0.245  Intensity of the relationship = 0.356	The hypothesis is confirmed, by increase in interactions among personnel and mangers, managers find more belonging feeling to organization and find more sensitivity to entrance and exit of personnel to organization.

11	Hypothesis 10: examine the relationship between procedural justice and administrative health of application of human resources subsystems  Through the Pearson test	The correlation coefficient = 0.966  Intensity of the relationship = - 0.102	The hypothesis is confirmed, but by increasing justice in interactions among personnel and managers, a kind of intimate feeling and not feeling need to learn new methods is created and mastery feeling and not need to discussions which are presented in training seminar are created in personnel and so they are formal evidences and documents. In this field we need to justify personnel seriously by managers in order to active participation in seminars.
12	Hypothesis 11: examine the relationship between procedural justice and administrative health of application of human resources subsystems  Through the Pearson test	The correlation coefficient = 0.719  Intensity of the relationship = 0.317	The hypothesis is confirmed, by increasing justice interactions among personnel and managers due to this issue that there is justice in face to face mode in organization we will in safety from corruption about distributing salaries and benefits.
13	Hypothesis 12: examine the relationship between procedural justice and administrative health of application of human resources subsystems  Through the Pearson test	The correlation coefficient = 0.897  Intensity of the relationship = -0.106	The hypothesis is confirmed, but by increasing justice in interactions among managers and personnel, a type of traditional and vulgar feeling is created in personnel to organization so that they feel there is no need to new management methods and accurate identification of worthy people for management posts that as the result we will cause to a little corruption about human resources management in organization that we need more familiarity with science of human resources management
14	Hypothesis 14: Effect of variable Group (administrative and teaching personnel) on the main variables of the research.  Through independent t-test	(Sig) significant level organizational justice= .367 (Sig) significant level administrative health of human resources system= 0.380	Viewpoints of two groups of school and the department to variables of the research are approximately equal because all personnel are in fact training and have attracted as teacher and also due to interactions among personnel, for this reason they have close viewpoints.
15	Hypothesis 14: Effect of sex variable on the main variables of the research.  Through independent t-test	The significance level (sig) Justice=0.7 The significance level (sig) administrative health of human resources system = 0.03	Viewpoints of both groups of male and female to variable of organizational justice of the research are approximately equal but viewpoints of two groups of male and female to administrative health of human resources system of the research are not equal.
16	Hypothesis 14: Effect of education variable on the main variables of the research.  Through analysis of variance test (ANOVA)	Significance level (F) Organizational justice =1.279 The significance level (F) administrative health of human resources system = 0.621	Viewpoint of 4 educational groups to variables of the research are approximately equal. Due to high interactions of personnel with each other both in school environment and department environment and exchanging ideas, viewpoints gradually become close to each other and has affected some factors such as education and....
17	Hypothesis 14: Effect of Age variable on the main variables of the research.  Through analysis of variance test (ANOVA)	Significance level (F) Organizational justice = 0.673 Significant level (F) administrative health of human resources system = 1.219	Viewpoint of 4 age groups to variables of the research are approximately equal. Due to high interactions of personnel with each other both in school environment and department environment and exchanging ideas, viewpoints gradually become close to each other and has affected some factors such as age and....
18	Hypothesis 14: Effect of work experience variable on the main variables of the research.  Through analysis of variance test (ANOVA)	Significant level (F) Organizational justice = 2.377 Significant level (F) administrative health of human resources system =1.563	Viewpoints of 4 groups of service years to variables of the research are approximately equal. Due to high interactions of personnel with each other both in school environment and department environment and exchanging ideas, viewpoints gradually become close to each other and has affected some factors such as service years and....

## 6) Discussion, conclusion and suggestions

This research is trying to evaluate effect of aspects of organizational justice on administrative health of human resources system of Education Organization of Zahedan city. In this regard as it is observed justice and justice-centered in this organization can have administrative health of human resources system. Most of direct relations in testing hypotheses of the research are related to procedural justice and then interactional and eventually distributional; this issue indicates that personnel consider more importance for way of correct executing procedures and processes and correct dividing duties and responsibilities and also interactions full of respect and reverence to personnel. And it is acceptable according to new management theories and hierarchy of Maslow's needs that psychological and spiritual needs are on top of the pyramid. Also the highest intensity of relationship is related to relationship between distributional justice and administrative health of subsystem of improving human resources that shows more effect of distributional justice on making personnel interested in efficient learning. Also due to this issue that most of the personnel have equal resource and are attracted as teacher and also because of high interactions of personnel with each other both in school and work environment and exchanging ideas, viewpoints become more close to each other gradually and has affected most of demographic factors of the research.

And the last point is that according to complexity of human and following that complexity of human resources systems, certainly this completely variable system is not under effect of one factor and is controlled by several inner and outer factors. Therefore due to limited effect of organizational justice on administrative health of human resources system in this research it is expected that some other important factors will exist with factor of organizational justice such as organizational culture, leadership style and evolutionary leadership in organization, organizational trust, type of intelligence, organizational creativity, job satisfaction and etc. that will need more researches. Research suggestions will include following cases: evaluating effective factors on creating organizational justice and strengthening that in organizations, evaluating standards of measuring justice in organizations, comparative comparison of justice-centered status in private and governmental organizations, executing research plans similar to the present research in other organizations, according to importance of issue of human resources and lack of enough researches in this field especially in Iran it is suggested to conduct wider researches and evaluations in this field in governmental organizations of the country which are main custodians of problems of personnel and human resources. More accurate and separate evaluation relation of each one of subsystems of human resources as a research with other variables related to organization according to severe lack of certain human resources researches according to limited effect of organizational justice on creating administrative health of human resources system it is expected some other important factors will exist with factor of organizational justice such as organizational culture, leadership style and evolutionary leadership in organization, organizational trust, types of intelligence, organizational creativity, job satisfaction and etc. so evaluating and studying in order to identify these creating factors of administrative health of human resources will be very useful, executing many researches in line with previous case in order to evaluate each one of identified factors on administrative health of system. Human resources, comparative evaluating effect of different factors on administrative health of human resources system

**Abstract:** In this study using linear model of the effect of independent variables on the dependent variable were examined. Bank profitability as a dependent variable and conditions of stagflation, GDP growth, changes in stock index securities, liquidity growth as independent variables and variables bank size and number of employees are also considered as control ones. The effects of economic fluctuations on the profitability of banks listed in the Tehran stock exchange based on the annual financial statements over the 2010 to 2014 of 12 banks. Overall, the evidence from the research were noted as between stagflation, GDP and changes Stock Exchange index has a significant relationship with profitability. However, there is no significant relationship between growth, liquidity and profitability.

**Keywords:** economic fluctuations, the profitability of banks, internal factors, stagflation

### 1 Introduction

Today the bank as an important element in financial markets play an important role in the economy. With the development of financial markets, banking and financial institutions have taken a wider dimension and no doubt that economic development is not possible without considering the role of banking and money markets. Banks play an important role in the economy for two reasons; Banks as financial intermediaries provide financial resources as well as on deposits indication that the debtors control is an important part of the national currency. Financial performance review and monitor the financial condition of banks for depositors, the owners, potential investors, managers, and regulators deemed important.

Today, any change in the country's banking system could greatly affect its business activity (Kavyani et al., 2012).

Banks are one of the main activators monetary market and community economic as an intermediary, attract additional financial resources in the form of deposits and they will pay for facilities to customers of financial resources and considering that all activities are conducted within the economy. Therefore, any change in the economic situation could also have an impact on them (Kallantari, 2011). According to the above functions, the banking system, it is obvious that the banking industry plays an important role in the economic growth of communities. The bank is a business and goal of any business is profit, therefore, the banks with the activities mentioned above are always thinking about more profitable and financial resources would lead towards lucrative targets. So given the profitability of the main objectives of the bank, therefore, changes in macroeconomic variables banking businesses directly and indirectly will affect. Therefore, this paper examines the effects of economic fluctuations on our profitability analysis bank.

### 2 History Research

Ricardas Mileris (2015) in their study examined the impact of the recession on the profitability of banks' loan portfolio data. Results of the analysis, higher sensitivity of NPLs to the economic downturn in Europe Union member states with incomplete macro-economic indicators confirmed. Moreover, the

results show that banks in these countries by assessing the credit risk of loan applicants should consider possible changes in the macro economy, because they have a significant impact on the profitability of banks' loan portfolio in future periods. Mohammad Fizan Malik et al., (2014) in a study of interest rates and their impact on the profitability of banks treaty in the Pakistan public and private sectors mentioned.

In this study, to better understand the effect of sample is divided into two categories.

1) Public sector banks, including four national banks

2) Private sector banks including six private sector banks for study (Does not include Islamic banks in the sample). Bank lending rates as a proxy for interest rates is considered, while return on assets (ROA) and return on equity (ROE) as the profit of the bank is taken into account. Regression model was used to study the effects of interest rates on profitability.

The results show that the interest rate impact on both return on assets (ROA) and return on equity (ROE) in private banks compared to public sector banks are responsible. Sallum and Hayek (2012) in his article the effect of macroeconomic variables such as GDP and inflation on the interest income of banks in Lebanon have investigated. The findings suggest that a significant positive relationship between GDP and interest income of the banks. We can say there is a positive relationship between economic growth and bank earnings. On the other hand, inflation has two effects on the Bank's income and expenses.

High inflation reduces the real interest rate is the issue of demand for bank facilities and consequently increase income. On the other hand, inflation increase banking costs (through the impact on operational costs). Tan and Flores (2012) studied the effects of inflation and the profitability of Chinese banks has this study is based on panel data conducted between 2003-2009.

The results of their research indicate that there is a positive relationship between profitability of Chinese banks with cost efficiency, the development of the banking sector, development of capital markets and inflation. Dietrich and Wanzenried (2011) factors affecting the profitability of commercial banks in Switzerland examined the period 1999 to 2006. The results indicate that the relationship between bank profitability and growth in GDP is positive. Renato Giovannini (2010) in a study of the relationship between investment banking services, ownership structure, financial advisers and plans for monitoring of public companies examined. The results of this study indicate that it is still impossible to be noted

Between willingness to Investment Banking and performance, there is a correlation. Seelanatha (2010), the impact of market structure on the efficiency and profitability of banks Sri Lankan examined. The results show that the performance of banks in relation to the Sri Lankan market concentration or market power does not have any of these banks. However, when the impact of the banking market structure and focus on the efficiency of measures, the existence of this relationship is confirmed. Molyneux and Thornton (1992), the determinants of bank performance between 1986 and 1989 in 18 European countries examined. The procedure was repeated Burke banks with the highest concentration of large size. Javanbakhht Miandehi (2015), in their study to identify and prioritize the factors affecting the profitability of banks using fuzzy techniques has been investigated. The data for this study was collected using a questionnaire phase and using all measures have been proposed AHP technique is classified. The results show that the main criteria for bank profitability by revenue, resource management, credit management, promote exchange activities, development of

electronic banking, customer relationship management, human capital development and sale of non-banking services. Naderi Bani and Enayati (2015) in their research examine the impact of macroeconomic variables on the profitability of banks in Iran during their five-year financial 2009-2013.

Econometric panel data is the method used in this research. The results show that the effects of macroeconomic variables of inflation, housing price index and the rate of exchange intensity dependent variable are negative and significant profit margins. Majidi Khamene and Ansari (2014) in their research examined the relationship between macroeconomic variables and the profitability of banks (Maskan Bank), in the period 2002-2011. The results showed that there is no direct relationship between liquidity and profitability of banks positively correlated with GDP, there was no significant relationship between inflation and the profitability of banks. Delkhahi (2014), in his study on the effects of economic conditions (boom, stagnation and stagflation) on the activity and profitability of the Bank Pasargad, using the linear model showed the impact of inflation and liquidity over profitability for the delay and reverse Pasargad Bank and effectiveness of GDP on bank profitability variable is declared for the delay and place. Pirayesh and Bahrami (2014), in his research studying the factors affecting the profitability of commercial banks listed on the Tehran Stock Exchange, during the period 2005 to 2012 concluded that the independent variables capital adequacy, asset quality, there is a significant relationship between the dependent variable profitability and cash management banks. Results from regression coefficient indicates the first step is the most important variable in determining the profitability of commercial banks, asset quality variable with 43 percent, the variance of the dependent variable; the next step is capital adequacy rate of 30% after 0.22 of variances in profitability and liquidity management of commercial banks explained. Walli John (2013), to evaluate the effect of macroeconomic variables on the profitability of the banking and public and private banks paid during the period 2005 to 2010. The results show that the bank special factors include the bank's capital, liquidity risk, combining private banking activities and bank ownership have had positive and significant effects on profitability, while the size of banks had a significantly negative impact on profitability.

As well as macroeconomic variables such as GDP, inflation rate have a significant positive relationship with profitability. Turki and Karimzadeh (2013) examined the effect of electronic banking on the profitability of Iran's Bank Mellat. The results showed that the bank's market concentration is greater positive effect on the profitability of the bank, this increase may be due to the emergence of a monopoly position in the market for concentrating said. Despite the problems and limitations, as well as the development of electronic banking, Bank Mellat has brought increased profitability. Noori et al., (2011) examined the effects of concentration in the banking industry and other factors have on the profitability of public banks, the results showed that there was significant inverse relationship between concentration and profitability of banks. The other factors efficiency, capital, national income levels and interest rates and banks' profitability has a direct relationship with the state while the size of the bank has an inverse relationship with profitability.

### 3 Methodology and Hypothesis

The population of this study includes all banks are listed the financial performance between 2010 to 2014 registered. The aim of the study is to identify and predict a phenomenon, in a statistical population. To obtain an understanding of the phenomenon, an example of that society, and the analysis is performed on selected samples and then extrapolated the results to the entire population. Due to the limited number of banks listed in the Tehran Stock Exchange and as pointed out in its population the research sample consisted of those banks that are listed in the Tehran Stock Exchange has the following measures:

1. Information is available for the periods 2010 to 2014.
2. The financial period of the banks, are identical. (At the end of March)
3. Selected Banks are not in the classification of the OTC market transactions.

Thus, among the banks listed in the Tehran Stock Exchange a total of 12 banks selected as statistical sample

According to 5-year period sample size is 60. According to the theoretical foundations of the research hypotheses are stated as follows:

First hypothesis: There is a significant relationship between the conditions of stagflation and profitability of banks.

The second hypothesis: There is a significant relationship between GDP growth and profitability of banks.

The third hypothesis: there is a significant relationship between Stock Exchange index changes and profitability of banks.

Fourth hypothesis: There is a significant relationship between growth, liquidity and profitability of banks.

Hypothesis test

The model presented in this study is as follows:

Model (1)

$$ROA_{i,t} = \beta_0 + \beta_1 STAGFL_{i,t} + \beta_2 GDPGR_{i,t} + \beta_3 TEDPCH_{i,t} + \beta_4 LIQUGR_{i,t} + \beta_5 BASIZE_{i,t} + \beta_6 PERNUM_{i,t} + \varepsilon_{i,t} \quad (1)$$

In this study combined data is used to test the hypotheses. In the combined data to choose between fixed-effects panel data test Chow test (test F) and to choose between tests of fixed effects and random effects test Hausman test was used. Top model variables are as follows:

Bank profitability (ROA): In this study, the rate of return on assets used for bank profitability, which is achieved by dividing net income, by total assets.

Terms of stagflation (STAGFL): In this study the conditions of stagflation is a dummy variable therefore, if the rate of inflation in the middle of this year the inflation rate over the course of further research. In addition, the rate of GDP growth rate of GDP this year is less over the study period and the value of this variable is assigned a value of zero.

GDP growth (GDPGR): GDP growth is calculated as follows.

Model (2)

$$NOE = \frac{GDP_t - GDP_{t-1}}{GDP_{t-1}} \quad (2)$$

Changes Stock Exchange index (TEDPCH): to compute the index of the Stock Exchange of cash return index of Tehran Stock Exchange (TEDPIX) is used, which is calculated as follows.

Model (3)

$$TEDPCH = \frac{TEDPCX_t - TEDPCX_{t-1}}{TEDPCX_{t-1}} \quad (3)$$

Liquidity growth (LIQUGR): through the growth of liquidity announced by the Central Bank can be obtained.

Bank size (BASIZE): Bank size is achieved through natural logarithm of the total assets of banks.

Model (5)

Model (4)

PREMIUM=LN number of employees (6)

BASIZE=LN Total bank assets (5)

#### 4 Findings

Number of employees (PREMIUM): the number of employees is achieved through natural logarithm of the number of employees.

In Table (1) Results Descriptive, statistics are presented.

Table 1: Descriptive statistics

Variable name	Symbol	Number of Views	Average	Middle	Maximum	Minimum	Standard deviation
Bank profitability	ROA	60	0.0182	0.0131	0.0844	-0.0013	0.0153
Terms of stagflation	STAGFL	60	0.2000	0.0000	1.0000	0.0000	0.4034
GDP growth	GDPGR	60	0.6800	1.3000	6.5000	-6.8000	4.7293
Stock exchange index changes	TEDPCH	60	61.787	57.362	107.71	11.208	33.407
Liquidity growth	LIQUGR	60	25.620	25.100	30.000	20.100	3.6166
Database size	BASIZE	60	18.814	18.978	21.039	15.045	1.2758
The natural logarithm of the number of employees	PERNUM	60	8.5063	8.0659	10.418	7.2556	0.9961

Table 1 shows the descriptive statistics, which some concepts of descriptive statistics of variables, including mean, median, minimum observations, maximum, standard deviation has been observed.

obtained can be said that the profitability of the banks surveyed the relatively high volatility. Average liquidity growth is 25.62% with a standard deviation (3.62%) is of relatively low volatility.

The results show that the banks examined, the average profitability is around 1.82% and the standard deviation (1.53%)

Table 2 also shows the correlation coefficient is variables.

Table 2: Correlation test result

Variable	ROA	STAGFL	GDPGR	TEDPCH	LIQUGR	BASIZE	PERNUM
ROA	1.000						
Possibility	---						
STAGFL	-0.1995	1.000					
Possibility	0.0000	---					
GDPGR	0.0907	-0.2751	1.000				
Possibility	0.0408	0.0334	---				
TEDPCH	-0.0898	0.1931	-0.0679	1.000			
Possibility	0.0428	0.0000	0.6064	---			
LIQUGR	0.053	0.0553	-0.1796	0.1129	1.000		
Possibility	0.2508	0.2126	0.0000	0.0000	---		
BASIZE	0.1077	0.2345	-0.2014	0.0775	0.2016	1.000	
Possibility	0.0150	0.0713	0.1227	0.5563	0.1225	---	
PERNUM	-0.3845	0.0235	-0.0162	0.0223	0.0234	0.1175	1.000
Possibility	0.0024	0.8584	0.9024	0.8657	0.8592	0.0079	---

Results table 2 shows the 95% confidence level, the situation of stagflation, changes Stock Exchange and the natural logarithm of the number of employees and a significant inverse correlation with the profitability of banks while GDP growth and the size of banks with bank profitability are correlated.

It is necessary to estimate models estimation method (combination or panel) are specified.

F-Limmer test has been used for this purpose. The observation that is likely to test more than 5% or in other words the test statistic is less than the statistic table, the procedure used and to

test the observation that the probability is less than 5%, Panel method used to estimate the model. His painting technique using two models of "random effects" and "fixed effects" can be done. Hausman test used to determine which model is used. The

observations that test the probability is less than 5% of the fixed effects model and the observation that is likely to test more than 5% of the random effects model was used to estimate the model.

Table 3: F-Limmer test results Panel method

Research Model	Type of statistic	statistic Value	Degrees of freedom	Possibility	Result
	F statistic	3.7076	(11.42)	0.0010	Panel method
	(Chi-square)	40.7137	11	0.0000	

Table 4: The results of Hausman

Research Model	Type of statistic	statistic Value	Degrees of freedom	Possibility	Result
	(Chi-square)	107.0083	6	0.0000	Fixed effects model

As the Tables (3) and (4) show, the probability of F-Limmer research model is less than 5% the panel method is used to estimate the model; and given that the probability is less than 5

percent Hausman test research model therefore, the fixed effects model was used to estimate it. Table 5 shows the test results are hypothesis.

Table 5: Results of the research model

Variable	Symbol	Estimated coefficient	Standard error	T-statistic	Possibility
Constant (intercept)	C	0.252892	0.081214	3.120115	0.0033
Terms of stagflation	STAGFL	-0.009586	0.003600	-2.662753	0.0080
GDP growth	GDPGR	0.033101	0.008970	3.690344	0.0003
Stock exchange index changes	TEDPCH	-0.014001	0.006972	-2.008074	0.0452
Liquidity growth	LIQUGR	0.002338	0.001272	1.839041	0.0730
Bank size	BASIZE	0.030600	0.010734	2.850601	0.0046
The natural logarithm of the number of employees	PERNUM	-0.019735	0.008867	-2.225656	0.0315
The coefficient of determination			0.602		
The coefficient of determination adjusted			0.562		
Durbin - Watson			1.821		
F statistic			22.6629		
Probability (statistics F)			0.0000		

First hypothesis: There is a significant relationship between the conditions of stagflation and profitability of banks. To test this hypothesis, the results of the model are presented in Table (5) have been used.

The probability (P) F equal to 0.0000, and because the amount is less than 0.05, the null hypothesis is rejected at the 95% confidence level, the model is significant. Watson Durbin statistic is 1.821. This value indicates the absence of autocorrelation of errors. The results show that the coefficient of determination adjusted, approximately 56.2% by independent variables and the dependent variable controlled models, explained. The results show that except for variable liquidity growth, the remaining variables in the model are significant at the 95% confidence level. The results of the control variables show that positive correlation between the size of the bank and bank profitability significantly. There is a negative and significant relationship between the natural logarithm of the number of employees and the profitability of banks. In general, the results show that the coefficient of the variable conditions of stagflation, that -0.009586 which reflects the negative impact of inflation on the Bank's profitability is recession due to the variable conditions of stagflation coefficient t-statistic is significant at 95% confidence level. In other words, we can say the conditions of stagflation and there is significant negative correlation bank profitability.

According to the above can be verified at 95% considered the first hypothesis this reflects there is a significant negative correlation between the conditions of stagflation and profitability of banks.

The second hypothesis: there is a significant relationship between GDP growth and profitability of banks.

To test these hypotheses, the results of the model are presented in Table (5) interest is taken. In general, the results show that variable rate of GDP growth, was 0.033101 that the positive effects of GDP growth on the profitability of banks, which varies according to GDP growth coefficient t-statistic is significant at 95% confidence level, in other words we can say that a positive relationship between GDP growth and profitability of banks significantly.

According to the above 95% in the second sub-hypothesis can be considered. This reflects the positive significant relationship between GDP growth and profitability of banks.

The third hypothesis: there is a significant relationship between changes of index Stock Exchange and profitability of banks.

To test these hypotheses, the results of the model are presented in Table (5) have been used. In general, the results show that the variable coefficient Stock Exchange index changes, -0.014001 represent negative impact of bank profitability on the stock

exchange index. According to the statistic t with variable coefficient Stock Exchange index change is significant at 95% confidence level, in other words we can say that the Stock Exchange index changes and there is a significant negative correlation bank profitability. According to the above 95% in the third sub-hypothesis can be considered confirmed. This reflects there is a negative and significant relationship between changes in stock index securities and bank profitability.

Fourth hypothesis: There is a significant relationship between growth, liquidity and profitability of banks.

To test these hypotheses, the results of the model are presented in Table (5) have been used. In general, the results show that the rate of growth of liquidity variable, was 0.002338

That the positive effects of liquidity growth on bank profitability however, due to the variable coefficient t-statistic liquidity growth at 95% is not significant in the model, in other words, we can say that the growth of liquidity and there is no significant relationship between bank profitability. According to the above fourth sub-hypothesis cannot be confirmed at 95%. This indicates that there is no significant relationship between growth, liquidity and profitability of banks.

Due to the limited number of banks listed in the Tehran Stock Exchange and, as pointed out in its population. The research sample consisted of those banks that are listed in the Tehran Stock Exchange has the following measures:

- 1 .Information is available for the periods 2010 to 2014.
- 2 .The financial period of the banks, are identical (At the end of March)
- 3 .Selected Banks are not in the classification of the OTC market transactions.

## 5 Conclusion

The extent of research and application of its results, more economic and more comprehensive studies are needed in this area is necessary. Given that the index of goods and services, inflation and purchasing power of the domestic currency of the country measure due to the high volatility in prices and the rise in inflation in recent years, economic experts should act in managing inflation.

Due to the high rate of bank profitability in the country and comparison with global statistics, interest rates and its management as a factor in lowering inflation is suggested.

That, where the study was conducted in Iran, can be used in future studies to investigate the factors affecting the Bank's profitability in various countries or using time series model to study factors affecting the profitability of a particular bank. It can also be paid to the effects of resource allocation on the profitability of banks because the allocation of financial resources, a contributing factor to the development of a society.

Email: <sup>a</sup>Behnaz.Shahnavazi, <sup>b</sup>Habib.Jadidoleslami@gmail.com

**Abstract.** This paper aims to detect, analyze, and compare various aspects of moon based on ancient astronomy in Naser Khosro, Anvari and Nezami's poems. To achieve this purpose, first the word astronomy science, astrology, and its manifestation in Persian poetry has been studied in brief. Then moon, locations of the moon, and its different manifestation in the poems of these three poets have been shown, analyzed and compared. The results of this study shows that moon had been shown in the poems of all these three poets in different forms such as showing moon in its twelve towers, cancer, Taurus, and folk beliefs about moon, eclipses.

**Keywords:** Naser khosro, Anvari, Nezami, moon and poetry

### 1 Introduction

Attention to sky and celestial phenomena caused men's surprise and encouraged them to unravel the mysteries and secrets of the beauties hidden in them. The first result of human's efforts for obtaining knowledge about star's movements was the fact that men believed in the possibility of life on the moon, this fact caused the creation of many religious and mythical beliefs, so that many of those beliefs has a special place in customs and religious beliefs of today's human despite the passage of thousands of years. The vast expanse of sky, incredible beauty of stars, the glow of moon, sunset and sunrise gradually increased the sense of interest and curiosity in mankind so that its manifestation can be seen in many artistic and literary works of the world, so that many of the poets and writers all over the world reflects the beauties of sky and astronomy in their works. Astronomy is one of the most ancient human sciences. In the past, people considered the situation of stars effective in the condition of their lives and also their fate. "Ancient people predicted climate change, wind, earthquakes, lunar eclipse, eclipse, rain and...by their observations and their personal experiences through centuries, doing this they have formed a set of rules which were transferred generation to generation to reach us today. In any case, these ideas are common knowledge and folklore culture; therefore they have a very important situation in anthropology because their roots are in wisdom, talent, and the accuracy of the folklore. (Shakurizade, 1993; 170). In the past, people lived in a context of folk and unscientific beliefs. Ignorance about the nature and cause of objects and phenomenon led to astronomical thoughts or beliefs. By astrological beliefs, we mean those opinions and beliefs that ancient people have had about stars, celestial bodies, and their effects on their lives and on the elements of nature: such as the belief that sunlight cause the creation of gems like garnet and amethyst.

Many works of poets and writers which are written to reflect all aspects of human life, show astronomy and all its beauties well. So that by looking them, we are able to solve many secrets of human issues especially ancient people. With the help of literature and literary works, we can come over time and place; we can see ancient people and live with them. In Persian literary works, astronomy is reflected so much. We can name the anonymous nature, and incredibility of sky, and also ancient's belief regarding the effect of sky and stars on human fate as the reasons of poet's attention to them. Persian literature as a mirror for Iran's art and culture, have had reflected many issues regarding sky in itself from the very beginning days of its creation. So it is necessary to study this issue in different Persian literary works. And the way of their reflection, their similarities and differences in the works of different poets should be compared.

Looking at the past Persian literature, it is obvious that all poets and writers have used heavenly and celestial phenomena in their works variously. Astronomy had a very important value and it was very common among wealthy families to appoint time for their works and also to show lucky or malevolent days, so that astronomy was regarded as one of the very essential information part of each spiritual and religious figure. On the other hand, there was a folk knowledge among people against each modern knowledge, in old days, sometimes the illusionary and superstitious aspect of some sciences were supposed more important than their rational and scientific aspects and some sciences were entirely based on superstition (Mahjoob,2003:137)

Astronomy had a very important value in pre-Islamic Iran, what is left in ancient books, clay tablets, and ceramics and especially in Ilami tablets about the name of months, 300-400 words, symbols and characteristics of stars shows that astronomy knowledge goes back to long before Babylon (Ghazani, 1990:546-547).

After the arrival of Islam, not only this interest was not finished, but also its various aspects grew with time passage, and it caused the creation of different terms associated with cosmic events. "this terms penetrated into poets works gradually, and created an important connection between poetical illusions and cultural ideas, some of which is gathered in *Astronomical Terms Culture Book* " (Ghafelebashi and Hashemi, 2010:121).

Religious astronomy was one shape of prediction which was based on the principle that stars and planets affect terrestrial objects and individuals' fates. Today this kind of astronomy is not regarded as a science. But in past it was a kind of science to know the characteristics, situation of people and showed effects of stars and planets on them, it found a place among people over time, and some beliefs were shaped about some parts of this science. Ancient people could not find justifiable answers to their questions and what happened to them, so they tried to justify some of those events by relating them to sky and astronomy. Anyway, religious astronomy itself became a base for astronomy knowledge and religious astronomy was terminated over time by great scholars such as Abureyhan Al-Biruni who did not believed in this superstitions.

Astronomy and issues related to it had a very important effect on Iran's culture; its biggest manifestation can be seen in its presence in the works of great poets and writers such as Naser Khosro, Hafiz, Anvari, Sa'di, Senaiee, Nezami and others. Poets sometimes mentioned astronomical terms in their speech as metaphor or as simile. And also they sometimes used these terms to exclude some superstitious thoughts among people. Fifth and sixth centuries were one of the most productive periods in Persian literature. Khorasan, Aran, Azarbayegan and Isfahan were regarded as the most important centers of literature and poetry in this period. In this period, Islamic culture has penetrated in all aspects of people life. Poets had always focused on the arrangement of words relying on their knowledge in scientific and literary areas and they had tried to achieve fresh and innovative themes.

Astronomy was one of the common sciences of fifth and sixth centuries.

The appearance of scholars such as al-Biruni, Omar-Khayam in west and Ibn-saed and Abu-Ishagh Zarghani in east of Islamic countries is a proof to this claim. The creation of Talili-Zeyj, Malekshahi Zeyj, and Jalali calendar are among the important activities of this period (Mahyar, 1990; 571). Learning astronomy was one of the essential things for scientists.

In this paper, we are comparing the manifestation of moon relying on ancient astronomy in Anvari, Nezami and Naser Khosro's poetry. The review of astronomy in the poems of these three poets can show their view to astronomy in Khorasani and Araghi style; it is done to show the maximum frequency of the appearance of moon will happen in which poets' works. This paper is going to answer this

question: According to ancient astronomy, how and for what purposes moon was reflected in poems of Naser Khosro, Anvari and Nezami?

### 1.1 Astronomy

Astronomy is the plural of "Najm" word meaning stars. Literally astronomy means the appearance and rising of stars and growing up of the plants. In terms of ancient knowledge, astronomy was regarded as one sector of mathematics and also a branch of arithmetic science between Muslims in which degrees, minutes, and seconds were discussed by multiplication, division, subtraction, and roots. Its subject matter was about understanding the situation of celestial bodies in relation to each other and also in relation to territorial creatures, their number, size and their movements. In fact, astronomy is a science in which the celestial bodies appearances, the rules of their true and apparent movements, sizes, distances and their natural properties is discussed.

### 1.2 Ecliptic

Ecliptic is the path of the annual apparent movement of sun in relation to earth in the celestial sphere. It is an imaginary circle in sky that apparently (in the eyes of the earth's inhabitants) believe sun to move around this circle in a year. This circle actually detects the circle in which earth goes around the sun which is literally named "Savabet planetarium". It seems that sun in its apparent annual movement goes through twelve constellations of stars and celestial sphere known as ecliptic.

These twelve constellations of star include: transportation (lamb), Taurus (bull), Gemini (twins), Cancer (crab), Leo (lion), Virgo (cluster), Scorpius (the scorpion), Aquarius (cathment), Pisces (fish).

### 1.3 Fifth and sixth centuries' poem

Persian's fourth and fifth centuries' poetry is named Khorasani style. Because the first poems related to pro-Islam belongs to an area in Transoxiana and Khorasan. Of course Persian poetry at that time had a very much broader geographical range compared with the present Khorasan of today. It used to spread from north to Oxus River, from south to Sistan and from east to China.

The simplicity of language, the ability of poets, their power in combining words, and creation of innovative themes, use of few number of Arabic word, the huge number of poems, the freshness of poetry thoughts and themes, metrical transformation, prosperous lives of most poets, signing of praise poems, describing nature and...are among the characteristics of Khorasani style poetry.

Sixth century poetry: the poetry of sixth century to the end of ninth century is known as Araghi style. This style includes Mughul, Ilkhanan, and Timurid periods. The reason for its naming is the fact that after the brutal attack of Mughul, the cultural centers moved from Khorasan to Iraq. Perhaps the most important style in all periods of Persian poetry is Iraqi style. Because the greatest Iranian poets belong to this period, and the most valued literary works of Iran belong to 7 to 9 centuries.

The entrance of numerous words and combinations from local dialects into Farsi, deeper and more extensive influence of Islamic culture, increase in Arabic words and combinations, the influence of Sufi thoughts and terms in poetry, pessimism of the poets to the situation of that time due to the ravages of this period, the spread of the poetry out of courts and its spread between wider groups of people, the expression of political and social situation, criticism of the mess, the expression of personal feelings and...are among the characteristics of this period's poetry.

## 2 Literature review

Comparative literature which is sometimes called "universal literature" is an essentially French science. In plain language it consists of the comparative review of works which have roots in different cultural areas. In fact, comparative literature is a branch of literary criticism which discusses the literary relation of nations, different languages, and the relation between nations' literature. It is an important branch of literature which discusses the similarities and differences between literature, language and nationality of different nations.

Comparative literature can compare the literature of two or more different countries, it can also compare the literature of one area with the literature of all other areas of earth, or even it can compare the literature of different periods of one single country among the poets and writers of that country. Therefore, in this article, the poems of Naser Khosro, the poet of Khorasani style, Anvari, the poet of Iraqi-Khorasani style and Nezami, the poet of Iraqi style are compared to show different reflections of moon in their works.

Our hypothesis is based on the principle that moon is manifested in the poems of the three poets; Anvari, Nezami, Naser Khosro, in various forms such as eclipse, moon's locations, brilliance of the moon and etc. We have discussed this hypothesis by analyzing and comparing the lyrics of these three figures.

So far numerous articles and books have been published regarding each of these three poets (Anvari, Nezami, and Naser Khosro). Also some researches have been done directly or indirectly about astronomy in the poems of these poets. But in the books, articles, theses, and other comparative studies which have been done so far, any works have been done focusing on moon in the works of these three poets. Among the works done about these poets, we can mention the below cases:

The book "Astronomy in the Works of Naser Khosro" written by Zahra Hesariani. The writer has discussed Naser Khosro's beliefs, the poet of fifth century (391-481), regarding the effects of stars and astronomy in universe. The article "astronomical beliefs in Nezami's poetry" written by Fatemeh Elahi. This article has discussed folk beliefs in three works of Nezami; "Khosro and Shirin", "Lili and Majnoon", and "Haft Peykar". The Thematic and Structural comparative thesis done on Anvari and Khaghani's poetry" written by Roghaye Hedayati Sani and many more studies which we cannot name in the article.

## 3 Results

### 3.1 Moon

Humans used to benefit moon's regular rotation as calendar, particularly in agriculture. Passengers and sailors also used the presence and moon's light for orientation and navigation. Moon also was presented in myths of many nations. In some cultures, people worshiped moon as a god.

In Persian literature, moon has had a very prominent place. It was always a symbol for beauty and brilliance. Using moon to describe and to show similarity is so common among Persian poets, that you can find few poets who had not used moon for these purposes.

Moon is also named "Maj, Mas, and Mahir" in Farsi. In Iranian's older language, it was seen as "Mang" too. In Persian literature, the words glowing, nocturnal, unwashed face, and merciful are attributes of moon, and the terms lights, flame, silver circle, circle glass, cup, tablets, bergamot, apple, sandals, cotton balls, and claw are among moon's evocations.

Moon is the nearest planet to earth. The beautiful image which humans have in their mind regarding moon has always had a great influence in their imagination and their feelings. "From astronomical aspect, moon is a planet which is dependent to earth, the time circle needed for its rotation is 33/27 days, and therefore

always one side of the moon is toward earth. Moon has had a prominent role in Iran's ancient myths, in Zoroastrianism, it was regarded as animals guard and the twelfth day of each solar month was named moon" (Mashhur, 2009; 75).

In moon's definition, the following words are mentioned in Dehkhoda's dictionary. In many parts of Iran, especially in popular opinion, moon and sun are man and woman who love each other. The spots on moon are the effect of sun's hand which has had put his muddy hand on moon's face as a result of envy. Ancient people believed that if a crazy person look at moon, his craziness will increase.

In the past, people also had some other beliefs about moon. "They believed, at ecliptic times, moon or sun were captivated by Jinns, they started beating drums and shooting guns to release moon or sun." (Mirnia, 1990, 241). They believed moon's light causes the growing of plants and the color of flowers. "the common belief was that moon will cause the color of flowers, so poets called moon Mashate (meaning cosmetologist) or Sabagh, meaning the painter of flowers" (Mosafa, 2002, 696).

### 3.2 Moon's crescent manifestation in Nezami, Anvari and Naser Khosro's poetry

Ancient astronomers regarded moon as the nearest planet to earth. By the appearance of Batlimuce and the publication of "Mojasti", this belief became a real fact and moon was known as the first star of the multiple spheres (seven, eight, and nine) and this opinion was accepted by all astronomers. Accordingly, they had expressed various opinions about moon, they believed moon's home is in Cancer, its appearance is in Taurus, and its demise is in Capricorn. They also believed that travelling is not permissible when moon is in Scorpion and when it is in Gemini, intending to do something was not permissible too.

We should note that sun is shining itself, but it is not the case about moon. We see moon, because of sun's shining at it. We see full moon, if that side of moon which is toward us be exposed to sunlight. If sunlight shines to only some part of the moon, we saw moon as a thin crescent, half-moon or like a round circle depending on the amount of shined light. This optical phenomenon is called different phases of the moon.

When moon is placed completely opposite to sunlight, it fades in intense radiation of sun and we cannot see it. This situation is called New Moon. Anyway, all these astronomical changes lead us to see moon in different shapes; from a thin crescent in first days of the month to a full-moon in the fourteenth night of the month. This beautiful manifestation of moon in the sky has caused many beautiful poems in Persian literature especially in the works of Nezami, Anvari and Naser Khosro. In some of the below cases, poets have likened their beloved one to moon in respect of their beauty.

The image of the laugh of the crescent has been portrayed in the sky (Nezami, 1995: 538). "Lili and Majnoon".

Your face is as beautiful as sun and moon, your lips are as sweet as sugar and honey (Anvari, Sonnet, 11) - the book of poem.

Your beauty is like the fourteenth- night moon, your beauty is like Azeri idol (Anvari, sonnet No.11) the book of poems.

Anvari and Nezami have superiority over Naser Khosro in describing moon and also in the creation of beautiful images and metaphors by using moon. Their similes are very beautiful and in some cases the similes are their own innovations. One of the beautiful descriptions of moon in Persian literature relates to the appearance of the crescent of moon for Eid al-Fitr declaration. The appearance of Shawwal crescent was necessary to declare Eid. Poets have used this event and have created beautiful images in this respect. Such as the poem by Anvari:

He said" say God and worship God

I said " oh the crescent of Ramadan" (Anvari, Ode No.134)-the book of poems.

### 3.3 Moon's location

Since third century AD, many astronomers relied on a set of stars which were near to moon and the planetary alignment to determine moon's location in sky. They wanted to determine instances of moon's orbit in sky. They believed "at any time in day or night, there are fourteen locations above the horizon and also fourteen locations below it, and when one of the locations rise in west, the fifteen locations falls in east. And it is clear that from the rise of one location to fall of the other location, it will last 13 days" (Alfonso Nalyno: 1970, 143).

Past astronomers categorized these 28 locations in four groups of spring, summer, autumn, and winter. They have chosen these names for the locations: Aldebaran, Soraya, Jibhe, Spica, Boothes, Rosemary, Saad Zabh, Saad al Seud. Nezami has named most of moons location in his poem:

Quake has happened in the sphere, from the shape of towers and moon's location in sky. The image of the crescent of the moon is portrayed in the heaven. The Cow constellation is like sea's cow, it is like a gem in Soraya. June has seen on a bed made of two bodies. Crab is like forest's cubits whose nail is removed. Jibhe has made sky as shining as one hundred lights by its beauty. The hearth of Lion constellation is shining as a result of the presence Lion, like the fire of flares which are shining. Like generous people, it has spread its light in the sky. Like a generous person who put bread in the bowl of orphans. Mizan has spread its light like a wise man that spread his knowledge by his tongue. Bootes is like a hunter who is riding two hunting dogs. Scorpion has superiority over the bows. Baldeh has had all the blessings under its presence. Joday has cut his head like a goat, because it has heard the myth of the goat. Zabeh has closed its mouth, because of its fear and has taken the leash of Sa'ad. (Nezami, 1934:174-176). -"Lili and Majnoon"

Anvari has also mentioned some of these locations:

My voice in praising you will arrive to Nasre, in your praise, I will sing poem after poem. (Anvari, Ode No.181)- The book of poems

It has turned from a fly to an eagle, it has gone up to spica from a very low position (Anvari, sonnets, 466) - the book of poems

Poets have paid more attention to some moon's locations in comparison with other locations; therefore we will mention a few of them below.

### 3.4 Bootes

Bootes is the fifth location of northern constellation which is also called "Sayah", "Beghar", "Gavcheran", "Hares al-Sema", and "Hares al-Shemal". Booths represents a hunter, holding the leash of two dogs in one of his hands while riding a lion.

Bootes is like a hunter riding a lion while having the leash of two hunting dogs in its hands (Nezami, 1934: 174-176) Lili and Majnoon

Booths constellation is not mentioned in Anvari and Naser Khosro's poetry, but it is mentioned in Nezami's poems several times.

Debor means entering from the back. This star is named Aldebaran, because it comes out from the back of Soraya. It is also named "Tabe al-Najm", "Tali al-Najm", and "Hadi al-Najm". Because of the fact that it is placed in the center of Taurus constellation, it is also called "Eyn al-Taurus", meaning the eyes of Taurus constellation.

Aldebaran has the fourth location among Moon's locations. Astronomers believe that it is malevolent. In the past, astronomers regarded the rain which came in this location, to be malevolent and assumed it to be an introduction for drought.

The intention of Aldebaran is not toward nullity, if you are a friend, know the reality of Aldebaran (Naser Khosro, 1976:544) - the book of poems

Aldebaran constellation is used just in Anvari and Naser Khosro's poetry, Nezami has not used it in his poems at all.

The tenth location of moon is called Jibhe which has had much manifestation in Persian Poetry. Jibhe constellation is manifested in Nezami's poetry, Anvari and Naser Khosro had not mentioned it in their poems.

Jibhe has lightened the sky by its beauty as if there is one hundred lights in the sky (Nezami, 1934: 174-176).

Astronomers have named the red shining star which they have observed out of Bootes constellation as "Rameh Spica". Of course "Azal Spica is placed in the fourteen location of moon and it is not regarded as one of Scorpion's constellation stars.

Brightness and high position of these two Spicas are among the most important motivations which have caused poets to mention them in their poems so much.

All three poets have mentioned these two Spicas in their poetry but Anvari has used it more than the others.

Astronomers have named the three stars which are placed in front of Scorpion constellation as Eklil; they are placed in a line. This constellation is the seventeenth location of the moon. In Persian poetry, when we say the seventeenth location, we mean "Eklil", we should not interfere it with "Northern Eklil" or "Southern Eklil".

Eklil is the heart of the crown, it has superiority over scorpion (Nezami, 1934: 175\_ - "Lili and Majnoon

Last night the sun of sky, Eklil was seen. I hope both of them to be lucky (Anvari, Ode No. 122).

"Eklil Constellation" is manifested in Anvari and Nezami's poetry. Naser Khosro had not used it in his poems.

"Baldeh is the twenty-first location of moon. This location is the place between "Na'ayem" and "Sa'ad Zabe" in which there vacuum space. It is among those locations of moon that poets have paid great attention to it and have mentioned it more than other locations of moon. But in the poetry of the three desired poets, we can see its manifestation just in Nezami's poems.

The placement of moon in the shadow of earth is named lunar eclipse. The darkness of half of the moon or even its whole darkness has lead poets to create beautiful images by their innovative minds. Therefore there are many beautiful verses in this regard in our poetry.

Lunar eclipse is another phenomenon which is just reflected in Anvari's poetry. Naser Khosro and Nezami had not mentioned it in their poems.

Sun and moon will get together at the end of each lunar month in one single tower, one single minute and one single degree, this phenomenon is called community. In this situation moon will be placed under the radiations of sun, and it causes it to be invisible. The time period in which moon is located under sun's radiation is called community. And Arabs have named it "Serar"(meaning hidden), because it is hidden beneath the sun's radiation. Also it is named "Mehagh". Some astronomers regard this phenomenon to be malevolent.

The brilliance of your face has superiority over Mehagh, your beauty will remove the intoxication of the drunken (Anvari, Ode No.78) the book of poem

The ancient people believed that moonlight will cause cotton to be spoiled. This issue is reflected in Anvari and Nezami's poetry, but Naser Khosro had not mentioned it in his poems.

Moonlight will spoil cotton, but her beautiful moon-like face has not any defect (Nezami) Khosro and Shirin)

How much is remained to your appearance, my heart is like a cotton which is placed under moonlight (it is spoiling) (Anvari, Ode No.9). The book of poems

In the past, people believed that looking at moon will cause the disturbed people to get more disturbed. This issue has a very beautiful reflection in Persian Poetry. This phenomenon is not mentioned in the poetry of Anvari and Naser Khosro, but Nezami has reflected it in his poems.

He cannot turn toward me, because the crazy people are not permitted to look at the moon. (Nezami, ode No.13).

\*the verse mentions the belief that disturbed people cannot look at the moon, doing so, they will get more disturbed (Nezami, 1934: 105) – "Lili and Majnoon"

Like a crazy person who has seen the moon, sometimes he stands up and sometimes sits down.

\*again it has mentioned the idea that crazy people are not permitted to look at the moon.

It's better not to make me happy by seeing you, because the crazy one cannot look at the New Moon (Nezami, 1934: 77).

Ancient people believed that moonlight is a guide for passengers and for those who have lost their ways. Muslims also had a strong believe in this regard, there is also one verse of the "Holy Koran" which mentions this phenomenon "God is the one who has placed stars for you to find your ways in the darkness of land and see, we surely guided those who know" "Verse 97 of Sura Anam). Anvari has a poem which reflects this issue beautifully.

Moon came out as a guide and Venus came out as a beloved, it will guide you in all the way (Anvari, Ode No.189) - the book of poem

Astronomers have divided the twelve towers of "Zodiac" into two parts; they have specified six towers to moon and the other six to sun. They have specified the towers beginning from the start of Leo Capricorn to the end of Goat to sun, and from the beginning of Aquarius to the end of Cancer to moon. Accordingly, they have regarded Leo Capricorn as sun's location; they also have assumed Cancer Capricorn as moon's location. They have allocated the five remaining towers of moon and sun to other planets based on astronomical data. Nezami has reflected this idea that moon's location is in Cancer Capricorn in one of his poems.

Moon entered into its towers, as if it is coming to its castle (Nezami, 1964:383) - "Khosro and Shirin

Ancient astronomers regarded some towers as the position of dignity for some planets. They assumed these places based on astronomical information and accurate grading. Accordingly the dignity of moon is considered in Taurus tower, Nezami has mentioned this issue in one of his poems.

Whenever Venus is placed in Taurus, and Jupiter in Sagittarius, they are placed in their heavenly location, (it's time of their dignity) (Nezami, 1964: 99).

\*it has mentioned the dignity of moon in Taurus.

In past, people assumed the entrance of moon into Scorpion to be malevolent. They especially believed that travelling is not permissible in this situation. This belief is reflected in Persian Poetry. In the poems of Anvari, Nezami and Naser Khosro, there is not any direct mention to this issue, but Anvari has reflected the malevolently of Scorpion in their poems.

Your revenge is as malevolent as Scorpion's

Your kindness is as good as the luckiness of Scales (Anvari, Ode, No145) - the book of his poems

\*it has mentioned the ominous nature of Scorpion

Nayerin or sun and moon together

The brilliance and indefinable beauty of moon and sun has long been in the focus of people especially astronomers and poets have created beautiful images and meanings regarding these two. This issue has been reflected beautifully in the poetry of all three poets; Anvari, Nezami, and Naser Khosro. But it is seen in the poetry of Anvari more than the two others. Anvari has written a whole ode in this regard, he has brought moon and sun together in all its verses to praise it.

Sadness and happiness of the beloved, fear and hope of the beloved

Moon and sun, the creator of night and day (Nezami, 1996:125).

\*this verse has mentioned to moon and nights together (Nayerin) as the creator of nights and days.

Her face is more beautiful than the sun

She has given of her beauty to moon and sun (Nezami, 1995:151)

\*here again the verse has mentioned moon and sun together (Nayerin) and says his beloved is more beautiful than moon and sun.

As moon has the sun shining on his face, it will turn to a luminous crescent (Naser Khosro, Ode No.136) – the book of his poems

\*here again moon and sun have come together (Nayerin).

Since you have been born, no one has seen any other mother giving birth to moon and sun together (Anvari, Sonnet No. 19)- the book of his poems.

\*in this verse, the poet has mentioned Nayerin again.

Moon and sun with all their beauties, are the servant of your beautiful face. (Anvari, Sonnet No.171). The book of his poems

\*here again, the poet has mentioned moon and sun together

#### 4 Conclusion

Naser Khosro, Anvari and Nezami, all lived in fifth and sixth century, a period which can be assumed as golden ages of poetry and literature in Iran. Many great Persian poets appeared in this period. In that time, innovation and the creation of beautiful poems have got such a great importance among poets that they tried to get superiority over each other. Accordingly little by little the entrance of scientific information into poems became a sign of superiority among poets. Astronomy was among those sciences that poets tried to enter it into their poetry. One of the most beautiful astronomical images in poetry is the image of moon in the poems of Anvari, Nezami and Naser Khosro. In a comparative study of different reflections of moon in the poems of Nezami, Anvari and Naser Khosro, the following results were obtained.

- Based on ancient astronomy, moon is reflected in the poems of Anvari, Nezami and Naser Khosro variously including the brightness of moon, its crescent, and also various image creations of moon such as moon's location, moon in its twelve towers, eclipse, and the presence of moon and sun together.
- Among the different images of moon, there are some ancient and to some extent superstitious beliefs in the poetry such as the beliefs about the effect of moon on cotton, the belief that says the crazy people got more crazy by looking at moon, and also the belief about its being guide for passengers.
- Referring to moon and sun together (Nayerin) is reflected in the poetry of Anvari more than Nezami or Naser Khosro's, Anvari has a whole poem in this respect.

- The frequency of the use of moon in creation of beautiful images is seen in the poetry of Anvari and Nezami much more than Naser Khosro's.
- In the creation of images by using moon, the only towers which are reflected are Cancer and Taurus.
- The images in Anvari's poetry are much more in praise of the beloved in comparison with Nezami and Naser Khosro.
- The reference to most locations of moon is seen just in Anvari and Nezami's poetry and Naser Khosro has mentioned them less.
- The frequency of the use of moon and its different locations especially Eklil is seen in the poetry of Anvari much more than Nezami and Naser Khosro's.

<sup>b</sup>*masoud.alizadeh.kl@gmail.com*

**Abstract.** The current paper aimed to investigate the dominant approach in Iran's legislative policy on medical crimes taking into account various criminal, judicial and executive aspects. Some of the findings and the results show that firstly, legislative criminal policy approach in dealing with medical crimes are punishment based lacking corrective and preventive attitudes. Secondly, legislative criminal policy of Iran disclaims responsibility of the physician based on consent, the presumption of innocence, legality and respect for the scientific and technical work. Third, the basis for criminal liability of physicians in Iran law is not transparent and criminal attitude of the legislator is allowed to develop the scope of inclusion of medical liability of the physician while there are the conflicts on legal articles.

**Keywords:** criminal legislative policy, medical liability, medical crimes.

### 1 Introduction

Studies show that the criminal policy of Iran lacks systematic and goal-oriented strategy with the ability to prevent crimes, general and specific deterrence and reformation and rehabilitation of offenders not only in dealing with medical crimes but in different aspects of dealing with delinquency. And the manifestations of different conflicts and problems in criminal legislative, judicial and executive policies in turn faced criminal policy of Iran with ambiguity and inefficiency, and not only there is no corrective or preventive or precautionary statements sensible and reliable indicative of having new knowledgeable approaches to criminology but weakness in controlling crime has established a reasonable suspicion that Iran cannot follow a scientific and systematic criminal policy on dealing with medical crimes or other crimes (NajafiTavana and Milaki, 2011). The current study attempts to study the various aspects of criminal policy of criminal offenses in the intervention areas of medicine, and its efforts aimed at analyzing the concept and principles of criminal liability of physicians in Iran criminal policy and in this context provide answers to the research questions.

### 2 Criminal policy and its variants

Today, the criminal policy is an independent field of study contrary to the scholars of the past that took it as a branch of criminology or applicable criminal law. A proper criminal policy, contrary to criminal law, not merely relies on penal policy; instead, the resolving of social problems; removing the causes of delinquency; elimination of legal discrimination and injustice; and cure and rehabilitation of criminals are of its characteristics. Favorable criminal policy is a general concept that uses many sciences in order to achieve goals and on the other hand is associated with many organizations through which implements their measures; Therefore, criminal policy is classified from different angles, one is division into three legislative, judicial and participation parts (Katoziyan, 1995).

#### 2.1 Criminal legislative policy

It involves a series of measures to combat delinquency manifested in law with assured enforcement of legal sanction.

#### 2.2 Criminal justice policy

In its narrow sense means the criminal policy which is reflected in the decisions and performance of the courts of justice. After legislator implemented criminal policies in the form of laws and regulations, these laws and regulatory messages are perceived, interpreted and accepted differently.

### 2.3 Criminal policy of partnership

It means to determine the effective participation of civil society actors in the criminal policy. In other words, it means taking into account the effects of creation of strengthening tools and levers other than the police or the judiciary in order to give more credit to criminal policy, which is prepared and enacted by the executive and legislative branches.

The word responsibility means guaranteed, liability, obligation, reprimanded, being obliged to do something, committed to come and man of duties and any actions man undertakes and is responsible for (Jafarilnagrodi, 2013). In jurisprudence the responsibility and liability are used interchangeably and the responsible person is liable (Dehkhoda, 1995).

Medical liability is a fundamental issue in medical law arises in the physician -patient relationship. In fact, the physician -patient relationship is as a contract that is signed between them and by virtue of this contract, the physician as an active player in this relation gains income as to his scientific services while entitled to obligations have been called liability in legal literature. In this regard, the physicians is liable of their expertise and the size of its scientific capabilities, in accordance with the regulatory system and taking into account confidentiality and non-disclosure of this relationship takes care of patient and any " malpractice "by him, will be the realization of civil and criminal liability. In fact, when the legal relationship is established between patient and physician, the practitioner responsibility will be crystallized in the field and medical malpractice and errors arises responsibilities from this relationship as the case may be (Khalilifar, 2011). Civil liability comes when losses inflicted on individuals as a result of medical procedures .The responsibility is to compensate for the loss or damage and sentenced physicians by medical malpractice compensate for the damage personally or via insurance companies.

The medical crime is the fraudulent medical office jobs without having conditions of legal regulation and malpractice and negligence and violation of medical rules and regulations in handling tasks and legal obligations.

### 3 The basis for civil liability of physician in the IPC and Jurisprudence

Articles 319 to 321 of Islamic Penal Code enacted in are on medical responsibility and circumcision and veterinary that first we analyze and criticize them. Then we refer to the provisions of the new Islamic Penal Code. Article 319 of Islamic Penal Code on civil liability and the legal liability of physician stipulates: "the physician is liable if, although qualified and professional, causes loss of life, injury or property damage in treatment by them, or ordered by them, however, with the permission of the patient or their guardian." Article 319 of IPC is based on the Shi'a jurists; and they know physician liable even guilty in applying knowledge, qualified, and permitted by the patient or guardian. Evidence of liability is referred to in view of the reasons given in support of the theory (Sivsalari, 2001; MahmoodRezaee, 1993). There is another promise in jurisprudence that is the basis of acceptance of medical responsibility of the physician in case of malfunction that will be discussed later.

Article 321 of the Penal Code that refers to a veterinarians similar to Article 319 and apparently accepted the vet immediately responsibility and provides that: "a veterinarian shall be held liable, although an expert, inflicts damages on animal during its treatment, though with the permission of the owner". This Article is consistent with the Article 319 and is with the same jurisprudence roots of the Article 319 because scholars compared physician liability to that of the veterinarian. Accordingly, physician and veterinary liability in the IPC is a strict liability and is not based on fault; in other words physician and veterinary liability, on compensation for medical maltreatment, it is enough to realize the harm suffered and the

causal relationship between the loss and the agent lawsuit to prove; while circumcision responsibility under Article 320 is apparently based on the fault. This article stipulates: "the circumciser is liable if causes offense or loss due to the excess of the amount necessary cut although skilled." It seems that 'cutting more than enough' "is a fault; because the fault in the sense accepted by most lawyers and civil law and Islamic jurisprudence is compatible with "deviate the conventional behavior". But, in case of circumciser who is a professional, his act should be compared with the behavior of similar experts. It is clear that specialist circumcision does not "cut more than enough" and it is the violation of practice of medicine. Thus, specialized circumcision that exceeds normal behavior must be liable. However, Article 320 is also based on the opinion of some Shi'a jurists.

#### 4 Examples of medical crimes and their punishment

In this section, due to the limitations, we will discuss two examples including Suicide medical assistance and abortion; and then end up with the discussion with the conclusion of the discussion.

##### 4.1 medical assisted suicide

Physician-assisted suicide (Rezapour, 2011) means to end the life of patient by received physician assistance through the voluntary choice of the patient. In the other words, in this type of suicide, "the physician provides patient with suicidal tools (for suicide), knowing that he intends to use it to commit suicide." Some believe that Physician-assisted suicide is in fact, one of the types of euthanasia and consequently should be discussed under this system. Thus, some literatures have been divided euthanasia into two types of direct and indirect. This division refers to the role of who perform the deprivation of life operation, in a sense that if the physician themselves deprives the patient of life; it will be direct euthanasia and if the physician provides the patient with the suicidal tools; it will be indirect euthanasia (Zeraat, 2001).

##### 4.2 Abortion

Abortion is a difficult and complex issue of the today's society. Almost all human societies are faced with this problem given the breadth and diversity of religious beliefs and moral influence among the various classes of society. Naturally, the legal systems claiming the protection of the values and beliefs of citizens, encounter this issue more seriously and more objective. According to Iran the Ministry of Health and Medical Education records, the number of 80 thousand abortions take place annually, mostly illegal and unhealthy.

Under Article 622 of the Penal Code, "Whoever knowingly and intentionally, through beating or annoying pregnant women causes abortion, s/he would be liable to pay atonement or retribution and subject to imprisonment from one to three years."

In this context, Article 718 can be noted that provides: "If a woman aborts her fetus intentionally, quasi-intentionally or on pure error, atonement shall be paid by the perpetrator or her guardian based on the case."

#### 5 Conclusion

According to the historical development of medical liability laws passed in Iranian law, According to the Penal Code in 2013 in the absence of medical fault in science and practice, there is no liability on the physician, even if the acquittal is not gotten. In fact, the new Penal Code has accepted the fault. However, before that the physician was considered responsible for damage that was caused to patients during treatment even if negligence was not the case. It should be noted on the one hand due to the sanctity of the medical profession from the divine perspective and tradition and on the other hand the relativity of human progress in medicine, a skilled professional shall be distinguished from who treats patient by the lack of necessary expertise and in fact with fault, because it is compatible with the principles of fairness and justice and a safety issue for young physicians to stay away from the rebuke of absolute fault taking advantage of their expertise and dare generalize their skills in the field of finding solution in the treatment of disease. In this regard, the new law is a fundamental step in the realization of rights and ethics closeness because highlighted the good will as the principle that combined with the profession and associated with it. Although there are ambiguities in the context of some recent laws, they must be corrected with openness and transparency in order to move towards human and divine value.

Legal procedure must be adjusted to avoid a conflict between Article 492 and Article 496 and the adjustment means to sum up between two wills (the will of the physician and the will of nurse). Also, it is not fair to consider the nurse knowledgeable and the physician ignorant where traditionally the physician has higher medical expertise and skills, especially that meeting this is associated with certain complexities, especially in case that nurse provides physician with medical note but faces with his insistence. It was a good idea if the legislator support nurses in different ways to get rid of the confusion in a transparent manner and do not ignore physician. In fact, the legislator should take into account the sensitivity of the profession and clearly apply a consistent procedure to avoid obscurity and support for health.

## FEASIBILITY STUDY AND ECONOMIC-SOCIAL EVALUATION OF IMPLEMENTING THE SOLUTIONS OF GREEN DESIGNING IN TEHRAN CITY

<sup>a</sup>SOMAYEH AJANK, <sup>b</sup>AFSHIN PARAM

<sup>a</sup>*Masters of architecture, Islamic Azad University, Dmavand branch, Tehran, Iran*

<sup>b</sup>*Assistant Professor, architecture from Sapienza University of Rome, Tehran, Iran*

Email: <sup>a</sup>ph\_s\_arjang@yahoo.com, <sup>b</sup>afshin.paramjh@gmail.com

**Abstract.** The purpose of this research is to study the possibility of specified development and plan for converting Tehran to a sustainable and green city as a proper model for all cities in Iran. It was specified that green designing of Tehran not only causes to promote the social life quality, create interaction spaces and meet the mental and physical needs of citizens, but also economically causes to save the costs remarkably which are spent for achieving clean air, acoustic tranquility, quality and life span of buildings and use of cheap and clean energies. For this purpose, at first the importance of the green designing issue, study of green architecture background and its roots have been explained and then the general principles have been explained and in the continuation, the solutions of green designing in Tehran city have been mentioned.

**Key words:** Green architecture, sustainable designing, sustainable development, urban green designing

### Introduction

According to the statistics related to the population fund of United Nations organization, the world population has become three times during the recent 70 years. Now, 75 million persons are being added to the world population yearly and the predictions have estimated the world population between 9.7 to 9.10 billion persons in 2050 (Dehghani Bidgoli, 2008). This statistic indicates insufficiency of existing sources in future. In an era that the energy crisis with its acceleration ends the sources existing in the world especially fossil sources quickly. For continuance of life, renewable and healthy sources like water are needed seriously (Sedaghati and Tayyeb Ghasemi, 2014). Access of developing countries to the kinds of new energy sources has significant importance for their economic development and new researches have indicated that there is a direct relation between the development level of a country and the amount of its energy consumption. With utilization of green architecture, negative effects of buildings such as pollution and destruction of environment have been reduced and at the same time, the quality of spaces is increased. Also reuses of consumptive water and substitution of clean and renewable energies instead of unrenewable and destructive energies promote the social and economic situation of environment in the earth tangibly.

In Iran country also with regard to the increase of population and following it, incremental need to the energy sources, limitation and reduction of fossil energy sources on one hand and the necessity of keeping the environment healthy and protection of it on the other hand, the necessity and importance of using of new energies (like wind, sun, water and thermal energies) become double (consumption management group of electricity distribution company of Semnan province, 2012). Green architecture is an old process, because it has existed fundamentally in many traditional civilizations and architecture such as Iran's traditional architecture. New issue is to understand and applying this important that in addition to create beauty and diversity in buildings architecture, embraces the protection of the natural sources, immunity from pollutants, protection of the Ozone layer and health of future of humanity. The necessity to apply this architecture as a duty for construction of buildings becomes more clarified in our country day to day (Dashti Shafiee, 2013).

### 1. The research background

Combination of architecture with nature and plants isn't a new idea; the idea of creating small garden on roof and cultivation on it has been applied by Iranian people on the roof of Ziggurats in

2500 years ago. Also green roofs had been constructed by Babylon's people 600 years before nativity (Razavian, 2010). Suspended gardens of Babylon in fact weren't the gardens suspended in the air, rather they were green spaces which were placed on the roofs and terraces of several buildings, but development of this phenomenon scientifically for the first time was expanded by construction of green roofs in Canada and United States in 19<sup>th</sup> century. Modernist architects like Le Corbusier, Frank Lloyds Wright and Roberto Beverly Marx whom are accounted as the main owners of green architecture idea, promoted the advantages of roof-gardens and constructed modern green roofs (English nature, 2003: 498). From successful samples of modern roof-gardens since 1930s onward, famous garden of Rockefeller in New York, modern roof-garden of Kensington in London can be mentioned (Dabaghian, 2009). Between the years of 1950-1990 in most of the countries, multi-floor buildings which were constructed with «international style» were similar with administrative buildings. Ventilation devices were substituted instead of natural ventilation. Construction of terrace was ignored and nature lodged for automobiles and car parks. Discussion and researches about green designing are very few in our country and with regard to the importance and necessity of issue, they need and depend on the doubled study, deep thinking and ambition. We hope that after writing this article, the attention of more researchers to be attracted to the therapeutic and hospital issues and it leads to study and collect a research with new approach about sustainable and green designing and new models and findings.

Zandieh and Parvardinezhad in a study entitled "sustainable development and its concepts in residential architecture of Iran" know that the most important factors which pollutes the environment in the world and especially Iran are fossil energies which are used for providing and supplying the consumptive hot water and heat of residential spaces, in the continuation, they know traditional architecture as a kind of sustainable and green architecture and according to this, they suppose that utilization of Iran's traditional architecture in residential and non-residential sections and even combination in general and vaster level like city is necessary. Keshkar Ghalati et al., (2010) in the article of "development of green roof system according to the criteria of sustainable development in Iran" introduce the green roof system and study its kinds and features and know the green system as one of the sustainable development components. Razavian and et al., (2010) in their research introduce green roofs or roof-gardens as a proper solution for reconciliation with nature and change of urban perspective and they study and analyze its defects and advantages in comparison with normal roofs. Dashti Shafiee also in an article entitled "studying the principles and place of green architecture in Iran and presentation of solutions for development of it" meantime emphasis on existence of green architecture in an old process and belonged to the ancient civilizations, understands the important and discussable issue and introduces its practical application in Iran and adds "the necessity of applying green architecture as a duty for construction of buildings becomes more clarified in our country day to day" (Dashti Shafiee, 2013).

### 2. Methodology

**Information collection method:** Since the methodology always follows the research subject, with regard to the current research subject, two main methods have been used in order to collect the information: 1-Documentary method, 2-surveying method.

**Methodology:** In this research, the applied methodology is a descriptive-analytical kind and the information collection method is a library, grounded and surveying kind. In this method, the researcher has used of his most important tool namely note-taking.

#### 2.1 The research questions

In order to do the research, at first some questions related to the studied issue were proposed so that the research to be expanded according to these questions and the intended purposes to be achieved. These questions are as follows:

- Whether green architecture has been come out in executive form in our country or it has remained in the theory tradition.
- In what regions has green architecture been used applicably?
- What are the benefits and profits of green architecture for Tehran Township?
- Is the execution of projects justifiable in green form for Tehran's constructors?

**3. Sustainable development**

**3.1 Sustainable development definition**

According to a definition which has been expressed by World commission, Environment and development, sustainable development<sup>1</sup> meet the needs of today's generations without

threatening the abilities of future generation in meeting its needs (United Nations, 1987).

**3.2 Purposes and principles of sustainable development**

The sustainable development concept is an important change in understanding the relation of human, nature and humans with each other. This issue contradicts with the look of two centuries ago; a view which is according to the separation of environmental, social and economic issues. It can be said that sustainable development and sustainable architecture with regard to their initial rites consider the protection of environment with changing the approach to the nature. Reforming the look to the nature and consequently changing the humans behavior to it which will lead to change the consumption culture is a very significant step in sustainable development. Originally, neither natural nor social conditions can have superiority situations to each other. A co-construction process should be recognized and searched. In this path, instead of accounting the nature as an independent and external existent which should be saved or utilized, we should understand and communicate with nature through different ways.

<sup>1</sup>- The three Rs: Reduce, Reuse and Recycle

Figure 1: Sustainable development purposes

Generally, sustainable development has three main indexes:

- A) Sustainable ground of sources which is resulted from populations and ecosystems utilization.
- C) Sustainable economic development without destruction of existing sources for future generations.

B) Biological diversity of individual species in the ecosystems ground in comparison with human utilization and more generally humans interventions.

Figure 2: Sustainability domains

### 3.3 Principles and stages of green architecture

Nowadays, sustainability issue is proposed in different scientific and executive domains all around the world. In architecture, sustainability is also proposed. Imposing the least destruction on environment, regard to the biological diversity, reduction of pollution and wastes in natural environment, reduction of greenhouse gases in the earth atmosphere, use of clean and renewable energies, use of local and recyclable materials, regard to the physical and mental health of society's people economically, socially and culturally, protection and resuscitation of historical textures are some cases which are considered by sustainable architecture (Ghobadian, 2013).

In sustainable development, it is attempted that environmental issues to be observed in 3 stages of construction, residence and destruction of building (diagram 3). In the construction stage, local and natural materials should be used,; for example, stone in the mountain, brick in desert and wood in forest are from proper materials for construction sustainably, because the factory process of these materials is very small for being converted to the building materials and many costs and energies aren't consumed for transportation of them to the building workshop.

In the residence stage, it is attempted that the need to the energy to reach to the minimum and clean and renewable energies like sun, wind, or biogas energies to be used instead of fossil energy. Therefore, in sustainable architecture, using of fossil energy is prevented as much as possible. One of the problems in current century is the limitation of fresh water and incremental need of human to it. Therefore, this vital material should be used correctly, with awareness and least prodigality. Due to this, at first by using of new equipment, the consumption of it should be reduced. Using of rain and well water, saving and refining it in the place are emphasized by sustainable architecture. Also reuse of rubbish or in other words, rubbish separation in the origin and hygienic disposal of it in a form that creates the least local waste are from other cases which are considered in sustainable architecture. Nowadays in western countries and somehow in our country, cases like paper, cardboard, glass, plastic and metals are separated from rubbish in the origin and each one above cases is sent to the related factory for being converted to the materials for new products.

In the stage of building destruction, it is attempted that building materials such as brick, stone or girder to be reused and wastes or what isn't reusable are disposed correctly (Ghobadian, 2014).

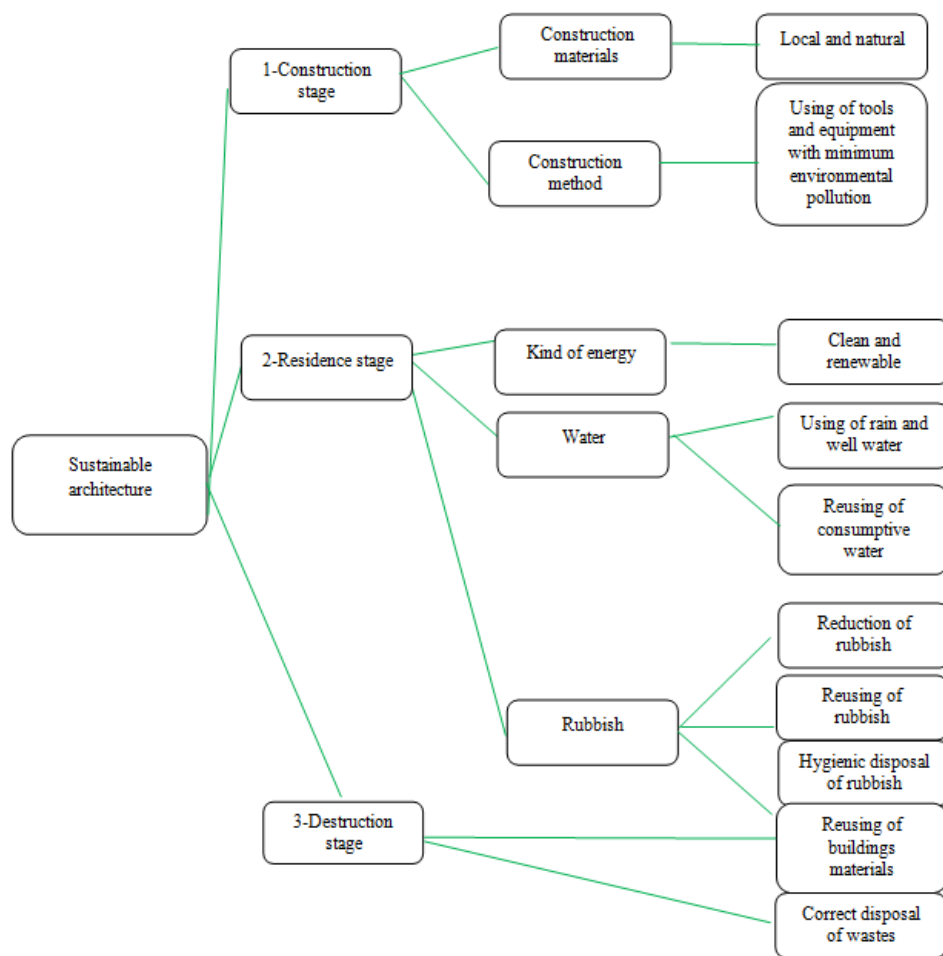

Figure 3: Triple stages of sustainable architecture for protection of environment (Ghobadian, 2009)

Green designing stages include compiled planning. Planning includes recognition and evaluation of needs, formation of specialized work-groups, designing according to the region conditions (climate, topography and kind of soil), selection of designing site, selection of green materials, selection of green mechanic and installation system, utilization of site and natural landscapes, constant protection and repairmen (Dashti Shafiee, 2013). A study which was done by the environment section of Canada in Toronto in 2002, indicated that urban temperature will be reduced from 1 to 3° if only 6 percent of the city's roofs are green (government of Canada, 2002).

### 3.4 Green architecture in Iran

In Iran also green architecture hasn't been unknown and historical city of Masouleh can be accounted as one of the most successful samples of local architecture experiences in green building which has ecological and environmental architecture designing and urban texture (Dashti Shafiee, 2013).

In Iran according to the last announced statistic, 41 percent of the whole energy consumption in the country is in the domestic and commercial section. An architect should design a system which is compatible with the processes of biological system and natural energies consumption with the least destruction in the biological system and also he/she should use of renewable sources cautiously. Therefore, green architecture has proposed itself as an architecture compatible with climate and most of architects in recent decades have had abundance tendency to design the buildings in the green architecture domain (Dashti Shafiee, 2013). In relation with metropolises like Tehran that on one hand is facing with environmental pollutions like air

pollution, pollution arising from urban sewage, acoustic pollution, pollution of superficial waters and on the other hand due to the existence of thermal islands and increase of temperature in urban centers arising from non-standard and non-homogenous development of urban textures and with excessive consumption of fossil energies, it seems that now the best time for expansion of green architecture is accounted as the effective solution in optimization of contemporary urbanism of Iran (Ghiabaklou, 2010).

### 4. Executive solutions of green architecture in Tehran

- Project designing and multi-purpose maps in which the residential and commercial uses have been combined with each other in order to help to create alive communities and also reduce the fossil pollution sources of machines.
- Maximum use and expansion of public transportation, biking paths and pedestrians to the significant and necessary services of city.
- Using of walls, facades and green roof has the main role in management of waters arising from raining, recycle of water, reduction of greenhouse gases effects, environmental diversity in urban creatures (plants and animals), prevention from UV radiation to the building, reduction of temperature, moderation of air, improvement of climatic quality and creation of air conditioning in the city, creation of urban beautiful landscapes, palatability and utility of urban spaces, cleanness and reduction of air pollution, saving the energy, reduction of acoustic pollution, reduction of costs related to the protection and replacement of buildings' roof, creation of tranquil environment in the urban chaotic areas and increase of new spaces for recreational activities<sup>2</sup>.

- The buildings should be replaced in a manner that the existing environmental and climatic situation to be utilized maximally and the building should be designed compatible with it, like using of vegetation flexible with autumn in the southern side and eastern and western expansion of buildings for optimum planning and using of solar energy.
- Using of natural and renewable energy for houses and commercial places which have high share in energy consumption.
- Using of clean energies instead of fossil energies which have high pollution.

<sup>2</sup>- [www.civilica.com](http://www.civilica.com)

- Using of solar panels and heater and saving it in the designed sources and using of it in the cloudy and cold days of winter and autumn.

Nowadays, the buildings also form a part of environment and create a great part of environmental pollutions. Of course, construction cannot be stopped but with a precise thinking, designing and planning, those kinds of buildings can be constructed which have the least negative effect on the environment (Zandieh, 2010).

### **The effective factors on increase and reduction of constructing green buildings**

#### **Advantages**

Encourager policies of government, subsidy and facilitating in using of new and clean energies and green materials

Informing and educating the architects, designers and utilizers of advantages and life quality compatible with environment and green architecture

Increase of fossil energies cost

#### **Defects**

Slow procedure of promoting clear standards of construction and grading the buildings in the energy consumption section.

Slow procedure of controlling the qualitative level of execution by contractors

Unawareness of profits and positive effects of these constructions on the environment, future and life quality of humans.

Encouragement and unsparing supports of mayors in this regard have led that the owners of constructions to find out the advantages of applying this technology in designing, planting, allocating and constructing the roof-gardens and value added arising from them. According to the existing estimates, nowadays about 10 percent of all roofs in Germany somehow are green roof<sup>1</sup>.

### **5.1 The models of converting Tehran to the green city**

Difference between a new green roof and a traditional green roof is related to the difference of purposes and materials applied in this kind of roof; the main purpose in the past has been the use of grass for insulation and elimination of caulk layer that has been often accomplished by trees' bark.

But nowadays, green roof is constructed with the purpose of environmental and economic health and in relation with improvement of management, reform of superficial sewage in the city and regard to the aesthetic issues (Ghiabaklou, 2010). With increase of modern world's problem, sustainable systems were placed in the priority of developed countries' policies. Developing countries like Iran now are also seeking for

execution of these policies in order to solve different cultural, social and environmental problems and with considering the economic consequences.

The costs of designing and executing a green roof shouldn't be compared with the costs of a normal roof; rather this comparison should be accomplished with stupendous costs arising from water, air and environment pollution, diseases and death arising from these pollutions, individual and social damages arising from lack of green space in artificial environment. Heavy costs of using of fossil fuels downwards, deep psychological effects arising from ugliness and inanition of cities, problems arising from flood-waters, costs of controlling the superficial waters, costs arising from insulation, re-execution of traditional black roofs should be added to the above costs (Keshtkar Ghalati, 2010).

Incremental and imbalanced development of Tehran city has caused to increase the procedure of land demand for construction of different uses especially house. In urban uses planning, the amount of per capita is an important tool which can play role in providing urban designs and manner of distributing and dividing the lands in the city. With regard to the development of strategic designs and abolishment of comprehensive traditional designs, the attitude of using of urban per capita has been changed to high extent. One of the achievements of this new approach includes: emphasizing on the quality issue vs quantity and valuing the people' participation. According to the existing information, the constructed lands (roofed) with different uses have formed 67.9 percent of Tehran's space with an area of 730 km<sup>2</sup> and the rest is related to the passages and open spaces. With regard to the population of Tehran city, the land per capita averagely is 81.9m<sup>2</sup>. The most per capita of uses is related to the residential per capita with 22 m<sup>2</sup> which has allocated 26.9 percent of the constructed lands to itself<sup>1</sup>. According to the statistics of Tehran municipality, total area of parks in this city is 1298.6 Hectare currently. Among urban regions of Tehran, the most ratio of green space level to the total area of region is 77.45 percent in region 22<sup>2</sup>. The standards of green space determined for each person is 12m<sup>2</sup> that with regard to Tehran's population with 13 million persons, the per capita of existing green space is less than standard. In such conditions, with encouraging the citizens to execute green roof design, at least about one-fifth of Tehran city level can be converted to the green space and the amount of air pollution can be reduced tangibly (Razavian, 2010).

It is suggested for achieving green city of Tehran, in some cases, installation of green roofs to become in a law form like the lands that formerly have had green use, the areas with pollution crisis, factories, workshops and all buildings which pollute environment, all buildings and installations dependent on the organization in charge of green space, environment and related organizations, granting special supports like selecting superior designs of green roof or encouraging the assemblies which are environment lovers, creating ground for designing and executing the floored parks in the areas with high congestion which are facing with shortage of standard green space. Applying these policies in the society causes to propagate the use of these roofs (Keshtkar Ghalati, 2010).

### **6. Conclusion**

Green architecture is an old process because it has existed in many traditional civilizations and architectures such as traditional architecture of Iran fundamentally. Between the years of 1950-1990 in most of the countries, multi-floor buildings constructed with «international style» were similar with administrative buildings. Ventilation device was substituted instead of natural ventilation. Construction of terrace was ignored and nature lodged for automobiles and parking. The environment ministration of America defines green building in this manner: "a process for increasing the building quality in which for the buildings and placement of them, water, energy and materials have been used and the negative effects of building on the human and environment health are reduced through better

location, construction designing, execution and protection of full life cycle of a building". Therefore, green building participates in ecosystem positively.

In Iran, according to the last announced statistics, 41 percent of total energy consumption of the country is in the domestic and commercial section. In green architecture, designer has constrained the natural energies and use of them in the buildings in best form. In a green building, those kinds of materials are used that don't damage the nature and rather they are recyclable, a building which has been constructed by using of materials in its environs and in establishment of such a building, easy access to the proper public transportation is considered. It is attempted that the building to be constructed with regard to the optimum direction of sun radiation and with the purpose of using of natural light and acquiring clean energy; and the importance of compatibility and balance of environment constructed by human in this kind of buildings is in priority but in "the profession related to the construction and sale of buildings", providing a way and possibility for entering the nature to the building isn't very important that although these solutions at first look contradict with governing thoughts, but finally they are as the most economical methods of architecture.

Study of 2002 in Toronto, Canada which was done by the environment section of Canada indicated that the urban temperature is reduced from 1 to 3°. If only 6 percent of the city's roof is green, although designing the green buildings will be good but it will not be promoter of affairs and it should be done simultaneous with a green urban designing. With regard to this issue that the construction of green space in the cities due to the shortage of land and its high price is very expensive and most of the lands have been occupied by buildings and streets, with converting the building roof to the garden, the nature conquered by the city can be returned to it and the per capita of open and green space can be promoted in the cities. Simultaneously, construction of roof-garden is an effective and cheap solution for reduction of environmental pollutions. The standard of green space determined for each person is 12m<sup>2</sup> and with regard to the population of Tehran metropolis with 73 million persons, the per capita of existing green space is less than standard. In such conditions, with encouraging the citizens to execute the green roof design, at least one-fifth of Tehran city level can be converted to the green space and the amount of air pollution can be also reduced tangibly. Basically, the per capita of open and green spaces can be protected and promoted by expanding vertical green spaces in the buildings and their facades and also ordaining green construction laws in the domain of townships around large cities like Tehran. The costs of designing and executing a green roof shouldn't be compared with the costs of a normal roof; rather this comparison should be accomplished with stupendous costs arising from water, air and environment pollution, diseases and death arising from these pollutions and individual and social damages arising from lack of green space in the artificial environment (Gazze, 2010).

## REVERSE ENGINEERING GEOMORPHOLOGIC (REG) IMPLEMENTATION FOR THE REGION GEOMORPHOLOGIC ANALYSIS

<sup>a</sup>MEHRAN MAGHSOUDI, <sup>b</sup>SEYYED MOHAMMAD ZAMANZADEH, <sup>c</sup>MOJTABA YAMANI, <sup>d</sup>ABDOLHOSSEIN HAJZADEH

**Abstract:** This technique (Reverse Engineering) is used in most fields and equipment reconstruction, but in the field of geomorphology has not found a place that in this paper, the new idea of using this method is shown in geomorphology based on REG concept, it can be said that geomorphology unknowns consisted of the three vectors of displacement, velocity and time. It can be concluded that the geomorphological reverse engineering that is the idea of using reverse engineering in geomorphology and is presented here.

**Keywords:** Reverse Engineering, geomorphological reverse, Implementation for the Region, REG

### 1. Introduction

Reverse engineering, is the processes of extracting knowledge or design information from anything man-made and re-producing it or re-producing anything based on the extracted information (Eilam, 2005). Geomorphology can be defined as follows:

Geomorphology as a discipline in Earth Science has its roots from Geology, Hydraulic Engineering and Physics. This is

different from other natural sciences in that its focus is on the study of the processes of production, movement and storage of sediment within the landscape and on the characterization of the features these processes produce. In its widest definition, Geomorphology encompasses the study of glacial, coastal, slope, wind and fluvial processes of sediment movement across the surface of the Earth (Sear et al. 2003).

And in other definition, the Geomorphology is therefore a discourse on Earth forms. It is the study of Earth. It is the study of Earth's physical land surface features, its landforms-rivers, hills, plains, beaches, sand dunes, submarine landforms, landforms of other terrestrial and myriad others (Huggett, 2007)

So, according to these definitions of reverse engineering and geomorphology, it can be said that the geomorphological reverse engineering that is the idea of using reverse engineering in geomorphology and is designed by the authors, is defined as follows:

This method (REG) is based on the size and direction of processes and physical forces and geometry of geomorphological landforms during time that modeled landforms changes on the basis of four parameters (x, y, z, t). Components of coordinates (x, y, z) obtained through mapping techniques, descriptive characteristics through sedimentology, geology, hydrology, and time (t) component through dating methods. So REG model is information extraction from the geomorphological landforms and geometry simulation in the present and past and then re-creation of the landforms geometry in the coming times. REG conceptual model shown in the figure below, followed by the options of the model.

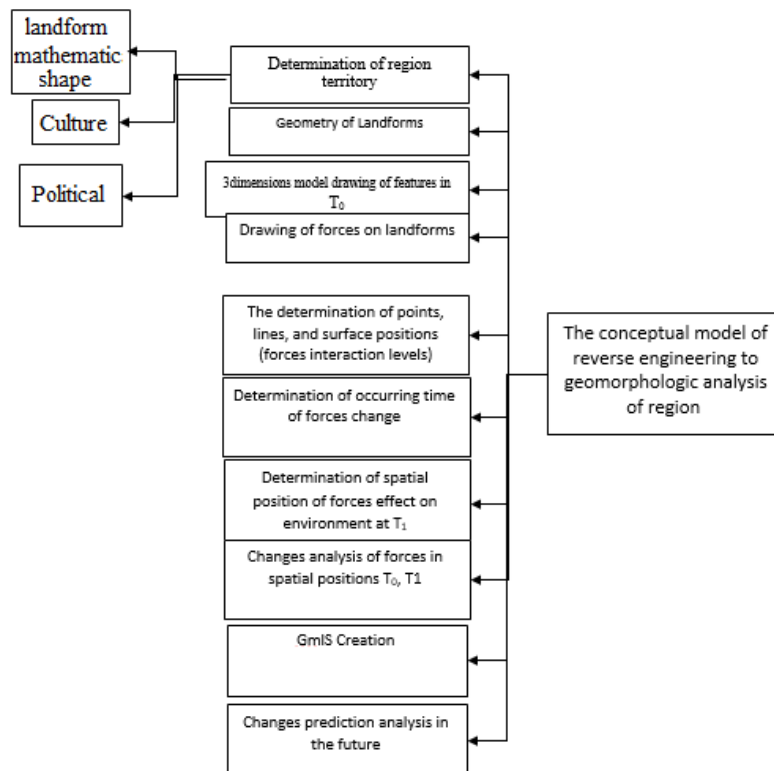

Figure 1: The conceptual model of REG

## 2. Description of REG conceptual model options

### 2.1 Determination of the studied area range

In this flowchart to start, at first the constraints must be specified using one of the mathematics, natural (basin) or political provisions that each one is described below:

#### 2.1.1 Determination of the range using a mathematical method

In this approach, the region can be determined based on mathematical geometry of features, for example, to determine the lake range, circle drawing (or close to it) or for the river, a certain buffer of river terraces, used to determine boundary.

#### 2.1.2 Determination of the range using natural methods (basin area)

In this method, landforms are specified based on the basin area. The basin area determined through topographic maps and DEM (Digital Elevation Model).

#### 2.1.3 Determination of the range using political methods

In this method, the boundaries determined based on political divisions without being affected by the topography of the area.

The case is determined according to the researcher views and region topography and basin area are not effective on them.

### 2.2 Determination of the landforms geometry

In REG model, the geometry for all features considered in three-dimensions and planar geometry is not defined for it. In principle in REG model, there is no absolute planar feature and is not defined and features that are not in three dimensions can be considered in 3 dimensions by devoting an initial value of zero ( $Z = 0$ ). The features geometry is composed of point, linear and surface topology but in some landforms, the features geometry selected as combinational due to temporal and spatial intervals that is considered as the fourth type, i.e., complex. Also, the selection of the type of features geometry depends on spatial interval of the research feature, it means that point features, such as mud volcanoes can be considered superficial if they would be investigated locally.

This division has been obtained by vertical looking (vertical profiles) to feature such that if you look at to feature from horizon (horizontal profiles), feature geometry may change, for example, dyke feature considered almost as points and in horizontal look as linear. And if the analysis scale is large, this feature can be investigated as superficial.

The features geometry is shown in Figure 2.

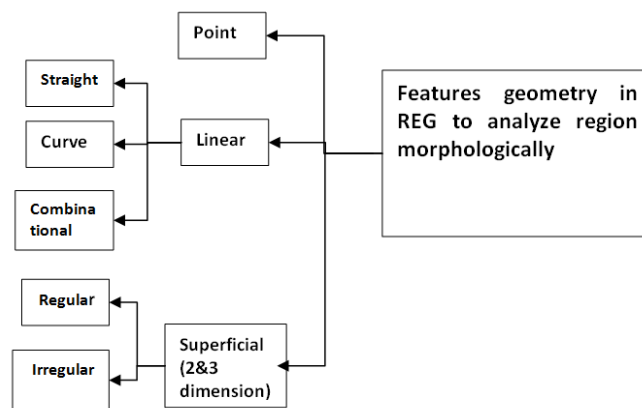

Figure 2: Features geometry in REG

### 2.3 Drawing of features three-dimension model

At this stage, features are drawn using associated software in three-dimensions and the position of each feature can be drawn in appropriation to the entire region, it means that the region studied in terms of topography. The aim of this work is putting the basic computing level for investigation and subsequent analysis that other changes and analysis measured in appropriation to the computational level and ancient changes as well as future changes can be surveyed according to it. The drawing can be seen in the present time  $T_0$  and long-term changes are shown as  $T_1, T_2, T_3, \dots$  and forthcoming changes as  $T'_1, T'_2, T'_3, \dots$ .

For geomorphological analysis of region, it is required that each feature be studied and each of features put in a reverse engineering cycle and morphometric changes are obtained. It should be noted that in this cycle, some features have more severe morphometric changes than others and some have no changes or less severity. The output of this stage is as topographic and geomorphology maps.

### 2.4 Drawing of forces on features

Identifying the force physics is surveyed from the direction and intensity of forces. Different forces applied on each feature in micro- or macro scale that some of these forces become active in different time intervals and reach to its critical level and reshape the feature. The time parameter has importance in force survey because the effect of some great forces in short periods of time is negligible and creates minor changes in the form and geometry of the feature and vice versa. By better understanding the forces and the effectiveness of them, future changes can be modeled and predicted.

### 2.5 Determination of the position of points, lines and surface of forces interaction

For each feature in the specific geometric position, the resultant force reaches to its maximum value that the understanding of the situation in REG model is important for further analysis and mapping their effectiveness. For example, in a trench, there are multiple layers of sediments of various sizes that the texture of each layer and the next layer is separated and in almost uniform layer it can be said that process and equal force applied in the

certain time interval and as soon as the force and environmental conditions change, layer texture changes. The border of the environment and force change in REG model has importance in order to define the secondary topology.

### 2.6 Determination of occurring time of forces change

The force changes determination can be detected from changes in texture, geometry, type. The time of these forces occurring can be estimated exactly as relative or absolute by measurement of years. In calculation of changes in time, landforms changes, the rate of changes, compared to the basic time  $T_0$  are useful.  $T_1$  time related to force  $F_1$  that  $\Delta t = |T_0 - T_1|$  has distance to initial time ( $T_0$ ) can be considered as basic time for the time before it, i. e,  $T_2$ .

### 2.7 Determination of the spatial position of forces effect on the environment in Time $T_1$

Each force affects on the environment and being affected by the environment in a spatial position according to its intensity that the greatest effect is on the focus of environment (point, line or surface) and by going away from the focus, the effect will be less. With knowledge of the spatial environment and force, the interaction between the force and the environment can be analyzed. With spatial position, the changes on the environment can be studied in the present or future.

### 2.8 Analysis of the changes in forces in 2 spatial positions $T_0, T_1$

Initial levels at the time  $T_0$  and lower levels at  $T_1$  have the time difference  $\Delta t$ , which in the time interval some changes occurred that turned lower level to the initial level (or superior) for previous changes. In this interval, the number of processes applied on the lower environment and caused changes in the lower forms. These forms and processes are known using some laboratory, field, and library works and archeology.

### 2.9 Creation of GmIS (Geomorphological Information System)

Geomorphological Information System (GmIS) as a special type of Geographic Information System (GIS) focused on collecting, maintaining and analyzing geomorphic information is an excellent tool for geomorphological analysis. This idea (GmIS) has been mentioned by several authors (e. g. Barsch, Dikau 1989, dikau 1992, Minar 1996, kusendova 2000, vozenilek et al. 2001). However, some problems remain which we would like to solve.

The structure of the physical model follows the logical model and is divided into three parts:

Adopted layers (hydrology, geology, topography and others), basic layers (elementary forms, digital elevation model and derivatives, documentation materials, genetic groups of landforms, morphodynamic phenomena, basin based features and geomorphic network) and special layers (morphostructural analysis, comprehensive geomorphological analysis and so on) (Mentlik et al., 2006)

### 2.10 The analysis to predict changes in the future

In REG model with possessing landforms geometry components, the forces acting on landforms, and descriptive characteristics in various APECs, the landforms movement path from the past to present can be simulated, and by determination of path and  $T_i'$ , the movement rate and direction of landforms movement can be modeled at time  $T_i'$ , in other words, landform position can be simulated in the future.

### 3. Tools and data

To implement the reverse engineering geomorphology, data and tools are needed to be able to model forces acting on landforms and also apparent geometry of landform. For the apparent geometry of landforms, 2 models of DTM (Digital Terrain Model) and the DEM (Digital Elevation Model) used. In DEM only parameter Z (height) of area with high precision is achieved but in DTM, all three components (X, Y, Z) of region from land surface are displayed. In this model, the artificial features surface is not displayed, but normal surfaces of land, i.e., dry lands, lakes, rivers are shown. In another model called DSM (Digital Surface Model), artificial features surface is shown. To specify a range, the satellite images are viewed and different maps used that output accuracy of REG model depends on the accuracy of input data. To determine the time, carbon-14, OSL (Optically Stimulate Luminescence), TL (Thermo Luminescence) methods, uranium-lead method and other methods can be used.

Also to explain and model the internal and external forces, the laws of physics, hydrodynamics, tectonics, gravity are used which vary according to the location of region. For better forces, engineering software, simulation software, programming can be used.

### 4. The method of implementation

According to the velocity- movement relation (Halliday et al., 2013),  $\vec{x} = \vec{v} \times \vec{t}$ , that is composed of the three vectors of movement, velocity and time, third vector can be obtained using 2 vectors.

By mathematical modeling of feature, it can be considered as a rigid body and all forces acting on it be modeled and obtaining the intensity and direction of the forces, their resultant forces are estimated.

Then, calculating the mass of landforms, its acceleration can be estimated. By knowing acceleration, landform movement velocity can be estimated. Finally having time and velocity, the landform movement would be estimated (following relations)

$$\begin{cases} \sum \vec{F} = m \vec{a} \\ \vec{v} = \vec{a} t \\ \vec{x} = \vec{v} t \end{cases} \quad (1)$$

In this formula,  $x, v, t, F, a$ , respectively, are acceleration, force, time, velocity and movement. Since the forces acting on the landform change constantly so the landform movement is accelerated. Landforms have variable direction and velocity over time so have accelerated movement. Used time in REG dependent on the type of implementation (regressive or progressive) is as follows.

This means that present time regarded as the base time (zero) and used as an observation and also by help of it and other observations, landforms can be modeled in the past. Finally, based on landforms details in the present and the past, the landforms situation in the future can be predicted.

### 5. The division of time

In REG method, the time parameter is defined according to following diagram and consisted of 3 parts of basic time  $T_i, T_0, T_i'$  which are related to the past, present and future. It is better that these times be related to fundamental changes in the geometry of landforms, the layers texture.

Figure 3: The division of time in REG (the authors)

REG model has errors in proportional to the accuracy of the input data. Among effective errors in modeling REG, carefully dating, mapping precision, landforms boundary determination accuracy, precision of experiments, drawings precision can be mentioned. Which must be modeled from rules of errors report and the error rate balanced. (Ranjbar and Hajizadeh, 2016)

## 7. Conclusions

based on REG concept, it can be said that geomorphology unknowns consisted of the three vectors of displacement, velocity and time, which show the same relationship  $\vec{x} = \vec{v} \times \vec{t}$  that some vectors are in unknown different positions of research. REG model can be presented as integrated and comprehensive way to simulate geometrical and physical landforms. REG method is a tool to predict changes in landforms. If in the REG model, data and detailed log information be introduced, it can model the evolution of landforms in an engineering approach and by modeling landforms and future changes, finding location and land use and land preparation in the region are implemented.

**Attention:** This article is extracted from a doctoral thesis. The authors thank of Dr. Abas Moghadam (the assistant Professor of Cultural Heritage and Tourism Research Center). Also the authors appreciate the Mahvareh Publication to provide resources and books.

## DEVELOPMENT AND GLOBAL ARCHITECTURE OF EDUCATION

<sup>a</sup>HESAM PESIANZADEH

<sup>a</sup>Islamic azad university, Oslo University College, Tehran, Iran  
Email: Hesampesianzadeh.12@gmail.com

Abstract. Globalization is used for transferring the dominant culture which is not only different but contradictory in terms of social, cultural, and historical aspects with the culture of many other societies. Also, many international organizations and executors trying to make positive changes in different societies are facing with such challenges mentioned above because their thoughts are based on western epistemology discourse. This paper briefly has tried to study the theoretical and practical support of global architecture of education and show the challenges of these international organizations. In order to clarify this issue, two countries such as South African as a country affected by socio-educational changes by international organizations and Cuba as a country whose education system is based on historical and cultural values has been analyzed.

Keywords: Globalization, developments, educational development, Global architecture of education.

### 1 Introduction

Educational development in a global world is one of the complicated contemporary concepts today. In one sense to have "education" is a fundamental right for human beings and is essential to have development in society. However at the same time, education for who and for what is a very important question. "Development" itself also is a very contestable concept because in post-colonial countries some people see development as a new tool to colonize their mind and use the society's resource as their previous historical experience was. Another concept that is very complicated is "Globalization" which has a positive and negative side to it. Global organizations are practical side of globalization that have advantage and disadvantage role over the many years in world.

However, it is important to understand relationship between education and development in an African context in order to understand the positive and negative role a global organization may have in developing their life condition.

The first part of the article will discuss education and development as concepts. Secondly the article will continue by discussing global architecture of education and the role of global organizations like the World Bank and UNESCO in an African context. To have more practical discussion both in terms of broader socio-historical and cultural relations in development, South Africa and Cuba will be looked at.

### 2 Education and development

In the first part of the article, the writer will try to examine the relation between education and development at a global level. To put light on this, the article will try to use Serpell (1993) as a theoretical framework to understand education in a developmental sense.

According to Serpell (1993), the economic, cultural and pedagogic agendas of schooling, seek to promote 'economic progress, transmission of culture from one generation to the next, and intellectual and moral development' (Serpell, 1993.). Serpell is trying to explain how those three agendas have an important role in educational policy around the world. Earlier, the schools' role was to transfer culture from generation to generation, however, much attention has turned to economic and pedagogic role of the school (A. Breidlid, 2003; Hoppers, 2002; Serpell, 1993; Tucker, 1999). Therefore, nowadays education is seen more as an economic, cultural and pedagogic agenda system to reach development in societies.

As Fagerlind and Saha (1989) mentions: "There have been few concepts in social and economic thought which have been as ambiguous as that of development the terms has been used in a variety of contexts, often clouded with political and ideological

overtones" (p.4). In addition, Holmarsdottir (2006) explains there is two differing conceptions of development "development conceived of as increased prosperity, measured in terms of economic growth", which is a neo-liberal assumption. Secondly, development is to meet human needs, which enables the potential of human personality to be realized (p.2). The dominant view to development is to see countries develop based on the "economic-growth paradigm". Though there are disputes over this, still the dominate perspective categorizes countries into "First world" and "third world", the first world referring to industrial western countries and the third world applying to countries where the economy growth is not high and they are usually located in the global south.

Therefore, it is very clear that the dominant understanding of development is the neo-liberal perspective of development (Ilon, 2002, Holmarsdottir, 2006) that plays a crucial role in educational policy at a global level. Further, the discussion now turns to the background of development theory in order to show how it has affected educational policy.

According to Fagerlind and Saha, "Ideas and concepts do not occur in a vacuum but are products of the social, cultural and historical events surrounding them. Such has been the case in the thinking about development" (1989, p.5). So after World War II, the European people experienced horrible times and thus, different development theories emerged. One of the theories that effected education was human capital theory that "postulates the most efficient path to the national development of any society lies in the improvement of its population that is its human capital" (Fagerlind& Saha, 1989, p.18). Furthermore, human capital theory was developed by economist as a reaction to other theories that were developed by sociologists and named it modernization theory (ibid.).

Modernization theory is a "intellectual responses to the World War two" (Fagerlind& Saha, 1989, p.15). In modernization theory, modern values like achievement motive which is seen by McClelland as essential to have open societies, which in turn provides economic and technological advancement which is necessary to have modern and civilized societies (Fagerlind &Saha, 1989). For modernization theory, education is directly related to the acquisition of modern values to reach economic development. Likewise, for human capital theory education is viewed as productive investment, as Schutz (1961) states: that "educated population provides the type of labor force necessary for industrial development and economic growth" (Fagerlind& Saha, 1989).

It can be argued that these two perspectives are linked to the global architecture of education. I think as Fagerlind and Saha mention "As with modernization theory, human capital theory provided a basic justification for large public expenditure on education both in developed and developing nations" (1989). Furthermore, this view helped global organizations to enforce a Western epistemology on to countries with a different social-historical context. Hence, they are affecting their cultures and values. Now the article will explore the nature of global architecture of education. In addition, it will discuss the World Bank as one of the oldest global organizations that is involved with education.

### 3 Globalization

As Levin Institute (2011) point out:

"Globalization has become the new buzzword and is often defined as a process of interaction and integration among the people, companies and government of different nations, a process driven by international trade and investment and aided information technology" (Sited in Breidlid, 2013). Hence, globalization is one of the difficult concepts to define, but there is some common understanding of it. As Held (1999) mention

“Globalization as the widening, deepening and speeding up of world-wide interconnectedness in all aspect of contemporary social life, from the cultural to the criminal, the financial to the spiritual” ( Crossley& Watson,2006). In addition, as Wallerstein points out, there are two sets of globalization, old and new one. With the old one we refer to colonization and capitalism that began 500 years ago. So for some societies, “globalization” is the continuing of modernization and westernization of other cultures. As Chakrabarty (1992) point out: “Modernity is something exclusively invented in isolation in North-western Europe, but has been assimilated, incorporated, molded, and universalized to fit European colonial expansion” (Breidlid, 2013). Hence, some people see globalization as new a version of colonization which has changed face in the later years. For them global architecture of education is the main tool that western is using to colonize their mind and ignore their cultural value.

Globalization has also some advantages as H.S Bhola (2003) states optimistically: “Brought about its dialectical opposite; the desire for localization, the search for community, indigenous values, mother tongues; and the wish to search preserve cultural heritage, and indigenous knowledge” (sited in Breidlid, 2013).It can be argued that, we should see social phenomena form two angles before judging. For example, globalization has opened many doors to spread information between people which can provide more understanding about each other and can bring more peace to our world.

### 3.1 Global Architecture of Education: Historically and in context

Global architecture of education is part of complex a process that emerged with “Globalization”. As Jones (2007) points out “A complex web of ideas, networks of influence, policy framework and practice, financial arrangements and organizational structure (2007).

It is important to discuss the global architecture of education because it plays a homogenizing role in many countries with different social and cultural contexts “The global architecture of education or the global educational discourse has had and still has, enormous consequences for how the school systems function in various parts of the world” (Breidlid, 2013).Furthermore, it is essential to understand the historical background of that concept to fully comprehend the effects of it today.

Since Enlightenment, to have modern values and modern society became the main discourse in Western European. A main feature of modernity is the idea that everything from the western world is scientific and logic. Any culture that does not fit into sciences is unscientific. This view has led western society to take their assumptions as universal and led them to spread it to other regions. In global architecture of education “The view that education should be a part of the market is normalizing which results in governments taking less responsibility for the education sector in their country, leaving it to the private sector (Jones, 2006).

Likewise, modernity and westernization with privatization of education that was background for globalization led western societies to understand their education as “right” education system that can be fit with other context. Consequently, “Transferring of education” emerged.

When transferring of education, it was done to improve other countries’ socioeconomic situation, and it was thought a need to transfer western understanding of education to the global South. The idea was that education could be exported to other countries in third world, so from practice to theory would produce what already existed in western society. Although all experience show that idea of transferring is not really sufficient, according to Tucker: “The transfer of goods, gadgets, capital, technology, hospital and roads. The economic policies and the economic

accomplishments of the west cannot be replicated in the Third world countries.

As was mentioned above, one of the main tools to transfer Western epistemology to the Third world is global organizations. One of the most important organizations that is active in educational development is the World Bank, and therefore, the article will now discuss the structure of the World Bank structure and how it has been a source of failures and frustrations in countries in the attempt to make developmental progress.

### 3.2 World Bank as global organization:

There are many organizations that are active in the sector of education since it is often regarded as a means to a better end. Therefore, “it has gained a central role in the international system of development and aid” (Shiotani, 2010, p.5). Based on the World Bank report in 2011, the organization is one of the important actors in education:

“The World Bank has probably been the most important contributor around the globe in education over the past 50 years; it has been the single largest source of support in the field of international education. The Bank has, since its inception, invested more than \$69billion globally in education through more than 1500 projects. The Banks support for education in terms of loan commitments was more than \$5 billion in 2010” (Breidlid, 2013; p.73).

It can be argued that the World Bank plays important role in transferring Western educational discourse to the South. As Breidlid (2013) states:

“The world Banks entire history, its creation, and its rationale are rooted in the post-war reconstruction (and development) of capitalist economies according to the dominant Western/Eurocentric paradigms that scientific knowledge leads humankind’s dominance of nature for endless, linear growth, and development”.

This quote here is to show the nature of World Bank is as a main actor in education, which is based on economic and western scientific understanding of the world. It is discourse because power and practice have significant role on it. In other world, “development has uniform characteristic” (Crewe &Harrison, 1998). This uniform is economic (both modernization theory and human capital theory) which believes that to have modernity and development in society, we should try to have modern humans as well.

From that point of view, the World Bank take knowledge produced in North and transfers it to South in order to aid development in society. In other words, their policy “is one size fits all” (Kless, 2002, Breidlid, 2013). According to Breidlid: “In the last decades the World Bank has been associated with neo-liberal ideology, and although there have been some changes, its belief in the Western educational discourse have remained constant”.

Consequently, World Bank is not just an organization that distributes money to develop the educational situation in the South but is also a promoter of the western hegemonic discourse on education (Jones, 2004). It is a kind of discourse that is more European-centered understanding of education which ignores cultural and historical context of countries in the South. “This one-size-fits-all approach, besides its modernist and unsustainable profile neglects the fundamental differences in educational topography in the various countries where the World Bank enters to assist” (Breidlid, 2013).

This is the place that global organizations have failures and frustration result in educational development because firstly, they teach their partners in South to be dependent on them so they are not as self-reliant as they could be. Secondly, those countries that normally have corrupt political systems, try to

attract more money, and aid money can end up financing corruption instead of helping people. Thirdly, the price of development may be that people forget their own societal cultures.

### 3.3 Two sides of the same coin

It should not be forgotten that the World Bank has also had a role in helping people in different countries to have a better standard of living. Furthermore, World Bank has had a positive role to give basic education to children and youth in different countries so that they are able to know about their culture and indigenous knowledge. Secondly, the World Bank activities are helping to spread educational technology like computer and internet in the South countries. Spreading knowledge around the world can give countries more opportunity to see different points of view and opportunities to know different ways to face their problems. Third aspect of the World Bank is that they are trying to change their programs as Kless (2002) states: "The Banks changes in development rhetoric to include empowerment, participation, even partnership, have positive aspect". Also, as Breidlid (2013) points out, World Bank education Strategy 2020 includes three new areas: "Knowledge generation and exchange, technical and financial support, and strategic partnership".

Hence, it may be noted the World Bank has progressed from their neo-liberal perspective to recognize their partner's rights to organize their education system based on their social-cultural context. We should keep in our mind that change is not something that can happen in one night. For the World Bank (2011) "Education is fundamental to development and growth" (Breidlid, 2013). Before moving to the second part of the article which will discuss South Africa and Cuba, it is necessary to explore what is meant by African values and culture? Which aspects of societal cultures are neglected by global organization?

## 4 Results

### 4.1 Tradition, Home culture, Modernity in Africa:

We cannot find any society without inherited cultural values as Gyekye (1997) argues:

"It may be said that from the point of view of a deep and fundamental conception of tradition, every society in our modern world is traditional inasmuch as it maintains and cherishes values, practices, outlooks, and institutions bequeathed to it by previous generations".

However, behind each modern society, tradition has taken place. Often, unfortunately, everything that is modern looks better than tradition, and tradition is usually seen as "rural, unscientific, and resistant to change" while "modernity is characterized as scientific, change-oriented, dynamic and urban" (Breidlid, 2002). From here, it could be helpful to discuss tradition in general and what is tradition and culture in Africa, in abroad sense.

Fleischacker defines culture as a set of practices and beliefs that persists over several generations and tradition as a set of practices and beliefs that persists over several generations hence "practices-rituals, customs, superstitions-that passed down from generation to generation are tradition (Gyekye, 1997). Therefore, to understand what is tradition, it is good to try to have an idea about concepts that play a traditional role in Africa, such as: Ethnicity, place and space, land, spirituality, indigenous knowledge, ancestor. Because of space limitation the writer will explain briefly some of these concepts in order to understand the Western epistemology discourse in relation to alien educational system introduced to South Africa particularly. The explanation will be related to educational part of those concepts.

### 4.2 Ethnicity and education

South Africa is not a homogenous society. The region suffered from colonization still South Africa has very diverse ethnicity that "requires awareness, sensitivity and responsiveness on the part of school leaders" (Woods, 2004, p.98). As Chabal and Daloz (1999) mention, colonization wanted to establish the nation-state based on European understanding of it which in turn greatly impacted the multi-ethnic nature of Africa.

Colonial powers and the apartheid system had significant role in the process of establishing education policy because they transferred curriculum that was not based on student home culture of the indigenous students in South Africa. Thus, they suffered because the knowledge they bring from home was not being discussed or valued in the classroom (Breidlid, 2013). So many students have to study an alien culture that is completely different to what they experience in their daily life. This can be more problematic if we think how these children should construct their identity in school. In other words, they will have socialization process that is not fit with their cultural background.

As Breidlid argues: "There is an Othering here when your own culture and self-understanding is constantly being marginalized and looked down upon" (2013; p.56). On a large scale, what some scholars argue is that global architecture of education brings to Africa an education system which is completely different with the African context. This may affect the African situation negatively. Abdi states that: "Globalization is not designed... to develop the African people and its educational prescriptions are making the situation worse for African children" (Breidlid, 2013). Hence, the global architecture of education greatly impacts on education systems, such as the one in South Africa.

It is very important to remember that there is not only one path to development, in other words: "What kind of education is appropriate for what kind of development, and in whose interests?" (Fägerlind&Saha, 1989). This is a relevant question when global organizations want to make policy for educational development. Western development in education system is impressive, however, experience shows, it cannot always have the same good results in different contexts. Any educational system should be fit with people's cultural background.

### 4.3 Indigenous knowledge

One of the important concepts in global south, and in South Africa particularly, is indigenous knowledge. Semil and Kincheloe(1999) define it as: "Indigenous knowledge (as) are knowledge produced in specific historical and cultural contexts or rules and orally passed down from one generation to the next"(as cited in Breidlid, 2013). Further, "indigenous" people can also be defined "...in terms of a shared experience of domination".

Indigenous people were affected, and still are by historical issues like colonization or that they are a minority group in their land within a dominant state system. In other words, they are not living in their cultural context due to historical or political events.

Indigenous knowledge is relevant to our discussion because it is important part of African culture as E.bldowo (1982) have exposed the "importance of metaphysics, spirituality, and religion in African epistemologies" (sited in Breidlid, 2013). Likewise, indigenous knowledge is coming from African context that is best way to reach sustainable development in Africa. As African philosopher Gyekye (1997) sees culture as socially created and nurtured meanings constituting and the greater portion of our necessary social context (Breidlid, 2013).

A western epistemology discourse, which was discussed earlier, has had an important role in the construction of the global architecture of education, which in turn has impacted on the development of educational policy in Africa. However, the

context of such a discourse is that it ignores indigenous knowledge in Africa, since from the western point of view, Western means “developed, industrialized, urbanized, capitalist, secular and modern” (Hall, 1996) and every other concept that cannot be related to that discourses is usually referred to as underdevelopment. From this view, indigenous knowledge can exist just in religious ceremonies or rituals, while numerous Africans practice it in their everyday life. African societies often see the world differently than how the western society sees it, as Chivaura (2006) states:

“The African worldview declares that our world has two aspects: they are the physical and spiritual...the difference between African and European worldviews concerning earth and heaven relate to differences in their attitudes towards the material and the spiritual” (sited in Breidlid, 2013).

Problems rise here because from western epistemology, knowledge should be secular and scientific and not spiritual, while an African understanding of knowledge is related to both the physical and spiritual part of life. Therefore, a western based educational system which is transferred to a differing context may produce an alienated person from their African culture.

#### 4.4 Ecology and indigenous knowledge

One of the areas western epistemology ignores when transferring educational system to Africa, is the ecological part of the indigenous worldview in the African context. As Semali and Kincheloe (1996) point out: “Indigenous knowledge focus on relationship of human beings to both one another and to their ecosystem ... an emphasis which has been notoriously absent in the knowledge produced western science over the last four centuries” (sited in Breidlid, 2013). Therefore, the educational system that comes from different context cannot be fit with an African context since it lacks the three most important parts, which are the human being, land and spirituality. The kind of education given teaches children a completely different set of values and has little relation with who they are historically, socially and environment part.

As Max Webers (1905) argues that capitalism is based on the assumption that “...there is a close relationship between Protestantism and capitalism the idea is that domination over nature through hard work and frugality will be rewarded by God” (as sited in Breidlid, 2013). However, African understanding of ecology and environment is as Nahtani Wane (2006) explain based on spirituality: “is vital life force that animates African peoples and connects them to the rhythms of the universe, nature, ancestor and the community” (sited in Breidlid, 2013). Hence, it can be understood there is a difference between the epistemologies of western and African societies.

African world view has different understanding of ecology and environment which can be helpful for our world when it comes to serious ecological problems. Some ecological problems have root in western understanding of environment, where man controls nature.

However, it is important to point out that indigenous knowledge does not have all answers to environmental issues in the modern world and should also be looked at critically. As Breidlid (2013) points out: “The potential rebirth of indigenous knowledge does not mean that indigenous knowledge should be essentialized, romanticized, or presented as monolithic and uncontested even by indigenous populations”. Furthermore, though indigenous knowledge are essential aspects in how one views the world, it does not mean it should form new discourses to manage world views. However, it is essential to value alternative epistemologies to solve world problems and also is necessary that African can be able to have education based on their culture, society and ecology.

To have clear idea about African context article will turn to second part that is about South Africa and Cuba. In second part,

the article will explain socio-historical and cultural relations in development in a South African context in order to understand what is the role of the global architecture of education in that particular context. Then Cuba will be discussed as a country that established a different educational system, which differs from the western epistemology. This is done in order to see an alternative to education which other countries can use to build their own systems.

#### 4.5 Part Two; South Africa

South Africa experienced a harsh apartheid education system that had different educational opportunities for black and white people. After Apartheid, South Africa tried to have an educational system based on a post-apartheid condition, therefore, they had different policy from 1994 to 2005 that resulted in curriculum 2005 (Breidlid, 2002, 2013).

Nelson Mandela and Thabo Mbeki had important roles in African renaissance and their “focus is related to building a nation where African values, knowledge and heritage are central” (Breidlid, 2013). To reach that aim, curriculum 2005 stipulates that indigenous knowledge such as their technology and science should be included in the curriculum so that students can be familiar with indigenous cultures (Breidlid, 2002). However, despite this statement in the curriculum, the South African education system is based on western science, and indigenous knowledge “play peripheral or even exotic role” (Breidlid, 2002). Hence, children’s socialization process may be alienating them because this separates students’ home and school culture. To show how it may be, article will continue to explain relationship between indigenous and western education in South Africa.

According to Breidlid (2013): “majority of school children in South Africa come from backgrounds where the key concepts and epistemological orientation that are linked to a modernist education system are alien”. In addition, as other research performed among other ethnic groups in South Africa shows, indigenous worldviews is based on “spirituality and ancestral beliefs” (Leclerc-Madlala, 1999; Mbiti, 1969). The challenges that curriculum 2005 face is because it “...is modeled on a Western discourse, depending heavily on different international context” (Breidlid, 2013). Although, other part of the curriculum which is about giving skill and knowledge to the learner so they can be useful for their country in a post-apartheid society is very worthwhile. However, these skills and knowledge may not fit with their context and what this can produce is a learner, alien to their identity. As OlugbemiroJ. Jegede and Glen S. Aikenhead (1999) point out:

“When the culture of science is generally at odds with a student’s life world, science instruction will tend to disrupt the student worldview by trying to force that student to abandon or marginalize his or her life-world concepts and reconstruct in their place new ways of conceptualizing” (sited in Breidlid, 2013,).

Interestingly, the revision of curriculum 2005 did not recognize indigenous knowledge and it tried to adapt its national curriculum to other international curriculums in the world (Breidlid, 2013). So, after many years, educational policy-making in South Africa does not recognize their own culture and society, which can offer a different alternative for educational development beyond a liberalist one. Furthermore, students in South Africa have to practice western educational system while they could be learning about their cultural capacity to contribute for sustainable development.

Department of Education (1997) in South Africa seeks to construct “a shared understanding of a common South African culture” (Breidlid, 2013). This ignores the fact that their context has multiple identities based on their historical background and social reality. Hence, what the curriculum is doing is trying to create “a sense of constructing a national identity where certain

cultural values are promoted and others are not" (Breidlid, 2013). Consequently, C2005 want to create a society based on Western understanding of a nation-state with the belief that introducing modern education will help reach western economical standard.

The growth that western societies have experienced is not being experienced in the general society of South Africa. Partly, the reason for this can be that the education system is divided into two parts. In one part, western educational perspective affects all their institutions, have a very formal structure as presented by Department of Education. On the other side, is the indigenous knowledge that is represented by indigenous peoples and communities (Breidlid, 2013). Combining these two parts can in turn have "...the possibility of generating cultural centered knowledge in a third space" (Breidlid, 2013).

Another example of westernization is that the South African education system has English language as its language of instruction in schools which can be an obstacle in children's socialization process and is a heritage from colonial time. Nguniwa Thiong'o states that: "from a word, a group of words, a sentence and even a name in any African language, one can glean the social norms, attitudes and values of a people" (1986), underlining the importance of one's own language. This is another challenge which comes from C2005 that does not recognize South African context and believe that only way to develop is to fit with a western standard of education.

#### 4.6 Cuba

Cuba has one of the best educational systems in the global South. Here, the writer will discuss Cuba's educational and social context in order to explain: how Cuba can establish a different, yet "successful" educational system apart from the global architecture of education.

The Cuban "educational system is famous for its focus on inclusion and equality of opportunity, but also for its focus on political and ideological conformity" (Breidlid, 2013). It can be discussed that to have an ideologically hegemonic educational system is a negative side of Cuba's education system, which forces people to have certain education and certain jobs. Most human beings wish to be free to choose their own lifestyle. This ideological part of education is a negative part of any education system that is ideologically based; either it is Islamic ideological education system in Sudan or Iran, or western education system that wants to force liberal values upon the global south. However, as Breidlid (2013) point out "when analyzing the Cuban educational discourse there is needed to distinguish between the educational systems ideological and epistemological foundation".

The Cuban communist government emerged after the revolution in the 1950's. The communist party runs the economy and the society. In fact, based on undemocratic and hierarchical structure of Cuba there is no other political party (Carnoy, 2007; Breidlid, 2013). Fidel Castro sees education as a very fundamental right for society as he states: "the happiest country is the one which has the best educated sons, both in the instruction of thought and the direction of their feelings" (Breidlid, 2013). From that point of view after revolution, Cuba established a literacy campaign in order to have "Free education and health care were factors that contributed positively to the improvement of the lives of those people who had been oppressed by the Batista regime" (Breidlid, 2013).

As UNESCO research in 1997 and 1999 show: "Third and fourth grade children scored much higher in math and language than pupils in other Latin American countries" (Sited in Carnoy, 2007). This research is important because Cuba has shown it can have a successful educational system without assistance from the World Bank or any other global organization. As Breidlid states: "Cuba has resisted the globalized drive for privatization, and its

merits have been accomplished with no assistance from the World Bank".

Cuba's education is free of charge from kindergarten to university so their success is not dependent on their parents' economic background. In other words, "students in the Cuban system are not disadvantaged because of present forms of racism, present forms of structural inequalities" (Breidlid, 2013). Cuba's education system is not just good in a quantitative way, rather as EFA Global Monitoring and UNESCO Report in 2005 mention "Cuba is one of four countries mentioned which have achieved high standards of education quality" (Sited in Breidlid, 2013).

In addition, Cuba is trying to combine indigenous knowledge with their educational system as Breidlid explains how Cuban children in primary school are "trained in herbal remedies, which they can prepare at home as poultices, tinctures, salves and teas" (2013; p.159). Further, students in "Grade 8 focuses on energy and renewable energy sources and their relationship to the environment" (Breidlid, 2013).

To understand how Cuba can do better with their educational system, Carnoy (2007) introduced four criteria: first) State-Generated Social Capital Matters as Cuba education system spend resource to have equal and high-quality education for all children in a safe and healthy environment. Second) Curriculum Matters, but its Implementation Depends on Teacher capacity as Cuba curriculum is more practical and is more covered in school because it is more fit with teacher's educational background. Third) Teacher training education in Cuba is more professional approach to teacher training. In addition, it has a clear vision of a high-quality, successful teacher education program. Fourth) Cuba education system is organized around high-quality instruction to make sure that required curriculum is being implemented. Therefore, Cuba education has an evaluation system that helps them to improve their teachers and curriculum.

Recently, Cuba got a new secondary education policy that has some negative effect on the quality of teaching because teachers in Cuba used to teach in their special subject but now "teachers are expected to teach all subjects with the exception of foreign language, computing and arts" (Breidlid, 2013). Likewise, the effect of tourism and oil industry has brought different social class with different economic ability, which expects to have private schools. Therefore, Cuban educational system is facing some challenges but the important point about Cuba educational system is that students do not experience an alien educational discourse like what happened in South Africa. In addition, the main reason Cuba was used as an example was to show how the global south countries can have other alternatives in front of them. They should trust their resources such as their people, culture and environment in order to have development.

#### 5. Conclusion

The article tried to introduce some of the most complicated concepts in the world today. Concepts like education, development, western hegemonic discourses, Indigenous knowledge were discussed. Firstly, the article wanted to show the background of global architecture of education is. Secondly, how global architecture of education effected Africa and South Africa in particular. Thirdly, to show how the World Bank as a global organization is active in transferring educational system from west to global south. Even though the global architecture of education affects educational systems, it is not white and black. In other word, organizations like World Bank and UNESCO have a lot of positive effect to educational development as well. Lastly, the article tried to bring Cuba in as an example that can do better with their educational system even though it is not connected to western discourses in education. Other countries may learn from this.

With all the discussion around concepts about how educational systems should be in the 21<sup>st</sup>- century, I hope educational

policy-makers can agree with what Freire suggests that: “every human being is a repository of knowledge, not an “empty vessel” devoid of knowledge, and he has valuable experiential knowledge to be applied in problem-posing dialogues” (sited in Breidlid, 2013).

**Abstract.** The vegetative (stem and leaves) and generative (flowers and fruits) parts of *H. elymaitica* (Apiaceae), which is endemic of Iran, were collected during the growth stages from Takhtan Mountain area around Dehloran (Ilam province) and The essential oil was obtained by using hydrodistillation method. The antioxidant potential of the samples was evaluated using free radical scavenging method 2, 2-diphenyl-1-picrylhydrazyl (DPPH) method in comparison with Ascorbic acid. The results showed that inhibition percentage of different parts of essential oil increased with increasing concentration similar to ascorbic acid also there was a considerable difference between antioxidant activities in 200 and 400 p.p.m concentrations their considerable difference is appeared.

**Keywords:** *Hausknechtia elymaitica*, antioxidant activity, antibacterial activity, essential oil

### 1 Introduction

Use of medicinal compounds with plant origin has been always considering by human. Medicines, which are largely used today to treat different types of diseases such as bacterial, viral, and fungal infections as well as different types of metabolic diseases and even cancer, have natural origin (Tchakam, et al., 2012). Free radicals are molecules with a single electron shell and are generated in organisms' body naturally, but when generation of these radicals is more than the normal level then substrates such as cell membranes, proteins and nucleic acids will be exposure to oxidation. In this case, degradation of macromolecules such as DNA and protein degradation occurs. Antioxidant compounds can neutralize free radicals and protect the body (Oke et al., 2009). According to the warnings of World Health Organization about indiscriminate use of antibiotics and serious concerns in relation with increased resistance against pathogenic microorganisms, many studies have been started in field of antibacterial materials affecting these resistant microorganisms (WHO 2011, Bhullar et al., 2012).

Antioxidant and antibacterial activity of plant essential oil has been studying for several years but the highest concentration on this issue has occurred during past 30 years. In this period, plants with traditional use have been studied specially in China and USA. Whereas, reports related to endemic plants in Iran have few (Suffredini, 2006).

Umbelliferae (Apiaceae) family is one of the largest plant families with about 300 genera and 3000 aromatic herbal species. There are various medicinal species among plants of Umbelliferae and many of these plants are used in traditional medicine; also, leaves and fruit of these plants are used as food (Zargari, 1980). *Hausknechtia* or white celery, which has perennial specie in Iran called *H. elymaitica*, mostly grows in mountain and oak forests of Zagros west of Iran. This endemic plant grows in Iran not seen in any other places in world (Mozaffarian, 1994). This unique specie is a perennial plant with alternate leaves, numerous cuts and divisions ending

to sheathed petioles that covers the stem in the junction place. This plant has an erect, smooth and glabrous and mostly has one-three stems beside each other in one base of plant and these stems might be with or without branches with height of 3 meter. White celery grows in west of Iran in some provinces and local people use the leaves and different parts of this plant as food spice traditionally (Mozaffarian, 1996, Mozaffarian, 1987). This plant is named as a medicine for diabetes, blood pressure, anti-stress and anti-tension in many of scientific texts (Ghorbani, 2013). Three important medicinal compounds are discovered from photochemical examinations that these compounds are two Phenylpropanoids called Trans- methyl eugenol and Trans-Asaron as well as a derivative of benzoic acid called Asarunic acid. Habibi et al., (2012) studied chemical compositions of aerial part of this plant using Column chromatography and GC/MS methods, isolated, and identified 12 different parts of the essential oil of this plant such as  $\alpha$  - zingiberene,  $\beta$  bisabolene, sesquiphellandrene, and alpha-phellandrene (Mohammadi et al., 2012). Other studies were conducted on the essential oil of *H. elymaitica* fruit and 10 types of chemical materials were isolated and purified that amount of the  $\beta$  bisabolene was more than Trans Asaron and lavandulyl acetate (Mehregan and Ghannadi, 2013). According to the presence of various photochemical materials in *H. elymaitica* plant, there was not any reports in scientific references about the evaluation of antioxidant and antibacterial activities in this plant. Considering the mentioned properties, the purpose of this study is to examine antioxidant and antibacterial potential and activity of essential oil in vegetative (leaf and stem) and generative (flower and fruit) parts.

### 2 Materials and Methods

#### 2.1 Plant collection and preparation

During spring and summer 2015, we went to growth location of examined plant in mountain area of Takhtan in Dehloran (Ilam Province), Iran and removed vegetative and generative organs of plant. We dried and mixed these organs at the environment temperature in the shade and placed them in closed containers far from direct sunlight until the essence extraction.

#### 2.2 Producing essential oil

The essential oil of mixed and dried herbal materials of *H. elymaitica* was extracted using hydro distillation method and Clevenger apparatus for 4 hours, material was put into a dark closed container at the 4°C temperature until the use time after filtering and dewatering using Sodium Sulfur.

#### 2.3 Measuring antioxidant properties using DPPH method

In this test, the ability to free hydrogen atom or electron by different essential oils or compositions is measured through discoloring de-purple solution 2-diphenyl-1-picrylhydrazyl in methanol. In this method, DPPH material (Sigma-Aldrich) as an indicator for stable radical combination. In this regard, 50 microliter of different concentrations of essential oil of control sample and Acid Ascorbic added to 5 ml 0.044% solution of DPPH in methanol. After 30 minutes remaining in oven at room temperature, the optical absorbance of samples was read at 517-nanometer wavelength against blank disc. Percentage of scavenging of free radicals in DPPG was calculated using the following formula (Burits and Bucar, 2000):

$$\% = (A_{\text{blank}} - A_{\text{sample}} / A_{\text{blank}}) \times 100$$

Where,  $A_{\text{blank}}$  indicates optical absorbance of negative control without essential oil and  $A_{\text{sample}}$  indicates optical absorbance of different concentrations of essential oil.

## 2.4 Antibacterial activity

### Bacterial strains:

The bacteria used in this study were given by Biotechnology Research Center in University of Baqiyatallah. General list of these bacteria with their symbol codes are described in table 1.

Table 1. Standard bacteria used in antibacterial effect test

Bacteria name	Symbol	Properties
Staphylococcus aureus	ATCC 25923	Gram-positive cocci
Staphylococcus epidermidis	ATCC 14990	Gram-positive cocci
Pseudomonas aeruginosa	85237 ATCC	Gram-negative bacilli
Escherichia coli	ATCC 25922	Gram-negative bacilli

Test method of Antibacterial effect was chosen based on Disc Diffusion Method. To prepare bacteria suspension, one-night culture of microorganism with concentration equal to 0.5 McFarland standard was used. Then, bacteria sample was cultured on the Mueller-Hinton agar. To examine antibacterial effects, 5 concentrations including 70mg/ml, 80mg/ml, 90mg/ml, 100mg/ml, and 110mg/ml prepared from vegetative (leaves and stem) and generative (flower and fruit) parts in 5% DMSO solvent (Dimethylsulfoxide) and then sterilized paper discs were added to plate contained bacteria and each of them was inoculated with 15 $\mu$ l of mentioned dilutions. All of examinations were conducted as three parallel replications. Gentamicin was used to compare antibacterial effects of essential oil and Dimethylsulfoxide (DMSO) was used as negative control. At the end, diameter of inhibition zone was measured after plates heating for 24 hours at 37°C temperature and 3 repetitions were determined averagely (Elgayyar et al., 2001).

To determine the Minimum Inhibitory Concentration (MIC) and Minimum Bactericidal Concentration (MBC) of the examined essential oils, serial dilution method was used. To determine MIC, serial dilutions 70, 80, 90, 100, 100, 120, and 200mg/ml were prepared in NB environment (Wiegand et al., 2008). After preparing serial dilutions, 20 $\mu$ l of 0.5 McFarland bacteria suspension was added to positive control (positive environment of essential oil). Finally, the inoculated serials were incubated for 24 hours at 37°C temperature. The lowest dilution of

essential oil without any impurity considered as MIC. To determine MBC, some sample of serials without any growth was cultured on Mueller-Hilton agar medium. The inoculated mediums were placed at 37°C temperature for 24 hours. After incubation, the lowest concentration of essential oil without any growth considered as MBC. Nutrient Broth medium with bacteria-less essential oil and medium without bacteria-containing essential oil were used as positive and negative controls, respectively.

## 3 Results

### 3.1 Examining antioxidant properties using DPPH method

In figure 1, scavenging level of DPPH radical in concentrations 25, 50, 75, 100, 200, and 400-m.p.p essential oil and Acid Ascorbic are presented. Results indicate that inhibitory percentage of essential oil in vegetative and generative parts has been increased with increasing concentration amount and this effect has been more on generative organs (flower and fruit) than leaves and stem; also, in low concentrations, inhibitory effect of generative part is more than Acid Ascorbic and the difference is more significant in concentrations 200-400 m.p.p of essential oil in flower and fruit compared to low concentrations. The most percent of free radicals scavenging was recorded to 80/75% in concentration of 400 mg/ml. Results obtained from free radical scavenging by different concentrations are indicated in table 2.

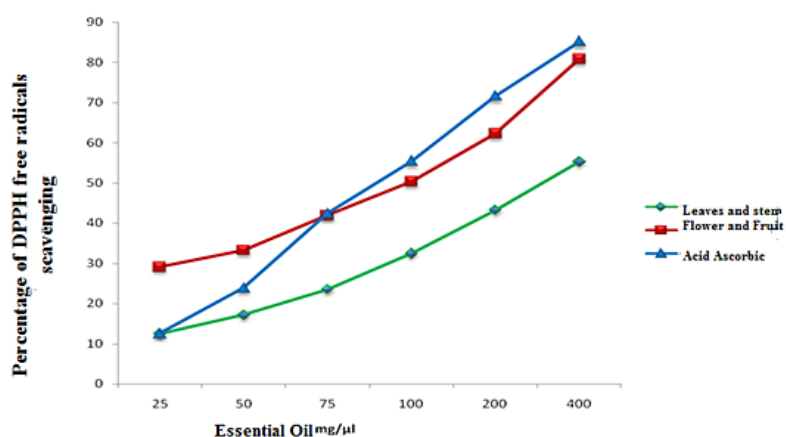

Figure 1. Comparing DPPH radical scavenging by different concentrations of essential oil in vegetative and generative parts with Acid Ascorbic antioxidant in 517nm

Table 2. Comparison of DPPH radical scavenging by different concentrations of essential oil in vegetative and generative parts with Acid Ascorbic antioxidant in 517nm

Examined part of plant	Essential oil concentrations					
	25 mg/ml	50 mg/ml	75 mg/ml	100 mg/ml	200 mg/ml	400 mg/ml
percentage of free radical scavenging in generative part (flower and fruit)	29.12	33.25	41.88	50.33	62.21	80.75
percentage of free radical scavenging in vegetative part (leaves and stem)	12.45	17.12	23.52	32.45	43.23	55.24

percentage of free radical scavenging of Acid Ascorbic	12.56	23.88	42.35	55.42	71.59	85.12
--	-------	-------	-------	-------	-------	-------

Diameter of inhibition zones in disk diffusion method (table 3) for essential oil of generative part of *Haussknechtia elymaitica* indicated that *Staphylococcus epidermidis* was affected in 110mg/ml concentration with average diameter of inhibition zone equal to 25/32±2. In similar conditions, *Staphylococcus aureus*, *Escherichia coli*, and *Pseudomonas aeruginosa* indicated

average diameter of inhibition zone to 23/90±1, 18/33±2, and 16/42±1, respectively (table 3).

As can be seen in table 3, the most effect of essential oil of different parts of *H. elymaitica* was on *Staphylococcus epidermidis* and the lowest effect was on *Pseudomonas aeruginosa*.

Table 3. Mean± Standard deviation of diameter of inhibition zone (mm) obtained from different concentrations of essential oil in vegetative (leaves and stem) and generative (flower and fruit) parts for studied bacteria

Bacteria type	Examined part	Essential oil concentration					Gentamicin 10mg/ml
		70 mg/ml	80 mg/ml	90 mg/ml	100 mg/ml	100 mg/ml	
<i>Staphylococcus aureus</i>	A	17.82±1	19.32±2	20.10±1	21.72±3	23.90±1	25.90
	B	14.24±2	16.34±1	17.18±1	18.92±1	20.10±2	
<i>Staphylococcus epidermidis</i>	A	19.18±1	20.87±2	21.72±2	23.36±1	25.32±2	27.84
	B	17.10±1	18.73±2	19.54±2	20.18±1	22.75±1	
<i>Pseudomonas aeruginosa</i>	A	10.31±2	11.52±1	13.00±1	14.38±2	16.42±1	20.54
	B	8.52±1	10.83±2	12.38±1	13.82±2	15.22±1	
<i>Escherichia coli</i>	A	12.90±2	14.00±1	15.10±1	16.16±1	18.33±2	22.62
	B	10.20±1	11.84±1	13.10±1	14.25±2	16.14±1	

A: Essential oil of generative part (flower and fruit)

B: Essential oil of vegetative part (leaves and stem)

Also, results obtained from diameter of inhibition zone show that growth inhibitory effect of examined parts on positive-gram bacteria has been more than this effect on negative-gram bacteria. Also, with increase in concentration of essential oil the diameter of inhibition zone will increase.

Results obtained from MIC and MBC indicated that Minimum Inhibitory Concentration and Minimum Bactericidal Concentration of essential oil of flower and fruit is more than that of essential oil of leaves and stem. The MIC equal to 70mg/ml was

observed in essential oil of generative parts of *Staphylococcus epidermidis* bacteria that this concentration was equal to 90mg/ml in essential oil of vegetative parts. Results related to MIC and MBC (table 4) indicate that *Pseudomonas aeruginosa* has more resistance against the essential oils extracted from *H. elymaitica* plant compared to other studied strains; MIC and MBC of bacteria in essential oil of flower and fruit indicated concentrations 100 and 120mg/ml, respectively. In essential oil of leaves and stem, concentration for MIC was equal to 120mg/ml and for MBC to 200mg/ml.

Table 4. Results of MIC and MBC of essential oil in vegetative (leaves and stem) and generative (flower and fruit) parts for studied bacteria

Essential oil	Bacteria	MIC µg/mm	MBC µg/mm
generative part (flower and fruit )	<i>Staphylococcus aureus</i>	80	100
	<i>Staphylococcus epidermidis</i>	70	100
	<i>Pseudomonas aeruginosa</i>	100	120
	<i>Escherichia coli</i>	90	110
vegetative part (leaves and stem )	<i>Staphylococcus aureus</i>	100	120
	<i>Staphylococcus epidermidis</i>	90	110
	<i>Pseudomonas aeruginosa</i>	120	200
	<i>Escherichia coli</i>	100	120

#### 4 Discussion

Results obtained from this research indicated that essential oil of both vegetative (leaves and stem) and generative (flower and fruit) contains compositions with antibacterial and antioxidant properties but these properties are different in these parts. Since there has not been any reports of antioxidant or antibacterial effects of essential oil of plant *H. elymaitica*, the results obtained from other genera of this family (Umbelliferae (Apiaceae)) used in this research. Examining of diameter of inhibition zone, it was found that essential oil of flower and fruit parts had more inhibitory effect on growth of tested microorganisms although inhibition zone was observed in growth of all used microorganisms; however, some bacteria such as *Staphylococcus epidermidis* and *Staphylococcus aureus* have more sensitivity toward herbal essential oil compared to negative-gram bacteria and negative-gram bacteria of *Pseudomonas aeruginosa* is more resistant. These results are matched with results obtained from study conducted by Pas et al., (2012) on antibacterial effect and antioxidant activity of essential oil of *Echinophora cinerea* Boiss plant from Umbelliferae family. In the mentioned study, *Staphylococcus aureus* was reported as sensitive bacteria and *Pseudomonas aeruginosa* as resistant bacteria. Essential oil of *Echinophora cinerea* Boiss indicated a considerable effect on *Staphylococcus aureus* and had inhibitory effect in dilution of MIC=0.16mg/ml and bactericidal effect in dilution of MBC=0.63 and these values were equal to MIC=87mg/ml and MBC=175mg/ml for resistant *Pseudomonas aeruginosa* (Pas et al., 2012). In other studies, antibacterial effect of *Dorema ammoniacum* specie from Umbelliferae family, which are similar to *H. elymaitica* specie in terms of flower and fruit, on bacteria *epidermidis*, *S. aureus*, and *E.coli* was equal to 22, 17, and 14mm, respectively (Yousefzadi et al., 2011). This similar effect on bacteria might be because of common chemical compositions such as  $\alpha$ -phellandrene and beta-bisabolene that effect of their antioxidant activity has been studied (Yousefzadi et al., 2011). Study on essential oil of genera of *Ferula* specie (Iranian *Ferula* and desert *Ferula*) indicated the most sensitivity among positive-gram bacteria *Bacillus subtilis* and *Pseudomonas epidermis* and negative-gram bacteria *E.coli* and lowest effect on *Pseudomonas aeruginosa*.

Results obtained from MIC, MBC were matched with findings of disc diffusion method, and it was found that essential oil of different parts had antibacterial effect on majority of bacteria. A study was conducted on antibacterial activity of *Cuminum cyminum* and *Alcea Digitata L.* and the obtained findings from MIC and MBC indicated the most sensitivity of bacteria *S. aureus*; negative-gram bacteria of *Escherichia coli* and *Salmonella typhimurium* were the most resistant bacteria (Zareii, et al., 2014). The difference between inhibitory levels of essential oils in different bacteria can be attributed to different mechanisms of microorganisms against factors limiting growth. The reason for sensitivity of positive-gram bacteria toward oil essentials might be raised from monolayer cell wall, while negative-gram bacteria have multilayer cell wall. In other words, negative-gram bacteria have an outer membrane and a periplasmic space, whereas positive-gram bacteria have none of them. Outer membrane of negative-gram bacteria is recognized as a barrier for penetration of antibiotic molecules. On the other hand, this membrane prevent from penetration of hydrophyte into the bacteria. Periplasmic space contains some enzymes that can decompose the external molecules entered from outer space.

Conducted examinations indicate that essential oil of flower and fruit has a better antibacterial and this point implies the presence of more and better antibacterial compositions in these parts. The mention point is matched with the results obtained from the study conducted by Mehregan and Ghanadi (2013) on chemical compositions of *H. elymaitica* plant. Conducted studies on white celery show that chemical compositions obtained from different parts of this plant has a good potential to treat some diseases such as epilepsy, hypertension (lowering cholesterol), diabetes, gallstones, ulcers and stress (Habibi et al., 2013). Also. These materials can be used in chocolate industry, the production of

pesticides and cosmetics. However, pharmacological effects of scavenging of free radicals DPPH in essential oil of different parts of *Haussknechtia elymaitica* Boiss plant was determined and it was seen that inhibition percentage of essential oil of different vegetative and generative parts increases with an increase in concentration. However, radicals scavenging activity is one of distinguished mechanisms during activity and creation of synergistic effects. This activity in essential oils of flower and fruit parts was more than leaves and stem and this difference might be related to more percent of  $\alpha$ -phellandrene and lavandulyl acetate compositions and Trans Arason in these parts that their antioxidant effects have been studied and approved in different plants (Dehghani, 2013).

#### 5 Conclusion

Results of this study indicated that different parts of *Haussknechtia elymaitica* Boiss contains compositions with antioxidant and antibacterial properties and these effects in generative step (production of flower and fruit) is more than vegetative step. Therefore, in accordance with created pharmaceutical resistance and results obtained from study, it is recommended to isolate active pharmaceutical ingredients of studied plant and use them as a suitable and low-cost substituent for antibiotic and antioxidant medicines.

#### Acknowledgement

We appreciate all people who contributed to this research also appreciate Dr. Valiollah Mozafarian who helped to identify examined plant.

**Abstract:** The aim of this study was to evaluate the effects of employing talent staff for managerial posts on performance of human resources in Endowment and Charity Affairs Organization. This research in term of aims is applied and in term of method as descriptive - survey. The research population consists of all managers, supervisors and staff which population community was 500s staffs. Cochran formula is used to determine the sample size, the sample size with respect to 500 staff as population community was 217 staffs. That according to its sample size of 217 staffs was studied. In this study simple random sampling was used. The results show that there is a significant relationship between employing talent staff for managerial posts on performance of human resources in Endowment and Charity Affairs Organization.

**Keywords:** employing talent staff, organizational factors, personal factors, process factors and performance factors

### 1. Introduction

Talent management has been considered as a complete set of process to identify, development, maintenance and development of talented employees needed for the successful implementation of the organization's activities and the organization will ensure that the right people with the right skills, job in the appropriate position in order to achieve the expected targets are located. Due to the novelty of talent management in large organizations in Iran, this study has a positive effect on the human resources managers. Talent management in recent years, much research attention because of its ability to create and sustain competitive advantage has attracted companies (Ingram et al., 2016). The planned use of talent for leadership positions that allow the organization to identify knowledge gaps and staff develop a way to progress their career aspirations in a secure environment, positive and comfortable express (Christy, 2005). On the other hand increasing competition, privatization and outsourcing of Government policy, in this regard, organizations and institutions in the country and more detailed, organizations need leader's capable endowments, innovation and are committed to continue the growth and development organization. With regard to the subjects mentioned and given the critical role and talent staffs in organizations, it was achieved among staff to consider the charity's endowment. Basically, this study seeks to susceptible actors in the deployment of staffs for managerial positions in the Endowment and Charity Affairs Organization.

### 2. Literature review

The definition of employing talent staff:

Term of employing talent staff, for the whole of range of planning future capital requirements for staff will be used. In general, refers to talent management, talent creation of internal and external resources, develop these resources in a central location and emphasis on job motivation, organizational commitment and their behavior, which eventually lead to

improved organizational performance (Ingram et al., 2016). Talent management, human resource planning process includes a process of identifying, selecting, maintain and develop human resources and talented staff in the organization (Tajodin et al., 2015). In fact, talent management, include keeping talented people in the organization. Talent management, implementation of the approved activities and finding relevant information relating to attract, identify, recruit, development, motivation, promotion and retention of those who have strong potential for success within the organization (Balayn and Sparrow, 2009). Institute CIPD, talent sophisticated combination of skills, knowledge, cognitive abilities and potential and knows and talent management to identify and focus on high-potential defines a part of the human resources (Guy et al., 2009).

### 2.1 Talent management components

Talent management strategy includes factors such as performance management, employee education, rewards and recognition, the atmosphere and the culture of openness and communication. The first component of talent management strategy (performance management) process in which managers seek to improve the quality of the performance of teams and individuals, access to current and future goals and objectives of the organization possible. One of the important aspects of this process, the relationship between employees, supervisors, so that this relationship is different context to fully understands the objectives and cognition provides organizational goals. The second component of the talent management strategy (education workers), for updating knowledge, skills and capability of employees is considered. Previous studies have demonstrated that humans retain talented people in the organization to drastically reduce costs. One way to retain employees is creating opportunities for them to learn new skills and develop their abilities. The third component of talent management is rewards and recognition. Organizations through strategies, policies and processes, determine the value of your employees through this legislation, people who have worked to achieve organizational goals to identify and encourage (Armstrong, 2010). The atmosphere and culture of openness is the fourth component of the talent management strategy. Relatively stable intrinsic properties and collective feeling and understanding of those features, optional features define organizational climate (Alikhani, 2009). The last component of talent management is the communication, the exchange of information and ideas in the organization (Armstrong, 2010).

### 2.2 Factors affecting the employing of talent staff

A) Process factors: The process factors include:

- 1) Assessing the needs of future tasks: a strategic plan, current and future priorities, which, by creating a deployment plan is likely, identified (Ibarra, 2005).
- 2) Identify important posts and employees with high potential: important positions are those necessary to achieve the business results for the organization, department, section, business unit or team, are required (ibid.).
- 3) Identify competencies: competencies should be integrated within an organization's performance management system.

Rating identifies competencies as part of the deployment of talent, the capabilities that are necessary for the workplace of today and tomorrow. Examples of qualifications: mentoring, decision-making, initiative and tenacity are conflict management.

4) Complete analysis of gap: leading a gap analysis to determine whether the size of the qualifications for each post (ibid.).

5) Select educational and development activities: a variety of resources available to individuals and groups, to close the gap and building upon the merits of the powerful, who are employees (such as job assignments, job rotation, job enrichment, etc.). This step of the application process for the selection and design talent development strategies has been created.

6) Training Management: Managers should focus on education, on strengthening the skills and knowledge to develop talent development need to be involved. Such as: identification of key replacement needs and people with high potential; identify current and future activities and business results (Ibarra, 2005).

#### B) Organizational factors:

Environment of organizations are considerably effective in talent staff deployment process. Strongest impact on the planned deployment of talent staff is historical records. Most likely use of talent, previous approaches take shape. Suppose that the deployment of talent on process properties listed by other environmental factors will influence the chart above. "Planning horizon" as much as long-term goals of the immediate challenges are mastered, refers to: longer time, permit the transfer position and subsequently focus more on the day-prone deployment. Then, succession planning, "perceptions of domestic labor" will affect, so whether internal coalition intended to remove external sources, or if the search for external sources to be taken seriously, to what extent has it been discussed. "Political space" is the relative weight given to objectively determine the suitability of mutual relations. Finally, the "openness" in the enterprise space, to the extent that the process of implementation talent to be effective communication within the organization (Garman, 2004).

Figure 1. Planning process model of deployment of talent staff (Succession) (Garman and Glawe, 2004)

#### C) Individual factors: individual factors including;

Level education and expertise, knowledge relating to jobs, work experience, talent is work-related. Education indicators expertise include sufficient expertise and powers in the field of job tenure, having adequate skills in the field of job tenure, work experience, work experience and training is required (Rezaeian, 2005).

Job autonomy: having full autonomy and independence in monitoring devices under its oversight. Include indicators related to job autonomy; financial decisions by the employees affected by the absence of influential people, allowing employees within the laws and regulations (ibid.).

Organizational support: support or assistance that employees need to do their jobs successfully,

Such as insufficient funds, facilities and equipment to do the job right, the necessary support from other organizational units.

Indicators of organizational support including the provision of office facilities conference space suitable working environment (ibid.).

Motivation or desire: to motivate employees to do the work is concerned, motivated, successful completion of the work that employees have on hand. Employees are more inclined to do business successfully afford to be motivational for them. Job motivation factors are: the interest of employees to their jobs, cash and non-cash compensation received from organizations and social status and position in the government and society (same source).

### 3. Organizational Performance

To understand corporate performance should first understand the concept of performance. Performance; to do the job tasks that an employee completes refers and shows how a worker accomplishes the requirements of a job (Byars and Rue, 2008). Organizational performance, to the missions, tasks and organizational activities and results of applied to them. Another definition, organizational performance is to achieve organizational goals and social or go beyond them and the organization's responsibilities (Haghighi et al., 2010). In measuring performance, there are two main approaches: objective and subjective, and both approaches have their own advantages and disadvantages. Objective measures, more real, but the scope of coverage is limited to financial data and other organizational dimensions do not explain. On the other hand, subjective scales, less realistic, but they provide rich descriptions of organizational effectiveness. These measures allow a wide range of organizations in different industries are analyzed (Allen et al., 2008).

#### 3.1 Performance Evaluation

Practice, often with the "efforts", which refers to the energy spent equated. Performance is measured based on the results of operations. For example, a student may apply great effort in preparing for a test, but the little score. In this case, much work has been done, but the performance was low. According to Byers Vero (2008) performance can be in a position as a result of interaction between: a) efforts, b) abilities and c) perceptions of the role will be considered. "Effort", that the excitement stems referring to energy expenditure (physical or mental) that a person spends its duty. "Enablers", personal characteristics and are used in performing the job 'perceptions of the role of "the paths people believe should guide their efforts in order to do their jobs, and so on.

Noe et al., (2008) performance due to personal characteristics, skills and know like it. As shown in the figure below, these characteristics are objective results through employee behavior. In fact, employees only if the knowledge, skills, abilities and other characteristics necessary to perform a job they can show their behavior. Other components of the new model and colleagues are "institutional strategies". Often, the relationship between the management and performance strategies and goals of the organization ignored. The top model of "position limits" is mentioned, plays an important role in practice. As previously mentioned, people may do proper behavior, but do not gain good results. Therefore, employees should have specific features for a set of behaviors and achieve some results and to achieve competitive advantages, characteristics, behavior and results should be tied to organizational strategies.

Sayadi, et al (2012) carried out a study entitled "The relationship between talent management and job satisfaction" the aim of this study was to determine the relationship between talent management and job satisfaction of employees in the headquarters of the Social Security Fund. The method of this research is descriptive and correlational survey method was used. Our findings that there is a meaningful relationship between talent management and job satisfaction have been

approved. Tahmasebi et al (2012) has identified the most effective factors to attract and retain scientific talent at universities. This research is an applied and descriptive study was conducted at Tehran University. The sampling is simple random sampling and data collection tools. The collected data were analyzed with SPSS software. The results show that the cause of climate research is most effective in attracting talent at Tehran University.

Taleghani et al. (2013) determined the effectiveness of their talent management strategies on the performance of faculty members. This study is applied and in terms of style, descriptive of correlation. A total of 213 people were chosen randomly sorted, for example. To gather the views of respondents, the questionnaire is used. Research hypotheses were tested using structural equation modeling. The results indicate that strategy, talent management, positive and significant effect on the performance of its faculty members.

Nopasand Asl et al., (2014) examined the relationship between talent management processes and organizational performance. The aim of this study is applied and descriptive correlational. The population included all employees of Gilan Ports and Maritime Organization via Morgan table and using stratified random sampling method, the number of 162 people was chosen as samples. To collect data, a questionnaire was used. For data analysis, Pearson's correlation coefficient bivariate and multivariate regression was used. The results showed that there is a significant relationship between the activities related to talent management and quality of service and innovation in services as well as attracting top talent to the greatest positive impact on increasing the power of innovation in the organization.

Ghosi et al., (2015) examines the role and relationship between talent management in maintaining human resources potential in the National Oil Products Distribution Company in Sari. The research method is descriptive - survey and stratified random sampling method used and a questionnaire designed to measure the impact of talent management and the sample was composed of 95 employees and officials have been distributed. For the purpose of data analysis software SPSS, descriptive and inferential statistics and t-test was used. The results showed that the four talent management outcomes that are not abandoning talented people from the organization, job security and stability, talented people, create an empty treasury, talent and stay ahead of key positions, respectively, of the results of talent management in the organization. Bethke et al., (2010) in a study entitled "Effective talent management strategies in companies in Switzerland" show confidence and motivation for higher performance, the results of applying the talent management strategy. Tajodin et al (2015) examined the impact of talent management in Malaysia are banking on the quality of work life. The results indicate the potential impact on loyalty and performance management of employees in Malaysia bank. Bymond et al (2016) in their study are to evaluate the talent management in emerging economies. Their research suggests that cultural and institutional differences in talent management by an affected area. The social relations influence talent management, decision-making and skills.

### 3.2 Conceptual model

Figure 2: Research Conceptual Model (Wadadi, Zarefar, 2011)

## 4. Hypotheses

### 4.1 The main hypothesis

1. There is a significant relationship between employing the talent staff for managerial posts on performance of the staff in Endowment and Charity Affairs Organization.

### 4.2 Sub-hypotheses

1. There is a significant relationship between organizational factors of employing the talent staff for managerial posts on performance of the staff in Endowment and Charity Affairs Organization.

2. There is a significant relationship between individual factors of employing the talent staff for managerial posts on performance of the staff in Endowment and Charity Affairs Organization.

3. There is a significant relationship between process factors of employing the talent staff for managerial posts on performance of the staff in Endowment and Charity Affairs Organization.

## 5. Results

The study in term of aim is applied and in term of data collection method is descriptive and in term of type is correlational. After careful study to collect information relevant to the literature, indicators affecting the deployment of talent staff in managerial posts have been investigated. As well as to collect data from the survey (the effect of talent for managerial posts and staff performance) with 37 questions was used. The study population will comprise staff of Endowment and Charity Affairs Organization and simple random sampling was used. To analyze the data, application and software SPSS22 Smart PLS structural equation modeling was used. Also in this study to determine the reliability test, Cronbach's alpha was used.

The statistical distribution in terms of gender, marital status, age, education, work experience of respondents is as follows:

The table below the total number of respondents is 236 people who, in terms of gender, 75% (177) were men and 25% (59) were women. In terms of marriage, 53% (125) of the respondents were married and 47% (n = 111) are single. In terms of age, 13% (n = 30), 20 to 30 years, 40% (94 patients) from 30 to 40 years, 35% (83 patients) from 40 to 50 years and 12% (N = 29) were 50 years and higher. In terms of education level, 8% (20) of diplomas, 18% (n = 43) has an associate degree, 46% (108) bachelor and 25% (59) MA and 3% (n = 6) were PhD. In terms of work experience; 12.7% (n = 30) under 5 years, 17.8% (n = 42) 5-10, 19% (n = 45), 10-15 years, 17.8% (n = 42), 15-20 years, 23.8% (56) had 20-25 years (8.8%) of 21 over 25 years work experience.

Table 1. Demographic statistical distribution

Variable	Condition	Frequency	Percent
Gender	Man	177	75
	Woman	59	25
Marital status	Married	125	53
	Single	111	47
Age	20 to 30 years	30	13
	30 to 40 years	94	40
	40 to 50 years	83	35
	50 years and higher	29	12
Education	Diploma	20	8
	Associate Degree	43	18
	Bachelor	108	46
	MA	59	25
	PhD	6	3
Work experience	Under 5 years	30	12.7
	5 to 10 years	42	17.8
	10 to 15 years	45	19
	15 to 20 years	42	17.8
	20 to 25 years	56	23.8
	Over 25 years	21	8.9

Analysis of the models in structural equation modeling approach Partial Least Squares (PLS-SEM) in two main stages "model search" and then "hypothesis testing" is done.

Table 2. Convergent validity and reliability

Variables	The average variance extracted (AVE)	Combining reliability coefficient (CR); <b>CR &gt;0.7</b>	Cronbach's alpha reliability coefficient
Performance	<b>0.766</b>	<b>0.929</b>	<b>0.897</b>
Organizational factors	<b>0.725</b>	<b>0.955</b>	<b>0.946</b>
Process factors	<b>0.741</b>	<b>0.945</b>	<b>0.930</b>
Individual factors	<b>0.765</b>	<b>0.963</b>	<b>0.956</b>

As can be seen in all three criteria listed above model is very good.

Table 3. Correlation Matrix and check the validity via the method of Larkr Fornell (1981)

	Performance	Organizational factors	Process factors	Individual factors
Performance	<b>0.8752</b>	<b>0.000</b>	<b>0.000</b>	<b>0.000</b>
Organizational factors	<b>0.752</b>	<b>0.8514</b>	<b>0.000</b>	<b>0.000</b>
Process factors	<b>0.799</b>	<b>0.798</b>	<b>0.8608</b>	<b>0.000</b>
Individual factors	<b>0.787</b>	<b>0.787</b>	<b>0.799</b>	<b>0.8746</b>

This applies to all research structures and highlights the divergent validity is confirmed. Results obtained from the Smart PLS software in the above tables shows that the models measure of validity (convergent and divergent) and reliability (loadings, Cronbach's alpha reliability coefficient combination) is appropriate.

Table 5 Path factor and significant number of sub-hypotheses

Hypothesis	Path coefficient	T-statistic	Test result
Employee Performance ← Organizational factors	0.452	3.477	Confirmed
Employee Performance ← Individual factors	0.392	4.358	Confirmed
Process factors ← Employee Performance	0.508	4.358	Confirmed

According to the statistic T (3.477) is higher than 1.96, and path coefficient (0.452) at 95 percent, there is significant relationship between organizational factors of employing the talent staff for managerial posts and performance of the staff in Endowment and Charity Affairs Organization.

According to the statistic T (4.358) is higher than 1.96, and path coefficient (0.392) at 95 percent, there is significant relationship between individual factors and employing the talent staff for

Figure 5. Model in significant numbers

Figure 6. Models in standardized coefficients of factor loading

The main hypothesis: There is a significant relationship between employing the talent staff for managerial posts on performance of the staff in Endowment and Charity Affairs Organization.

Table 4 Path factor and significant number of the main hypothesis

Test result	T-statistic	Path coefficient	Hypothesis
0.850	43.111	Confirmed	Employing the talent staff ← Employee Performance

According to the statistic T that is higher than 1.96, and path coefficient (0.850) at 95 percent, there is a significant relationship between employing the talent staff for managerial positions and the performance of the staff in Endowment and Charity Affairs Organization.

Sub-hypotheses:

managerial posts and performance of the staff in Endowment and Charity Affairs Organization

According to the statistic T (4.358) is higher than 1.96, and path coefficient (0.508) at 95 percent, there is significant relationship between process factor and employing the talent staff for managerial posts and performance of the staff in Endowment and Charity Affairs Organization.

## 6. Conclusion

The aim of this study is to "evaluate the effect of employing the talent staff for managerial positions and the performance of the staff in Endowment and Charity Affairs Organization. Data analysis using SPSS software and analysis necessary structural equation modeling software Smart PLS was based on the results of which are as follows:

Result of main hypothesis: There is a significant relationship between employing the talent staff for managerial posts on performance of the staff in Endowment and Charity Affairs Organization.

According to the statistic T that is higher than 1.96, and path coefficient (0.850) at 95 percent, there is significant relationship between employing the talent staff for managerial positions and performance of the staff in Endowment and Charity Affairs Organization. In order to compare the results of this study can be said previous research, the results Ghosi et al., (2015) show that four issues of talent management they are not abandoning talented people from the organization, job security and stability, talented people, create an empty treasury, talent and stay ahead of key positions, respectively, of the results of talent management in the organization. The study also found there is significant relationship between employing the talent staff for managerial positions and performance of the staff in Endowment and Charity Affairs Organization. Results of Nopasand Asil et al., (2014) in a study entitled the relationship between talent management processes and organizational performance, showed that the activities related to talent management and there is a significant relationship between service quality and innovative services as well as measures to retain talent in the organization the most impact on the quality of rendered services and attracting top talent to the greatest positive impact on organizational innovation is increasing that is consistent with the results of the present study. The results Taleghani et al., (2013) that talent management strategies, positive has significant effect on the performance of faculty members that the results is consistent with the study findings.

Result of first sub-hypothesis: There is a significant relationship between organizational factors of employing the talent staff for managerial posts on performance of the staff in Endowment and Charity Affairs Organization.

Result of second sub-hypothesis: There is a significant relationship between individual factors of employing the talent staff for managerial posts on performance of the staff in Endowment and Charity Affairs Organization.

Result of third sub-hypothesis: There is a significant relationship between process factors of employing the talent staff for managerial posts on performance of the staff in Endowment and Charity Affairs Organization.

In this study, three of process, organizational and individual factors affecting employing the talent staff of organization were identified. Research findings of Sayadi et al., (2011) that there is a meaningful relationship between job satisfaction and talent management approved. Bymond et al., (2016) in their study shows that talent management affected by cultural and institutional differences in an area. As well as the social relations influence on talent management, decision-making and skills. Results of this study also show the relationship between talent management processes and organizational performance. Results of Tajodin et al (2015) reflects the impact of talent management and employee performance database is the loyalty. Also Bethke et al (2010) showed that the confidence and motivation for higher performance, the results of applying the talent management strategy is that these two studies are consistent results.

Email: <sup>a</sup>naser\_rahimi\_1478@yahoo.com, <sup>b</sup>sa.sh.mn@gmail.com

**Abstract.** Different designing approaches for detection of the high impedance fault occurrence location are investigated in this paper and the main goal of representing this research is to design a software system for 20 KV distribution networks in Iran. Machine learning for high impedance fault detection, finds the location of fault by feature extraction using discrete wavelet transform and applying partial and approximate coefficients and following that using the multi-class Support Vector Machine classification, provides the possibility of fault estimation. Results are indicative of appropriate performance of system and fault detection accuracy in training and testing states and some problems like uncertainties and relation with actual output, are removed.

**Key words:** high impedance fault, electrical protection, machine learning, wavelet transform, support vector machine.

## 1. Introduction

Occuring high impedance faults in transmission and distribution systems can lead to irreparable faults and therefore it is purposed to first: the place of this occurrence be determined accurately and second: the possibility of predicting it be provided. However it is clear that location of high impedance fault is as a main challenge for current and voltage of network, the greatest impact of this issue and addressing it indicates itself in electrical protection (Akorede and Katende, 2010). Moreover, complexities such as voltage and current levels being heterogeneous and existence of side branches in distribution and transmission system have increased the location of high impedance fault. Ordinary fault which is known as high impedance fault in distribution network will be hardly detectable because of current intrinsic increase which gets form following resistance value limitation (Sedighzadeh et al. 2010). Now a day it is need to a powerful and strong system exist that detect this fault automatically. In most of cases, researchers in recent years were looking for designing this intelligent system, but they have not found convenient tool. It seems that the best tool for making intelligent in this field is artificial intelligence which can detect this fault automatically. But in order to automate the finding this fault, in a few researches the multiple factors such as time, accuracy, and confidence factor of fault occurrence location is considered. Therefore, the importance of research gets raised in terms of finding the fault quickly and accurately.

## 2. Related systems

Another approach is to apply detection based on electrical components of transmission line. These methods are based on analysis of voltages and currents of beginnings of feeders and are divided to four parts in a general class:

1. presented method in time domain (Kumar, 2014)
2. presented method in frequency domain (Michalik, 2006)
3. presented method in time-frequency domain (Samantaray and Dash, 2009)
4. intelligent combined methods (Bakar et al. 2014)

For systems which are grounded in some points, the angle and domain of unbalanced load current ( $I_0$ ) is not constant and fault current is variable too. Therefore, over current relays cannot be made sensitive. If a relay can sense only the fault current, its sensitivity increases. In suggested relays by attention to simplicity of measuring the unbalanced load current ( $I_0$ ), system current ( $I_N$ ), fault current ( $I_F$ ), based on equation (1) are calculated and leads to relay operation (Sedighi et al. 2005).

$$I_F = k_1 I_0 + k_2 I_N \quad (1)$$

In which  $I_0$  and  $I_N$  are unbalanced load current and neutral wire current respectively and  $k_1$  and  $k_2$  are constant. Considering this issue that these faults are impressible of other physical and environmental factors, a unique technique cannot effectively lead to detect all of them, therefore, some researchers for increasing the reliability of made devices use intelligent techniques or some techniques simultaneously to detect the high impedance (Milioudis et al. 2015).

Lai et al. in 2008 represented a model which includes two variable resistances with serried time and is controlled by EMTP/ATP models. Sharaf in 2004 defines the detection of high impedance fault method in time domain based on low frequencies (third and fifth circulation harmonics patterns). Marek Michalik et al. in 2006 provided a simple and effective method for detecting high impedance in distribution systems by wavelet transformation technique. Samantaray in 2012 introduced an intelligent method for detecting high impedance in power distribution feeders by advanced signal processing techniques such as time-time, time-frequency combined with neural networks.

## 3. Suggested controllers

Using feature extraction model and classifying by support vector machine as the main cores of intelligent systems are suggested that will be introduced in following.

Three phase voltage signal  
Location of fault detection  
Feature extraction  
Type of fault detection  
Classification  
Location Multiclass classification  
Making decision about fault

### 3.1 Feature extraction from signal with wavelet transformation

Discrete wavelet transformation is applied as an efficient transformation in feature extraction. After preprocessing of line signal by decomposing to wavelet coefficients, we transform it to different signals. Every stage of this process includes two digital filters and down-sampler with sampling factor of 2. In first filter,  $g$  is discrete base wavelet and intrinsically high-pass and  $h$  is mirror version of the same wavelets which are intrinsically low-pass.

The output of first order down-sampler for high-pass filters includes partial coefficients  $D1$  and approximate coefficients  $A1$  respectively. The first approximate equation is  $A1$  which is decomposed more than other coefficients. All of the wavelet transformation can be indicated in the form of an equation of low pass filter which satisfies the equation (2) conditions.

$$H(z)H(z^{-1}) + H(-z)H(-z^{-1}) = 1 \quad (2)$$

In which the  $H(z)$  is the  $z$  transformation function of filter  $h$  and the supplement of high pass filter can be indicated based on equation (3):

$$G(z) = zH(-z^{-1}) \quad (3)$$

A series of filters with increasing length (with index  $i$ ) can be shown with equation (4):

$$H_{i+1}(z) = H(z^{2^i})H_i(z) \quad i = 0, \dots, I - 1 \tag{4}$$

$$G_{i+1}(z) = G(z^{2^i})H_i(z)$$

In which the initial conditions  $H_0(z) = 1$  is considered and two-scale relationship in time domain can be expressed based on equation (5):

$$h_{i+1}(k) = [h]_{2^i} * h_i(k) \tag{5}$$

$$g_{i+1}(k) = [g]_{2^i} * h_i(k)$$

In which the  $[h]_{2^i}$  and  $[g]_{2^i}$  are indicator of up-sampling with a factor of 2 and on the other hand  $K$  is considered as discrete time of sampling. The base functions and normalized wavelets can be defined as following form:

$$\varphi_{i,l}(k) = 2^{i/2} h_i(k - 2^i l) \tag{6}$$

$$\psi_{i,l}(k) = 2^{i/2} g_i(k - 2^i l)$$

In which  $2^{i/2}$  is the normalized result of inner product.  $i$  and  $l$  are scale and translate parameters respectively. The decomposition of discrete wavelet transformation can be expressed by equation (7):

$$a_{(i)}(l) = x(k) * \varphi_{i,l}(k) \tag{7}$$

$$d_{(i)}(l) = x(k) * \psi_{i,l}(k)$$

In which  $a_{(i)}(l)$  and  $d_{(i)}(l)$  are approximate and partial coefficients with accuracy of  $i$  respectively. As result of these calculations, we will be capable of decomposition and rebuilding of signal practically.

### 3.2 Classification by support vector machines

In soft margin or support vector machine the equations (8) and (9) allow a little deviation from marginal hyper-planes by adding  $\zeta$  positive parameter.

$$(w \times x) - b \leq -1 + \zeta \tag{8}$$

$$(w \times x) - b \geq 1 + \zeta \tag{9}$$

It can be concluded that support vector machine is an optimum isolation method that output of it is obtained by Bayesian theory. In this set of equation  $b$  is the threshold parameter of optimum hyper-plane. The  $x_i$  or  $\alpha_i > 0$  training data are called support vectors and SVM finds the hyper-plane in which the distance

between support vectors and hyper-plane is maximum. After feature extraction, it is need to fault and its type be classified. To do this we only use the sum of approximate coefficients of first level of second round. This value is divided by sum of approximate coefficient obtained from following equation.

$$AR = \frac{a(HIF)}{a(Normal)} \tag{10}$$

Based on this value the high impedance fault is divided to one of the following four faults:

1. Single phase line to ground fault in which in average for Iran 20 KV voltage signal the AR of it for one of phases is less than 1 and for other two phases is more than 1.
2. Three phase fault in which the AR of all phases almost is equal.
3. Double phases fault (double line) in which the healthy phase like before has value (AR is almost equal to 1), while change in phase associated with fault have a less than 1 domain and is equal to other phases.

For calculating accurate AR we need to apply an appropriate threshold. This threshold is determined considering the classification output change.

### 4. Scientific results and simulation

The 20 KV electricity was used as intended overall network. For each type of fault five value of impedance including 60, 70, 80, 90, and 100 will be used for simulation in middle line of each section. Corresponding to occurrence of  $M$  cases of fault,  $2M$  feeders is used and finally, a 13 bus distribution network is considered as necessary standard bus in signal analyzing and processing stage. The MATLAB programming environment functions is used for simulation. Some of the values are considered as initial values which are shown in accordance with table 1. The location of fault occurrence is illustrated in figures 1, 2, and 3 for each of two states. The effect of fault signal breaking for one of the faults can be seen in figure 3 that in that fault location the effect of it on impedance is observable. Based on available outputs and considering initial labeling, we can predict the final operation of system in detecting types of quadruple fault. Mechanism of system is clear and is consist of two main phases of fault location detection and detecting type of fault.

Table 1: initializing of different states of high impedance fault occurrence

		Initial values for simulation					
		Fault index	Operation time	Transformation time	Transformation time based on fault index	Cycle number	Fault occurrencesection
resistance	80 ohm resistance	1	0.16 second	10 second	0.08 second	2	Section 12
	70 ohm resistance	1	0.21 second	14 second	0.1 second	2	Section 3
	85 ohm resistance	2	0.15 second	15 second	0.07 second	2	Section 8
	75 ohm resistance	2	0.13 second	13 second	0.06 second	2	Section 4

Figure 1: first fault occurrence location

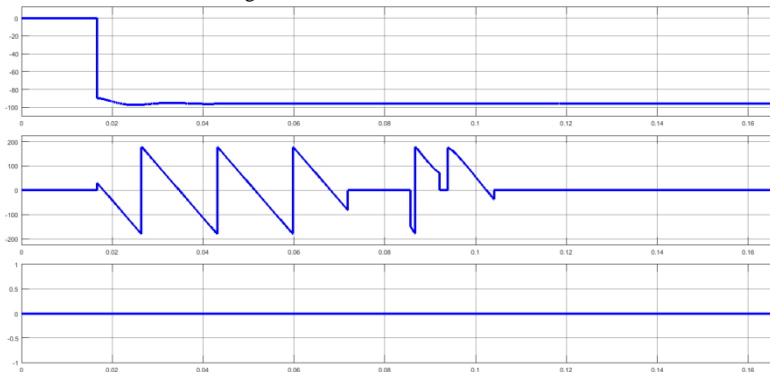

Figure 2: second fault occurrence location

Figure 3: voltage broken signal for one type of fault that have the location and effect of fault on impedance in itself.

The average of absolute difference between features of tested signal and each section of reference data signal can be shown as equation 11:

$$AAD = \frac{\sum_{i=1}^n |a_i - d_i(measured) - r_{mi}|}{n} \quad (11)$$

In which, m is numbers between 1 to the number of line section. Moreover, n is the number of signals which are between data

and  $(a_i - d_i(measured))$  the sum of test voltage signals coefficients and finally  $r_{mi}$  in database. In table (2) based on inferred value of average absolute difference and definitions that we have based on thresholds about fault and its type, we can estimate the type of fault. In tables (3) and (4), the result of classification in training and testing stages is shown for on time repetition.

Table 2: type of fault estimation for some sample states

impedance	(AR) Approximate rate values		
60 ohm impedance	First value	seconf value	third value
	1.3084	-0.3470	0.9140
<b>(third type) duoble line fault</b>			
70 ohm impedance	First value	seconf value	third value
	0.9614	0.8935	0.9069

		(second type) three phases fault		
80 ohm impedance	First value	seconf value	third value	
	1.6231	1.1318	0.4123	
	(first type) single phase fault			
90 ohm impedance	First value	seconf value	third value	
	1.3915	-0.1898	1.1645	
	(third type) duoble line fault			

Table 3: calculating the accuracy of classes classification for training stage

	First type fault	second type fault	third type fault	forth type fault	accuracy
First type fault	11	1	0	0	91.67%
second type fault	1	12	1	0	86.67%
third type fault	0	0	12	2	85.71%
forth type fault	0	1	2	11	84.62%
<b>Average fault</b>					<b>87.16%</b>

Table 4: calculating the accuracy of classes classification for testing stage

	First type fault	second type fault	third type fault	forth type fault	accuracy
First type fault	6	1	0	0	85.71%
second type fault	0	7	0	0	100%
third type fault	0	0	12	2	71.43%
forth type fault	0	0	1	6	85.71%
<b>Average fault</b>					<b>85.71%</b>

## 5. Discussion

In most of prior systems which are done to detect and isolate the high impedance fault and its type, the process of detection automating has been less considered and in some cases some

researches can be addressed in this field that have automation in detection and generally use feature extraction model and classification. Table 5 shows the comparison of presented method in this paper with other similar methods in early years.

Table 5: comparison with similar methods in early years

Author	Combined algorithm	database	results
Bakar et al.	Feature extraction by wavelet by ranking method	Gathered data of 11 KV Malaysia network	four type fault detection, no accuracy report, no uncertainty addressing, and outputs and their relationship with real labels are not clear
Samantaray	Using classification which is based on decision tree and Kalman filter superposition	Different lines of India including 25 KV and 138 KV	one type of fault Detection from natural state, existing 98% and 88% accuracy for training and testing stages, operation reliability factor of 99% and fast operation
Rafinia et al	Using neural network and fuzzy logic system	Underground 20 KV lines of Iran	Two types fault detection associated with normal state of network, different states of frequency and low studied impedance, no clearance of predictability of testing and training stages
Hong et al.	Wavelet transformation, Clustering K-means methods, genetic algorithm and Support Vector Machine	18 bus 15 KV distribution system	Complexity of algorithmç no training and algorithm testing, low detected fault types, no uncertainty addressing, no clarity of outputs and their relationships with real labels
<b>Suggested method</b>	Feature extraction by wavelet and classification by ranking method and isolation of data for testing and training	Iran 20 KV network	Some fault types detection, resolving uncertainty and convenient generalizability for other network in distribution, 87% and 85% accuracy for testing and training stages in classification

## 6. Conclusion

In this paper different approaches of intelligent detection of high impedance fault was investigated and accordingly an optimized approach based on feature extraction by discrete wavelet transformation and support vector machine classification is suggested. Some of analysis showed better result than other location of fault and type of fault detection techniques including techniques such as Bakar et al. (2014), Rafinia and Moshtagh (2014), Hong and Huang (2015), Samantaray (2012), which generally have used automation for detecting. Therefore, most of these guidelines or almost all of them are trying to estimate fault in different distribution network including 11 KV, 20 KV, 132 KV, and or 400 KV and tailored to their needs in their country. Simulation and mathematical analysis of suggested algorithm is done in MATLAB programming environment and the results were promising and some of important factors which were

neglected in prior other guidelines got investigated. Nevertheless, we need to improve the performance which can lead to optimum high impedance fault detection in future.

**Abstract.** Social responsibilities' accounting is a part of accounting knowledge with the aim on measuring and reporting social effects (social costs and benefits) caused by business activities. This study has been conducted to examine the relation between audited financial reporting and voluntary disclosure of social responsibilities of listed companies in Tehran Stock Exchange. For this purpose, statistical sample, including 95 companies in Tehran Stock Exchange during 2010-2014, was chosen. Multivariate regression method was applied to test hypotheses using panel data. Total results of study indicates that there is a significant relation between audited financial reporting and disclosure of information related to staffs relationships. The obtained results also show no significant relation between audited financial reporting and disclosure of information related to environment.

**Keywords:** social responsibilities, voluntary disclosure, audited financial reporting

### 1 Introduction

Transparent and reliable financial information generated by a comprehensive and suitable reporting system is one of key factors for evaluating situation and performance of a firm and deciding on exchange of securities issued by that firm. In today's professional societies, information are treated as reliable ones from the perspective of users if an independent organization supervises over reporting process of firms and over the important part of this process, which is financial statement. Audit organization is a sample of such independent organizations that usually monitor and investigate structure of internal control of reporting unit and the product of this internal control system, which is financial statement, in commercial units. According to the position and role of audit institutions in decision of user, real independence of auditor and quality of the audit institutions' performance is considered as the key factor for preparing audit reports. The role of audit in validating earning information of firms has become more important following the failure of large companies. Differences in audit qualities indicate themselves as differences in provided credit by auditors and quality of earnings of business holders (Hassa Yeganeh & Jafari, 2010).

The broadest concept of disclosure is providing information. Accountants employ this term limitedly and their purpose of this term is disseminating financial information related to a firm in financial statements, usually in frame of annual reports. In some cases. This concept is more limited that means providing information that is not concerned in financial statements. Dissemination of information in balance sheet and loss-profit statement as cash flows is usually considered under the title of recognition and measurement; therefore, the most limited concept of information disclosure consists of management analyses, notes attached to financial statements and complementary reports. Corporate social responsibility and disclosures related to it is a necessity that leads to firms' survival, because all firms have relationships with society. Hence, the society prepares the field for long-term survival of firms. Society benefits from activities and behaviors of firms. Expansion of companies' responsibilities implies that responsibilities of firms is outpaced its meaning in past, which was providing money for shareholders. Firms should be responsible toward beneficiaries including shareholders,

customers, staffs, product suppliers, banks, policy makers, environment and society. In this regard, companies have both economic and social responsibilities; therefore, financial statements should be accurate in accordance with the considerable role of corporate social responsibility and disclosures related to it. Nowadays, complexity of relations between firms as well as their communication with government and society people has created a circumstance in which, firms not only are responsible towards beneficiaries but also are responsible toward society members. In fact, the concept of social responsibilities discussed in theoretical literature of accounting due to the lack of attention to the interest of other society groups and environmental effects caused by business activities.

Accounting of social responsibilities is a part of accounting knowledge with the aim on measuring and reporting social effects (social costs and benefits) caused by business activities. Since each commercial unit is a member of society that is continuously in interaction with other members of society. According to the unwritten social agreements between society members to protect interests of all members, commitments and responsibilities of commercial unit should not be only limited to protecting stakeholders' interests but other commitments and responsibilities toward other groups in community such as creditors, staff, customers, sellers and other groups in society and surrounding environment. Social accounting can be defined as the disseminated information by an organization that enables beneficiaries to evaluate organization's performance when encountering with social problems (positive or negative) (Jafari, 1993).

The main objective and strategy of each firm is maximizing the value of the firm, which can be achieved through concentrating on risk and uncertainty. According to conducted studies in past, researchers believe that high level of participation of firms regarding high social responsibilities is associated with higher performance and value of firm, lower financial risk, lower informational asymmetry, accessibility to financial resources, and lower capital cost. In firms with lower social responsibility, social responsibilities' activities is one reasons for conflict between different beneficiaries, reduction in firm's resources due to unnecessary costs, and competitive weakness compared to firms with more social responsibilities.

According to the role of audit in quality of financial and non-financial statements of firms and importance of the level of social responsibilities of companies in increasing performance and value of firms, this study was conducted to examine the relation between audit of financial statements and voluntary disclosure of social responsibilities of firms with the aim on explaining the behavior of firms in field of their policies related to social responsibilities' reporting in order to improve relative position of firms compared to their competitors.

### 2 Theoretical Literature and Research Background

Audit is a kind of supervision that is applied in firms in order to reduce informational asymmetry and to control managers' freedom of action within financial reporting. Auditors would increase the validity of available information to investors. The higher the accuracy and quality of provided information by the firm, the lower informational risk and uncertainty of investors will be. Reduced uncertainty leads to lower demand for rate on return by investors (Elahi et al., 2015). Accordingly, it can be stated that quality of audit leads to reduced capital cost. Increase in accuracy of relevant information to higher quality of audit reduces the ability of manager to use voluntary accruals; hence, this negatively affects earning management. Therefore, firms with high quality of audit have lower earning management.

Manager prepares financial statements and these financial statements are audited before disclosure. Auditors are capable of effecting on chosen accounting methods by managers (Rick et al., 1991); hence, they influence on ultimate financial statements leading to increase reliability of reported accounting figures (Elliott et al, 1998). Large audit institutions have more financial ability to have better control and assurance compared to small audit institutions. Auditor guarantees that financial statements are free from material mistreatment. Audit subtilizes undesirable effects of separation between ownership and management reducing informational asymmetry between users and providers of financial statements. Therefore, auditing is used as a tool to reduce informational risk and increase quality of financial reporting. Reduced informational risk leads to reduction in capital cost of ordinary shares (Leuz & Verrecchia, 2005).

Accounting disclosure plays an important role in individual and corporate decision making. In particular, a fundamental use of accounting information is to help investors make an effective decision concerning their investment portfolios (Omran & Hoque, 2010). Disclosure should not be only considered in scope of providing information for investors and creditors. Every commercial unit as a reporter unit, has various beneficiaries including managers, staffs, customers, government, legislating authorities and the public whose rights has been less considered due to shareholders' ownership and the rights of debt securities. Today's economy in which, financial and non-financial information is the base of majority of decisions makings in capital markets, managers of commercial units play an important role in disclosure of such information (Ghorbani, 2009). According to the prior experiences, companies are not willing to increase disclosure level in their financial statements. However, information disclosure is a vital factor for optimal decision making by investors for capital survival (Salahinejad & Tabatabaean, 2009).

Disclosure of environmental information of the firm is a part of environmental and social reporting and disclosure, which mostly has non-financial nature. Disclosure of accounting information of environment, a key element in environmental reporting, would enable firms to perceive the conditions of environment protection and cope with environmental issue using this information. Also, it is possible to create a positive attitude among shareholders and capital market through a suitable disclosure of environmental information and financial reporting and to increase wealth of shareholders increasing earning and income of each share besides increasing current value of stock.

Disclosure of environmental and social information by the company has several roles including:

1. Evaluation of environmental and social effects of corporate activities
2. Effective measuring of environmental and social programs of company
3. Reporting environmental and social responsibilities of company
4. Allowing internal and external information systems to evaluate all resources and sustainable effects of company (Jenkins & Yakovleva, 2006).

There are various and important regulations for financial reporting and disclosure in many countries. For instance, businesses in USA should follow rules and regulations of disclosure enacted by SEC in order to access to capital markets (Naderi Qomi, 2007). In Iran, Article 18 in chapter 3 of Information Disclosure Act for listed companies in Tehran Stock Exchange entitled "method of information disclosure" approved in 2002 and 2003 by Stock Accusation has ruled that in order to guarantee simultaneous access of users to the information of this Act, publisher of stock market should disclose relevant

information on internet at the considered time (Mahdavi poor et al., 2010).

Chen et al., (2015) conducted a study to investigate the relation between audited financial reporting and voluntary disclosure of corporate social responsibility reports. Prior researches imply that social responsibility report of make investors aware but it has no validity. This research studies weather commitment to audit of financial results, a measure of audited financial reporting, is associated with more validity of social responsibility report. Results obtained from this research show that audit fees is positively related to the possibility of issued independent social responsibility report and this positive relation will be stronger if managers experience more need of validity.

Frank et al., (2015) studied on characteristics of chief executive officer (CEO), social responsibilities and firm's value. This study has applied traditional prediction theory of agency cost to examine if companies with powerful executive managers tend to invest more in activities with high corporate social responsibility. For this purpose, three criteria including CEO compensation, CEO tenure, and duality of CEO's task were used to measure the power of CEO. Results obtained from research indicate that power of CEO is negatively related to the level of social responsibility in company. Also, results imply that firm's activities regarding increase in social responsibility would lead to increase in firm's value.

Bahar Moghadam et al., (2013) studied the effect of corporate governance mechanisms on disclosure of social responsibility of companies. In this study, the effect of some corporate governance mechanisms on disclosure of corporate social responsibility in studied using regression method of panel data to test research; therefore, it is determined in this study that selected variables of corporate governance mechanisms except dual responsibility of OECD in board of managers has a positive and significant relation with disclosure of corporate social responsibility and disclosure level in selected 93 companies in Tehran Stock Exchange during 2006-2010 is low.

Foroghi et al., (2008) conducted as study entitled "attitude of managers toward disclosure of social accounting information in listed companies in Tehran Stock Exchange". Questionnaire was used to collect required data. The results obtained from this study show that managers of Iranian companies tend to disclose information related to social interests and welfare issue of employees, while they are not willing to disclose information related to social cost of their organization.

### 3 Research hypotheses

According to the determined objectives, research hypotheses are as follows:

Main hypothesis: there is a significant relationship between audited financial reporting and disclosure of corporate social responsibility.

Secondary hypotheses:

Hypothesis 1: there is a significant relationship between audited financial reporting and disclosure level of information related to employee relationships.

Hypothesis 2: there is a significant relationship between audited financial reporting and disclosure of information related to community involvement.

Hypothesis 3: there is a significant relationship between audited financial reporting and disclosure of information related to production.

Hypothesis 4: there is a significant relationship between audited financial reporting and disclosure of information related to environment.

### 3.1 Statistical population and sample

Statistical population of this study consists of all listed companies in Tehran Stock Exchange during 2010-2014. Some limitations were applied to select sample firms:

- Its financial period is on March 19<sup>th</sup> regarding comparable increase
- There is no change in financial year during studied period (2010-2014)
- Financial information are available
- The firm is not included in financial companies (such as banks and financial institutions), investment companies or financial intermediaries.

According to the mentioned limitations, the sample obtained to 95 listed companies in Tehran Stock Exchange in frame of 475 year-company, which their information was collected from Tehran Stock Exchange Organization, Rahavard Novin software, and audited financial statements of companies. Eviews6, econometric software, was used to estimate regression model.

### 3.2 Research model and variables

According to theoretical bases of research, research's model, which is adopted from study of Chen et al., (2015), is as follows:

$$CSRDi_{i,t} = \beta_0 + \beta_1 LNFEI_{i,t} + \beta_2 SIZE_{i,t} + \beta_3 ROA_{i,t} + \beta_4 LEV_{i,t} + \beta_5 MTB_{i,t} + \varepsilon_{i,t} \quad (1)$$

#### 3.2.1 Dependent variable

##### Disclosure of corporate social responsibilities

This variable consists of 4 dimensions including disclosure of information related to employee relationships (EMPD), disclosure of information related to community involvement (COMD), disclosure of information related to production (PROD) and disclosure of information related to environment (ENVVD). Total value of corporate social responsibilities is obtained from sum of partial values of social responsibility dimensions and this can be calculated based on the following equation (Nirwanto et al., 2011; Saleh et al., 2010; Chen et al., 2015):

$$CSR = EMPD + COMD + PROD + ENVVD \quad (2)$$

##### Disclosure of information related to employee relationships (EMPD)

6 criteria are required to indicate disclosure level of information related to employee relationships. These criteria include:

1. Environmental health of employees
2. Employee training
3. Employee benefits
4. Employee characteristics

5. Employee share ownership
6. Employee safety and health

##### Disclosure of information related to community involvement (COMD):

6 criteria are required to indicate disclosure level of information related to community involvement. These criteria include:

1. Granting cash
2. Charity program
3. Scholarship program
4. Financial supporters for sport activity
5. Supporters of national pride
6. Public plans

##### Disclosure of information related to production (PROD):

4 criteria are required to indicate disclosure level of information related to production:

1. product safety
2. product quality
3. product development
4. After-sales service

##### Disclosure of information related to environment (ENVVD):

4 criteria are required to indicate disclosure level of information related to environment:

1. Air pollution control
2. Compensation and Prevention Program
3. Protect and use of recycled products
4. Granting reward in field of environment (ISO 14000).

The firm will get the score 1 if each of indices above are disclosed in financial statements and annual reports provided by Board of Directors for the General Assembly; otherwise, the firm will get score 0. Total of scores each variables indicates the disclosure level of corporate social responsibilities.

#### 3.2.2 Independent variable:

**Audited Financial Reporting:** according to the study of Chen et al., (2015), natural logarithm of firm's audit fee is used to measure audited financial statements in this study.

#### 3.2.3 Control variables:

- **Firm size:** natural logarithm of firm sale
- **Return on Asset:** ratio of earnings before interest and tax to total assets
- **Financial Leverage:** ratio of book value of all debts to book value of total assets
- **MTB:** market value of equity to book value of equity

## 4 Results

Descriptive results obtained from research variables indicated that mean of audit fee of studied companies was equal to 6.338. Also, disclosure level of information showed that companies have the most disclosure of information related to employees and community involvement, meanwhile, they have the lowest level of disclosure of information related to environment. In other words, the lowest level of disclosure among companies was associated with environmental information.

Table 1. Descriptive statistics

variable	mean	med	standard deviation	Min	Max
Audit fee	6.338	6.304	0.887	2.89	8.9
Disclosure of employee information	2.83	3	0.794	1	5
disclosure of community involvement information	2.263	2	0.849	1	4
Disclosure of production information	1.446	1	0.572	0	3
Disclosure of environment information	1.202	1	0.585	0	2
firm size	13.23	13.22	1.500	8.9	18.44
return on asset	0.672	0.654	0.282	0.085	2.184
MTB	2.262	1.860	1.98	3.967	8.923

#### 4.1 Results of testing hypothesis 1

Hypothesis 1: there is a significant relationship between audited financial reporting and disclosure level of information related to employee relationships. As it is seen, significance level of t value of audit fee (4.322) at error level of 5% is lower than this level; hence, it is significant (Sig=0.000). Accordingly,  $H_0$  is rejected at confidence level (>95%) and it means that there is a positive and significant relation between audited financial reporting and disclosure level of information related to employee

relationships among listed companies in Tehran Stock Exchange. In other words, the higher (or lower) the audit fee of financial statements in companies, the more (or lower) the disclosure level of information related to employee relationships will be in companies. Also, control variables testing indicated that at error level of 5%, variables including return on assets and BTM had negative and positive effect on disclosure level of information related to employee relationships respectively, while firm size and financial Leverage had not significant effect.

Table 2. Results of estimation of regression model of hypothesis 1

variable	regression coefficient	standard error	t value	Sig level	result
Intercept	0.479	0.716	0.669	0.504	-
Audit fee	0.222	0.051	4.322	0.000	$H_0$ is rejected
Firm size	0.081	0.058	1.386	0.167	-
Return on assets	-0.975	0.388	-2.511	0.013	-
Financial Leverage	-0.194	0.184	-1.053	0.293	-
MTB	0.051	0.018	2.771	0.006	-
determination coefficient	0.483		F value		3.541 (0.000)
Adjusted determination coefficient	0.374		Durbin-Watson		2.195

#### 4.2 Results of testing hypothesis 2

Hypothesis 2: there is a significant relationship between audited financial reporting and disclosure of information related to community involvement. As it is seen, significance level of t value of audit fee (1.653) at error level of 5% is more than this level; hence, it is not significant (Sig=0.099). Accordingly,  $H_0$  is not rejected at confidence level (>95%) and it means that there is not a positive and significant relation between audited financial

reporting and disclosure level of information related to community involvement among listed companies in Tehran Stock Exchange. Also, control variables testing indicated that at error level of 5%, only the variable of firm size had a positive and significant effect on disclosure level of information related to community involvement, while financial Leverage, return on assets, and BTM had had not significant effect.

Table 3. Results of estimation of regression model of hypothesis 2

variable	regression coefficient	standard error	t value	Sig level	result
Intercept	-0.399	1.114	-0.358	0.720	-
Audit fee	0.114	0.069	1.653	0.099	$H_0$ is not rejected
Firm size	0.164	0.082	1.996	0.047	-
Return on assets	-0.625	0.470	-1.330	0.185	-
Financial Leverage	-0.116	0.237	-0.491	0.624	-
MTB	0.018	0.025	0.725	0.469	-
AR (1)	0.113	0.058	1.929	0.055	-
determination coefficient	0.656		F value		5.322 (0.000)
Adjusted determination coefficient	0.533		Durbin-Watson		2.308

#### 4.3 Results of testing hypothesis 3

Hypothesis 3: there is a significant relationship between audited financial reporting and disclosure of information related to production. As it is seen, significance level of t value of audit fee (3.279) at error level of 5% is lower than this level; hence, it is significant (Sig=0.001). Accordingly,  $H_0$  is rejected at confidence level (>95%) and it means that there is a positive and significant relation between audited financial reporting and

disclosure level of information related to production among listed companies in Tehran Stock Exchange. In other words, the higher (or lower) the audit fee of financial statements in companies, the more (or lower) the disclosure level of information related to production will be in companies. Also, control variables testing indicated that at error level of 5%, none of variables had significant effect.

Table 4. Results of estimation of regression model of hypothesis 3

variable	regression coefficient	standard error	t value	Sig level	result
Intercept	0.155	0.891	0.173	0.862	-
Audit fee	0.180	0.055	3.279	0.001	$H_0$ is rejected
Firm size	0.004	0.067	1.065	0.948	-
Return on assets	-0.302	0.385	0.786	0.433	-
Financial Leverage	0.018	0.194	0.093	0.926	-
MTB	0.020	0.020	1.000	0.318	-
AR (1)	0.093	0.053	1.600	0.111	-
determination	0.466		F value		2.434

coefficient			(0.000)
Adjusted determination coefficient	0.274	Durbin-Watson	2.283

#### 4.4 Results of testing hypothesis 4

Hypothesis 4: there is a significant relationship between audited financial reporting and disclosure of information related to environment. As it is seen, significance level of t value of audit fee (0.684) at error level of 5% is more than this level; hence, it is not significant (Sig=0.001). Accordingly,  $H_0$  is not rejected at

confidence level (>95%) and it means that there is not a positive and significant relation between audited financial reporting and disclosure level of information related to environment among listed companies in Tehran Stock Exchange. Also, control variables testing indicated that at error level of 5%, only firm size had positive and significant effect.

Table 5. Results of estimation of regression model of hypothesis 4

variable	regression	standard error	t value	Sig level	result
Intercept	-0.666	0.837	-0.796	0.427	-
Audit fee	0.035	0.051	0.684	0.495	$H_0$ is not rejected
Firm size	0.125	0.062	2.013	0.045	-
Return on assets	0.220	0.361	0.609	0.543	-

determination coefficient	0.550		F value		5.405 (0.000)
Adjusted determination coefficient	2.350		Durbin-Watson		0.388

#### 5 Conclusion

This study was conducted to examine the relation between audited financial reporting and voluntary disclosure of social responsibilities in listed companies in Tehran Stock Exchange. According to the results obtained from testing main hypothesis, hypotheses 1 and 3, in relation with significant relationship between audited financial reporting and disclosure of information (based on the criteria of employee relationships and production), were accepted in regression test and this relation is positive and direct. It means that the higher the audit fee of financial statements in companies, the more the disclosure level of information related to social involvement and production will be in companies. The reason for this result might be related to the credit and fame of large audit institutions in society; hence, these institutions can more independently issue their vote compared to small audit institutions. Quality of audit reporting of large institutions is more than small audit institution. However, small audit institutions are not as famous as large audit institutions and their contracts are fewer than contracts in large audit institutions; accordingly, report quality of small audit institutions is lower than reports of large audit institutions. According to the research results and theoretical bases in this regard, audit is a kind of supervision in companies that is applied in firms to reduce information asymmetry and to control freedom of managers' actions within financial reporting. In comparison with small audit institutions, large audit institutions have more financial power to perform better control and assurance. Auditor provides a rational confidence that financial statements are free from considerable distortions. Audit would attenuate undesirable effects of ownership and management separation reducing informational asymmetry between users and providers of financial statements. Therefore, auditing is a tool to reduce informational risk and increase quality of financial reporting. Audit fee is one of criteria to measure quality of audit. Audit fee shows the extra effort of auditor to increase quality of audit. In this case, employers pay more to large audit institutions because they expect to receive high-quality audit services. Empirical evidences approve the relation between size of audit institution and quality of financial statements. Large audit institutions are more strongly able to discover earning management. Also, conducted studies in this field corroborate the positive relationship between audit institution size, audit fee and auditor's accuracy so that great auditors disclose those reports that are more accurate with more information. Expert auditors would improve the quality of employer's disclosure, increase the effect of information of financial statements on decisions of investors, and reduce fraud or provided inaccurate

financial statements. Audit of large audit institutions can effect on disclosed information by companies for its shareholders reducing likelihood of lack of optimal disclosure of information or disclosure of invalid information; therefore, it can be concluded based on testing hypotheses 1 and 3 that disclosure of social responsibility related to employee relationships and production of companies are affected by audit fee of financial statements. It means, the higher the audit fee and the larger the size of audit institution, the more improved the disclosure of corporate social responsibilities will be. This mechanism is the infrastructure of social responsibility disclosure. In other words, results obtained from study indicate that effectiveness of audited financial reporting in disclosure of social responsibility related to employee relationships and production was accepted through interference of large audit institutions. The results indicate that benefitting from large audit institutions acts as a facto to increase social responsibility disclosure.

The results obtained from testing hypotheses 2 and 4 of main hypothesis, in relation with the significant relationship between audited financial reporting and disclosure level of information based on criterion related community involvement and environment, led to rejection of these hypotheses in regression test. It means that empirical findings and evidences indicate that there is not a significant relation between audit fee and disclosure level of information based on criterion related community involvement and environment. According to results of hypotheses and comparing them with previous studies, some other factors (except audit fee) can effect on disclosure of information based on criteria related to environment; therefore, some other criteria and variables except disclosure of information based on criteria related to social involvement and environment should be considered to examine the relationship between audited financial reporting and disclosure of information in companies. Furthered studies should be conducted to identify these factors. Some recommendations can be proposed in accordance with results obtained from research hypotheses:

- According to the results obtained from hypothesis 1, the positive relationship between audited financial reporting and disclosure level of information related to employee relationships, it is recommended to investors and to large investors in particular that prefer investing in companies with high audit fee, because audited financial statements by large audit institutions improves disclosure of corporate social responsibility reports related to employee relationships.

- According to the results obtained from hypothesis 3, the positive relationship between audited financial reporting and disclosure level of information related to community involvement, it is recommended to managers performing more serious actions in field of using large audit institutions in order to increase the quality of disclosure of social responsibility considering audit as an essential factor for long-term survival for companies.
- According to the results obtained from hypotheses 2 and 4, the lack relationship between audited financial reporting and disclosure level of information related to community involvement and environment and comparing them with previous studies, other factors except audit fee can effect on disclosure of information based on criterion related to environment; therefore, other factors and criteria except disclosure level of information related to community involvement and environment should be studied in further studies in order to evaluate the relationship between audited financial statements and corporate social responsibility disclosure.

**Abstract.** The present study was conducted to examine the relationships between internal marketing and feedback with service quality among employees working at a fitness clubs. Samples consisted of 50 male and 50 female (n = 100) employees in charge of working fitness program in Total Resistance Exercise (TRX) clubs. In this correlational-descriptive study, Davis' questionnaire (2005) assessing internal marketing, feedback and service quality was used as the data collection tool. The results indicated that there is a significant relationship (r=0.80) between feedback and internal marketing which means that an increase in the amount of feedback results an increase in the effectiveness of internal marketing. The relationships between internal marketing and service quality (r=0.84) and between feedback and service quality (r=0.84) were statistically significant (p<0.01).

**Keywords** Internal Marketing, Feedback, Service Quality

### 1 Introduction

In today's dynamic environment and competitive world, human resources are considered the most important intangible assets and the main sources of sustainable competitive advantage in organizations. Hitt et al., (2007) stated that the only ways to survive in today's competitive world are to consider human resources as the main organizational assets and to put ongoing effort into meeting their needs. Therefore, organizations should focus their efforts on the development and reinforcement of organizational culture in which internal customer (employees) satisfaction is as important as external customer satisfaction (Liu, 2009). In order to obtain superior service quality and a high level of external customer satisfaction, having customer-oriented internal customers (employees) committed to organizational goals and visions is a need. Such employees do not hesitate to do extra job-related activities in favor of organizational success. The concept of internal marketing highlights the importance of the role played by internal customers (employees) in the success of external marketing processes (Papasolomou & Vrontis, 2006). The scope of financial services is changing quickly worldwide. In this ever-changing and competitive environment, fitness clubs have to act quickly to achieve higher levels of customer satisfaction and superior service quality (Arasli, et al, 2005). Superior service quality leads to higher levels of customer satisfaction, customer loyalty and customer retention and boosted market shares, productivity, performance and profitability (Kazazi, 2010). Thus, employees' skills, attitudes and behaviors are very important, because employees are

responsible for providing services consistent with customers' expectations (Awwad & Agti, 2011). In addition, employees' organizational commitment and voluntary practices of citizenship behaviors improve service quality and customer satisfaction. Internal marketing facilitates the achievement of these goals by considering employees as internal customers. It can be said that proper internal marketing equips service provider organizations with competencies and capabilities required for taking advantage of environmental opportunities and improving employees' performance (Rodringuse, et al., 2010).

Suspension training is a form of resistance training that has been categorized as a subfield of physical fitness. The field of suspension training is still very new and, therefore, further steps can be taken to introduce it to the society. Suspension exercises help participants use a specific resistance and endurance protocol. Each suspension exercise strengthens the body and simultaneously develops strength, balance, flexibility and stability. In fact, these exercises are prerequisites of all types of sport and even routine daily activities of non-athletes. Randy Hetrick developed the Total Resistance Exercise (TRX) equipment and its suspension training exercises in the 1990s.

Evidence shows that no similar study has been conducted in this area. Accordingly, the results of this study can provide fertile ground for the qualitative and quantitative development of the TRX by recognizing the relationships between internal marketing, feedback and service quality in fitness clubs offering suspension exercises in Karaj. Therefore, the present study aimed at answering the following questions: 1) is there any significant relationship between internal marketing, feedback and service quality? 2) Which of the variables of internal marketing and feedback can predict service quality in fitness clubs of Karaj?

### 2 Methodology

The present study was a descriptive-correlational study. The population consisted of employees working for 50 fitness clubs (TRX) in the city of Karaj, Iran. First, thirty fitness clubs were randomly selected and then a total of 100 employees (50 men and 50 women) randomly served as two samples of this study.

In order to collect data, Davis' questionnaires (2005) internal marketing (25 items), feedback (7 items) and service quality (16 items) were used to collect the data. The three questionnaires were scored on a 5-point Likert scale ranging from strongly agree to strongly disagree. Cronbach's alphas of 0.89, 0.84 and 0.78 were obtained for internal marketing, feedback and service quality, respectively

### 3 Results

The descriptive results are presented in table (1).

Table 1. Descriptive statistics of variables

Variable	Statistical indices					
	Mean			Standard Deviation		
	Female	Male	Total	Female	Male	Total
Internal Marketing	3.84	3.73	3.78	0.40	0.52	0.47
Feedback	3.72	3.55	3.63	0.42	0.68	0.57
Service Quality	3.85	3.67	3.76	0.44	0.68	0.58

Research Hypotheses are presented as follows:

H1: There are significant relationships between internal marketing, employees' feedback and service quality of fitness clubs in Karaj.

In order to investigate the relationships between study's variables among all employees, Pearson correlation test was used. As shown in table (2), the relationship between internal marketing and feedback was significant (r=0.81), indicating that increased amount of feedback led to more efficient internal

marketing practices among employees; the relationship between feedback and service quality was significant ( $r=0.84$ ), indicating that greater amount of feedback led to higher levels of service quality; the relationship between feedback and service quality was also significant ( $r=0.84$ ), indicating that greater amount of feedback resulted in higher service quality.

Therefore, the first hypothesis concerning significant relationships between internal marketing, employees' feedback and service quality of fitness clubs in Karaj was confirmed.

Table 2. Results of Pearson Correlation (total employees)

Variable	1	2	3
1. Internal Marketing	1		
2. Feedback	0.81**	1	
3. Service Quality	0.84**	0.84**	1

\*\*correlation is significant at 0.01 significance level ( $p<0.01$ )

H2: There are significant relationships between internal marketing, female employees' feedback and service quality of fitness clubs in Karaj.

practices led to higher levels of service quality; the relationship between feedback and service quality was also significant ( $r=0.52$ ), indicating that greater amount of feedback led to higher levels of service quality.

In order to investigate the relationships between study's variables among female employees, Pearson correlation test was used. As shown in table (3), the relationship between internal marketing and feedback was significant ( $r=0.71$ ), indicating that increased amount of feedback resulted in more efficient internal marketing practices among female employees; the relationship between internal marketing and service quality was significant ( $r=0.62$ ), indicating that more efficient internal marketing

Therefore, the second hypothesis concerning significant relationships between internal marketing, female employees' feedback and service quality of fitness clubs in Karaj was confirmed.

Table 3. Results of Pearson Correlation (female employees)

Variable	1	2	3
1. Internal Marketing	1		
2. Feedback	0.71**	1	
3. Service Quality	0.62**	0.52**	1

\*\*correlation is significant at 0.01 significance level ( $p<0.01$ )

H3: There are significant relationships between internal marketing, male employees' feedback and service quality of fitness clubs in Karaj.

( $r=0.88$ ), indicating that more efficient internal marketing practices resulted in higher levels of service quality; the relationship between feedback and service quality was also significant ( $r=0.88$ ), indicating that greater amount of feedback led to higher levels of service quality.

In order to investigate the relationships between study's variables among male employees, Pearson correlation test was used. As shown in table (4), the relationship between internal marketing and feedback was significant ( $r=0.86$ ), indicating that increased amount of feedback led to more efficient internal marketing practices among male employees; the relationship between internal marketing and service quality was significant

Therefore, the third hypothesis concerning significant relationships between internal marketing, male employees' feedback and service quality of fitness clubs in Karaj was confirmed.

Table 4. Results of Pearson Correlation (male employees)

Variable	1	2	3
1. Internal Marketing	1		
2. Feedback	0.86**	1	
3. Service Quality	0.88**	0.88**	1

\*\*correlation is significant at 0.01 significance level ( $p<0.01$ )

H4: Feedback, internal marketing and gender can predict service quality of fitness clubs in Karaj.

percentage of criterion variable predicted by predictor variables) were determined. Therefore, the predictor variable feedback could predict 77% of variance in service quality of fitness clubs in Karaj. So, there was a linear relationship between the predictor variable and the criterion variable.

In order to examine the predictive power of variables gender, feedback and internal marketing to predict service quality of fitness clubs in Karaj, multivariate regression analysis was conducted. As shown in table (5), in the first step, coefficient of multiple correlation between internal marketing and service quality ( $R=0.84$ ) and coefficient of determination ( $R^2=0.70$ ) (i.e. the percentage of criterion variable predicted by predictor variables) were determined. Therefore, the predictor variable internal marketing could predict 70% of variance in service quality of fitness clubs in Karaj. In the second step, coefficient of multiple correlation between feedback and service quality ( $R=0.88$ ) and coefficient of determination ( $R^2=0.77$ ) (i.e. the

To examine regression coefficients, stepwise regression analysis was conducted and the constant value of  $-0.1$  was obtained. Therefore, considering regression coefficients of internal marketing, feedback and the obtained constant value ( $-0.1$ ), regression equation was as follows:

$$Y' = -0.1 + 0.57 (\text{internal marketing}) + 0.47 (\text{feedback})$$

(1)

Table 5. Results of Stepwise Multivariate Regression Analysis

Criterion variable	Predictor variable	R	R2	F, P	Regression coefficient	
					Internal Marketing	Feedback
Service Quality	Internal Marketing	0.84	0.70	229.3/0.001	B=1.03	
					$\beta=0.84$	
					0.001	
	Feedback	0.88	0.77	164.9/0.001	B=0.57	B=0.47
					$\beta=0.46$	$\beta=0.46$
					0.001	0.001

#### 4 Discussion

The present study was conducted to examine the relationships between internal marketing, feedback and service quality among employees working at fitness clubs in Karaj (Iran). The results indicated significant relationships between internal marketing, employees' feedback and service quality; so that, increased amount of internal marketing practices and feedback led to higher levels of service quality. These findings were in line with results of other studies conducted by Davis (2005) and Rafiq and Ahmad (2000). Davis (2005) examined the relationship between internal marketing and service quality and Rafiq and Ahmad (2000) explored the concept of internal marketing. The concept of internal marketing has been developed as a result of the development of service-provider industries in the 1980s and considerable efforts made to increase the quality of services by analyzing and monitoring service-provider mechanisms (i.e. employees). Internal marketing practices are based on a fundamental assumption stating that superior service quality can only be achieved by a group of motivated and customer-oriented employees. The relationship between customer satisfaction and employee satisfaction was first theoretically examined in retail marketing studies and gradually gained a prominent place in other areas of management and marketing; so that, the most recent model relating customer loyalty and employee satisfaction to profitability of service-provider organizations is the service-profit chain. Further studies not only confirmed the existence of a significant relationship between customer loyalty and employee satisfaction, but also expanded the scope of internal marketing practices. For example, Berry (1985) proposed that employees are internal customers of organizations and defined internal marketing as the consideration of employees as 'internal customers' and duties as 'internal products' meeting the needs of internal customers in line with organizational goals. He also stated that internal marketing implies treating employees like external customers and that internal marketing is a strategy to design occupational duties in line with employees' needs. The overall goal of internal marketing is to create organizational climate and occupational products that result in the availability of qualified employees who provide services more efficiently. When the overall employees' performance is calculated based on the amount of sold products, the marketing task is not only encouraging external customers to buy products, but also motivating internal customers to provide services efficiently. Internal marketing associate's concepts related to human resources with concepts related to marketing practices. Gronroos (1984) believed that the goal of internal marketing is to apply a marketing-based approach to motivate employees to become voluntarily involved in providing customer services.

The results also showed that internal marketing, feedback and gender can predict service quality. This finding was in line with results of a study conducted by Davis (2005). Davis believed that organizations can achieve superior service quality only when they produce products or provide services beyond their customers' expectations. Hence, the main objective of the Total Quality Management (TQM) is to fully satisfy the needs of customers (Kotler & Armstrong, 1999). Internal marketing is the basis of service marketing. The nature of business has changed; so that, in many successful organizations, it is believed that providing efficient customer services is a source of competitive

advantage. The need for effective interactions between external and internal customers has been extensively discussed in the management literature. Experts believe that better-quality internal customer services result in better-quality external customer services. Effective internal transactions are prerequisites for successful exchanges with external markets. Moreover, it has been emphasized that 'ignoring internal customers and suppliers can endanger external customer satisfaction'.

#### 5 Conclusion

The results showed that internal marketing and considering the important role of employees can extensively affect service quality in fitness clubs. Paying attention to employees' needs and getting their feedbacks have a significant role in the decision-making processes, because the quality of internal marketing practices and employees' feedbacks can predict service quality. Research on the effects of feedback and internal marketing on service quality is still rare and it cannot be expected to solve all workplace-related problems at once. Moreover, other than internal marketing and feedback, there are many factors affecting service quality. Therefore, it is important to constantly focus on the organizational performance factors. In occupational environments, especially sports environments, the ultimate organizational goal is to enhance service quality by creating a proper occupational environment for all employees. The main limitation of this study was the lack of employees' familiarity with the concept of internal marketing.

The most important finding of the present study was the confirmation of significant relationships between internal marketing, feedback and service quality. Accordingly, organizational managers, especially sport managers, have to assess and reassess the statuses of internal marketing and employees' feedback periodically. They also have to appropriately react to employees' indifference and make efforts to create an ethical and motivating work climate to enhance internal marketing practices. Working in such an environment enhances employees' performance and improves organizational status. According to the results, the highest correlation was observed between internal marketing and service quality; therefore, understanding employees' organizational behaviors and paying attention to their feedbacks can provide fertile ground for the enhancement of service quality. The two variables of internal marketing and feedback could predict the quality of services in fitness clubs. In this study, internal marketing highly affected the quality of services; therefore, managers must be capable enough to effectively understand, analyze and manage a great deal of organizational behaviors.

**Abstract.** The aim of this research was to comparison of the effect of music training and listening to Mozart music on cognitive & social development of preschool's children of Kerman City in 2013. This study was assigned in two groups of music training (experimental group) and listening to Mozart music (control group). For experimental, the music training and rehearsal in the Orff Approach were performed in 20 sessions of 75 minutes, and control group, exposed of fragments of Mozart's *D major* key at the 20 sessions of 75 minutes. Wechsler test and Vineland test were conducted on both groups before and after the interventions. Data analysis was carried out by one-way analysis of covariance. Results showed that the children attended at music training sessions have significantly gained higher scores than those listening to Mozart in terms of verbal and non-verbal abilities, IQ and social.

**Keywords:** music training; Mozart listening; cognitive and social development; preschool children

### 1 Introduction

Non-musical effects of musical training are examined and the results showed that they are mostly alluded to the childhood. Education in primary phases of childhood is of paramount importance in terms of sensitivity and receptivity of children from educational environments and sustainability of learning. Primary learning is an appropriate context for children's upcoming transactions; in fact, what are learnt in the childhood are more enduring and difficult to forget (Ghasem Tabar et al., 2011).

In the recent decades, musical learning has been taken in to account as an effective strategy to increase communicational, cognitive, and emotional capabilities of the children. Most scholars believed that musical responses of children are the most natural reactions which play important roles in various learning respects (Noor Mohammadi, 2004). In the recent years, there has been different scientific research (Bilhartz, Bruhn, and Olson, 1999) whose main common point has been the result that musical training is effective on cognitive growth and abstract thought. Gardner addressed music as an organizer of children's cognitive processes (cited by Ruscher & Zupan, 2000). Research indicates that musical lessons have positive relationship with performance in verbal abilities (Schellenberg, 2005; Marques, Moreno, Castro, and Besson, 2007; Patel & Iversen, 2007; Moreno et al., 2008), phonology awareness (Schellenberg & Peretz, 2008), spatial reasoning (Hetlnd, 2000), mathematics (Vaughn, 2000), memory (Rauscher et al., 1997; Lee, Lu & Ko, 2007; Stoesz et al., 2007; Jakobson et al, 2008), and IQ (Schellenberg, 2006). In describing the fact that musical capabilities and spatial reasoning abilities are related, Leng and Shaw (1991) put forward the "trion model of the cortex", based on which certain neuron activity patterns that are arranged in vast areas of the cortex for mental spatial-time processes are used for both spatial reasoning and musical activities. EEG-aided studies support trion model of the cortex. Leng and Shaw's model, together with theory of children's early sensitivity to music (Olsho, Schoon, Sakai, Turpin, & Sperduto, 1982; Krumhansl & Jusczyk, 1990; Jusczyk & Krumhansl, 1993), proposes the theory that musical training causes an improvement and evolution of neural paths involved in environment-dependent cognitive processes including spatial abilities. According to Hebb's learning principles, making reparative use of this neural network through musical learning can make it more capable to complete other abilities (Lefrancois, 2000).

There is overlapping between areas related to cortex's verbal abilities (BA22 and Wernicke's area) and areas of temporal stratum which is engaged for professional musical activities (Lotze et al, 2003). Since, according to conducted studies

(Gromko & Poorman, 1998; Rauscher, 1999; Mirbaha, Kaviani & Poorsaleh, 2003; Ho Cheung & Chan, 2003; Rauscher & Hinton, 2003; Schmithorst & Holland, 2004; Gromko, 2005; Jausovec, Jausovec & Gerlic, 2006; Bulduc, 2009; Hyward & Gromko, 2009; Amirian, 2011; Herrera et al, 2011), musical training can grows verbal abilities such as phonological awareness, verbal reasoning, and verbal memory.

Based on above-mentioned studies and aligned with them, this research is aimed at investigating the effects of musical training on children's cognitive and social abilities. Social development is an important aspect of growth that refers to interpersonal relationships (Seif, 2008). Social skill is a collection of learnt behaviors which enables individuals to make effective relationships with others and prevent from illogical social reactions. Social development is a balanced set of social skills and learnt adaptive behaviors. Masteries such as cooperation, responsibility, sympathy, continence, and self-reliance are components of social development (Amirtash, Sobhaninejad & Abedi, 2006). Slaby and Guara (2003) interpret social skill as social compatibility and the ability to make relationship with others in various social respects. Those whose social development is flourished have achieved a level of social relationship which enables them to easily live beside others. Basic indicators of social development can be found in fondness for others, self-confidence, relation with peers, development of social activities, tendency to criticism and reformation, and predisposition to leadership. Slawmouski and Dann (1996) consider social skill and recognition as a process which enables youngsters to predict and apprehend others' behaviors, control their own behaviors, and adjust their social interactions. Although several social groups and factors impact on the social development process (family, school, media, friends and etc), family is more influencing agent in social development of children (Shakerinia, 1997). It is the smallest, while the most important, social unit, which plays a key role in shaping children's personality and furnishing basic physical and emotional needs of the community individuals. Children's personality is directly influenced by their parents' genuine behaviors and is profiled in interaction thereto (Dillon, 2005, cited by Farrokhzad, 2008).

Hars, et al (2013), investigated effect of music-based multitask training on cognition and mood in older adults, were randomly assigned to intervention group, and control group. Six months of once weekly music-based multitask training was associated with improved cognitive function and decreased anxiety in community-dwelling older adults, compared with non-exercising controls. According to Schellenberg (2011a), 144 children were divided in to two groups, one of which was trained for 36 weeks and the other left untrained. Wechsler intelligence scale was used. Post-test showed that experimental group had significantly better scores in intelligence test as compared to control group. Schellenberg (2011c) investigated the relationship between musical lessons and intelligence in 106 male and female children of 9 to 12 years using Wechsler intelligence scale. 50 children were trained music for averagely 2 to 3 years and 56 children were left untrained. One-way analysis of variances indicated that trained group had significantly higher IQ rates than their untrained counterparts ( $P < 0.001$ ,  $F = 17.72$ ). Franklin et al (2008) in their research in the University of Michigan examined the impact of musical practices on verbal memory of 20 musicians of 10 years of experience using Reiven test and verbal memory. T-test showed that musicians gained significantly higher scores in verbal memory. In his study, Schellenberg (2007) investigated the relationship between musical training and IQ in Toronto, Canada, in 147 children of 6 to 11 years of old including 72 boys and 75 girls who had experienced musical training sessions for 23 months using Wechsler intelligence scale. Results of correlation test demonstrated that there is a positive and significant relationship between musical training and verbal IQ ( $p < 0.001$ ,  $r = 0.34$ ). He conducted the same study on 150 students of 16 to 25 years of age including 112 females and 38 males to examine the correlation between cognitive abilities in adulthood

and musical training in childhood in those who have experienced musical training sessions for an average of 3.7 years. Results showed that subjection to music in childhood has a positive relationship with IQ and educational performance ( $p < 0.01$ ,  $r = 0.23$  and  $p < 0.05$ ,  $r = 0.21$ ). On the basis of Sarkar & Biswas's review research (2015), the effect of music on the social behavior of ASD children can be established. In their investigation, Larijani and Razzaghi (2008) addressed application of performance art in social development of intellectually disabled students. They found that performance art-aided group training socially develops the intellectually disabled children ( $P < 0.01$ ). Since the conducted research affirms the effectiveness of musical training, this study aims to examine the impact of musical training on cognitive and social development as compared to listening to Mozart in both male and female Kerman's preschool children in 2012-13 educational years. Following questions are put forward:

1. Does musical training of preschool children cause an improvement of their Intelligent Quotient (IQ) as compared to those who have listened to Mozart?

1-1. Does musical training of preschool children cause an improvement of their verbal abilities as compared to those who have listened to Mozart?

2-1. Does musical training of preschool children cause an improvement of their non-verbal abilities as compared to those who have listened to Mozart?

2. Does group musical training of preschool children cause an improvement of their social quotient as compared to the control group?

## 2 Methodology

This study was quasi experimental design that was carried out based on pre-test and post-test with control group. 52 children were randomly selected and divided in to training group and Mozart group, the members of the former of which were trained for 20 weeks (one session of 75 minutes per week) and the member of the latter were exposed to Mozart's *D major* key for 20 weeks (one session of 75 minutes per week). After termination of the sessions, post-tests were conducted on both experimental and control groups. Statistical analysis of the data was carried out by analysis of covariance where all its suppositions were taken into account: normality, homogeneity of variance (table 1), random independent samples and homogeneity of regression slopes (Table 2).

Table 1: Test of Homogeneity of Variances

Variables	F	df1	df2	Sig.
Verbal abilities	0.001	1	50	0.97
Nonverbal abilities	0.041	1	50	0.84
IQ	0.389	1	50	0.53
Social quotient (SQ)	0.09	1	50	0.79

Table 2: homogeneity of regression slope

Variables	SS	F	Sig.
Verbal abilities	431.89	5.00	0.3
Nonverbal abilities	39.78	0.5	0.48
IQ	93.99	1.22	0.27
Social quotient(SQ)	694.16	1.02	0.31

### 2.1 Statistical Population, Samples, and Sampling

Population of this research includes all Kerman's preschool children in 2012-13. One preschool center was randomly selected by cluster random sampling method. In this research, from among all preschool centers from Kerman Province, one center was firstly selected. Then, 26 students were randomly selected for experimental group and the same number of students for the control group.

### 2.2 Instruments of the Research

Wechsler intelligence scale for children (1974) was utilized for measuring verbal abilities, nonverbal abilities and IQ of children between 5 to 15 years of old. It consists of measurement of verbal and nonverbal abilities in 12 equally divided subtests

(Ganji, 2007). Reliability coefficient of Cronbach's alpha was calculated to be 0.72.

*Vineland Social Maturity Scale* (1935) was utilized for measuring social maturity. It consists of 117 items and developed with regard to social maturity or individuals' abilities to take care of themselves and meet their own needs. Questions are age-based and include birth to 25 years of old. Scale questions are propounded on the ground of eight abilities, including: SHG-Self Help General, SHE-Self Help Eating, SHD-Self Help Dressing, SD-Self-Direction, OCC-Occupation, COM-Communication, LOC-Locomotion, and SOC-Socialization. In this research, a total of 57 items were presented to the parents of the children. Total scores of the questions for children less than three years of ages were taken into account for all subjects. Reliability coefficient of Cronbach's alpha was 0.85.

Table 3: A summary of musical training package in Orff Approach

Sessions	Training axes
before treatment	Pre-test
1 <sup>st</sup> session	Acquaintance and communication Familiarity with sound characteristics
2 <sup>nd</sup> session	Teaching notes' sequence and their names Teaching thrumming Rehearing concentration Musical games to improve audition and mental accuracy
3 <sup>rd</sup> session	Teaching de major key Teaching notes on five carrier lines Improvement of pitches recognition and quality of sounds
4 <sup>th</sup> session	Teaching a short lyrics-included piece Developing motional skills, body coordination, rhythm recognition, and motional precision
5 <sup>th</sup> session	Teaching notes' traction and their written form

6 <sup>th</sup> session	Rehearsing notes' traction on a new piece Developing rhythm recognition as well as emotional and motional precision
7 <sup>th</sup> session	Familiarity with silence in music
8 <sup>th</sup> session	Teaching new music Developing imagination, visualization, and creativity.
9 <sup>th</sup> session	Group rehearsals for more coordination
10 <sup>th</sup> session	Performing a demo concert for parents
after treatment	Post-test

Table 4: Research Design with two groups, Pre-test &amp; Post-test

Group	Pre-test	Treatment	Post-test	N
Experimental group = E	O	music training	O	26
Control Group = C	O	listening to Mozart	O	26

### 3 Results

Descriptive and ANCOVA findings are demonstrated in Tables 5 and 6. Scores averages of training group and Mozart group in verbal abilities, nonverbal abilities, IQ and SQ have significant differences in pretest. As seen in Table 6, effects of pretest in verbal abilities ( $p < 0.001$ ,  $F = 12.42$ ), non-verbal abilities ( $p < 0.001$ ,  $F = 82.39$ ), IQ ( $p < 0.001$ ,  $F = 42.29$ ) and Social Quotient ( $p < 0.001$ ,  $F = 58.05$ ) have been statistically significant and effective. In other words, pretest score has had an effect in

posttest, and some of variances of posttest scores has been impacted by pretest. Afterwards, to examine inter-mediatory effect on the dependent variable; pretest effect was omitted as covariate variable. After pretest scores were adjusted, a significant difference between two experimental and control groups in score average of verbal abilities ( $p < 0.001$ ,  $F = 91.56$ ,  $\text{Eta-square} = 0.651$ ), non-verbal abilities ( $p < 0.001$ ,  $F = 22.31$ ,  $\text{Eta-square} = 0.313$ ), IQ ( $p < 0.001$ ,  $F = 71.83$ ,  $\text{Eta-square} = 0.594$ ) and Social quotient ( $p < 0.001$ ,  $F = 340.52$ ,  $\text{Eta-square} = 0.861$ ) was obtained.

Table 5: Average of subjects' scores in pre- and post-tests

Indices	Tests	Training group		Mozart group	
		Average	SD	Average	SD
Verbal abilities	Pretest	102.92	13.07	97.69	13.11
	Posttest	109.96	15.36	99.53	13.19
Nonverbal abilities	Pretest	96.38	18.23	98.19	16.92
	Posttest	122.38	8.87	94.30	12.26
IQ	Pretest	99.15	14.6	97.42	13.02
	Posttest	118.23	11.7	96.5	11.98
Social quotient(SQ)	Pretest	180.68	22.52	183.81	21.84
	Posttest	243.48	22.2	178.65	17.92

Table 6: Analysis of Covariance (ANCOVA)

Tests		SS	df	MS	F	Sig.	Eta-square	adjusted mean Mozart	adjusted mean training
Verbal abilities	Pretest	1158.26	1	1158.26	12.42	0.001	0.202	-	-
	Group	8538.3	1	8538.3	91.56	0.001	0.651	95.26	121.4
Non Verbal abilities	Pretest	6428.50	1	6428.50	82.39	0.001	0.627	-	-
	Group	1740.88	1	1740.88	22.31	0.001	0.313	98.9	110.5

\*\*\*  $p \leq 0.001$

So, the answer to question "Does musical training of preschool children cause an improvement of their Intelligent Quotient (IQ) as compared to those who have listened to Mozart?" will be positive and the difference of pre-test averages to the post-test was the effect of musical education. Eta square is about 0.594 and 59.4 % of whole variance of IQ scores is being explained by the musical education. Adjusted mean in experimental group (117.7) in comparison of adjusted mean in control group (97.1) indicated that IQ increased in music training group.

Eta square in verbal abilities is 0.651 and based on the adjusted average of verbal ability scores of music group (121.4) to the adjusted average of Mozart group (95.2) refers to 65.1% of individual differences in the pre-test scores of verbal ability of

experimental group related to the effect of musical education. So, for answering this question " Does musical training of preschool children cause an improvement of their verbal abilities as compared to those who have listened to Mozart?" is positive and the reason was the difference of the average of pre-test scores to the post-test of musical education. In the non-verbal abilities, adjusted average of non-verbal ability scores of musical group (110.5) to the adjusted average of Mozart group (98.9) was shown, which attributed to eta square (0.313) which indicates that 31.3% of individual scores in the pre-test scores are related to the non-verbal ability of experimental group related to the effect of music education. Therefore, answer to this question "Does musical training of preschool children cause an improvement of their non-verbal abilities as compared to those

who have listened to Mozart?" is positive and the difference of the pre-test averages to the post-test was the effect of musical education.

The scores of social quotient of music group (244.5) to the average of Mozart group (177.6) and the effect size of 0.861 showed that 86.1% of individual differences to the pre-test scores of social quotient of experimental group was related to the effect of musical education. So the answer to this question "Does group musical training of preschool children cause an improvement of their social quotient as compared to the control group?" is positive.

#### 4 Discussion

This research is aimed at comparing the effect of musical training and listening to Mozart on the cognitive and social growth of preschool's children of Kerman City. By neutralizing the effect of pre-test scores, it can be said that musical training affected the cognitive growth of children and had a positive effect on the verbal and non-verbal abilities of experimental group and finally on their IQ in comparison with the other group who listened to Mozart music.

This result is consistent with the studies of Schellenberg (2006, 2011a, 2011b, & 2011c), Ho, Cheung and Chun (2003), and also the study of Gromko and Poorman (1998) based on the positive and significant effect of music lessons on IQ. The positive effect of musical training on the verbal ability is consistent with the studies of Mirbaha et al(1993), Amirian (2011), Herrera et al. (2011), Schellenberg (2011b), Gromko (2005, 2004), Ho et al (2003), and Piro and Ortize (2009) as the training of music is along with the positive effect on the verbal abilities such as verbal reasoning, verbal perception, numerical rate, phoneme recognition, fluency, auditory perception, the sequence of letters, words and phoneme segmentation. The positive effect of musical training on the non-verbal abilities is along with the results of the studies by Ghasem Tabar et al.(2011), Schellenberg (2011b), Gromko(2004), Ho et al. (2003), Gromko & Poorman (1998), Rauscher et al. (1997) regarding that musical training affects the non-verbal abilities such as spatial reasoning, spatial-geometric relationships, mathematical skills and memorizing numbers. Group training of music showed the high social growth to Mozart group and this result is along with the study of Amirtash et al. (2006) as the cooperation of individuals in the group activities is effective in their social growth. In order to explain this finding, it can be added that being in the group activities require the cooperation and accepting the others which can be effective in the social growth of children. The final result is that music training has a positive and significant effect on some aspects such as verbal and no-verbal ability as well as intelligence and also the several aspects of social growth. The children who were participated in the musical classes accessed the high score of verbal and non-verbal abilities rather than the other who listened to Mozart music. The result of this study showed high score of cognitive growth to the control group (who listened to Mozart). The group of music training (in the field of sub-verbal tests) had a good performance to the Mozart group, however, in the sub-non-verbal tests (two of them), no significant difference was observed and in the domain of subtests of Mazes, Mozart group had a better performance to the former group and it can be due to two reasons: a) Music training affects the verbal abilities to the non-verbal ones, b) The effect of Mozart music is limited to the left hemisphere of brain which is related to the non-verbal abilities. Therefore, listening to Mozart increases the performance of children toward some of the non-verbal abilities. As a result, the music training is along with the social and cognitive growth of preschool children.

#### 5 Conclusions

Importance of education and training in preschool periods is presently taken into more account than before (YazdKhashti, 1998). Many research's indicated that the students who have passed the preschool period in relevant educational centers are equipped with more social compatibility than those who have not passed the same. Moreover, passing preschool period stimulates learning, educational progress and social

development. Education before elementary school through environmental enrichment enables children to achieve new perspective. Therefore, education before formal schools has found vital importance and many countries have focused their attention there on. Since children are in constant give-and-takes with the environment, the more enriched and user-friendly the environment, the higher the impression of the children from the environment. The interval from three to six years of age is the span in which the personality shapes. The prominent function of the education in preschool years is empowering children with social life. Among other objectives of education are physical-motional growth, language and discourse development, cognitive growth, and creative evolution (Yazd Khasti, 1998). Since musical training is effective on cognitive and social development of children especially in preschool periods, it can be taken advantage of in assisting children to grow socially and cognitively parallel with other preschool training courses.

**Abstract.** The main objective of this study is to determine the effect of changing auditors for the mandatory audit on stock liquidity and the stock liquidity. Due to the nature and method used in this study, it is a descriptive correlational study. Research in terms of empiricist epistemology, it argued systems, inductive and from the study, is the archival field. The population of this research in terms of geographical scope is limited to firms listed in the Iran economic and the time included from the 2011 to 2015. The results showed that the liquidity of the stock of companies that change their auditors, the auditor materially from those companies that do not change, is different. The results showed that the liquidity of the stock of companies that Hsabrshan because System auditors alter, importantly than firms to change auditors, is different.

Key words: Mandatory Auditor, Voluntary Auditor, Liquidity

### 1 Introduction

Increasing economic entities, development of communication technology and the existence of conflicts of interest, creates monitoring needs. The issue of economic globalization and the information revolution, the state has even lost control (Boone, 1988). This situation makes the audit profession and gradually try to keep pace with technological change in order to remain behind moves to community needs. In this environment, users make decisions on various information such as financial information about businesses need (Acharya, 2005). Financial statements as financial information is the most important collections. But the important thing is the uncertainty about the reliability of information that stems from a conflict of interest. In addition to conflict of interest issues, including the lack of direct access to information users has resulted in demands for independent audit services. In fact, the role of auditors is to assess the quality of information for users (Amihud, 2002). De Angelo audit also emphasized that the mistake is discovered and reported, the independent auditor literally. Therefore, by definition, Angelo Di audit quality, increasing the ability to detect distortions in accounting and auditing and auditor independence assess the ability of the market. When De Angelo used these concepts, the basic assumption was that he market, which reflect the actual quality audit quality audit understands (Li, 2015). Obviously, depending on the place and role of audit firms in the decisions of users, the existence and independence of auditors and audit firms improve the working quality as key factors considered in the preparation of the audit report (Kwon et al., 2014). be audited. The bankruptcy of companies such as Enron, World Com and Parmalat as well as major banks such as Lehman Brothers, Northern Rock and in recent years has led to finger pointing to the accounting profession. In this case the requirement of periodic audit firms to change their employers as a solution to improve auditor independence was considered. Because many lawmakers believed in people, especially long-term relationships the auditor and auditee, the auditor oversight and audit quality decreases (Boone, 1988).

### 2 Literature Review

Accounting earnings are the most important indices of performance applied in many economic decisions such as stock evaluation, performance assessment, determination of managers' rewards and appropriation of retained earnings. These decisions affect the transfer of resources between different people and for this reason, they receive special attention in the capital market. In an economic environment with situations of conflicting

interests, including those between shareholders and managers, there is always the possibility that managers attempt to manipulate earnings. Management or manipulation of earnings is a deliberate action of managers to achieve desired financial results that may exist for various reasons. In the decision-making process, investors choose companies whose earnings are of higher sustainability and of greater quality indeed. In cases where entities are economically volatile, managers influence the earnings figures reflected in the financial statements leading to the positive views of those using financial statements, particularly investors. Because information is the life resource of market and the investors take the risk of investment in the capital market, they rely on the information published by the companies and invest therein. They require timely, understandable information in analyzable forms. Accordingly, the market will have to be able to manage earnings. The ability of market in detecting earnings management has two important implications. First, potential benefits reduce earnings management due to the weakening of altered components, and the second consequence is an increase in the costs of earnings manipulation. Additionally, the separation of ownership from management creates conflicts in the representatives, which may actuate managers towards opportunism and self-interest.

The role of liquidity in stock valuation, due to illiquidity risk concept stock crystallized in the minds of buyers that can cause investors to withdraw from the investment. Due to the importance of liquidity as well as important issues related to the auditor and the auditor, in this study attempted to examine the effect of changing the auditor be paid on stock liquidity (Liu, 2006; Justin et al., 2007).

Strategic product audits of financial statements for stakeholder credibility of financial information provided by the company. In today's uncertain world, firms of auditors is expected to provide professional services to consumers, to the delivery of financial condition and performance relative calm notify them by reducing uncertainty to provide claims management

So it can be said that in addition to psychological and social influences its economic role audit control as well. Increase in the number and complexity of financial reporting and accounting rules, disagreement between the auditor and the client increases (Choi, et al., 2015). Hence, there is criticism that the increase of auditor change in recent years, exacerbated the differences and the ability to play an important role accredited auditor for fiscal damage. On this basis, it is argued that the change of auditor reduces audit quality and thus by Atbar latest financial faces. That's why some regulatory authorities are worried that the increased frequency of audit, financial reporting reliability to the users (and not just to the financial statements of the companies change auditor) reduce. We find some evidence that the IFRS-related audit fee premium is lower in countries with stronger legal regimes.

### 3 Methodology

The research in the field of research funding is positive. According to the historic data is used to test the hypothesis, the research team tested overnight. is descriptive correlational study. Research in terms of empiricist epistemology, it argued systems, inductive and from the study, is the archival field.

The literature regarding the voluntarily or mandatory rotation of auditors is wide and approaches numerous aspects of this type of action: the auditing costs, the opportunities of such a rule, the implications on the quality of the accounting information, the investors' reaction, the difference between voluntarily and mandatory rotation, the probability of frauds, the effects on the auditor's independence and objectivity, the effects on the financial market, the difference between the auditors affiliated to

Big4 and the other auditors, the negotiation between the auditing companies with the clients.

As for the costs that are supported by the auditing company, and, implicitly, by the audited company, an accepted approach is that it ends up with their increase, justified by the efforts the auditing companies must make to understand the business and the organizational model of the audited company, as well as the effects of this initiation on the management of the audited company (PCAOB, 2011; Ho, 2010). GAO (2003) cites estimations of the auditing companies considering that the auditors' rotation will increase the auditing costs by 20%. Said & Khasharmeh (2014) propose a literature review and notice that, generally, one reaches an increase of costs, both for the audited companies and the auditors from 20% up to 50%. This, in fact, represents, a constant for the auditors that takes a company, irrespective of the fact that it is about rotation or about a mission received due to other reasons – the first audit year is always more expensive than the other years (GAO, 2003). Also, the existence of an indirect relation between the period of the engagement and the auditing costs was proven. On the other side, mandatory rotation can also have an effect, namely the

decrease of some auditing fees by the companies that wish to obtain a financial auditing mission (Barton, 2002 identifies such a situation for the Italian auditing companies).

#### 4 Results

We test the predictions in H1 and H2 by estimating a model that explains credit ratings in the final year of the mandatory regime (2003) and the initial year of the voluntary regime (2004) for the companies that keep the audit and the companies that opt out of the audit.

Hypothesis of 1: Liquidity stock companies change auditor, the auditor materially from those companies that do not change, is different.

H0: liquidity stock companies change auditor, the auditor materially from those companies that do not change, is not different.

H1: liquidity stock companies change auditor, the auditor materially from those companies that do not change, is different.

#### 5 Discussion and Conclusion

According to compute beta coefficient ranges between +1 and 0 is for variables that show a positive relationship between the variables. In addition, Due to the significant level calculated for each of the predictors that were lower than the accuracy (0.05) is that it appears liquidity stock companies change auditor, the auditor materially from those companies that do not change, is different.

The size of audit firm has a significant influence on the relationship between earnings management and audit opinion. The level of error probability related to the null hypothesis indicating no effects of relationship between earnings management and audit opinion is 0.14, which is greater than 0.05; so null hypothesis is confirmed with a confidence level of 0.95. It can, therefore, be concluded that audit firm size has no significant effects on the relationship between earnings management and audit opinion.

## THE IMPACT OF EMOTIONAL ATMOSPHERE OF FAMILY AND INITIAL SUPPORT OF PARENTS ON SELF-REGULATION AND ITS STRATEGIES IN HIGH SCHOOLS STUDENTS OF LAMERD CITY

<sup>1</sup> PARVANEH DOODMAN

<sup>a</sup> Faculty of Economics and Social Sciences, PNU mailbox, 19395-3697, Tehran, Iran

Email: "fdoodman@gmail.com"

**Abstract:** The aim of this study is evaluation of amount of prediction of children self-regulation dimensions (Metacognitive, cognitive and motivational strategies) by dimensions of family emotional atmosphere and initial support of parents. The study sample were included 200 high school students in Lamerd city that from this number 100 were girls and 100 were boys from different fields, the students were selected by random cluster sampling, results of multiple regression showed that among the eight subscales of emotional atmosphere of family, Love, encourage and caress in family are able to prediction self-regulation. Love between parents and children is able to prediction cognitive strategies; and sense of security and common experiences between parents and children is associated with metacognitive strategy and motivation.

**Keywords:** emotional atmosphere of family, initial support of parents, self-regulation

### 1. Introduction

The family is the smallest social unit, this social unit is incidence origin of human emotions and focus of the most intimate interpersonal relationships and interactions. It's important is to the extent that Health and development of any society is dependent on the health and development of families (Satir, 1988). Family is like any social system with basic needs, Among these needs in Psycho - social aspects can noted such as feelings of worthiness, physical security, intimacy, dependance and belonging, Sense of responsibility, need motivation and others confirmation, Need to happiness and success and spiritual needs. If members of society especially parents be aware from effects of family emotional atmospheric and their performance on health and prosperity of the children Will try to provide relaxed, balanced and supportive atmosphere to their children (Navabi Negad, 2001). Initial support of parents is said in different and various forms to children and contains warmth and affection, availability of parents, the relationship between parents and children and sacrifice (Sillick and Schutte, 2006). In terms of Bandura learning by observing own behavior and consequences of behavior, is the most effective way to perception of behavior and Pattern-making of people from environment are part of learning environment determinative, Thus self-regulation strategies can be taught through observing patterns which applies this strategy (Talebi Marand, 2005). One of the environment factors influencing on the level of the individual Self-regulatory, is family. Family is the first institutional and global public systems that is necessary to meet Vital and emotional requirements of Human and Survival of the community. An important factor in providing health and mental health of children, is adequate and balanced relationships of parents with them (Baumrind, 1992). When mothers, have good insight into the performance of their children, she was confident about their abilities and are valued for school assignments, Children also will have a positive motivational beliefs and will affect to self-regulation which also includes motivational variables, Karreman et al. (2006), in their meta-analysis on relationship between style of parenting and self-regulation, point out to this results that negative control of parents has negative impact on children's self-regulation and positive control has positive and constructive impact on children's self-regulation. Since training programs are effective in raising the level of self-regulation in children's, Parents and teachers play an important role in the development of this feature (Dignath et al. 2008). In terms of Schunk et al. (2008), self-regulation is process in which students become active and to achieve knowledge and behaviors that systematically pushing them towards their goal. In the field of family emotional atmospheric effects and Initial support of parents, several studies have been done on amount of self-regulation and its dimensions among Stright et al. (2001), have concluded that Interaction and training of parents have important

role in predicting children's self-regulated learning. Metacognitive and strategic training of parents and their modeling helps children to learn cognitive knowledge and thus improve self-regulation. Hosseini and Samani (2011), have said, Warm and acceptor behaviors of parents have follow favorable developmental consequences for children, while rejecting behaviors and hostility of parents have follow unpleasant for the children. Harris et al. (2007), achieved to this conclusion that one of the most important factors in upbringing of children, is creating mental health in them. If be created field of mental health in the family, parents will have children with character, balanced, consistent, sentimental, social, self-confidently, responsible and logical. Nahidi, (2010), showed that there is relationship between family emotional atmospheric with formation of personality traits of hardness and self-actualization of adolescents. So considering to important role of family and emotional atmosphere prevailing in students' self-regulation, this research will examine relationship between Initial support of parents and families emotional atmosphere on self-regulation and its dimensions in high school students in Lamerd city. In addition, is following to determine, which one of dimensions of family emotional atmosphere are significant predictors for self-regulation and its impacts on students.

### 2. Methodology

Statistical population of current study were boys and girls high school students in the city Lamerd. The number of studied sample were included 200 students that from this number 100 were girls and 100 were boys from different fields, the students were selected by random cluster sampling and questionnaires were given to them as a group to respond to questions. 3 measurement tool was used in this study.

**2.1. Initial support of parental questionnaire:** This questionnaire has been made in 2004 by Sho and others, this questionnaire is including six questions that measure emotional support received from parents in childhood. For Scoring each phrase, degree between 1 (never) to 4 (always) awarded to each participant. Scores range is between 6 to 24. In this study of Shu and others internal consistency has been reported higher than 0.90. Since no information was not available about reliability of this scale in Iran, Therefore, reliability of this questionnaire were assessed in present study ,Cronbach's alpha method was used to determine the reliability and coefficient obtained equal to 0.87.

**2.2. Family emotional atmosphere questionnaire of Hill Berne:** this questionnaire has been made in 1964, for assessing love in child- parent's interactions. This questionnaire has 16 questions and Measures 8 derivative (Love, caress, confirmation, gift, common experiences, sense of security, trust, encouragement) in this questionnaire questions are Five-choice (very low, low, medium, high and very high) and subjects according to their sense marks one of them. Scoring is variable from 1 to 5, this means that awarded to very low option, score 1, low 2, medium 3, high 4 and very high 5. High scores than average represent appropriate emotional atmosphere between family members and lower scores than average showed weak emotional atmosphere among family. In a study in Iran, reliability coefficient of cronbach's alpha and test-retest, respectively obtained 0.87 and 0.83 (Barani, 2014). In this research Cronbach's alpha obtained for family emotional atmosphere and its eight dimensions 0.67 to 0.9.

**2.3. Self-regulation questionnaire of board and colleagues:** The first factor consists of 7 items constitute dimension of metacognitive strategies, the second factor contains 9 items, evaluates dimension of cognitive strategies and the third factor contains three items constitute dimension of motivational

dimension. In this study Cronbach's alpha obtained for self-regulation and its three dimension 0.68 to 0.75. in this research Initial support of parents and family emotional atmosphere and eight dimensions of Love, caress, confirmation, gift, common experiences, security, trust as an predictive variables and self-regulation variable and Metacognition, cognitive and motivational dimension were considered Criterion variables.

Correlation and multiple regression methods were used based on purpose of this study which is to examine the relationship between family emotional atmosphere and initial support of parents with amount of self-regulation and its dimensions in students.

### 3. Results and findings

Descriptive findings of this study include mean and standard deviation of the samples, for family emotional atmosphere scale and its dimensions, the scale of initial support of parents and scale of self-regulation and its dimensions have been presented in Table 1. Among the eight dimensions of emotional atmosphere scale, highest mean was relating to sense of security variable (7.48) and the lowest mean was relating to caress (6.45).

Table 1. Mean and standard deviation of subjects in studied variables

standard deviation	Mean	variable	standard deviation	Mean	variable	scale
			54.12	48.55	Total score of family emotional atmosphere	
05.2	46.6	gift giving	13.2	01.7	Love	emotional atmosphere
94.1	33.7	Encourage	29.2	45.6	caress	
04.2	35.7	Trust	88.1	91.6	Corroborate	
17.2	48.7	Feeling of security	34.2	51.6	Common experiences	
88.3	49.22	Metacognitive strategy	62.8	24.61	Total score of self-regulation	self-regulation
22.2	83.8	Motivation strategy	41.5	92.29	Cognitive strategy	
			43.4	88.14	total score of Initial support of parents	initial support of parents

Table 2. The correlation coefficient between family emotional atmosphere and its dimensions with self-regulation, metacognition, cognition and motivation

\*\*Significant at 0.01 \*Significant at 0.05

As is seen in Table 2, there was significant correlation between at level of confidence 0.01 among score of self-regulation and family emotional atmosphere of students. This significant relationship was observed on all aspects of family emotional atmosphere. The highest correlation between dimensions was related to love (0.318) that was significant at 0.01 level. There was significant correlation between at level of confidence 0.01 among total score of self-regulation with family emotional atmosphere and Initial support of parents. This significant relationship was observed on all aspects of self-regulation. The highest correlation between dimensions in family emotional atmosphere and Initial support of parents Related to metacognition dimension was with amounts of correlation 0.327.

As is seen in Table 3, there was significant correlation between at level of confidence 0.01 among metacognition and family emotional atmosphere of students. This significant relationship was observed on all aspects of family emotional atmosphere. The highest correlation between dimensions was related to love (0.318) that was significant at 0.01 level. The results showed that eight dimensions of the family emotional atmosphere explain 10.5% of metacognition variance and common experiences and Sense of security dimensions have predictive power to student's metacognition and explain respectively 20.4 and 17.2 percent of this variance and other dimensions of family emotional atmosphere were not significant predictors in the model. There

was significant relationship between at level of confidence 0.01 between cognition and family emotional atmosphere of students. This significant relationship was observed on all aspects of family emotional atmosphere except common experiences. The highest correlation between dimensions was related to love (0.358), the results showed that eight dimensions of the family emotional atmosphere only explain 12.8% of cognition variance and love dimensions has predictive power to student's cognition and explain 35.8 percent of this variance and other dimensions of family emotional atmosphere were not significant predictors in the model.

There was significant relationship between at level of confidence 0.01 between motivation score and family emotional atmosphere of students. This significant relationship was observed on all aspects of family emotional atmosphere except confirming and gift giving. The highest correlation between dimensions was related to common experiences (0.224) that is significant at 0.01 level. The statistical analysis results showed that eight dimensions of family emotional atmosphere explain 8% of motivation variance and Sense of security and common experiences dimensions have predictive power to students motivation and explain respectively 27.9 and 23.1 percent of this variance and other dimensions of family emotional atmosphere were not significant predictors in the model.

Table 3. Stepwise multiple regression analysis to predict metacognition based on the dimensions of family emotional atmosphere

significance level	Test statistic (F)	beta Value	coefficient of determination	Predictor variables	Instant prediction Variable
000.0	557.11	204.0	082.0	common experiences	
		172.0	105.0	Sense of security	metacognition

#### 4. Discussion

This study is done with aimed to evaluate predictive value of children's self-regulation and metacognitive, cognitive and motivational strategies by dimensions of family emotional atmosphere (Love, caress, confirmation, gift, common experiences, sense of security, trust, encouragement) .Study results showed correlation coefficient was significant between the total score of family emotional atmosphere and initial support of parents with student's self-regulation. This significant relationship was observed in all dimensions of self-regulation. According to the results of this study, can confirmed this assume that family emotional atmosphere and initial support of parents are able to predict self-regulation, metacognition, cognitive and motivational. Results of this study were consistent with the results Stright et al., (2001). However, in this study, impact of family emotional atmosphere have been studied on some of self-regulation variables and research was not found that have all three variables, at explaining the confirmation of this hypothesis. It can be said, confirming impact of family emotional atmosphere and initial support of parents are not unexpected on self-regulation and its dimensions. In Investigate relationship of family emotional atmosphere, including (Love, caress, confirmation, gift, common experiences, sense of security, trust) with Self-regulation and its strategies Such as metacognition, cognition and motivation in students, in this study the results showed that there is significant relationship at confidence level 0.01 between score of Self-regulation and its strategies with family emotional atmosphere of students. In self-regulation and metacognition strategies, this significant relationship was observed in all dimensions of family emotional atmosphere. In cognitive strategy there is this significant relationship about all dimensions of family emotional atmosphere except common experiences. In Motivation strategy also this significant relationship was observed in all dimensions of family emotional atmosphere except confirming and gift giving. Stepwise multiple results of regression analysis to determine predictor of self-regulation, metacognition, cognitive and motivational from family emotional atmosphere dimensions, Showed that the

dimensions of love, Encourage and caress have predictive power self-regulation and dimensions of common experience and Sense of security have Predictive power metacognition and dimension of love have predictive power cognitive and dimensions of sense of security and common experiences have predictive power Motivation for students. Obtained results of this study, confirm findings of research that Inside and outside the country have shown significant relationship between family emotional atmosphere and self-regulation of Students (Kharrazi and Kareshki, 2008; Najjar Pour). Coordination between finding of this study and the previously research indicated that there is Positive and significant relationship between family emotional atmosphere and self-regulation.

#### 5. Conclusion

It can be said that many problems of growth and education and training of children have root in emotional space governing the family and solving these problems is done by helping to growth and awareness of parents. It can be concluded where parents investigate to emotional needs of their children within reasonable limits and with knowing the basics of education and training and how Personality development in each stage of their growth, they deal with their children, will be witness their Self-regulatory. It is obvious that necessary condition for having attention, motivation and willingness to learn, is to meet their basic needs in family environment, especially by parents. Unfulfilled or incomplete satisfaction of physiological needs and psychological needs such as need for security, love and respect leads that children at school are undergoing anxiety and insecurity and instead of problem solving and addressing to cognitive tasks, be more distressed their Biological and emotional needs and also Insecure and threatening conditions of classroom space.
